11. In a weighing-machine, the combination, with a receiving-hopper, a tiltable weighing-hopper, a weighing-beam, and levers connected therewith and supporting the weighing-hopper, of a cut-off for the receiving-hopper which is adapted to swing under the latter, a lever 22 pivotally connected with the hopper by means of toggle-bars, and means connected with said lever 22 and serving to hold the cut-off retracted, the cut-off being released and allowed to swing automatically to reduce the flow of grain to a dribble when the load in the weighing-hopper becomes sufficient to depress it and thereby elevate the lever 22 in the manner shown and described.

12. In a weighing-machine, the combination, with the receiving-hopper, the weighing-hopper, the weighing-beam, and levers connected with the latter and supporting the said hopper, of a swinging cut-off for the receiving-hopper, a slidable bar connected therewith and provided with a series of holes to receive a stop-pin, and a bar arranged vertically for supporting said slidable bar and serving also as a stop, whereby the swinging movement of the cut-off is regulated in the manner shown and described.

13. In a weighing-machine, the combination, with a weighing-beam, a tiltable weighing-hopper, a frame in which the hopper is hung, and levers connected with said beam and suspending the hopper-frame, of swinging gates which are separated by a slot and arranged below the hopper for alternately closing the same and allowing discharge of its contents, and lugs attached to the hopper-supporting frame and adapted for arresting the gates, when the hopper makes its preliminary shifting movement, substantially as shown and described.

14. In a weighing-machine, the combination, with the weighing-hopper having a central partition dividing it into two compartments, and a weighing mechanism suspending the hopper as described, of shiftable gates arranged for alternately closing the compartments of the hopper and separated by a slot through which discharge of the hopper takes place, vertical bars and a walking-beam pivotally suspending the said gates, and means for arresting the movement of the latter after the hopper has made its preliminary shift, substantially as shown and described.

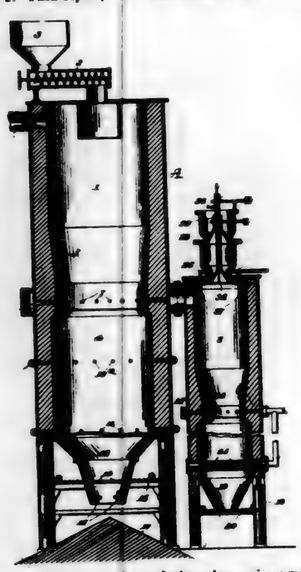
15. In a weighing-machine, the combination, with the weighing-hopper, the weighing-beam, and interposed levers from which the hopper is suspended, of gates for closing the mouth of the latter and curved upon the arc of a circle described from the pivot of said hopper, the latter being arranged in contiguity to, but out of contact with, the gates, cleaners consisting of transverse plates pivoted to the hopper and having extended arms, and spiral springs connected with said arms and serving to hold the cleaners in elastic contact with the gates, substantially as shown and described.

16. In a weighing-machine, the combination, with the receiving-hopper having a tapered and truncated lower portion, of the smaller guard-hopper arranged in the receiving-hopper and having a similar form, both hoppers having discharge-openings which are arranged in vertical alinement, and the guard-hopper being arranged below the upper edge of the receiving-hopper and separated from it by a considerable space, substantially as shown and described.

17. In a weighing-machine, a hanger or stirrup composed of two open loops having like form, one being larger than the other, whereby it is adapted to receive the same, the two being riveted together, and bearing-blocks supported in each end of the hanger and provided with depressions for receiving the pivotal bearings of the levers, substantially as shown and described.

18. In a weighing-machine, the combination with two sockets-bearings 10 10 spaced apart of the weighing-lever 13 having two conical fulcrum-pivots arranged opposite in the same horizontal plane and adapted to bear in such sockets and hold the beam in position without friction, said beam having also a pivot on the end of its shorter arm, and on the upper side of the latter, it being thus above the fulcrum-pivots, a stirrup 12 hung on such end pivot, a lever having a bearing in said stirrup, and a weighing-hopper connected with said lever, as shown and described.

706,448. PROCESS OF MAKING COKE. PAUL HAIN, New Brighton, N. Y. Filed Sept. 7, 1897. Serial No. 650,761. (No specimens.)



Claims.—1. In a process for producing coke, passing a mass of finely-divided carbonaceous material through a furnace or shaft and simultaneously forcing heated fluid and steam into said mass a considerable distance from both ends of said furnace or shaft, whereby successive portions of the mass will be coked, the coke desulfurized and the by-products absorbed by the heated fluid as it ascends through the mass and permitted to pass from the upper end of the furnace or shaft.

2. In a process for producing coke, passing a mass of finely-divided carbonaceous material through a shaft or furnace, generating a gas under pressure and heating said gas and coking said carbonaceous material by injecting said heated gas under pressure into the mass as it passes through the furnace or shaft, at a point between and a considerable distance from the ends of the furnace or shaft through which said mass passes, whereby portions of the mass will be coked successively and the hot gas with by-products absorbed thereby will ascend through the uncoked portion of the mass and be permitted to pass from the upper end of the shaft or furnace.

3. In a process of producing coke, passing a mass of finely-divided coking material through a furnace or shaft, introducing hot gas into said mass a considerable distance from the ends of said furnace or shaft and introducing steam into the descending coke at a point below the ingress of hot gas and a considerable distance above the outlet of coke at the lower end of the furnace or shaft.

4. A coking process consisting in passing a mass of finely-divided carbonaceous material continuously through a furnace or shaft, and subjecting the moving mass to the action of hot gas at a point a considerable distance from the top of the furnace or shaft and subjecting the descending coke at a lower point and a distance above the lower end of the furnace or shaft to the action of steam, whereby the mass will be gradually and rapidly coked and the by-products made to ascend through the descending mass and be permitted to pass from the furnace.

5. In a continuous process of producing coke, introducing into a body of finely-divided coking material, heated gas, at a distance from the upper end of the mass, introducing steam at a lower level and introducing water at a still lower level.

6. In a process of producing coke, subjecting a body of coking material to the action of heated gas and simultaneously injecting steam and water into the heated material at points below that at which the body of material is subjected to the action of heated gas.

7. In a continuous process for producing coke, coking coal by introducing a series of jets of heated gas into a body of fine coking material at the juncture of the coking and cooling chambers and a considerable distance from the other ends of said chambers at the respective ends of the apparatus.

8. The process of producing coke, gas and by-products which consists in passing heated gas through a body of coking material whereby the volatile matter is removed; injecting steam at a lower level whereby ammonia is formed by decomposition of the nitrogenous compounds contained in the coke and finally injecting water at a still lower level chiefly for the purpose of cooling the coke.

9. In a coking process passing a mass of carbonaceous material through a furnace or shaft, generating a heated gas mixed with steam in a separate apparatus and coking the carbonaceous material by injecting the mixed gas and steam into the mass thereof, whereby the latter is coked and desulfurized and the gas and by-products absorbed and permitted to pass from the top of the furnace or shaft.

10. The herein-described process of making coke which consists in taking hot gas from a shaft furnace or producer at such height that said gas will be under considerable pressure, and coking coal by passing said hot gas under pressure through a mass of coal.

11. The method which consists in subjecting a progressing column of bituminous fuel in one part to the action of coking and treating another part of the column of coke while said part is still highly heated for the elimination of impurities, without interfering with the structure of the coke.

12. The method, which consists in conducting gaseous fluid through a body of coking material in one part for the purpose of coking, and conducting a different gaseous fluid for the removal of impurities through another part.

706,444. COMPOSITION FOR USE IN SECONDARY BATTERIES. CARL T. J. OTTERBAEN, London, England. Filed Jan. 11, 1902. Serial No. 89,223. (No specimens.)

Claims.—1. In a secondary battery, the combination with the lead oxid constituting the active material, of bitumen in solution, whereby to render the active material harder and more coherent.

2. In the preparation of the active material for the plates of a secondary battery, the combination with lead oxid, of bitumen in solution in a light hydrocarbon.

3. In the preparation of the active material for the plates of a secondary battery, the combination with lead oxid, of bitumen in solution in benzene with the addition of alcohol.

4. In the preparation of the active material for the plates of a secondary battery, the combination with the lead oxid, of bitumen in solution in a light hydrocarbon and of dilute sulfuric acid.

5. A battery composition, consisting of active material admixed with a solution of bitumen in a solvent thereof and with dilute sulfuric acid.

6. A battery composition consisting of active material admixed with a solution of bitumen in a hydrocarbon liquid and with dilute sulfuric acid in quantities sufficient to form a paste.

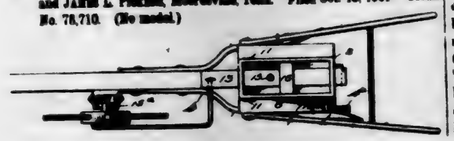
7. A battery composition consisting of oxid of lead admixed with a solution of bitumen in a hydrocarbon liquid and with a sufficient quantity of dilute sulfuric acid to form a paste.

706,445. RAIL-JOINT. CHARLES C. CHEVRAGUE and RANDALL L. GIBSON, Remington, Pa. Filed June 6, 1902. Serial No. 110,460. (No model.)

Claim.—1. A rail-joint comprising a boxing having side pieces to engage against the sides of joining rails, the bottom wall of said boxing having a depression or recess, rails adapted to engage with their lower portions against the ends of said joint, and lugs on the rails for engaging in said recess or depression, substantially as specified.

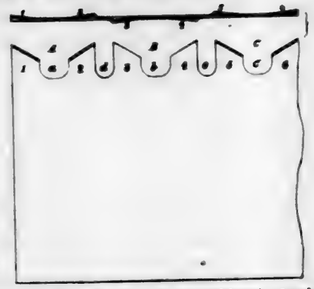
2. A joint for railway-rails comprising a boxing having side pieces for engaging against the web portions of joining rails, flanges extended outward from the bottom of the boxing and adapted to engage between flanges of the rail-sections, the bottom wall of said boxing having a depression or recess, and lugs on the under sides of the rail-webs at the ends for engaging in said recess or depression, the recess or depression being longer than the combined length of the lugs, substantially as specified.

706,446. COMBINED PLOW AND PLANTER. JAMES H. PARK and JAMES L. PERKINS, Mooreville, Tenn. Filed Oct. 15, 1901. Serial No. 78,710. (No model.)



Claim.—In a corn-planter the combination with a hopper, and a slide arranged therein, of means for reciprocating said slide comprising a wheel supported in front of the hopper, a connection between said wheel and slide, and supporting and adjusting devices for the wheel consisting of a guide formed with elongated slots at the front and rear, and a vertical slot at the outer side, a block within said guide having threaded projecting arms, nuts on said arms, and an axle projecting from the outer side of the block.

706,447. DOUBLE-ACTING SAW. GEORGE R. PEART, Sheffield, England, assignor of one-half to Frank Fuzen, Sheffield, England. Filed Sept. 9, 1901. Serial No. 74,816. (No model.)



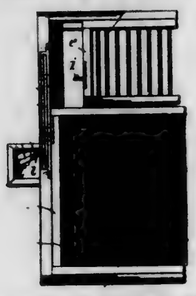
Claim.—A saw having its teeth arranged in pairs, 1 and 2, 3 and 4 and so on, with gullets *a*, *b*, between the members of each pair and with the gullets *d*, *e*, separating one pair of teeth from the next, the teeth of each pair having their edges converging inwardly toward the bottom of the gullet between them being sharpened from the same side and both set over in the same direction.

706,448. COMBINED BABY CARRIAGE AND ROCKER. JAMES C. PENDER, Crowley, La. Filed Apr. 26, 1902. Serial No. 104,864. (No model.)

Claim.—1. A combined baby carriage and crib comprising a frame having legs, rockers at the bottom thereof, a basket mounted on the frame, bars pivoted together at their inner ends and having sliding pivotal connections with said legs, spring-strips carried by said bars, axles carried by the springs, and wheels mounted on the axles, a handle in connection with the bars, a link pivoted to one of the cross-pieces of the frame, the bar T pivoted to said link and adapted to be actuated by said handle, whereby the axles carrying the wheels may be raised or lowered to throw the wheels above or below the rockers, as set forth.

2. A combined baby carriage and crib comprising a frame, legs thereon, rockers at the bottoms of said legs, a table, a basket secured thereto, bars pivoted together at their inner ends and having sliding pivotal connections with the legs, axles carried by said bars, a handle connected to the bars, a link pivoted to the cross-piece connected to the legs, a bar T, a pin carried thereby and about which said handle is bent, said bar T having pivotal connection with said link, said bars which have pivotal connection with each other and the legs adapted to buckle to hold the lower portions of the wheels above or below the rockers, as set forth.

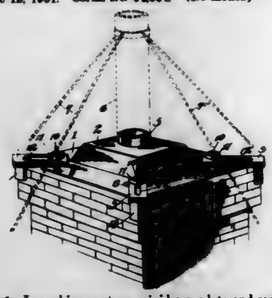
706,449. CAR-DOOR. EDWARD D. PEPPERS, Mobile, Ala. Filed Jan. 25, 1902. Serial No. 91,266. (No model.)



Claim.—1. In a car-door, the combination with a pair of upper and lower sliding doors, and latches carried by each of said doors; of a bar mounted to slide vertically in the door-frame, a stop upon the lower end of said bar, means carried by said bar for engaging said latches, a rock-shaft passing through the side of the car, a crank upon the inner end of said shaft provided with means for engaging said stop upon said bar, a hasp upon the outer end of said shaft to operate the same, and eyebolts upon the outside adapted to secure said hasp in its locked and unlocked positions.

2. In a car-door, the combination with a pair of upper and lower sliding doors, and latches carried by each of said doors; of a bar mounted to slide vertically in the door-frame, a stop upon the lower end of said bar, means carried by said bar for engaging said latches, a rock-shaft passing through the side of the car, a crank upon the inner end of said shaft provided with means for engaging said stop upon said bar, a hasp upon the outer end of said shaft to operate the same, eyebolts upon the outside adapted to secure said hasp in its locked and unlocked positions, and swinging doors hinged upon the outside of the car, adapted to close the door-opening from the outside.

706,450. CHIMNEY-TOP. CHARLES J. QUINN, Scranton, Iowa. Filed June 12, 1901. Serial No. 64,304. (No model.)



Claim.—1. In a chimney-top, a rigid cap-plate and radial chimney-engaging clamps which are longitudinally and laterally adjustable independent of the cap-plate.

2. In a chimney-top, a cap-plate provided with diagonally-disposed corner-slots, in combination with cleats having means for engaging the slots, and corner-clamping lugs carried by the cleats.

3. In a chimney-top, a cap-plate provided with diagonally-disposed slots, slotted cleats carrying corner-clamping lugs, bolts passed through the slots of the plate and the cleats, and nuts carried by the bolts.

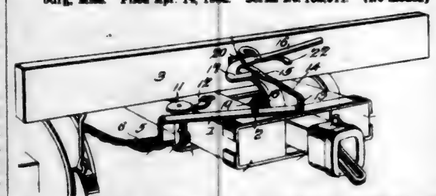
4. A chimney-cap having chimney-engaging clamps which are adjustable laterally and longitudinally, the cap and each clamp having crossed slots, and adjustable fastenings piercing the respective crossed slots of the clamps and cap.

5. A rigid polygonal chimney-cap having chimney-engaging clamps located at the corners thereof and both laterally and radially adjustable independent of the cap.

706,451. STORAGE SYSTEM. JOHN R. RECTOR, Lipan, Tex. Filed Feb. 9, 1901. Serial No. 46,670. (No model.)

Claim.—A storage system comprising a house, a stack mounted upon the ground some distance therefrom and provided with a revolvible funnel for facing the wind from different directions, an underground passage connected with said stack and extending beneath said house, a part of said passage beneath said house having a general tapering form and being provided with branch passages disposed obliquely to the general direction of said passage and terminating at points adjacent to the walls of said house, a slatted floor for said house, said floor being disposed over all of said branch passages, and means for permitting the escape of air-currents from the top of said house.

706,452. AUTOMATIC CAR-BRAKE. ARTHUR W. REED, Orvisburg, Miss. Filed Apr. 14, 1902. Serial No. 103,911. (No model.)



Claim.—1. In a device of the class described, the combination with a car having a car-coupling capable of longitudinal movement, of a transverse lever fulcrumed between its ends on the car and designed to be connected at its outer end with the brake mechanism, and means for connecting the inner arm of the lever with the car-coupling, said means comprising a connection and a lever arranged to place the connection under tension to cause the inward movement of the car-coupling to apply the brake and adapted to slacken or loosen the said connection to prevent the longitudinal movement of the car-coupling from affecting the brakes, substantially as described.

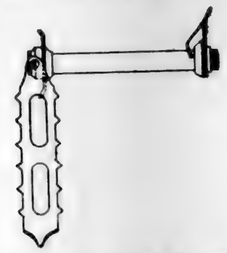
2. In a device of the class described, the combination with a car having a car-coupling capable of longitudinal movement, of a transverse lever fulcrumed between its ends on the car and designed to be connected at its outer arm with the brakes, a lever carried by the draw-head and fulcrumed at one end, and a connecting device extending from the inner arm of the transverse lever to the operating-lever and connected with the same beyond the fulcrum-point and adapted to be placed under tension by the operating-lever and to be slackened or released by the same, substantially as described.

3. In a device of the class described, the combination with a car having a car-coupling capable of longitudinal movement, of a transverse lever fulcrumed between its ends on the car and designed to be connected at its outer arm with the brakes, an operating-lever carried by the draw-head and fulcrumed on a suitable support, a flexible connection extending from the operating-lever to the transverse lever and adapted to be placed under tension by the former, and a resilient catch for locking the operating-lever against movement when the flexible connection is under tension, substantially as described.

4. In a device of the class described, the combination with a car having a car-coupling capable of longitudinal movement, of a transverse lever fulcrumed on the car and designed to be connected at its outer arm with the brakes, an operating-lever having a curved end portion and fulcrumed at the outer terminal thereof and carried by the car-coupling, and a flexible connection extending from the inner arm of the transverse lever to the operating-lever and connected with the same to the inner terminal of the curved portion, substantially as described.

5. In a device of the class described, the combination with a car provided with a car-coupling capable of longitudinal movement, a transverse lever fulcrumed on the car and designed to be connected at its outer arm with the brakes, a bracket secured to the draw-head, an operating-lever fulcrumed on the bracket, a flexible connection extending from the operating-lever to the inner arm of the transverse lever and connected with the former beyond the fulcrum and adapted to be placed under tension by the said operating-lever, and a spring secured to the bracket and forming a catch for locking the operating-lever when the flexible connection is placed under tension, substantially as described.

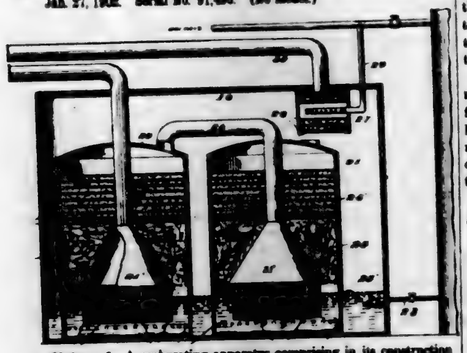
706,458. CONVERTIBLE BICYCLE-REST. WILLIAM R. RIDDALL, Edinburgh, Scotland. Filed Nov. 14, 1901. Serial No. 82,736. (No model.)



Claim.—1. In a bicycle-rest, the combination with a pedal shaft or axle and a supporting-plate at the outer end thereof, of a pedal-frame pivoted to said plate and adapted to swing downwardly to constitute a support for the bicycle, a plate fixed to and connecting the parallel members of said frame at their inner ends having a recess therein adapted to embrace the under side of said axle, an upright secured to the bearing-sleeve of the pedal on said axle, and a spring-actuated retaining device fulcrumed on said upright and provided with engaging portions adapted to coöperate with the latter plate for retaining said pedal-frame in raised position, said pedal-frame being of such length that the plate on its free end will reach to the ground when swung downwardly.

2. In a bicycle-rest, the combination with a pedal shaft or axle and a supporting-plate at the outer end thereof, of a pedal-frame pivoted to said plate and adapted to swing downwardly to constitute a support for the bicycle, a plate connecting the parallel members of said frame at their inner ends having a recess therein adapted to embrace the under side of said axle, an upright secured to the bearing-sleeve of the pedal on said axle, a lever fulcrumed in said upright having a forked lower end, the branches of which straddle said axle and are provided with engaging portions which coöperate with the latter plate for retaining said pedal-frame in raised position, and a spring acting upon said lever for holding it in operative position.

706,454. CARBURETER. CLARK ROBINSON, Hartley, Iowa. Filed Jan. 27, 1902. Serial No. 91,436. (No model.)



Claim.—1. A carbureting apparatus comprising in its construction a chamber containing carbureting-tanks, means for introducing air into one of said tanks, a hydrocarbon-liquid reservoir, a pipe for conducting a supply of the hydrocarbon liquid to the aforesaid chamber, devices for controlling the supply, and apertures in the walls of the carbureting-tank for permitting the liquid to flow from the aforesaid chamber into the carbureting-tanks, substantially as and for the purpose set forth.

2. In a carbureting apparatus, the combination of a carbureting-chamber, carbureting-tanks therein, mechanism for supplying atmosphere under pressure into one of said carbureting-tanks, a hydrocarbon-liquid reservoir, a pipe for conducting a supply of the liquid from the reservoir into the aforesaid chamber, devices for controlling such supply, means for permitting the liquid to enter the carbureting-tanks, means in said carbureting-tanks for causing an intimate commingling of the atmosphere and the hydrocarbon liquid, whereby a gas is formed, supplemental apparatus in said carbureting-chamber for straining and refining the gas in said supplemental straining apparatus, means for diluting the gas, and conducting apparatus for conveying the gas to the point of consumption.

3. In a carbureting apparatus the combination of a carbureting-chamber, carbureting-tanks in said chamber, mechanism for supplying atmosphere to one of said carbureting-tanks, means for supplying a hydrocarbon liquid to the carbureting-chamber and the tanks therein, and means in said carbureting-tanks for intimately mixing the atmosphere and hydrocarbon liquid to form a gas, such means comprising devices for introducing atmosphere into the body of hydrocarbon liquid at a point beneath the surface thereof, a body of condensing material placed above the surface of the hydrocarbon liquid, a series of perforated plates situated above said condensing material, the space between such plates being filled with a packing of condensing material, substantially as set forth.

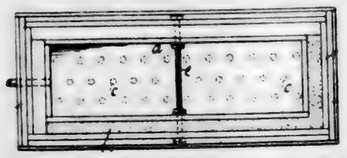
4. In a carbureting apparatus, the combination of a carbureting-chamber, and means therein for forming a hydrocarbon gas, such means comprising carbureting-tanks situated in said chamber, means for supplying a hydrocarbon liquid to the said tanks, a device in one of said tanks for supplying air under pressure to points below the surface of the hydrocarbon liquid, such device comprising a conductor-pipe extending from a suitable source of air-supply to the interior of said tank, a flared chamber formed at the end of said pipe, depending tubes communicating with said chamber and extending below the surface of the liquid, a body of condensing material placed above the surface of the liquid, a series of perforated plates situated above the condensing material, and a packing of absorbent material between the said plates.

5. In a carbureting apparatus, the combination of a carbureting-chamber, and means therein for forming a hydrocarbon gas, such means comprising a series of communicating carbureting-tanks, means for supplying a hydrocarbon liquid to such tanks, devices in one of said tanks for supplying air under pressure to a point beneath the surface of the hydrocarbon liquid therein, means situated above the level of the hydrocarbon liquid in the tanks for straining and refining the vapor thus formed, means for conveying the charge of gas from one tank of the series to another, an outlet in the last said tank for communicating with the chamber, a strainer situated in the chamber and means for conducting the gas from the chamber to the place of consumption.

6. In a carbureting apparatus, the combination of a carbureting-chamber, a series of tanks therein communicating with each other by suitable conducting-pipes, means in said tanks for causing an intimate commingling of the elements forming the gas, such means comprising a flared chamber at the ends of the communicating pipes, tubes depending therefrom to the hydrocarbon-liquid-condensing material placed above the surface of the liquid, a series of perforated plates above such condensing material, an outlet from the last tank of the series into the chamber, a strainer in said chamber, conducting means leading from the strainer to the point of consumption of the gas, means for introducing atmosphere to one of said carbureting-tanks, means for supplying hydrocarbon liquid to the tanks, a valve-controlled means for introducing atmosphere into the strainer for diluting the gas therein.

7. In a carbureting apparatus, the combination of a chamber and means for forming a hydrocarbon gas therein, a strainer in said chamber for refining the gas, comprising in its construction a chamber open at its lower end, a series of spaced parallel perforated plates therein, absorbent material between said plates, means for diluting the gas in said straining-chamber and means for conducting the gas to the point of use, substantially as described.

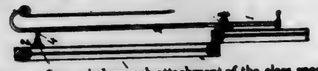
706,455. TANK OR ICE-CHEST. THOMAS R. ROGERS, Brooklyn, N. Y. Filed Dec. 13, 1901. Serial No. 85,762. (No model.)



Claim.—1. A tank or ice-chest comprising an inner and an outer casing, a water-tight material made to surround the inner casing, and chambers on the interior of the outer casing for securing the water-tight material to said outer casing, the inner casing being in contact with but not adhering to the water-tight material, so as to allow said inner casing to contract and expand without affecting the water-tight material or the outer casing, said water-tight material preventing leakage or moisture from the inner casing penetrating to the outer casing.

2. A tank or ice-chest comprising an inner and outer casing, water-tight material between the casings, a tie or screw rod having nuts made to sit against the casings to prevent buckling or bulging of the same, and chambers on the inside of the outer casing to hold or engage said water-tight material, said outer casing having a shell forming an air-space thereabout.

706,456. COMBINED SASH-FASTENER AND SHADE-SUPPORT. EDWARD A. SACKET, Denver, Colo., assignor of one-half to John Curran Anderson, Telluride, Colo. Filed Apr. 15, 1901. Renewed Apr. 14, 1902. Serial No. 102,780. (No model.)

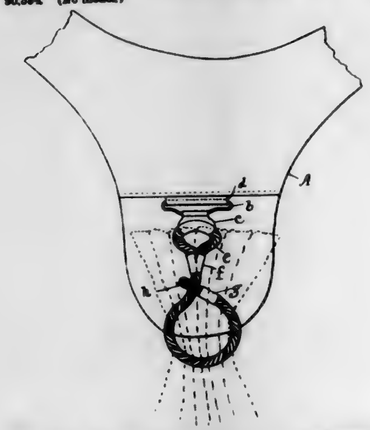


Claim.—1. In a window-sash attachment of the class specified, the combination with a socket adapted for attachment to a slidable sash and a rod engaging said socket and having its lower portion reduced in thickness, of a clamp adapted for attachment to a sash and having a lateral opening adapted to receive a reduced portion of the rod, but having less width at its mouth or entrance than the diameter of the body of the rod, substantially as shown and described.

2. In a window-sash attachment of the class specified, the combination, with a socket adapted for attachment to a sash, of a sash-fastening rod adapted to engage the said socket and provided with a gooseneck or curved top portion having a socket for reception of the journal of the shade-roller, substantially as shown and described.

3. In a window-sash attachment of the class specified, the combination, with sockets adapted for attachment to the upper sash and clamps adapted for attachment to the lower sash, of rods which engage said sockets and clamps and are provided at their upper ends with forward extensions having sockets for reception of the journals of a shade-roller, substantially as shown and described.

706,457. SUSPENDING DEVICE FOR CATAMENIAL BANDAGES. EDNA L. SCOTT, Portland, Me. Filed Jan. 20, 1902. Serial No. 90,394. (No model.)



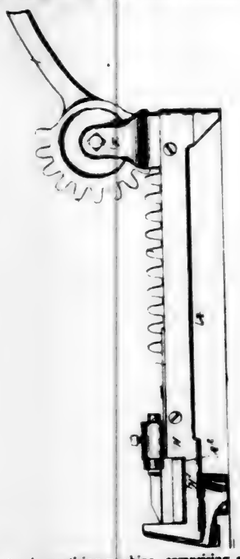
Claim.—1. The herein-described device for suspending catamenial bandages, consisting of a waistband having secured thereto an elastic cord having an eye formed of the same material in its lower end, the main cord passing through said eye to form a slip-noose, and the material in said eye adapted to be stretched or distended to create friction with the cord.

2. A suspending device for catamenial bandages, comprising a waistband with oppositely-arranged depending flaps, a loop carried by each flap, a clip suspended from said loop, an elastic cord connected to said clip and depending therefrom, and an eye carried by the free end of said cord adapted to have the body of the cord pass therethrough to form an elastic slip-noose, substantially as disclosed herein.

3. A device for suspending catamenial bandages, comprising a belt having depending flaps at the front and rear, a flexible loop secured to each of said flaps, a reinforcing-strip secured transversely across the flap and over the secured ends of the loop, and an elastic cord secured swingingly to said loop having an eye upon its lower end through which the body of the cord passes to form a slip-noose.

4. A device for suspending catamenial bandages, comprising a belt having two oppositely-arranged depending flaps, a flexible loop carried by each flap upon the outer face thereof, a metal loop secured in said flexible loop, a depending clip carried by said metal loop, and an elastic cord having a wide eye formed in its upper end to be engaged by said clip, and a long eye formed in its lower end; whereby said cord is adapted to pass through said long eye to form a noose to engage the bandage.

706,458. MORTISING-MACHINE. CHARLES J. SEAGUIST, Silverlake, Wash. Filed Nov. 14, 1901. Serial No. 82,311. (No model.)



Claim.—1. A mortising-machine, comprising a bed-plate formed with longitudinal guideways, a carrier mounted to reciprocate in the said guideways, a rack on top of the said carrier, a handled gear-wheel in mesh with the said rack, a bearing on the top of the carrier near the front end thereof, a tool-post for supporting the tool and having a shank held in the said bearing, a table held vertically adjustable in a depression in the said bed-plate near its forward end, an abutment at the forward end of the bed-plate and a longitudinally-adjustable clamp on the top of said bed-plate.

2. A mortising-machine, comprising a bed-plate formed with longitudinal guideways, a carrier mounted to reciprocate in the said guideways, means for reciprocating the said carrier, a bearing on the top of the carrier near the front ends thereof, and a tool-post formed with a socket for the shank of the tool and having a shank held in said bearing, the shank of the tool-post being eccentric to said socket.

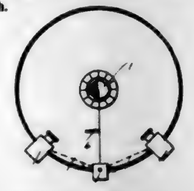
3. A hand-power mortising-machine, comprising a bed-plate having a depression near its forward end and an abutment at the end of the depression comprising an upwardly-extending flange integral with the bed-plate, a bearing carried by the bed-plate at the depressed portion, a table provided with a central depending post held vertically adjustable in said bearing, a set-screw extending through the side of the bearing and engaging the post to fasten the table in the adjusted position, a carrier mounted to reciprocate on the said bed-plate toward and from said table, means for reciprocating said carrier, and a tool-support on the said carrier and carrying the tool as set forth.

4. A mortising-machine, comprising a bed-plate, formed with longitudinal guideways, a carrier mounted to reciprocate in the said guideways, a rack on top of the said carrier, a handled gear-wheel in mesh with the said rack, a bearing on the carrier, a tool-post adapted to receive a tool, and having a shank held in said bearing, a table held vertically adjustable in a depression in the bed-plate, and a slotted clamp held longitudinally adjustable on the top of said bed-plate, the forward end of the clamp being adapted to engage wood of different thicknesses.

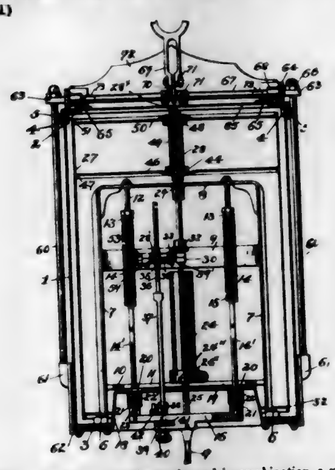
706,459. APPARATUS FOR COPYING MODELS. WILLY A. C. SELKE, Berlin, Germany. Original application filed Jan. 30, 1896, Serial No. 667,261. Divided and this application filed Oct. 4, 1900. Serial No. 32,053. (No model.)

Claim.—1. The combination, with a centrally-arranged model; of a source of light arranged on one side of the model, a screen arranged with its edge between the light and the model, and a photographic camera arranged on one side of the screen; a support connecting together the said source of light, screen and camera; and means for changing the relative positions of the support and model so that a series of photographs may be taken around the model in planes which intersect its axis, substantially as set forth.

2. The combination, with a centrally-arranged model; of a source of light arranged on one side of the model, a screen arranged with its edge between the light and the model, and two photographic cameras arranged one on each side of the said screen; a support connecting together the said source of light screen and cameras; and means for changing the relative positions of the support and model so that a series of photographs may be taken around the model in planes which intersect its axis, substantially as set forth.



706,460. PRICE-SCALE. HARRY B. SHERWOOD, Ashbourne, Pa., assignor to the Automatic Scale Company, Washington, D. C., a Corporation of New Jersey. Filed Oct. 7, 1901. Serial No. 77,875. (No model.)



Claim.—1. In a computing-scale, and in combination, a vertically-arranged cylindrical chart supported upon frames 46 50, one below the other and both mounted upon connected hubs, whereby is furnished a broad upper bearing for the upper end of the chart, the said hubs and frame being connected with the vertical shaft, with which the chart turns, all substantially as described.

2. In combination in a computing-scale, a casing having a bottom ring, a suspension-frame comprising rods 60, brackets carried by the lower ends of said rods and having feet fixed to the bottom ring of the casing, an upper ring 2 connected to the casing, segments 64 fixed to said upper ring, ears 63 on the segments from which the said rods 60 are suspended, a cross-bar 67 connecting the segment 64 and a suspension device connected to the bar 67, substantially as described.

3. In combination in a computing-scale, a casing, a frame supported at the lower end of the casing and comprising a cross-bar 10, a movable cross-head, springs for supporting said cross-head, rods 14' interposed between the cross-head and the springs, telescoping sleeves on the rods 14' and springs within the sleeves arranged to take up the shock when the weight is removed, the said bar 10 serving to sustain the blow of the sleeves, substantially as described.

4. In combination, a rotary chart, a shaft carrying the same and operating mechanism for said shaft, a supporting-frame, a cross-head, the rods 14' connected with the cross-head, the suspension-springs connected with the rods, a pneumatic cushion for retarding the return of the cross-head, and cushions for taking up the final impact, said cushions comprising the sleeves surrounding the rods 14' and the springs inclosed within the sleeves, substantially as described.

5. In combination with the supporting-frame comprising the cross-bar 10, the outer casing, the ring 2 connected therewith, the shell 16 closing the lower end of said casing and connected with the ring 2, impact-blocks 20 arranged between the cross-bar 10 and the shell 16, a cross-head, supporting means therefor, operating mechanism controlled thereby and the spring-cushions arranged between the cross-head and the impact-blocks, substantially as described.

6. In combination, the rotary chart, a rack-and-gear connection for operating the same, a bracket supporting the gearing, said bracket having a kerf for the rack-bar with a rib therein to afford a bearing for the rack-bar and a pin 59 extending into said kerf for engaging the rack-bar, substantially as described.

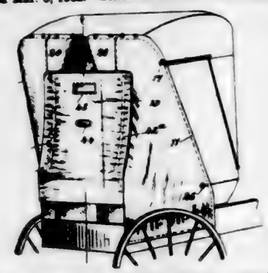
7. In combination, the casing, mechanism inclosed therein, suspension means comprising the suspension-rods extending along the outside of the casing and connected with the lower end of the same, a connection for the upper ends of the said suspension-rods extending transversely of the upper end of the casing and means connected with said transverse connection for suspending the casing, substantially as described.

8. In combination, the casing, the suspension-segments connected with the upper end of the same, the cross-rod extending between the segments, suspending means connected with the cross-rod, and the suspending-rods extending from the segments along the outside of the casing and connected at their lower ends thereto, substantially as described.

9. In combination, the casing, mechanism inclosed therein, the suspending-segments connected with the upper ends of the casing, a cross-rod connecting the segments, ears extending from the segments, suspending-rods extending down from said ears and connected at their lower ends with the casing, substantially as described.

10. In combination, a casing, consisting of a shell, upper and lower rings connected with said shell and suspending means consisting of the segments connected with the upper ring, a suspension device connected with the segments, suspending-rods connected with the segments and extending downwardly along the casing and brackets at the lower ends of the suspending-rods connected with the lower ring, substantially as described.

706,461. STORM-CURTAIN. JAMES W. SERMON, Bloomington, Ind. Filed Mar. 5, 1902. Serial No. 96,774. (No model.)



Claim.—1. A curtain for a vehicle, having a curved rear and top edge for engaging along the front bow of the vehicle-top, and a triangular wing extending along the inner edge of the curtain, and means for securing the curtain to the vehicle-body, substantially as specified.

2. Storm-curtains for a buggy, elastic straps extending along the front and rear edges of the curtains, transverse elastic straps connecting with the first-named straps, and a front curtain adapted for engagement with a dashboard and with the first-named curtains.

3. A storm-curtain for a buggy, adapted to be removably secured to the top of the buggy and to the body of the buggy, elastic straps extended along the front and rear edges of the curtain near the bottom, and a transverse elastic strap connecting with the first-named elastic straps.

4. A storm-curtain for a buggy, having its rear edge conformed to the front bow of the buggy-top and having at its inner edge extended from the top downward, an angular wing, fastening devices on the buggy-top for engaging with the curtain, the said curtain being made somewhat full at its lower portion, elastic material extended along the front and rear edges of the curtain at the lower portion, and an elastic material extending transversely of the curtain and connecting with the first-named elastic materials, substantially as specified.

706,462. APPARATUS FOR MALTING, DRYING, OR OTHERWISE TREATING GRAIN. JAMES SLEEMAN, Somerset, England. Filed Dec. 24, 1898. Serial No. 700,285. (No model.)

Claim.—1. An apparatus for malting and otherwise treating grain, comprising a rotatable vessel, one portion of which is formed with a grain-compartment having perforated walls and the remaining portion being formed larger than and communicating with said grain-compartment and constituting a mixing-chamber, and an air inlet and exhaust communicating with said grain-compartment, substantially as set forth.

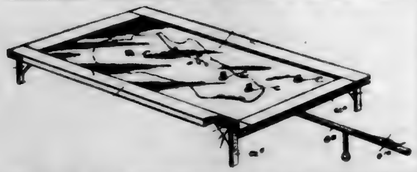
2. An apparatus for malting and otherwise treating grain, comprising a rotatable vessel, a hollow partition, or a series of hollow partitions having perforated walls and dividing said vessel into a number of communicating grain-compartments, and air inlet and exhaust pipes, said hollow partitions being alternately arranged in communication with said inlet and exhaust pipes, respectively, substantially as described.

3. An apparatus for malting and otherwise treating grain, comprising a rotatable vessel, a series of hollow partitions having perforated walls, dividing said vessel into a number of grain-compartments, each of said partitions having a segment or portion thereof, removed to afford a space communicating with all of said compartments, a series of imperforate walls dividing each of said hollow partitions into two chambers, and air inlet and exhaust pipes, said chambers being alternately arranged in communication with said inlet and exhaust pipes, substantially as described.

4. An apparatus for malting and otherwise treating grain, comprising a suitable vessel, a series of hollow partitions having perforated walls and dividing said vessel into a number of communicating grain-compartments, a supply-pipe and a series of air-ducts leading therefrom, and a central exhaust-tube, said hollow partitions being alternately arranged in communication with said air-ducts and said exhaust-tube, respectively, substantially as described.

5. An apparatus for malting and otherwise treating grain comprising a suitable vessel, a series of hollow upright partitions having perforated walls and dividing said vessel into a series of grain-compartments, removable caps or covers supported by adjacent partitions and closing said grain-compartments, and air inlet and exhaust pipes, said hollow partitions being alternately arranged in communication with said inlet and exhaust pipes, respectively, substantially as described.

706,468. EDUCATIONAL APPARATUS. WILLIAM L. SMITH, Boston, Mass. Filed Mar. 13, 1901. Serial No. 51,858. (No model.)



Claim.—1. An educational apparatus comprising a table having a top surface through which a map or similar object may be seen and on which it may be drawn or copied, means beneath said top surface for receiving and holding a map in position to be copied, supports for said table holding the same elevated sufficiently to permit free movement of an actuator, blocks or movable information-stations having their bases containing material to be attracted by a magnet, and an actuator containing a magnet adapted to be moved beneath said table for shifting the blocks as may be desired.

2. An educational apparatus comprising a copying-surface, means behind the said surface for retaining an object to be copied on said surface, a magnet movable behind said surface, means extending beyond said surface for moving said magnet, information-stations mounted on said surface and provided with means attractive to said magnet, whereby movement of the latter correspondingly moves the said stations to the locations required by the object copied thereon.

3. An educational apparatus comprising a table, having a surface capable of readily receiving marks, and sufficiently transparent to display therethrough an object placed behind the same, means behind said surface for holding a map to be copied, movable blocks carried on said surface and containing magnetically-attractive material, an actuator beneath said table provided with a handle extending beyond the table at one end, and having at its other end a magnet to attract said blocks, a support for said magnet provided with means permitting the same to slide around beneath the table, and means for raising or lowering the magnet relatively to said surface.

4. An educational apparatus comprising a table, having a surface capable of readily receiving marks, and sufficiently transparent to display therethrough an object placed behind the same, means behind said surface for holding a map to be copied, movable blocks carried on said surface and containing magnetically-attractive material, an actuator beneath said table provided with a handle extending beyond the table at one end, and having at its other end a magnet to attract said blocks, a support for said magnet provided with means permitting the same to slide around beneath the table, a lever pivoted to said handle, said magnet being carried by the inner end of said lever to be raised and lowered by the depressing or raising of the outer end of said lever.

5. An educational apparatus comprising a table, having a surface capable of readily receiving marks, and sufficiently transparent to display therethrough an object placed behind the same, means behind said surface for holding a map to be copied, movable blocks carried on said surface and containing magnetically-attractive material, an actuator beneath said table provided with a handle extending beyond the table at one end, and having at its other end a magnet to attract said blocks, a support for said magnet provided with means permitting the same to slide around beneath the table, a lever pivoted to said handle, said magnet being carried by the inner end of said lever to be raised and lowered by the depressing or raising of the outer end of said lever, and means for detachably holding the other end of the lever in depressed position.

6. An educational apparatus comprising a table, having a surface capable of readily receiving marks, and sufficiently transparent to display therethrough an object placed behind the same, means behind said surface for holding a map to be copied, movable blocks carried on said surface and containing magnetically-attractive material, an actuator beneath said table provided with a handle extending beyond the table at one end, and having at its other end a magnet to attract said blocks, a support for said magnet provided with means permitting the same to slide around beneath the table, a lever pivoted to said handle, said magnet being carried by the inner end of said lever, to be raised and lowered by the depressing or raising of the outer end of said lever, and means for detachably holding the other end of the lever in depressed position.

7. An educational apparatus comprising a thin table, having folding legs secured thereto, movable blocks bolted on said table and provided with magnetically-attractive material in their bases, and an actuator for moving said blocks, said actuator comprising a handle, a lever, a magnet, and a support for the latter, said support being carried by the inner end of said handle, and said lever being pivotally mounted in said handle and carrying the magnet at its inner end in said support, the outer end of the lever being in position to be engaged and operated by the manipulator of the handle, and serving to raise or lower the magnet beneath the table into or out of attractive relation with the blocks on said table for positioning the latter as required.

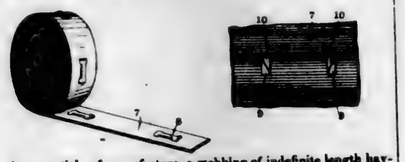
8. An educational apparatus comprising a thin table, movable blocks on said table and provided with magnetically-attractive material in their bases, and an actuator for moving said blocks, said actuator comprising a handle, a lever, a magnet, and a support for the latter, said support being carried by the inner end of said handle, and said lever being pivotally mounted in said handle and carrying the magnet at its inner end in said support, the outer end of the lever being in position to be engaged and operated by the manipulator of the handle, and serving to raise or lower the magnet into or out of attractive relation with the blocks on said table for positioning the latter as required.

9. An educational apparatus comprising a thin table, movable blocks on said table and provided with magnetically-attractive material in their bases, and an actuator for moving said blocks, said actuator comprising a handle, a lever, a magnet, and a support for the latter, said support being carried by the inner end of said handle, and said lever being pivotally mounted in said handle and carrying the magnet at its inner end in said support, the outer end of the lever being in position to be engaged and operated by the manipulator of the handle, and serving to raise or lower the magnet into or out of attractive relation with the blocks on said table for positioning the latter as required, the support for said actuator being provided with legs terminating in ball-like ends, for permitting the same to slide readily as required.

706,464. GARMENT-SUPPORTING WEBBING. CELIA A. SPURGIN, Des Moines, Iowa. Filed Feb. 3, 1902. Serial No. 93,237. (No model.)

Claim.—1. As an article of manufacture, a webbing, a hook-receiving metallic strip 8, and two pairs of fingers 9 and 10 integral with the strip and having oppositely-inclined sides, which fingers are passed through the webbing and overlap in the same plane upon the opposite side of the webbing with their inclined sides abutting.

2. As an article of manufacture, a webbing, a hook-receiving metallic strip 8, and two pairs of triangular fingers 9 and 10 formed integral with the strip, which fingers are passed through the webbing in a manner to perforate the same longitudinally and overlap in the same plane upon the opposite side of the webbing



3. As an article of manufacture, a webbing of indefinite length having permanently secured thereto at equal distance apart throughout its length a series of hook-receiving strips which are straight in the direction of length of the webbing, each of said strips being secured to the webbing by two pairs of fingers located, respectively, at opposite ends of the strip, which fingers are passed through the webbing in a manner to perforate the same longitudinally, and clenched upon the opposite side thereof.

706,465. FUNNEL. JOHN DE ST. LESLIE, Hicksville, N. Y. Filed Jan. 24, 1902. Serial No. 91,063. (No model.)

Claim.—1. A funnel provided with a strainer which is hinged at one edge within the body of the funnel, and a spring-handle attached to the free edge of the strainer, the hinge of the strainer being located below the top edge of the funnel at a point substantially equal to the diameter of said strainer, whereby the strainer may be raised to an inoperative position and the handle may snap over the top edge of the funnel to hold the strainer out of the way of matter passing through said funnel.

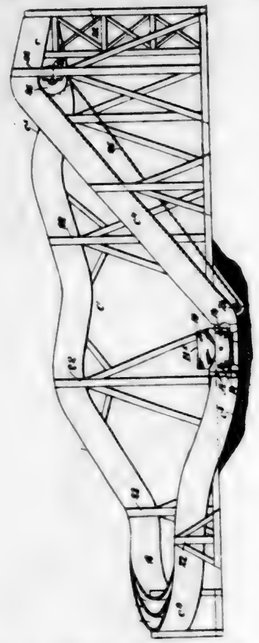
2. A funnel provided with a strainer which is concavo-convex in cross-section and is arranged within the body of the funnel to present its convex side uppermost and in facing relation to the broad open end of the body, said strainer being hinged to the body at a point below the top edge of the funnel equal to the diameter of the strainer, and means to firmly hold the strainer in its lowered and raised positions.

3. A funnel provided with a strainer which is hinged at one edge to the body of the funnel at a point below the top edge of the funnel equal to the diameter of the strainer, means adapted to engage the free end of the strainer and fasten it in the lowered operative position, and a fastener arranged to hold the strainer in a raised inoperative position within the funnel.

706,466. HYDRAULIC OR FIRE HOSE. BENJAMIN L. STOWE, Jersey City, N. J. Filed Jan. 2, 1902. Serial No. 88,211. (No model.)

Claim.—Hydraulic hose consisting of an inner seamless fabric rubber-lined tube, and an outer wrapping of rubber-coated duck upon said inner tube, the whole vulcanized together as set forth.

706,467. SACK-RACE STRUCTURE. JOHN J. WEBSTER, Brooklyn, N. Y. Filed Mar. 24, 1902. Serial No. 99,698. (No model.)



Claim.—1. In structures for amusement, a car comprising a body-section, a carriage adapted to receive occupants and pivotally mounted within the body-section, and springs concealed within the body-section and having bearing against the free upright walls of the carriage and opposing walls of the body-section, for the purpose described.

2. In a structure for amusement, a track, and a car adapted to travel on the rails of the track, the car comprising a body-section, a carriage adapted to receive occupants, pivotally mounted in the body portion, springs interposed between the body portion of the car and the carriage at opposite ends thereof, and a fabric extension from the upper portion of the said carriage, which fabric extension has the appearance of a sack extending above the body of the car, for the purpose described.

3. In a structure for amusement, an elevated endless track undulating for a portion of its length and inclined from its highest point in opposite directions to a lower point, each track consisting of side guard-rails and bottom rails, the bottom rails having a space between them, a car provided with supporting-wheels adapted to travel on the bottom rails of the track and with friction-rollers at its sides for engagement with the side rails of the track, the car being further provided with a pivoted basket mounted to rock in the body portion of the car, which basket is adapted to receive occupants, springs located at the end portions of the car, engaging with the body and with the basket, whereby the basket has rocking movement in the car-body against the tension of the said spring, and a sack-like extension from the upper portion of the basket of the car, as and for the purpose described.

4. In a structure for amusement, the combination, with an elevated track inclined downward in opposite directions from an elevated point, the said track consisting of side guard-rails, an intermediate guard-rail and bottom rails attached to the side rails and to each side of the intermediate guard-rail, of cars adapted to travel on the rails of the track at each side of the intermediate guard-rail, said cars comprising a body open at the top and at the bottom, supporting-wheels journaled in the body and adapted for engagement with the bottom rails of the track, a basket pivotally mounted in the body and extending below the bottom of the same, springs engaging with the body and with the basket at opposite ends, a sack-like extension from the upper portion of the basket, and friction-rollers carried by the sides of the body of the cars for engagement with the car-rails, for the purpose set forth.

5. In a structure for amusement, the combination with an elevated track inclined downward in opposite directions from an elevated point, the said track consisting of side guard-rails, an intermediate guard-rail

and bottom rails attached to the side rails and to each side of the intermediate guard-rail, of cars adapted to travel on the rails of the track at each side of the dividing guard-rail, said cars comprising a body open at the top and at the bottom, supporting-wheels journaled in the body and adapted for engagement with the bottom rails of the track, a basket pivotally mounted in the body and extending below the bottom of the same, springs engaging with the body and with the basket at opposite ends, a neck-like extension from the upper portion of the basket, friction-rollers carried by the sides of the body of the cars for engagement with the guard-rails, an endless chain belt located below the section of the track structure connecting the lowest point with its highest point, means for supporting the said endless belt, and devices carried by the said belt for pushing the car up the said connecting section of the track structure, for the purposes set forth.

706,468. STIRRUP-STRAP. LOUIS P. WELLMAN, West New York, N. J. Filed July 11, 1901. Serial No. 67,861. (No model.)

Claim.—1. The combination with a stirrup and a stirrup-strap, of a swivel uniting the stirrup-strap and said stirrup and permitting the latter to turn on a vertical axis and to assume different angular positions relative to the stirrup-strap, and a spring connection between the stirrup-strap and a member of the swivel, said spring connection holding the stirrup normally in a predetermined position relative to the stirrup-strap and allowing the position of the stirrup to be changed by pressure of the rider's foot.

2. The combination with a stirrup and a stirrup-strap, of a swivel uniting the stirrup and the strap and permitting the latter to turn on a vertical axis, and a spring connection attached to said strap and shiftably connected to a member of said swivel, as set forth.

3. The combination with a stirrup and a stirrup-strap, of a loop fitted to said strap to turn thereon as on a vertical axis, and a torsion-spring connection between said strap and the loop, as set forth.

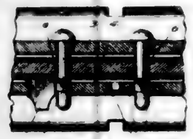
4. The combination with a stirrup-strap, and a member having a head, of a stirrup-support provided with a series of openings and with members which engage said head of the first-named member, and a spring connected with said first-named member and shiftably engaging with openings in the stirrup-support, said spring connection holding the stirrup normally in a predetermined position relative to the stirrup-strap and allowing the position of said stirrup to be changed by pressure of the rider's foot.

5. The combination of a stirrup-strap having a stem terminating in a head, a loop fitted loosely on the stem in engagement with the head thereof and adapted to turn freely thereon, a stirrup fitted to the loop, and means connecting the loop and the strap and holding the stirrup normally in a predetermined position relative to said strap, said stirrup and its holding means being yieldable to pressure applied to the stirrup.

6. The combination of a stirrup-strap, a loop swiveled on the strap and provided with a series of notches or slots, a spring attached to the strap and shiftably connected to the loop by engaging with either of the notches or slots therein, and a stirrup fitted in the loop.

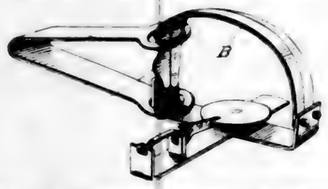
7. The combination with a stirrup-strap, of a swiveled loop provided with notches or slots, a spring attached to said strap and shiftably connected to the loop by engaging with either of the slots or notches therein, a stirrup fitted in the loop and held by the energy of the spring in a predetermined position, and means for confining said end of the spring in engagement with the loop.

706,469. RAIL-JOINT FASTENER. JAMES C. WESTZEL, Greensburg, Pa. Filed Nov. 9, 1901. Serial No. 81,747. (No model.)



Claim.—The combination with a pair of rails, of angle-plates secured in either side of the meeting edges thereof, one of said angle-plates having a keyhole-slot adapted to register with an opening in the rail, a second angle-plate provided with a keyhole-slot in the narrow portion of which is arranged cam-surfaces, a bolt adapted to pass through each slot in the first-named angle-plate and provided with a rib to fit in the narrow portion thereof, said bolt extending through the opening in the rail and through the slot in the remaining angle-plate, a shoulder formed on the bolt and adapted to engage the cam-surfaces of the last-named angle-plate whereby said angle-plate may be reciprocated with relation to the rails to tighten the bolt, and a wedge adapted to be inserted in the narrow portion of the slot to lock the angle-plate rigid with relation to the bolt.

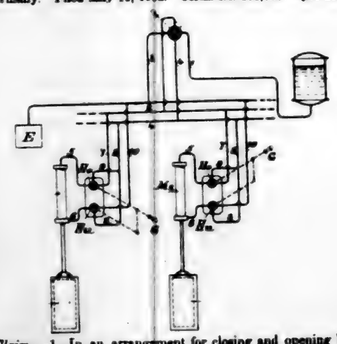
706,470. ANIMAL-TRAP. PARDON A. WHITNEY, Southington, Conn. Filed Mar. 4, 1902. Serial No. 96,625. (No model.)



Claim.—1. In a trap of the class specified the combination with the pair of pivoted jaws, of a latch engaging one of said jaws when in open position, and a spring, the one jaw which is engaged by the latch being provided with a projection adapted to engage the said spring.

2. In a trap of the class specified, the combination of the pair of pivoted jaws, one of said jaws being provided on its outer edge with an outwardly-projecting portion, a latch to engage the last-named jaw, and a spring adapted to be engaged by the projected portion of the said jaw when in open position, whereby both jaws are held in substantially the same plane.

706,471. MEANS FOR OPERATING BULKHEAD-DOORS. PAUL HOPPE, Berlin, Germany, assignor to Norddeutscher Lloyd, Bremen, Germany. Filed May 19, 1902. Serial No. 108,056. (No model.)



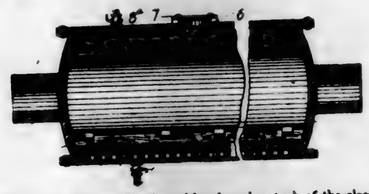
Claim.—1. In an arrangement for closing and opening bulkhead-doors from a central controlling-station, the combination with hydraulic cylinders fitted to the doors, means for operating the doors according as pressure is admitted to either end of said cylinders and a pressure-accumulator, of a pair of pipes connecting the accumulator with the cylinders, a third pipe connecting the cylinders with an exhaust-tank, independent pipes connecting said cylinders with said third pipe and controlled by local valves, and means for switching the pressure stored in the accumulator to either of the pair of pipes and connecting the other with the exhaust-pipe.

2. In an arrangement for closing and opening several bulkhead-doors from a common controlling-station which arrangement consists of a hydraulic cylinder fitted to each of said doors, means for operating the doors when pressure is admitted to either end of the cylinders and a pressure-accumulator the combination with means for switching the pressure stored in said accumulator onto either of a pair of pipes leading from the controlling-station to said cylinders and simultaneously connecting the other to an exhaust-pipe such means being located at the controlling-station of means for connecting the one end of said cylinders either with one of the said pair of pipes or with the said exhaust-pipe and for simultaneously connecting the other end of said cylinders with either of the said pair of pipes substantially as and for the purpose set forth.

3. In an arrangement for closing and opening several bulkhead-doors from a common controlling-station which arrangement consists of a pressure-accumulator, a hydraulic cylinder fitted to each of said doors and means for operating said doors when pressure is admitted to either end of said cylinders, the combination with a four-way valve located at the controlling-station of a pipe connecting said central valve to said accumulator, a second pipe connecting said central valve to each of the cylinders and leading to an exhaust-tank and of two more pipes connecting the central valve with the cylinders, the central valve being arranged so as to connect either of the two latter pipes to the pressure-pipe and the other to the exhaust-pipe or vice versa and of means for connecting one end of said cylinders with either of the said latter pipes and the other end with either one of said latter pipes or with the exhaust-pipe, substantially as and for the purpose set forth.

4. In an arrangement for closing and opening several bulkhead-doors from a common controlling-station the combination with hydraulic cylinders fitted to each of said doors, means for closing and opening said doors when pressure is admitted to either end of said cylinders, a pair of three-way cocks fitted to each of said cylinders each of which cocks is connected by a pipe or channel to one end of the cylinder, means for simultaneously operating both three-way cocks, such three-way cocks being arranged and connected so as to switch the one end of said cylinders onto either of a pair of pipes connecting all cylinders with the controlling-station and the opposite end of the cylinders either onto one of said pair of pipes or onto an exhaust-pipe likewise connecting all doors with the controlling-station, of a pressure-accumulator, a pipe connecting same with the controlling-station and of a four-way cock fitted at the controlling-station and adapted and connected so as to switch the pressure stored in said accumulator onto either of the above said pair of pipes and simultaneously to connect the other to the exhaust-pipe, substantially as and for the purpose set forth.

706,472. FILTER-BED FOR CHLORINATION-BARRELS. ALFRED E. JOHNSON, Colorado Springs, Colo. Filed May 17, 1902. Serial No. 107,909. (No model.)



Claim.—1. The combination with a barrel or tank of the class described, of a filter-bed located therein and composed of a number of bars arranged side by side and having their sides grooved or hollowed out, and filtering material filling the spaces between the bars, substantially as described.

2. The combination with a chlorination barrel or tank, of a filter located therein and composed of a series of bars placed side by side and having grooves in their sides, and filtering material filling the spaces between the bars which are notched at the top to allow the solution to enter and at the bottom to allow it to escape after passing through the filtering material, and suitable means for holding the filter in place.

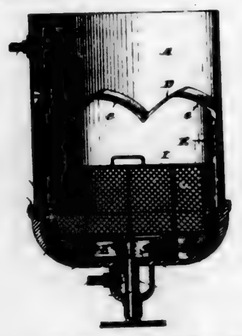
3. The combination with a chlorination barrel or tank, of a filter-bed placed therein and composed of a series of bars placed side by side and having grooves in their sides forming spaces for filtering material, the corners of the bars being cut away to permit insertion of the filtering material after the bars are placed side by side, and binding-strips located at the ends of the bars and covering the filling-openings, the said strips being secured to the barrel to hold the filter in place, an outlet being formed in the barrel below the filter, substantially as described.

4. The combination with a tank or barrel of the class described, of a filter located therein and composed of bars arranged side by side and having grooves formed in their sides, filtering material filling the spaces between the bars which are arranged to expose the said material to the solution and to allow the filtered solution to pass through the filtering material between the bars, the latter being provided with lugs or short legs to support the filter in place.

5. A filter composed of a number of bars having grooved sides, said bars being arranged side by side and filtering material filling the spaces between the bars, openings being left at the top and bottom to permit the entrance and escape of the solution, substantially as described.

6. The combination with a tank or barrel of the class described, of a filter located therein and comprising grooved bars arranged side by side so that the grooves in the adjacent side of any two bars register, filtering material placed in the spaces between the bars, openings being left at the top and bottom to allow the solution to pass through the filter, the filter-bars being provided with lugs to support the filter, the corners of the bars being cut away at their ends forming openings for the insertion of the filtering material, and binding-strips covering the end openings and secured to the tank to hold the filter in place, substantially as described.

706,473. DISH-WASHING MACHINE. HAMILTON F. LOW, New York, N. Y. Filed Oct. 28, 1901. Renewed July 14, 1902. Serial No. 115,561. (No model.)



Claim.—1. In a dish-washing machine, the combination of a tank or vessel, a casing forming a water-tight receptacle with the tank, an agitator within the casing, said tank having a series of webs or ribs upon the interior thereof extending from the base of the tank, and inclined from the perpendicular, and rising to a point somewhat above the middle of the cylinder, substantially as described.

2. In a dish-washing machine, the tank or vessel A having upon its interior surface curved ribs extending from the base, and rising to a point somewhat above the middle of the vessel, and a second series of ribs or webs, each rib of said second series extending from the apex of one of the ribs of the first series to a point near the apex of the next succeeding rib of the second series, substantially as described.

3. In a dish-washing machine, the combination of a tank or vessel, a casing beneath said tank, and an agitator within the casing, said casing being provided on its interior surface with ribs extending upwardly from the bottom and forming guides or conduits for the passage of water into the tank, substantially as described.

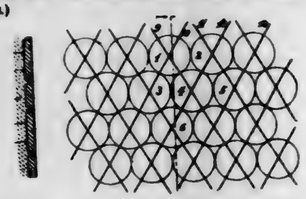
4. In a dish-washing machine, the combination of a tank or vessel, a casing with which said tank forms a water-tight receptacle, ribs upon the inner surface of said tank, a lining fitted against said ribs, an agitator within the casing, and means for imparting motion to said agitator, substantially as described.

5. In a dish-washing machine, the combination of a tank or vessel, a casing forming with the tank a water-tight receptacle, an agitator within said casing, and a plate or casting having a central aperture resting on the ribs within said casing, substantially as described.

6. In a dish-washing machine, the combination of a tank or vessel, a casing upon which said tank rests, said tank and casing being provided on their interior surfaces with ribs, and a lining fitting against the ribs in the tank, the upper edge of said lining being serrated and conforming to the shape of a deflector formed by a series of ribs in the tank, substantially as described.

7. In a dish-washing machine, the combination of a tank or cylinder, a casing upon which said tank or cylinder rests, and with which it forms an air-tight receptacle, an agitator within the casing, and a series of ribs disposed within the casing, and a series of ribs on the inner surface of the tank, the two series of ribs forming continuous water-channels from the casing to a point somewhat above the middle of the cylinder, substantially as described.

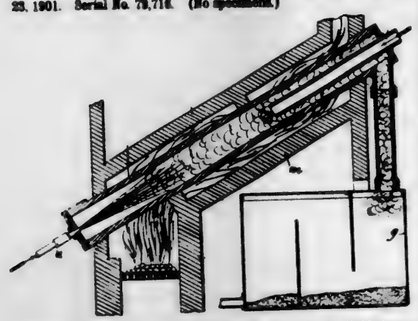
706,474. PROCESS OF SETTING TILES. JAMES H. MUNRO, Newark, N. J. Filed June 28, 1902. Serial No. 113,567. (No specimens.)



Claim.—1. That improvement in the art of preparing and setting tiles consisting in connecting said tiles loosely for transportation; adjusting said tiles, *in situ*, while still connected; and cementing said tiles in adjusted position, substantially as described.

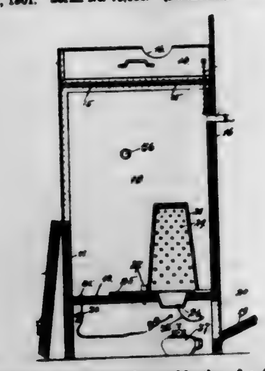
2. That improvement in the art of setting tiles which consists in connecting the respective tile members together flexibly, for adjustment, and in such a manner as to leave substantially the entire reverse portions free to access; and cementing and grouting the tile while said members are still connected, substantially as described.

706,475. METHOD OF PRODUCING METALS IN A FINELY-DIVIDED STATE. EDUARD POHL, Weisswasser, Germany. Filed Oct. 23, 1901. Serial No. 79,716. (No specimens.)



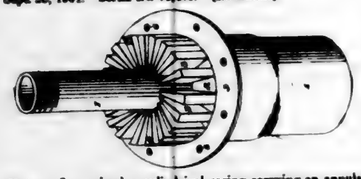
Claim.—A process for producing metals in a finely-divided state consisting in smelting the material, spraying the smelted material into a retort heated to a suitable temperature, evaporating the spray, and then condensing the obtained vapors.

706,476. BATH-CABINET. JAMES W. RILEY, Marshalltown, Iowa, assignor of one-half to D. C. Wilbur, Marshalltown, Iowa. Filed Sept. 21, 1901. Serial No. 76,106. (No model.)



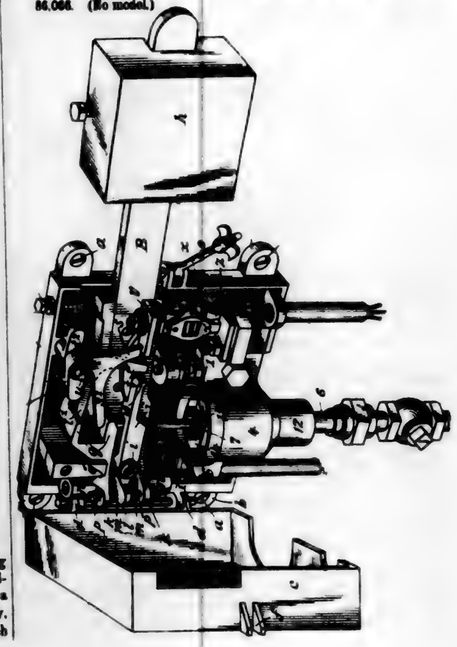
Claim.—In a bath-cabinet the combination of a frame comprising two sides, a back, and a front which is hinged at its central portion allowing the top portion thereof to swing outwardly and downwardly; a top divided along its longitudinal center capable of swinging outwardly, said top having a circular opening in its longitudinal center through which the operator may pass his head when the top is closed, a bottom piece elevated some distance above the lower edge of the front, back, and sides, means for introducing steam into the interior of the cabinet from beneath the bottom piece, a metal conductor-lining for the entire interior of the cabinet, a plate of insulating material resting upon the upper surface of the bottom piece having suitable openings therein, a metal seat resting upon the insulating-plate, removable metal pins passed through the insulator-plate and said bottom piece to engage the metal seat and limiting the movement thereof, a contact-plate to engage one of the metal pins when it is in position for use, a source of electrical supply, means for connecting one pole thereof with said metal lining and the other pole with said contact-plate, substantially as and for the purpose stated.

706,477. WHEEL. JOHN J. ROWE, New Kensington, Pa. Filed Sept. 25, 1901. Serial No. 76,475. (No model.)



Claim.—In a wheel, a cylindrical casing carrying an annular flange at one end thereof, a hub mounted within said casing, a series of radial wedge-shaped extensions carried by said hub having their ends extending beyond said flange of the casing, an interior sleeve having an enlarged end secured in said hub and extending therebeyond, a second cylindrical casing carrying an annular flange, a hub mounted in said last-named casing and having its end flush with the said last-named flange, said end of the hub having radial wedge-shaped notches formed therein for the reception of said extensions carried by the first-named hub, the said extensions adapted to have the spokes interposed therebetween and have their ends seated in said notches, the said flanges having registering apertures therein and engaging the sides of the spokes, and bolts passed through said flanges and engaging in the space between said spokes, substantially as described.

706,478. FLUID-PRESSURE ELECTRIC-SWITCH-CONTROLLING APPARATUS. AUGUST SUNDH, Yonkers, N. Y., assignor to Electrite Company, New York, N. Y. Filed Dec. 16, 1901. Serial No. 86,066. (No model.)



Claim.—1. In a fluid-pressure-controlled snap-switch, the combination with the stationary and movable contacts, and a lever carrying said movable contacts, of a fluid-pressure-operated lever whereon the contact-carrying lever is pivoted, and having opposing springs for actuating said contact-carrying lever in opposite directions, gravitating contact-lever stops respectively engaging said contact-lever and opposing the operating-springs of said lever for augmenting their tension for quick action, and tripping-jaws of the fluid-pressure-operated lever respectively releasing the contact-carrying lever from the stops.

2. In a snap-switch, the combination with the movable and stationary contacts, of a lever carrying the movable contacts, an operating-lever whereon the contact-carrying lever is pivoted, compression-springs for transmitting the power of the operating-lever to the contact-carrying lever, and means for stopping and releasing the contact-carrying lever for augmenting the tension of the springs, said contact-carrying lever pivoted on the operating-lever concentrically to said operating-lever pivot for causing rubbing action of the contacts.

3. In a snap-switch, the combination with the movable and stationary contacts, of a lever carrying the movable contacts, an operating-lever whereon the contact-carrying lever is pivoted, compression-springs for transmitting the power of the operating-lever to the contact-carrying lever, means for stopping and releasing the contact-carrying lever for augmenting the tension of the springs, said contact-carrying lever carried on the operating-lever, and means carried by said operating-lever for tripping the contact-lever stops to release the contact-carrying-lever-actuating springs.

4. In a snap-switch, the combination with the movable and stationary contacts, of a lever carrying the movable contacts, an operating-lever whereon the contact-carrying lever is pivoted, compression-springs for transmitting the power of the operating-lever to the lever carrying the movable contacts, means for stopping and releasing the contact-carrying lever for augmenting the tension of the springs, said means consisting of the gravitating stops, stop-catches on the contact-carrying lever, and the jaws of the operating-lever engaging the arms of the stops.

5. In a snap-switch, the combination with the movable and stationary contacts, of a lever carrying the movable contacts, an operating-lever whereon the contact-carrying lever is pivoted, compression-springs for transmitting the power of the operating-lever to the contact-carrying lever, means for stopping and releasing the contact-carrying lever for augmenting the tension of the springs, said means consisting of the gravitating stops, stop-catches on the contact-carrying lever, and the jaws of the operating-lever engaging the arms of the stops, said jaws located immediately of the stops and the operating-lever pivot.

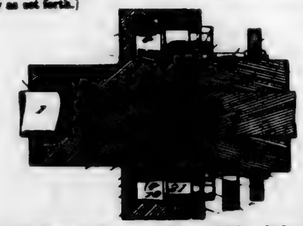
6. In a snap-switch, the combination with the movable and stationary contacts, of a lever carrying the movable contacts, an operating-lever whereon the contact-carrying lever is pivoted, compression-springs for transmitting the power of the operating-lever to the contact-carrying lever, means for stopping and releasing the contact-carrying lever for augmenting the tension of the springs, said means consisting of the gravitating stops, stop-catches on the contact-carrying lever, and the jaws of the operating-lever engaging the arms of the stops, said stops mounted independently of each other and arranged to gravitate in reverse directions for engaging the stop-catches of the contact-carrying lever, with their tripping-arms both ranging in the same direction, and in relation to the tripping-jaws of the operating-lever located one above another and in approximately the same relation to the pivot of said operating-lever, whereby the stops are respectively operated by the reverse movements of the operating-lever.

7. In a snap-switch, the combination with the movable and stationary contacts, of a lever carrying the movable contacts, an operating-lever whereon the contact-carrying lever is pivoted, means for operating the contact-carrying lever through the instrumentality of the operating-lever, and effecting snap action of the contacts, variable fluid-pressure apparatus for actuating the operating-lever, and a protective case inclosing the switch apparatus and the fluid-pressure apparatus.

8. In a snap-switch, the combination with the movable and stationary contacts, of a lever carrying the movable contacts, an operating-lever whereon the contact-carrying lever is pivoted, means for operating the contact-carrying lever through the instrumentality of the operating-lever, and effecting snap action of the contacts, and variable fluid-pressure apparatus for actuating the operating-lever, through the instrumentality of a pressure-actuated diaphragm and a rod mounted on said diaphragm, said diaphragm having a pendent socket guide-stem in which said stem is seated near the lower end of said stem, and said stem, having a guideway for its lower extremity.

706,479. REVERSING-CLUTCH. AUGUST H. SWIRBUL, Marquette, Mich. Filed Nov. 7, 1900. Renewed July 8, 1902. Serial No. 114,128. (No model.)

Claim.—1. A clutch mechanism comprising a driving-shaft, a driven shaft, a coupling-head on each shaft, each head having two tapered walls, two corresponding walls of the two heads being designed to be thrown into frictional engagement, the other walls being oppositely tapered to form a surrounding V-space, a series of tapered frictional rolls located within such space and designed to be thrown into frictional engagement with the adjacent walls of said heads when the before-mentioned walls are out of engagement, and means for effecting said engagements, substantially as set forth.)



2. A clutch mechanism comprising a driving-shaft, a driven shaft, a coupling-head fast on one shaft, a second coupling-head fast on the other shaft but capable, together with its shaft, of a limited longitudinal movement, a connection between said heads, each head having two tapered walls, two corresponding walls of the two heads being designed to be thrown into frictional engagement, a series of frictional rolls designed to be thrown into frictional engagement between the other walls of said heads when the before-mentioned walls are out of engagement, and means for effecting said engagements, substantially as set forth.

3. A clutch mechanism comprising a driving-shaft, a driven shaft, a coupling-head fast on the driving-shaft, a second coupling-head fast on the driven shaft which latter together with its coupling-head is formed with a longitudinal slot, a connection between said heads, a cross-rod carried by said connection extended through said slots, each of said heads having two tapered walls, two corresponding walls of the two heads being designed to be thrown into frictional engagement, a series of frictional rolls designed to be thrown into frictional engagement between the other walls of said heads, and means for effecting said engagements, substantially as set forth.

4. A clutch mechanism comprising a driving-shaft, a driven shaft, a coupling-head fast on each shaft, the coupling-head on the driven shaft together with the latter having coincident slots, a connection between said coupling-heads secured at one end within the head of the driving-shaft and extended into a bore in the driven shaft, a cross-rod carried by said connection extended through said slots, a raceway for said rod, each of said heads having two tapered walls, two corresponding walls being designed to be thrown into frictional engagement, a series of frictional rolls designed to be thrown into frictional engagement between the other walls of said head, and means for effecting said engagements, substantially as set forth.

5. A clutch mechanism comprising a driving-shaft, a driven shaft, a coupling-head fast on the driving-shaft, a coupling-head on the driven shaft having, together with the latter, coincident slots, a connection between said coupling-heads comprising a stem fitted in a bore of the driven shaft and a disk-like head, means for holding said disk-like head in the coupling-head of the driving-shaft, a cross-rod carried by said connection extended through said slots, rolls on the ends of said cross-rod, a raceway for said rolls, each of said heads having tapered walls, a series of frictional rolls, and means for effecting the driving of the driven shaft in the same or opposite direction as the driving-shaft, substantially as set forth.

6. The combination with the driving-shaft and a coupling-head fast thereon formed with inner and outer tapered walls, of a driven shaft having a hole or bore at one end, a coupling-head fast on said driven shaft which, together with the latter, has a longitudinal slot, a T connection having its disk-like head secured in the coupling-head of the driving-shaft and its stem fitted in the hole or bore of the driven shaft, a transverse rod carried by said stem extended through said slots, rolls on said rod, a disk, a series of frictional rolls carried by said disk located in the space between the outer tapered walls of the two coupling-heads, a ring secured to said disk and formed with a raceway for the rolls of the transverse rod, and means for simultaneously moving said series of frictional rolls and the coupling-head of the driven shaft in opposite directions, substantially as set forth.

7. The combination with the driving-shaft and the coupling-head fast thereon having an annular groove or channel formed with inner and outer tapered walls, of the driven shaft, a coupling-head fast thereon having inner and outer tapered walls, a connection between the two coupling-heads, a disk, a series of frictional rolls located in the space between the outer tapered walls of the two coupling-heads, studs for said rolls supported by said disk, two rings on the coupling-head of the driven shaft

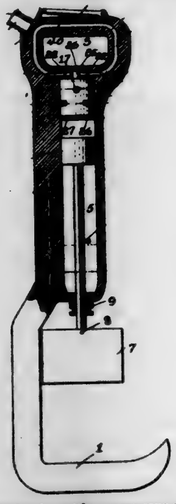
having opposite bearing-surfaces, a collar loose on said head, and an operating-lever fulcrumed to said collar and designed to engage said bearing-surfaces, substantially as set forth.

706,480. WHEEL. ALPHONSO A. VERE, Glasgow, Scotland. Filed May 17, 1902. Serial No. 107,751. (No model.)

Claim.—1. An improved wheel comprising the hub having radial plates arranged parallel and provided with radial slots, an annular spoke-socket arranged between said plates and provided with sockets to receive spokes and between said sockets with spaces for the cross-bolts and with spaces opening at the sides of the annular socket-piece and with wooden blocks therein fitting such spaces and relieving friction between the spoke-socket annulus and the parallel hub-plates, cushioning means between the hub and the annular spoke-socket and cross-bolts through the side plates of the hub and the spoke-socket annulus substantially as set forth.

2. An improved wheel comprising the parallel side plates, the annular spoke-socket between the same and having recesses opening at its sides facing said plates, and filling-blocks in said recesses and bearing against the side plates substantially as set forth.

706,481. DEVICE FOR CUTTING SUGAR-CANE, &c. JOHN H. H. WILSON, Honolulu, Hawaii. Filed Oct. 17, 1901. Serial No. 78,981. (No model.)



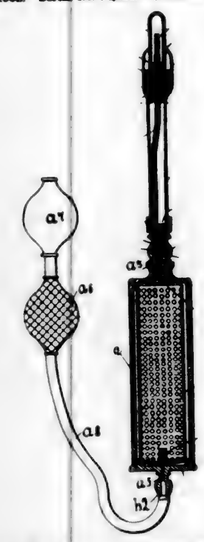
Claim.—1. In a device for cutting sugar-cane or the like, the combination with an operating-engine having a piston, of a body provided with a hook and a hand-grasp, and a knife attached to the piston of the engine and adapted to operate in connection with the hook to sever the sugar-cane or the like.

2. In a device for cutting sugar-cane or the like, the combination with an engine having a piston, of a body provided with a hook and a hand-grasp at its extremes, and a knife connected to the piston and adapted to operate in connection with the hook, substantially as set forth.

3. A light portable device for cutting sugar-cane or the like having a body provided with a hook at its lower end, a hand-grasp at its upper end and an engine-cylinder, a cutting-knife, a piston having connection with the cutting-knife and operating in the engine-cylinder, and a rotary valve device between the hand-grasp and engine-cylinder, substantially as set forth.

4. A device for cutting sugar-cane or the like comprising a body having a hook adapted to be placed against a stalk to be severed, and a pneumatic engine having a piston carrying a knife adapted to operate in connection with the hook to cut the stalk, substantially as set forth.

706,482. THERMOCAUTER. LOUIS WIESCHING, New York, N.Y. Filed Feb. 14, 1902. Serial No. 94,025. (No model.)



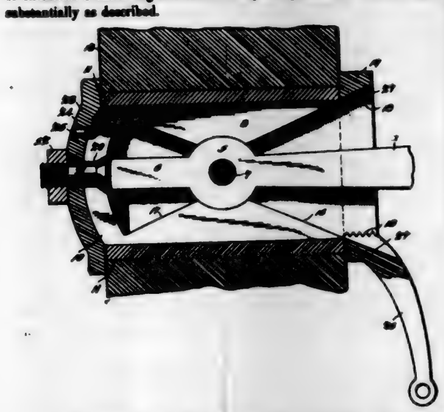
Claim.—1. In a thermocauter, a carburetor, an air-forcing device connected with one end thereof, a tubular arm connected with the opposite end thereof, a small tube placed within said tubular arm, a canter-head connected with the end of said arm and provided with a canter-tube, a conical casing connected with said canter-head and inclosing the base of said canter-tube, a burner-tube secured in said head and projecting into the canter-tube, the space within said conical casing being in communication with the interior of said arm and the inner burner-tube being in communication with the small tube within said arm, said canter-head being also provided with an annular space or chamber around the inner end of said burner-tube and with ports or passages communicating therewith and opening outwardly through said head, substantially as shown and described.

2. In a thermocauter, a carburetor, an air-forcing device connected with one end thereof, a tubular arm connected with the opposite end thereof, a small tube placed within said tubular arm, a canter-head connected with the end of said arm and provided with a canter-tube secured in said head and projecting into the canter-tube, the space within said conical casing being in communication with the interior of said arm and the inner burner-tube being in communication with the small tube within said arm, said canter-head being also provided with an annular space or chamber around the inner end of said burner-tube and with ports or passages communicating therewith and opening outwardly through said head and means for controlling the flow of carbureted air through said tubular arm, and the small tube within said arm, substantially as shown and described.

706,483. RUNNING-GEAR FOR VEHICLES. HERBERT A. WISE, Luxora, Ark. Filed Oct. 17, 1901. Serial No. 78,986. (No model.)

Claim.—1. In a device of the class described, the combination with an axle, of a spindle composed of two sections and provided with a pivot passing through the axle and connecting the sections, substantially as described.

2. In a device of the class described, the combination of a spindle composed of two sections provided with longitudinal openings having inner and outer tapered portions converging toward the center, a central pivot carried by the spindle, and an axle extending into the said openings and provided with an eye to receive the pivot, and having the arm or extension 6 extending into the outer tapered portions of the openings, substantially as described.



3. In a device of the class described, the combination with an axle, of a spindle composed of sections and receiving the axle, and a pivot carried by the spindle and connecting the same with the axle, substantially as described.

4. In a device of the class described, the combination of a spindle composed of sections, a collar or ring arranged at the inner ends of the sections and receiving the same and securing the sections together and adapted to abut against a hub, and a pivot carried by the spindle for connecting it to an axle, substantially as described.

5. In a device of the class described, the combination of a spindle composed of sections having longitudinal openings composed of circular central portions, and inner and outer tapered portions, an axle arranged within the spindle and having an eye located near its end and arranged within the central portions of the openings of the sections, and a pivot passing through the eye and connecting the sections, substantially as described.

6. The combination of an axle, a spindle composed of two sections receiving the axle and provided at their outer ends with registering grooves or notches, a pivot carried by the spindle and passing through the axle, and a screw having its head arranged within the grooves or notches, whereby it is detachably interlocked with the spindle, said screw extending outward from the spindle and adapted to receive an axle-nut, substantially as described.

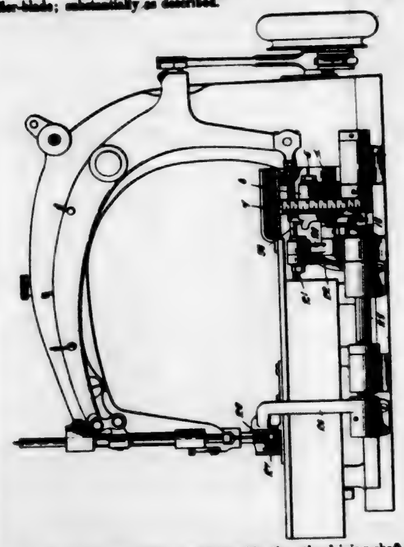
7. In a device of the class described, the combination of a spindle composed of separable sections, a screw interlocked with and extending outward from the sections, an axle-nut arranged on the screw, a washer mounted on the screw and having a perforation, and a projection carried by the spindle and engaging the perforation of the washer, substantially as described.

8. The combination of an axle, a spindle composed of two sections receiving the axle, a pivot carried by the spindle and connecting the latter to the axle, a longitudinally-disposed fastening device extending outward from the outer end of the spindle and detachably interlocked with the sections and adapted to receive means for holding a wheel on the spindle, and means for connecting the sections, substantially as described.

706,484. RUFFLING AND SEWING MACHINE. ROSSEL G. WOODWARD, Waukegan, Ill., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed May 17, 1902. Serial No. 108,071. (No model.)

Claim.—1. In a sewing and ruffling machine, suitable stitch-forming mechanism, a feeding device and a ruffling device including a ruffler-blade, a driving-shaft, a rock-shaft journaled on the bed of the machine beneath the work-plate and carrying a frame supporting the ruffler-blade which operates above said work-plate, a rocking frame journaled on the machine-frame with its axis, parallel with the first rock-shaft and operatively engaging the same, a second rocking shaft operatively engaging the rocking frame, and itself in operative engagement with the driving-shaft; substantially as described.

2. In a sewing-machine, and in combination, the driving-shaft and three rocking members journaled on the frame of the machine beneath the work-plate, one of said members carrying a frame having an eccentric connection with the driving-shaft, a connection between said frame, and an arm on the second rocking member, a second arm on said second rocking member, in engagement with an arm on said third rocking member, said third rocking member having also an arm supporting a ruffler-blade; substantially as described.



3. In a sewing-machine, and in combination, the driving-shaft and the three rocking members journaled on the frame of the machine beneath the work-plate, one of said members carrying a frame having an eccentric connection with the driving-shaft, an adjustable connection between said frame and an arm on the second rocking arm, and a second arm on said second rocking member in engagement with an arm on said third rocking member, said third rocking member having also an arm supporting a ruffler-blade; substantially as described.

4. In a sewing and ruffling machine, in combination with the driving-shaft, a rock-shaft provided with an upwardly-extending arm with an eccentric connection between the upwardly-extending arm and the driving-shaft, a rocking frame, an arm secured thereto at one end and having its outer end at the front of the machine secured to the upwardly-extending arm of the first rock-shaft, and a second rock-shaft having an upwardly-extending arm to the upper end of which is secured one end of an arm which at its opposite end is attached to the rocking frame, said second rock-shaft being also provided with an arm supporting the ruffler-blade; substantially as described.

5. In a sewing and ruffling machine, in combination with the driving-shaft, a rock-shaft provided with an upwardly-extending arm with an eccentric connection between the upwardly-extending arm and the driving-shaft, a rocking frame, an arm secured thereto at one end and provided at its outer end with a head adjustable upon the upwardly-extending arm of the first rock-shaft, a second rocking shaft having an upwardly-extending arm, to the outer end of which is secured an arm attached at its lower end to the rocking frame, said second rocking shaft being also provided with an arm supporting the ruffler-blade; substantially as described.

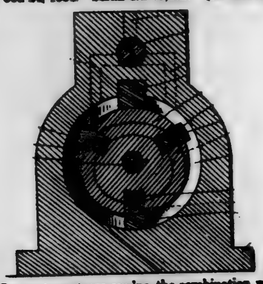
6. In a sewing-machine having stitch-forming mechanism, and a feeding device, the herein-described mechanism for operating a ruffler-blade or like fabric-manipulating device comprising a driving-shaft, an eccentric thereon, a pivoted arm having a slot and operated from the eccentric on the driving-shaft, a link, an arm pivoted to the link, and adjustable within the slot, a rock-shaft supporting the ruffler-blade, and an arm secured to the same, and pivoted to the link; substantially as described.

7. In a sewing-machine having stitch-forming mechanism, and a feeding device, the herein-described mechanism for operating a ruffler-blade or like fabric-manipulating device comprising a driving-shaft, an eccentric thereon, a pivoted arm driven from the eccentric, a pivoted link, a rock-shaft supporting the ruffler-blade and connections between the link and the ruffler-blade-supporting shaft, said first pivoted arm being provided with a slot, and an arm pivotally secured at one end to the link and

at its other end carrying a part adjustably secured within said slot; substantially as described.

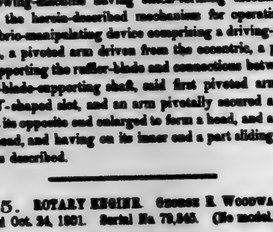
8. In a sewing-machine having stitch-forming mechanism, and a feeding device, the herein-described mechanism for operating a ruffler-blade or like fabric-manipulating device comprising a driving-shaft, an eccentric thereon, a pivoted arm driven from the eccentric, a pivoted link, a rock-shaft supporting the ruffler-blade and connections between the link and the ruffler-blade-supporting shaft, said first pivoted arm being provided with a T-shaped slot, and an arm pivotally secured at one end to the link, and at its opposite end enlarged to form a head, and a bolt passing through said head, and having on its inner end a part sliding in said slot; substantially as described.

706,485. ROTARY ENGINE. GEORGE H. WOODWARD, Bradford Pa. Filed Oct. 24, 1901. Serial No. 79,845. (No model.)



Claim.—In a rotary steam-engine, the combination with a cylinder provided with grooves in its ends, of heads secured to said cylinder, packing-strips located in said grooves and forming a steam-tight joint between the cylinder and the heads, cam-grooves located in the inner sides of the heads of the cylinder, an abutment-head located within said cylinder, a valve-casing provided with a steam-inlet having two ducts leading therefrom into the cylinder at opposite points of a vertical line drawn through said cylinder, said casing being also provided with exhaust-ports and with exhaust-ducts which lead into the cylinder at opposite points of a vertical line drawn therethrough, a valve-ring provided with two recesses in its periphery, one being designed to control the admission of steam into the cylinder at either side of the abutment-head, so as to reverse the direction of rotation of the piston, and the other designed to control the exhaust through the exhaust-ducts, a rotary piston having an annular groove intersected by slots open at their ends, wings located in said slots and having studs or trunnions projecting through the open ends of the slots and through the grooves in the heads of the cylinder, whereby as they approach the abutment-head, the wings will be drawn into said slots to permit of said wings freely passing under the abutment-head, substantially as set forth.

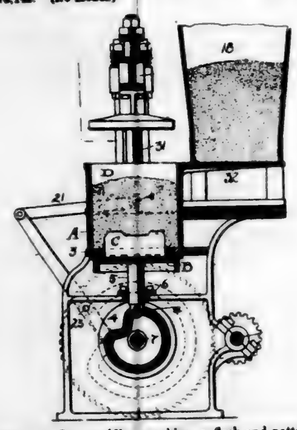
706,486. HYDROCARBON-BURNER. ALFRED A. ARNOTT, New Haven, Conn., assignor to the Arnott Light and Burner Company, New Haven, Conn., a Corporation of South Dakota. Filed Feb. 20, 1901. Serial No. 48,126. (No model.)



Claim.—1. A hydrocarbon-burner, comprising a tubular body member having a shank of reduced diameter at its lower end with a spiral shoulder formed by said reduction, and a vaporizing-tube wound spirally about said shank with the said spiral shoulder resting upon and engaging the whole of the upper coil of said vaporizing-tube, which tube projects laterally at its upper end from the said body member, and all of the coils thereof being below said projecting portion, all constructed and operating substantially as described.

2. In a burner, the combination with the tubular body member 1 having a shank 2 at its lower end of reduced diameter with a spiral shoulder formed by said reduction and a bore therethrough with a gauze cap 5 covering the upper end thereof; of a vaporizing-tube 6 formed into a spiral coil midway of its length which surrounds said shank 2 and supports said body member, the said spiral shoulder resting upon the top inclined coil of said vaporizing-tube, and the outside diameter of said coil and said body member being substantially the same, with the end 7 of said tube projecting laterally from said body member with all of the said coils below said projecting portion and the other end of said tube projecting downwardly substantially parallel with the axis of said body member and thence upwardly substantially parallel with the said downwardly-projecting portion and terminating below the bottom of the body member; and a perforated check-plate 10 covering the end of said tube; and a nut threaded thereon inclosing the said check-plate, all constructed and operating substantially as described.

706,487. MACHINE FOR MOLDING. JOHN H. BATTENFELD, Cleveland, Ohio, assignor to the Cleveland Automatic Moulding Machine Company, a Corporation of Ohio. Filed Aug. 24, 1901. Serial No. 73,142. (No model.)



Claim.—1. In a molding-machine, a flask and pattern, and means to support the same, in combination with a movable sand-feed box having a greater sand capacity than said flask when the pattern is in place therein and when the sand is compressed, means to support said feed-box above and in close relation to said flask, and means to operate said feed-box back and forth over said flask, substantially as described.

2. In a molding-machine, the flask and a support therefor, a ramming-plunger, a support for the pattern beneath said plunger, a sliding feed-box having a greater sand capacity than said flask when the sand is compressed, and means to carry said box over the pattern-support whereby part of its contents is discharged into said flask, and means to retire said feed-box to level the sand within the flask, substantially as described.

3. In a molding-machine, the flask and its support, a ramming-plunger arranged to operate above said support, means to raise and lower said plunger, a sand-feed box adapted to slide back and forth over said flask, said box comprising vertical walls with an open top and bottom, and constructed to carry more sand than said flask will hold when the pattern is in place therein and when the sand is compressed, a sand-supply box for said feed-box, and means to move said feed-box back and forth between said flask and supply-box, substantially as described.

4. In a molding-machine, the combination of a flask, a pattern-support beneath said flask, a ramming-plunger adapted to raise and lower in relation to said flask, vertical guides for said plunger, a power-gear, connecting-rods having crank connection with said gear and a sliding connection with said plunger, and springs mounted on said connecting-rods to provide a yielding pressure for the plunger, substantially as described.

5. A molding-machine provided with a flask and a support for said flask; a ramming-plunger having a cross-beam adapted to slide, rigid vertical guides for said beam, trunnions at either side of said beam, connecting-rod heads supported on said trunnions, power-gear, connecting-rods having crank connection with said gears and a sliding connection with said heads, adjustable nuts on the ends of said rods, and springs between said nuts and head to provide a yielding pressure for said plunger, substantially as described.

6. In a molding-machine, the movable ramming-plunger and a flask supported below the same, a pattern-support beneath said flask, a feed-box at one side constructed to hold more sand than said flask when the sand is compressed, and adapted to slide over the top face of the flask, a sand-supply box for said feed-box, means to slide said feed-box forward to convey part of the sand in said feed-box to said flask, means to slide said feed-box back to level the sand deposited in the flask, and means to operate said plunger to compress the sand fed into said flask, substantially as described.

7. A molding-machine comprising a sand-supply box, a flask, a feed-box having a larger sand capacity than said flask when the sand is compressed, and means to move said feed-box back and forth to fill the flask uniformly with sand and to level the sand therein, in combination with a ramming-plunger having means to operate the same to compress the sand fed to said flask, substantially as described.

8. A molding-machine having a movable pattern-support and a ramming-plunger in line with said support, and means to operate both said support and plunger, comprising a shaft centrally located beneath both said plunger and support, power-gears at each side of the vertical center of said plunger and movable support, connecting-rods for the plunger having crank connections with said gears, a cam on said shaft having operative connection with said movable support, and means to rotate said shaft, substantially as described.

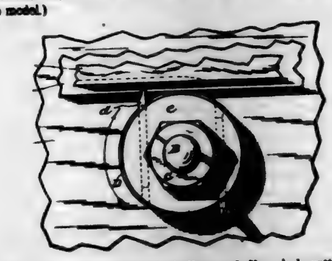
9. A molding-machine having a flask and a support therefor with a ramming-plunger arranged to operate above the same, a movable pattern-support arranged beneath said plunger, a cross-shaft beneath said pattern-support, a cam on said shaft to carry said support up and down and to hold the same in raised position during the filling of the flask and compression of the sand therein, power-gears on said shaft, connecting-rods for said shaft having crank connections with said gears, and means to rotate said shaft, substantially as described.

10. In a molding-machine having a frame constructed to support a flask and provided with a table at one side and level with the top face of said flask, a sand-supply box supported above said table, a movable feed-box having an open top and bottom with vertical walls to form a chamber having a greater sand capacity than said flask when the sand is compressed, and provided with an extension at its top and rear adapted to close the bottom of said supply-box when the said feed-box is shifted, means to shift said feed-box from said sand-box to the flask and back to partially discharge its load of sand into said flask, and means to level the sand in said flask by the back movement of said feed-box, substantially as described.

11. In molding-machines using flasks and patterns, a sand-supply box, a movable sand-feed box beneath said supply-box, a ramming-plunger, a movable support for the pattern, a cross-shaft beneath said pattern-support, a pair of power-gears on said shaft, connecting-rods having crank connections with said gears to operate said plunger, cam-grooves in the face of said gears, a pivoted lever mounted opposite each gear and having a roller riding in said grooves, links connecting said lever with the movable feed-box, means to rotate said gears and shaft, and means to automatically stop said mechanism at the end of the molding operation, substantially as described.

12. In a molding-machine using flasks and patterns, a movable sand-feed box for filling the flask, a ramming-plunger, a movable support for the pattern, a cross-shaft having power-gears with connected mechanism to operate each of said parts, a friction-clutch, a lever to throw said clutch, and means eccentrically mounted on one gear to engage said lever and stop the operation after each full revolution of said shaft, substantially as described.

706,488. ANTIFRICTION-COLLAR FOR WOOD-SHAPERS. THOS. S. CRAFF, Waynetown, Ind. Filed Nov. 28, 1901. Serial No. 84,010. (No model.)



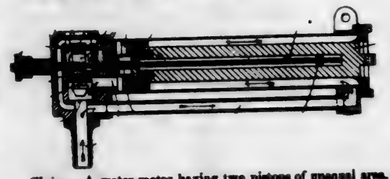
Claim.—1. A wood-shaper including a spindle, a hub, cutters, means for binding the cutters and the hub to the spindle, a collar mounted rotatively on the hub, and antifrictional bearings mounted between the hub and the collar.

2. A wood-shaper spindle provided with a hub secured thereto having a projecting flange, a cutter mounted at the top of the hub, a collar adjustably secured to the hub, the spindle and the hub and the cutter moving together, a guide-collar mounted rotatively on the hub between the flange and the collar, and antifrictional bearings mounted between the hub and the guide-collar.

3. An antifrictional guide-collar for wood-shaper spindles comprising a bored hub having a flange at the upper portion, a collar adjustably attached to the lower portion of the hub, a collar having an internal annular rib mounted rotatively on the hub, and antifrictional bearings having contact with the sides of the annular rib and also with the hub.

4. In a wood-shaper spindle, the combination of the hub secured to the spindle and having the downwardly-facing shoulder, the bearing-collar screwed to the lower end of the hub, the locking-nut engaging the bearing-collar, the guide-collar rotatively mounted on the hub and having the internal annular rib, and the ball-bearings situated at either side of said rib and engaging the shoulder and the bearing-collar, with the cutter, and means whereby the cutter and the hub may be secured to the spindle, substantially as set forth.

706,489. MOTOR. WILLIAM EVANS, Manchester, England, assignor of two-thirds to William Thomas Hill, Withington, Lancaster county, England, and Ronald Gale, Woking, Surrey county, England. Filed Jan. 8, 1902. Serial No. 88,822. (No model.)



Claim.—A water-motor having two pistons of unequal area, a port in uninterrupted communication with the water-supply and conducting pressure to the piston of the smaller area, a port leading to the piston of larger area, a double valve having a slotted valve-stem and a piston of larger area than the valve, a port leading to back of said piston, and a port leading to exhaust, piston-valves working in the slot of the double valve and actuated by the piston of the motor to govern such ports, and an exhaust-port arranged substantially as described.

706,490. LOCOMOTIVE-BOILER. JOSEPH J. GAGE, Mansfield, Ohio. Filed Mar. 7, 1902. Serial No. 97,110. (No model.)

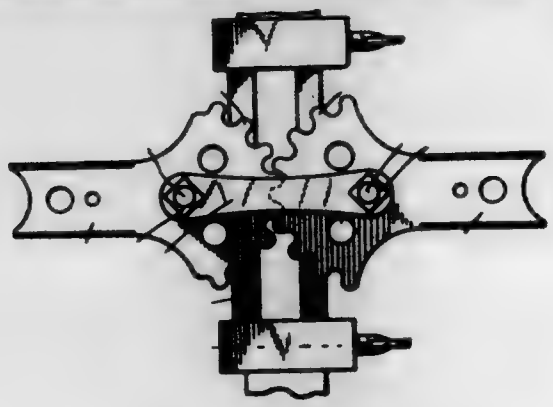
Claim.—In a device of the type set forth, the combination with a boiler having front and rear heads, of an intermediate vertical head secured in front of the rear head, with a series of horizontal flues passing through all of said heads, the intermediate head supporting the weight of the flues between the front and rear heads, a series of short flues located within said first-named flues and extending from said rear head through the intermediate head, the rear ends of said short flues being swaged over the ends of said horizontal flues, said short and horizontal flues being of the same thickness throughout, substantially as described.

706,491. BOW-FACING OAR. RICHARD B. HARRON, Buffalo, N. Y., assignor to J. Herbert Diehl, Buffalo, N. Y. Filed Jan. 16, 1902. Serial No. 89,962. (No model.)

Claim.—1. A device of the class described comprising a base-plate having a boxing thereon provided with upper bearing-faces, a rocker having a leg disposed within the boxing and having bearing-faces disposed against the corresponding faces of the boxing, and intermeshing gears mounted at opposite ends of the rocker and having opposite end sections of oars attached thereto.

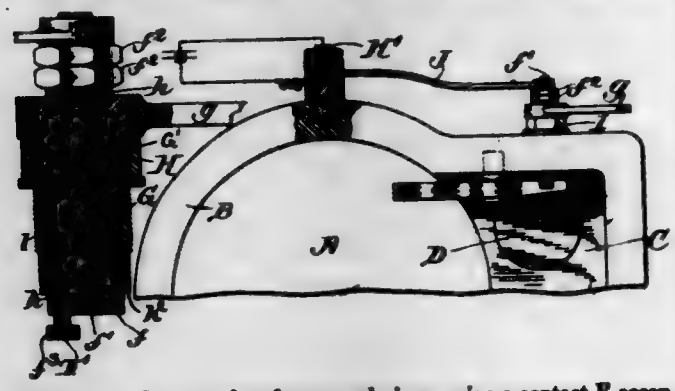
2. A device of the class described comprising a base-plate having convex bearing-faces, a rocker having convex bearing-faces disposed against those of the base-plate, means for holding the bearing-faces in mutual operative relation, end gears pivoted at opposite ends of the rocker and intermeshing, said gears having means for attachment of handle and blade sections of oars thereto, respectively.

3. A device of the class described comprising a base-plate having terminal clamps for engagement with the gunwale of a boat, an inclosure upon the plate having bearing-faces at its upper edge, a rocker having a depending lug disposed within the inclosure and having convex bearing-faces at the sides thereof resting upon the bearing-faces of the inclosure, and intermeshing gears arranged respectively at opposite ends of the rocker, said gears having means for attachment of oar-sections thereto.



706,492. SPARKING IGNITER FOR EXPLOSIVE-ENGINES.

JOSEPH LEMOTTE, Quincy, Mass., assignor of one-half to Helen N. Bray, Boston, Mass. Filed Dec. 11, 1901. Serial No. 85,442. (No model.)



Claim.—1. In a sparker for an explosive-engine a contact F eccentrically formed on a stud *f'*, an adjustable sleeve G carrying the stud and insulated therefrom, and a bushing I in which the sleeve is frictionally held from rotation, substantially as described.

2. In a sparker for explosive-engines, a stud *f'* provided with an eccentric contact, an adjustable sleeve G in which said stud is secured against rotation, insulating material separating the stud and sleeve, and means for holding said sleeve in its adjusted positions, substantially as described.

3. In a sparker for explosive-engines, a stud *f'* provided with an eccentric contact F, a sleeve G, an insulating-sleeve H between the stud and the sleeve G, means for binding the stud and the sleeves G and H together, a bushing I in which the sleeve G is mounted, and a spring G' for frictionally holding the sleeve G in its adjusted positions, substantially as described.

706,493. TROUSERS-SUPPORTER.

LUCIAN O. MILLER, Cincinnati, Ohio. Filed Nov. 8, 1901. Serial No. 81,643. (No model.)

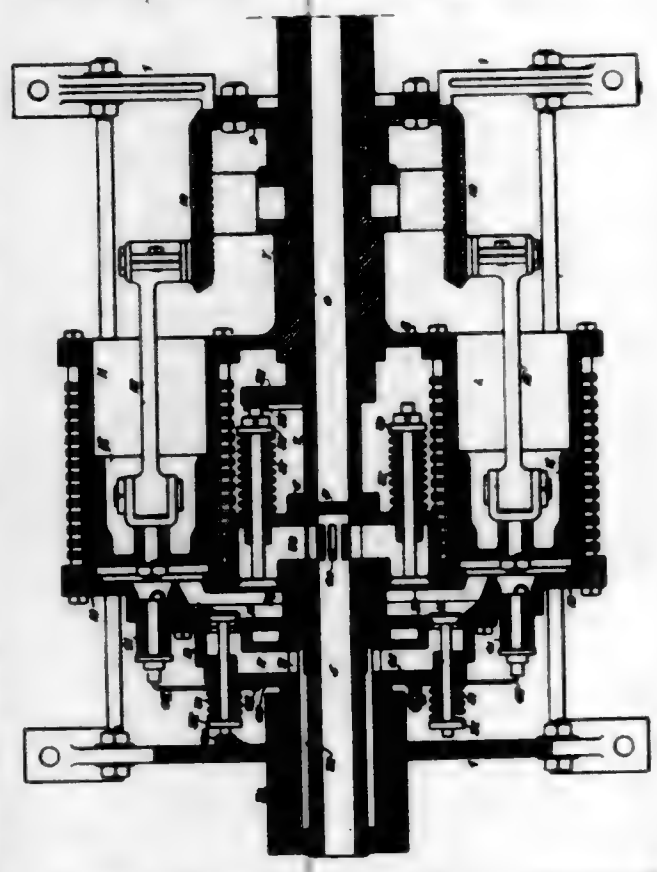
Claim.—1. In a trousers-supporter, the combination of a band or belt adapted to be passed about the waist, plates adapted for attachment inside the trousers, and slides having loops embracing and movable along said band or belt and provided with pads adapted to rest upon the hips of the wearer, one loop of each slide having means for detachable engagement with one of said plates for supporting the trousers from said band or belt, substantially as set forth.

2. In a trousers-supporter, the combination of a band or belt adapted to be passed about the waist and provided with means for attachment to the trousers and slides having pads adapted to rest upon the hips of the wearer, said pads having loose extensions below the slides and adapted to be interposed between the person and the lower edges of the slides and said band or belt, substantially as set forth.

3. In a trousers-supporter, the combination of a band or belt adapted to be passed about the waist, slides having loops embracing and movable along said band or belt, a headed stud on the outer side of one loop of each slide, pads on the slides and adapted to rest on the hips of the wearer and catch-plates adapted for attachment inside the trousers and provided with openings in which said headed studs are adapted to be engaged, substantially as set forth.

706,494. MOTIVE-POWER ENGINE.

MARTIN T. MISCOE, Springfield, Ohio, assignor of one-half to Simeon F. Pierce, St. Paul, Minn. Filed June 5, 1901. Serial No. 62,941. (No model.)



Claim.—1. The combination in an engine, of a series of cylinders each with reciprocating pistons therein, a cylinder-carrying structure rotatable about an axis parallel with the axes of all the cylinders, a series of pinions each rotated by connection with the piston of one of the cylinders and each rotating with and rotatable on the cylinder-carrying structure, and a fixed annular rack with which said pinions mesh, substantially as specified.

2. The combination in an engine, of a series of cylinders, a cylinder structure rotatable around an axis parallel with the axes of all of said cylinders, a series of pinions carried by said rotating cylinder structure but rotatable thereon on axes at right angles to its axis of rotation, a fixed annular rack with which said pinions mesh, and trunk-pistons reciprocating in the cylinders of the engine, each of said pistons being connected by a swinging rod to a crank-pin of one of the pinions, substantially as specified.

3. The combination in an engine, of a frame, a series of cylinders each having a reciprocating piston therein, a fixed shaft parallel to the axes of the cylinders, a cylinder structure rotatable about said shaft having inlet and exhaust chambers for the motive fluid, valves governing the communication between the cylinder and said inlet and exhaust chambers, and cams on the shaft and on the frame for operating said valves as the cylinder structure rotates, substantially as described.

4. The combination in an engine of a frame, a series of cylinders each having a reciprocating piston therein, a fixed shaft parallel to the axes of the cylinders, a cylinder structure rotatable about said shaft having inlet and exhaust chambers for the motive fluid, spring-closed valves on the cylinder structure governing communication between the cylinders and said inlet and exhaust chambers, and fixed cams upon the said shaft and upon the frame, one set of said cams acting upon the stems of the inlet-valves to open the same as the cylinder structure rotates, and the other set of cams acting upon the stems of the exhaust-valves, substantially as described.

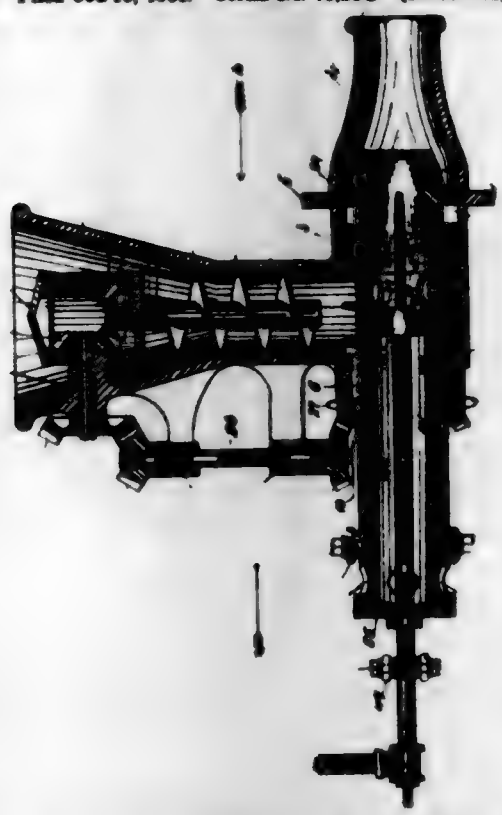
5. The combination of a fixed frame having attached to it an annular rack, a shaft carrying rotatable pinions meshing with said rack, a cylinder structure fixed to the shaft, cylinders provided with pistons carried by said structure having their axes parallel to said shaft, and a connecting-rod between each piston and one of the pinions whereby reciprocating motion of the piston causes its respective pinion to move on said rack, substantially as described.

6. The combination of a fixed frame having attached to it a beveled gear forming an annular rack, a shaft carrying beveled pinions meshing with said rack, a cylinder structure fixed to the shaft, cylinders provided with pistons carried by said structure having their axes parallel to said shaft and a connecting-rod between each piston and one of the pinions whereby the reciprocating motion of the pistons causes the pinions to move on the rack, substantially as described.

7. The combination of a fixed frame having attached to it an annular rack, a shaft carrying a number of auxiliary shafts, pinions on said shafts meshing with said rack, a cylinder structure fixed to the shaft, cylinders provided with pistons and carried by said structure, said cylinders having their axes parallel to the shaft, and means for connecting each piston with one of the pinions whereby the reciprocating motion of the pistons results in a rotary motion of the cylinder structur with its attached shaft, substantially as described.

8. The combination in an engine of a series of cylinders, a cylinder structure rotatable around an axis parallel with the axes of the cylinders and having inlet and exhaust chambers for the motive fluid, valves for controlling the flow of motive fluid to and from the cylinders, and a hollow fixed shaft having within it a partition at right angles to its axis whereby a chamber is formed at one end of said shaft for containing lubricating material, and a second chamber is formed at the other end; said second chamber forming an exhaust-passage and communicating with the exhaust-chamber of the cylinder structure, substantially as described.

706,495. PULVERIZED-FUEL BURNER. FRANKLIN H. REED, Indianapolis, Ind., assignor of one-third to Harry W. Roll, Indianapolis, Ind. Filed Oct. 19, 1901. Serial No. 79,204. (No model.)



Claim.—1. In a pulverized-fuel burner, the combination with a fuel-receiving chamber having a closed end and an open reduced ejecting or nozzle end, of an air-conducting tube situated centrally and extending longitudinally within said fuel-receiving chamber, and having its open ejecting or nozzle end directed toward the reduced or nozzle end of said fuel-receiving chamber, and means, adapted to operate in line with and between said air-conducting tube and the interior surface of said fuel-receiving chamber, to feed the fuel positively to the discharging-nozzle.

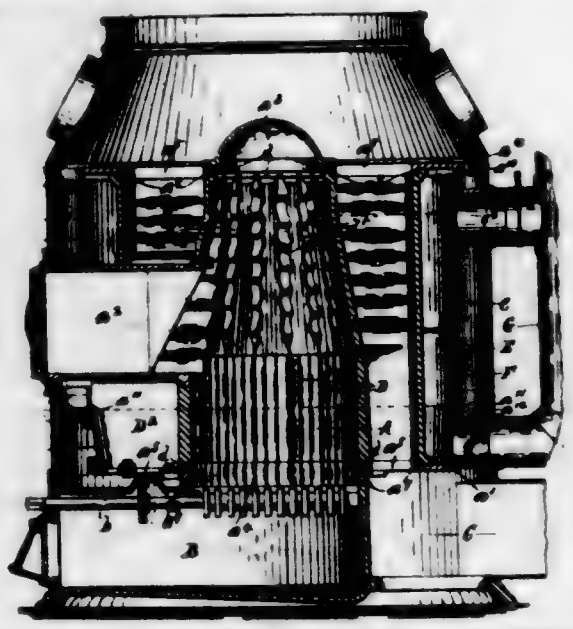
2. In a pulverized-fuel burner, the combination with a fuel-receiving chamber having a closed end and an open reduced ejecting or nozzle end, and a feed-hopper situated at or near the closed end of said fuel-receiving chamber, of an air-conducting tube situated centrally and extending longitudinally within said fuel-receiving chamber and having its open ejecting or nozzle end directed toward the reduced or nozzle end of said fuel-chamber, a spiral conveyer integral with and encircling said air-tube and means for rotating the air-tube and conveyer.

3. In a pulverized-fuel burner, the combination with a fuel-receiving chamber having a closed end and an open reduced ejecting or nozzle end, a vertically-extending feed-hopper situated at or near the closed end of said feed-receiving chamber of an air-conducting tube situated centrally and extending longitudinally within said fuel-receiving chamber and having its open ejecting or nozzle end directed toward the reduced or nozzle end of said fuel-chamber, a spiral conveyer integral with and encircling said air-tube and means for rotating said tube and spiral conveyer and for operating said hopper-conveying means simultaneously.

4. In a pulverized-fuel burner, the combination with a fuel-receiving chamber having a closed end and an open reduced ejecting or nozzle end, a vertically-extending feed-hopper connected to said fuel-receiving chamber, an air-conducting tube situated centrally and extending longitudinally within said fuel-receiving chamber and having its open ejecting or nozzle end directed toward the reduced or nozzle end of said fuel-receiving chamber, a spiral conveyer integral with and surrounding said air-tube, a depending spiral conveyer situated in said hopper and means for simultaneously rotating said air-tube and conveyers whereby equal and regular quantities of fuel are supplied to said fuel-receiving chamber as it is discharged from the nozzle of the latter.

5. In a pulverized-fuel burner, the combination with a fuel-receiving chamber having a closed rear end and an open reduced ejecting or nozzle end, of an air-tube situated centrally and extending longitudinally within said fuel-receiving chamber and having its ejecting or nozzle end directed toward the reduced or nozzle end of said fuel-receiving chamber, a steam or blast pipe extending centrally and longitudinally within said air-tube, and a liquid-fuel-conveying pipe within said steam-pipe and projecting beyond the open end thereof to a point at or near the ejecting-nozzle of said air-tube.

706,496. FURNACE. REUBEN O. RICKARD, Syracuse, N. Y., assignor to the Kelsey Furnace Company, Syracuse, N. Y. Filed Feb. 6, 1900. Serial No. 4,164. (No model.)



Claim.—1. In a furnace, the combination of upper and lower separable plates having openings extending vertically therethrough, a tubular shell interposed between the upper and lower plates, and upright air-heating conduits arranged between the upper and lower plates within the tubular shell and communicating with the openings in the upper and lower plates, the lower portions of the opposing walls of contiguous conduits being formed substantially flat and engaged with each other and the upper portions of said walls being corrugated and separated, substantially as and for the purpose set forth.

2. In a furnace, the combination of upper and lower separable plates provided with openings extending vertically therethrough and having their opposing faces formed with substantially vertical flanges, the flange of the upper plate being of less diameter than said upper wall, and the flange of the lower plate being provided with a peripheral shoulder arranged above the top face of the lower plate, a tubular shell surrounding the flange of the upper plate and the upper portion of the flange of the lower plate, and having its end edges respectively engaged with the lower face of the upper plate and the peripheral shoulder of the flange of the lower plate, upright air-heating conduits arranged between the upper and lower plates within the tubular shell and communicating with the openings in the upper and lower plates, the lower portions of the opposing walls of contiguous conduits being formed substantially flat and engaged with each other and the upper portions of said walls being corrugated and separated, and bolts passed through the air-heating conduits and engaged with the upper and lower plates, substantially as and for the purpose specified.

3. In a furnace, the combination of upper and lower separable plates having openings extending vertically therethrough, the upper plate being provided with a detachable central portion encircled by the openings therein, and the lower plate being provided with an upwardly-extending flange having outwardly-projecting tubular branches or extensions, a tubular shell interposed between the upper plate and the upwardly-extending flange of the lower plate above the tubular branches or extensions, upright air-heating conduits arranged between the upper and lower plates and communicating with the openings in said plates, and bolts passed through the air-heating conduits and engaged with the detachable central portion of the upper plate and with the lower plate, substantially as and for the purpose set forth.

4. In a furnace, the combination of upper and lower separable plates having openings extending vertically therethrough and being each provided with a detachable central portion encircled by the openings therein, the lower plate being also provided with an upwardly-extending flange having outwardly-projecting tubular branches or extensions, a tubular shell interposed between the upper plate and the upwardly-extending flange of the lower plate above the tubular branches or extensions, upright air-heating conduits arranged between the upper and lower plates and communicating with the openings in said plates, an outer series of bolts passed through the air-heating conduits and engaged with the outer portions of the upper and lower plates, and an inner series of bolts passed through the air-heating conduits and engaged with the detachable central portions of the upper and lower plates, substantially as and for the purpose described.

5. In a furnace, the combination of upper and lower separable plates having openings extending vertically therethrough, a tubular shell interposed between the upper and lower plates, upright air-heating conduits arranged between the upper and lower plates within the tubular shell and communicating with the openings in the upper and lower plates, the opposing walls of two of the conduits being separated and the remaining opposing walls of each pair of the conduits having their lower portions engaged with each other and their upper portions corrugated and separated, and an air-heating chamber arranged between the opposing separated walls of said two of the conduits and formed with upper and lower openings for the air, substantially as and for the purpose set forth.

6. In a furnace, the combination of upper and lower separable plates having openings extending vertically therethrough, the lower plate being provided with an upwardly-extending flange formed with an opening extending horizontally therethrough, a tubular shell interposed between the upper plate and the upwardly-extending flange of the lower plate, upright air-heating conduits arranged between the upper and lower plates within the tubular shell and communicating with corresponding openings in said plates, the opposing walls of two of the conduits being separated, and the remaining opposing walls of each pair of the conduits having their lower portions engaged with each other and their upper portions corrugated and separated, and an air-heating chamber arranged between the opposing separated walls of said two of the conduits and formed with upper and lower openings communicating with one of the openings extending vertically through the lower plate and the opening extending horizontally through the upwardly-extending flange of said lower plate, substantially as and for the purpose described.

706,497. SUIT-HANGER. DELBERT B. SALSBU and DEAN C. MITCHELL, Potsdam, N. Y. Filed June 22, 1901. Renewed June 13, 1902. Serial No. 111,579. (No model.)

Claim.—1. The combination in a garment-supporter, of a recessed bar having a contour conforming to the shoulder portions of a body-garment, an auxiliary bar adapted to fit within such recessed portion, the end walls of the recess being constructed to directly support said auxiliary bar, and a spring acting to press such bars together; substantially as described.

2. The combination, in a garment-supporter, of a bar, having a contour conforming to the shoulder portion of a body-garment and having a wedge-shaped recess formed therein, an auxiliary wedge-shaped bar adapted to fit within the wedge-shaped recess and to be supported by the end walls of the recess, and a spring acting to press the bars together, substantially as described.

3. The combination in a garment-supporter, of a recessed bar having a contour conforming to the shoulder portion of a body-garment, an auxiliary bar adapted to fit closely in said recessed portion, the end walls of the recess being so constructed as to support said bar directly, and a combined spring and suspending device comprising a single piece of spring-wire bent in suitable form, and having its opposite ends secured to said bar; substantially as described.

4. The combination in a garment-supporter of a bar A having a wedge-shaped recess *a*, a wedge-shaped auxiliary bar A' adapted to fit in such recess and to be supported by the end walls of the recess, a lining B arranged in the meeting faces of such bars, and a spring-wire section C having its ends secured to said bars, the intermediate portion of such wire being so bent as to form a suspending device *c*, coil c^2, and oppositely-disposed operating portions c^3; substantially as described.

706,498. STRONG LIGHT BODY AND METHOD OF PRODUCING SAME. JAMES B. SEELEY, Los Angeles, Cal., assignor to W. W. Sweeney Co., Los Angeles, Cal., a Corporation of California. Filed Aug. 2, 1901. Serial No. 70,606. (No specimens.)

Claim.—1. A new article of manufacture comprising a body of yucca-brevifolia wood fiber, united in its natural structure, and approximately free from the non-fibrous material with which said fiber is associated in its natural state.

2. A new article of manufacture comprising a body of yucca-brevifolia wood fiber, united in its natural structure, and approximately free from the non-fibrous material with which said fiber is associated in its natural state; and a binding material binding the intersections of the fiber together.

3. As a new article of manufacture, a body composed of yucca brevifolia wood fiber approximately free from the non-fibrous materia with which it is associated in nature; and fixed chromated gelatin binding the fibers of said body at their intersections.

4. The process of manufacturing a strong, light body set forth which consists in, first, removing from a body of yucca-brevifolia wood the non-fibrous material occurring in said wood in nature; second, applying to said body a binding material in solution; third, fixing said binding material.

5. The process of manufacturing a strong, light body set forth which consists in, first, removing from a body of yucca-brevifolia wood the non-fibrous material occurring in said wood in nature; second, applying gelatin to said body; third, fixing said gelatin.

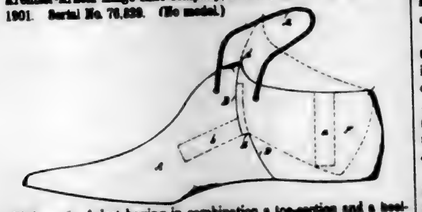
6. The process of manufacturing a strong, light body which consists in, first, boiling a body of yucca-brevifolia wood in an alkaline solution and thereby removing the non-fibrous material from said wood; second, drying the wood so treated substantially in the absence of actinic rays of light; third, applying to the wood thus treated and dried a solution of gelatin; and fourth, exposing the material thus produced to actinic rays of light.

7. A body composed of yucca-brevifolia veneer formed in a tube and approximately free from the non-fibrous material with which the fiber of said wood is associated in nature; and a coating of fixed gelatin on the fibers of said wood.

8. The process of forming a strong and light body which consists in, first, treating a veneer of yucca-brevifolia wood with a solution in which non-fibrous portions of said wood are soluble, thereby removing non-fibrous material from said veneer; second, forming said veneer in a tube over a form and coating the fibers of said wood with a gelatin solution; third, fixing said gelatin solution.

9. The process of forming a strong and light body which consists in, first, treating a veneer of yucca-brevifolia wood with a solution of bichromate of potash, thereby removing non-fibrous material from said veneer; second, forming said veneer in a tube over a form and allowing said veneer to dry in the absence substantially of the actinic rays of light; third, applying a gelatin solution to said wood; and fourth, fixing said gelatin solution.

706,499. LAST. FRED J. SEAMEN, Dayton, Ohio, assignor to Krentler-Arnold Hinge Last Company, Detroit, Mich. Filed Sept. 23, 1901. Serial No. 76,239. (No model.)

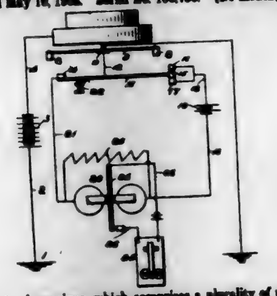


Claim.—1. A last having in combination a toe-section and a heel-section, the contiguous surfaces of said sections being formed in the arc of a circle having its center at or near to the angle formed between the upper and rear part of the heel-section.

2. A last having in combination a toe-section and a heel-section, each of said sections being provided with two surfaces formed in the arcs of circles having their center at or near to the angle formed between the upper and rear part of the heel-section, said surfaces being joined by a surface radial to the curvature.

3. A last having in combination a toe and a heel section, each of said sections being provided with two surfaces formed in the arcs of circles having their center at or near to the angle formed between the upper and rear part of the heel-section, said surfaces being joined by a surface approximately radial to the curvature, the dividing-line between the sections cutting the upper surface at the rear of the instep, and on the lower side at the forward part of the heel.

706,500. WIRELESS TELEGRAPHY. HARRY SHOEMAKER, Philadelphia, Pa., assignor to Mario V. Gehring and the Consolidated Wireless Telegraph and Telephone Company, Philadelphia, Pa. Original application filed Oct. 26, 1901, Serial No. 79,969. Divided and this application filed May 10, 1902. Serial No. 106,736. (No model.)



Claim.—1. A receiver, which comprises a plurality of plates in inductive relation, means for permanently charging the plates and a local circuit controlled by said plates.

2. A receiver, which comprises a plurality of plates in inductive relation, a source of high-potential energy in connection with opposing plates through an earth-circuit.

3. A receiver, which comprises opposing plates, a high-potential source of energy connected to said plates through an earth-circuit to permanently charge the same, and a circuit-controlling means operated by the reaction between said plates upon the reception of a signal.

4. A receiver, which comprises plates in inductive relation to each other, means for normally charging said plates to a high potential, means controlling a local signal-circuit operated upon fluctuations of charge on said plates due to received signal energy.

5. A receiver, which comprises a plurality of plates in inductive relation, batteries of high potential permanently charging the plates, and a local circuit controlled by said plates.

6. A receiver, which comprises a plurality of plates in inductive relation, a battery of high-potential energy in connection with opposing plates of an earth-circuit.

7. A receiver, which comprises opposing plates, a battery of high potential connected to said plates through an earth-circuit to permanently charge the plates, and a circuit-controlling means operated by the reaction between said plates upon the reception of a signal.

8. A receiver, which comprises a plurality of plates in inductive relation to each other, a battery for normally charging said plates to a high potential, means controlling a local signal-circuit operated upon fluctuations and charged on said plates due to receive signal energy.

9. A receiver, which comprises a plurality of plates in inductive relation, batteries of high potential permanently charging the plates, means kept under an electrostatic field interposed between said batteries and one of the plates, and a local circuit controlled by said plates.

10. A receiver, which comprises a plurality of plates, a high-potential source of energy connected to said plates and an electrostatic means interposed between one of the plates and the high-potential source of energy.

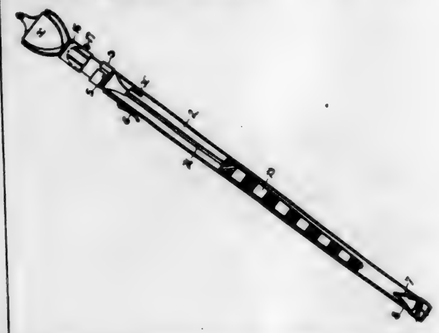
11. A receiver, which comprises a plurality of plates, a high-potential source of energy connected to said plates, an electrostatic means interposed between one of the plates and the source of energy, and a recorder instrument controlled by said means.

12. A receiver, which comprises a plurality of plates, a source of high-potential energy connected to said plates and an electrostatic means interposed between one of the plates and the source of energy, a relay-circuit controlled by said means and a recorder-circuit controlled by said relay-circuit.

13. A receiver, which comprises a plurality of plates, a diaphragm surrounded by insulation connected to one of the plates, a battery of high potential interposed between the plate and diaphragm, a disk adjacent to the diaphragm and connected to the other plate so as to be kept under an electrostatic field, and a recorder controlled by said disk.

14. A receiver, comprising a plurality of ground-plates, a high-potential source of energy interposed therebetween, a diaphragm connected directly with the source of energy, a disk mounted so as to be free to vibrate adjacent to said diaphragm and kept under an electrostatic influence by said source of energy, said plate or disk being directly connected to the other of the ground-plates and a recorder-circuit controlled by the disk.

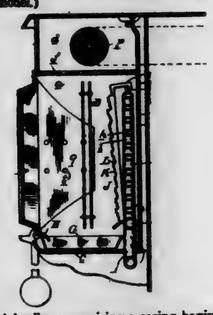
706,501. CANE. ALBERT SOBERS, Lincoln, Nebr., assignor of one-half to Joseph W. Edgerton, Grand Island, Nebr. Filed Feb. 19, 1900. Serial No. 5,862. (No model.)



Claim.—A cane constructed as shown and comprising the cylindrical sheet-metal cane portion 2, of the upper strengthening-collar 3, both col-

ler and upper cane portion being provided with an L-shaped incision, of the carrying-hook 6 secured near the upper end of the cane so that said cane may be carried stabbard fashion, aforesaid cane being open at the lower end and provided with the reed or horn portion 7, in combination with a suitable socket adapted to fit into the upper end of the cane and having a pin 5 adapted to be held within aforesaid L-shaped incision.

706,502. COMBINED BROILER AND TOASTER. PETER G. VAN WIE, Detroit, Mich., assignor to Ideal Manufacturing Company, Detroit, Mich., a Corporation of Michigan. Filed May 2, 1900. Serial No. 15,166. (No model.)



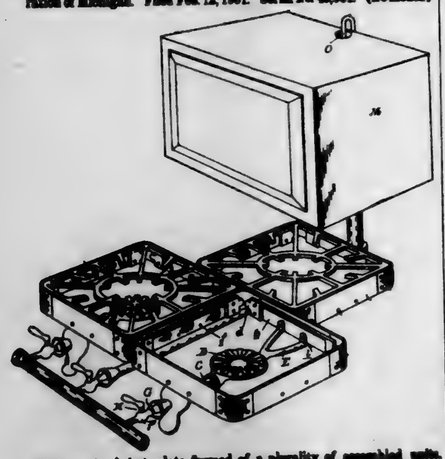
Claim.—1. A broiler, comprising a casing having an open front and sides partially cut away, a burner within said casing, a door for closing said front having inwardly-extending side flanges forming complementary portions of the sides of the casing, and a holder laterally adjustably secured to said side flanges for the purpose described.

2. In a broiler and toaster, the combination with a burner arranged in a vertical plane and a rack or holder parallel to said burner, of a foraminous screen between said burner and rack comprising a series of horizontal offsets or ledges and connecting inclined portions, substantially as and for the purpose set forth.

3. A broiler comprising a casing having an open front and sides partially cut away, a burner within said casing and a door for closing said front having inwardly-extending side flanges forming complementary portions of the sides of the casing and also forming a support for the article to be cooked.

4. A broiler and toaster comprising a casing having an open front, a burner arranged within said casing adjacent to the vertical rear wall thereof, a hinged door for closing said front also forming a drip-pan, a pan supported upon the bottom of the casing and a laterally-extending flange upon said door overlapping said lower pan.

706,503. HOT-PLATE. PETER G. VAN WIE, Detroit, Mich., assignor to the Ideal Manufacturing Company, Detroit, Mich., a Corporation of Michigan. Filed Feb. 12, 1901. Serial No. 46,861. (No model.)



Claim.—1. A hot-plate formed of a plurality of assembled units, each unit comprising an open frame or ring, a burner supported centrally therein and a supply-pipe for said burner extending to one side of said ring, said rings being adapted to be detachably secured to each other to form a common supporting-frame.

2. A hot-plate formed of a plurality of units each comprising a substantially rectangular open frame or ring, a burner supported centrally therein and a supply-pipe extending to one side of said ring, said units being assembled to have their supply-pipes extending in the same direction, and a common gas-supply pipe connected to all of said burner supply-pipes, said rings being adapted to be secured to each other in either straight or staggered series to form a common supporting-frame.

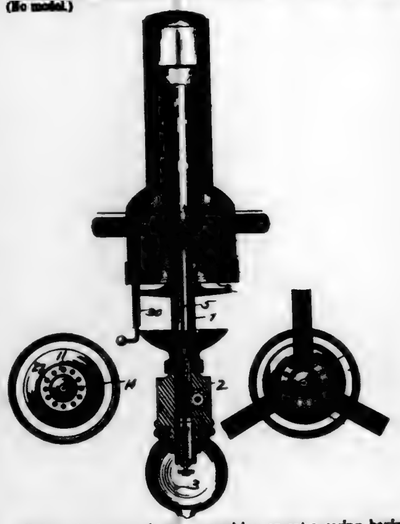
3. A hot-plate comprising a substantially rectangular open frame formed of corner-pieces and connecting straight side pieces, a burner arranged centrally within said frame, a supporting-bracket for said burner extending to and connected with one side of said frame, a supply-pipe extending to the opposite side of said frame, and a plurality of supporting-lugs connected to said frame centrally of said side pieces.

4. A hot-plate comprising an open frame or ring, a burner arranged centrally of said ring, a supporting-bracket for said burner extending inward from one side of said frame, a supply-pipe for said burner extending outward below the opposite sides of said frame and a supporting-lug for said frame apertured for the passage of said supply-pipe and forming a support therefor.

5. The combination with a hot-plate, of a tubular standard projecting upward from the margin thereof, and an oven sleeved upon said standard, a coil-spring within said standard, a rod supported upon said spring within said standard having a return-bend portion extending external thereof and secured to the wall of the oven-casing and a set-screw having a threaded engagement with an aperture in said return-bend portion adapted to bear against said standard and to hold the oven in different positions of adjustment.

6. The combination with a hot-plate, of a tubular standard projecting upward therefrom, an oven sleeved upon said standard, a coil-spring within said standard and a rod secured to said oven, extending centrally downward in said hollow standard and supported upon said spring.

706,504. HYDROCARBON INCANDESCENT LAMP. GEORGE WASHINGTON, New Brighton, N. Y. Original application filed Nov. 5, 1898, Serial No. 695,575. Renewed Jan. 22, 1901. Serial No. 44,301. Divided and this application filed July 24, 1901. Serial No. 69,905. (No model.)



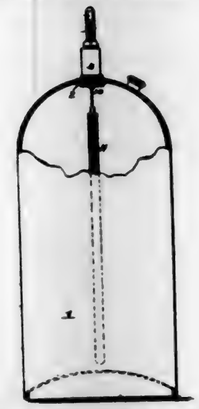
Claim.—1. A vapor-burner comprising an outer casing having a burner-tube arranged at its upper end, a mixing-tube within said casing, an intermediate tube within the casing and surrounding said mixing-tube, and a diaphragm in said intermediate tube above the open upper end of the mixing-tube, a vaporizer penetrating the bottom of the casing and arranged to discharge vapor into the mixing-tube, air-inlet tubes penetrating the sides of the casing and arranged to discharge air into said mixing-tube, and a vapor-jet burner connected to the base of said casing and arranged to heat said vaporizer, substantially as described.

2. A vapor-burner comprising an outer casing carrying a burner, a mixing or commingling tube within said casing, an intermediate tube closed at its top and open at its bottom and surrounding said vaporizing-tube, a vaporizer arranged to discharge vapor into the mixing-tube, air-inlet tubes discharging into said mixing-tube, and a vapor-jet burner connected to the base of said casing and arranged to heat said vaporizer, substantially as described.

2. A vapor-burner comprising an outer tube or casing carrying a burner, a mixing or commingling tube within said casing, an intermediate tube closed at its top and open at its bottom, a vaporizer arranged to discharge vapor into the mixing or commingling tube, air-pipes leading to the mixing or commingling tube, a valve for controlling the flow of mixed air and vapor from the intermediate tube to the outer tube or casing and an auxiliary burner adjacent to the vaporizing-tube for heating the latter.

4. In a lamp of the class described, the combination with a vaporizer, of a burner provided with tubes disposed one within another to form three communicating passages connected to cause the vapor to pass through the intermediate passage in the opposite direction from that in which it passes through the other two passages, and an air-supply tube extended across two of the said passages and communicating with the innermost tube above the vapor-outlet of said vaporizer to supply the vapor issuing from the vaporizer with air, substantially as and for the purpose specified.

706,505. GAGE. GEORGE WASHINGTON, New Brighton N.Y. Filed July 30, 1901. Serial No. 70,394. (No model.)



Claim.—1. In a gage for indicating the quantity of liquid in a tank or receptacle, the combination with a closed receptacle, a block secured thereto and a transparent tube supported on said block, of a plunger movable in said tube, a rod depending from said plunger and passing freely through the block, a weight within said closed receptacle and suspended from the lower end of said rod, and means for normally counterbalancing said weight.

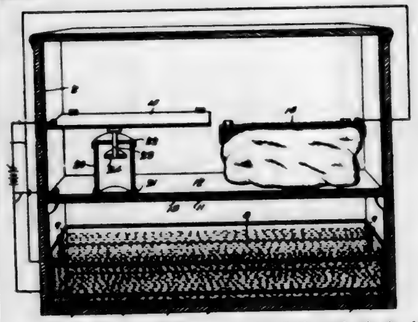
2. In a gage, the combination with a closed tank or receptacle, a block secured thereto and provided with a chamber, a rod passing through said block and the chamber therein, an enlargement on said rod, a spring on the rod, bearing at one end against said enlargement and at the other end in the bottom of the chamber in the block, and a weight within said closed receptacle and suspended from said rod and counterbalanced by said spring.

3. In a gage for indicating the quantity of liquid in a tank or receptacle, the combination with a block having a chamber therein, a weight to be immersed in the liquid in the tank or receptacle and a transparent tube communicating with said chamber, of a plunger in the tube, a connection between the plunger and weight, and a spring within said chamber, said spring bearing against the plunger and the bottom of said chamber, and acting to counterbalance said weight.

4. In a gage for indicating the quantity of liquid in a tank or receptacle, the combination with a closed receptacle or tank a weight to be immersed in the liquid in the tank or receptacle and a transparent tube carried by said tank or receptacle, of a movable plunger in the tube, a connection between the plunger and said weight and means for counterbalancing said weight.

706,506. APPARATUS FOR PRESERVING FOODS. MARSHALL D. ELLIS, Congress Heights, D. C., assignor of one-half to Guy H. Field, Highgate, N. C. Filed Sept. 16, 1901. Serial No. 75,526. (No model.)

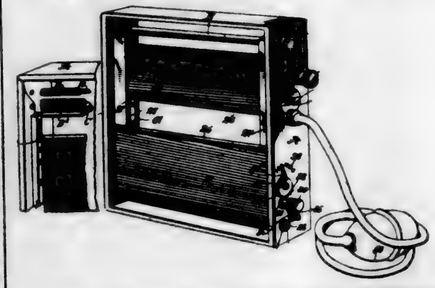
Claim.—1. In an apparatus for the purpose described, the combination of the casing, a rigid shelf or support having a conducting-surface, a circuit including a source of electrical energy having one terminal connected to said conducting-surface, and a movable conductor adapted to fall by gravity into contact with any substance located on said shelf, said movable conductor being connected to the opposite terminal of the circuit to thereby compel the passage of a current through the substance being treated.



2. In an apparatus for the purpose described, a casing having insulated walls, a fixed shelf or support arranged within the casing and having a conducting-surface, a circuit including a source of electrical energy, one terminal of said circuit being formed by said conducting-surface, a flexible conductor pivotally connected at one side or edge to one of the insulated walls at a point above the shelf or support and adapted to move by gravity into contact with a substance placed on the shelf or support for treatment, said flexible conductor forming the opposite terminal of the circuit to thereby compel the passage of a current through the substance being treated.

3. An apparatus for the purpose described, comprising a casing, a shelf arranged within the casing and having a conducting-surface, a movable conductor formed of a series of interwoven metallic links adapted to move into contact with the material to be treated and to conform itself by gravity to the contour of such material, and an electric circuit having its terminals connected to the shelf and to the flexible conductor.

706,507. PHOTOGRAPHIC SHUTTER. WILLIAM F. FOLMER, New York, N. Y. Original application filed Feb. 17, 1902, Serial No. 94,475. Divided and this application filed May 9, 1902. Serial No. 106,821. (No model.)



Claim.—1. In cameras, a curtain-shutter having a plurality of curtains forming an exposure-opening between adjacent ends, an upper set of plain rollers located one above the other, a lower set of tension-controlled rollers also located one above the other, one curtain being connected with the outer rollers of the two sets and the other curtain with the inner rollers of the sets, all of the rollers having the same diameter with the exception of the lower roller of the upper set, which is of increased diameter, a winding mechanism for the upper rollers, a tension-controlling device for one of the lower rollers, and a releasing device for the wound shutter, which releasing device is capable of being operated manually or pneumatically, as desired.

2. An adjustable curtain-shutter and its curtains, and a scale at the rear of the shutter for indicating the width of the exposure-opening in the shutter, and supports for the said scale independent of the curtains of the shutter, for the purpose specified.

3. A curtain-shutter having a plurality of curtains forming an ex-

posure-opening between adjacent ends, a scale for indicating the width of the exposure-opening, and a support for the scale adjacent to the said curtains, crossing the said exposure-opening and independent of the curtains, the scale being adjacent to the curtains and reading relatively thereto, as described.

4. In camera-shutters, a releasing device for the shutter, consisting of a cylinder open at both ends, a removable cap for one end of the cylinder, provided with an apertured projection to receive a flexible tube, a piston-head having sliding movement in the cylinder, a stem connected with the head, and a locking member for the shutter, connected with the said stem, as described.

5. In cameras, a curtain-shutter having a plurality of curtains forming an exposure-opening between adjacent ends, an upper set of plain rollers located one above the other, a lower set of tension-controlled rollers also located one above the other, one curtain being connected with the outer rollers of the two sets and the other curtain with the inner rollers of the sets, a train of gearing for winding the upper rollers, a master-wheel in connection with said train of gearing and provided with ratchet-teeth upon one face, a locking member for engagement with the ratchet-teeth of the master-wheel, and an exteriorly-operated releasing device for the locking member, as set forth.

6. In cameras, a curtain-shutter having a plurality of curtains forming an exposure-opening between adjacent ends, an upper set of plain rollers located one above the other, a lower set of tension-controlling rollers also located one above the other, one curtain being connected with the outer rollers of the two sets and the other curtain with the inner rollers of the sets, a train of gearing for winding the upper rollers, a master-wheel in connection with said train of gearing and provided with ratchet-teeth upon one face, a spring locking member for engagement with the ratchet-teeth of the master-wheel, a cylinder open at both ends, a removable cap for the said cylinder, provided with an apertured extension to receive the flexible tube, a piston-head mounted in the said cylinder, and a connection between the piston-head and the spring locking members, as described.

7. In a curtain-shutter for cameras, a frame, a plurality of curtains within the frame, forming an exposure-opening between adjacent ends, an upper set of plain rollers located in the said frame one above the other, a lower set of tension-rollers also located within the frame, one above the other, one curtain being connected with the outer rollers of the two sets and the other curtain with the inner rollers of the sets, a train of gearing for winding the upper rollers, a master-gear in connection with the said train of gearing and provided with ratchet-teeth on one face and a stop-pin extending from its opposite face, said ratchet-teeth being circularly arranged with a single break in the arrangement of the teeth of a width substantially equal to the length of a ratchet-tooth, a spring locking member attached to the frame and having a head for engagement with the ratchet-teeth of the master-gear, a push-pin mounted in the frame and connected with the said spring locking member, a stop-pin extending from the frame below the said pin, an arm carried by the push-pin, adapted for engagement with the stop-pin on the master-gear and the stop-pin on the frame in one position of the said push-pin, a dial at the outer part of the frame, and a pointer carried by the outer portion of the push-pin and adapted to travel over the said dial, whereby to regulate the movement of the shutter for time or for instantaneous exposure.

8. In a camera, a curtain-shutter having a plurality of curtains forming an exposure-opening, and exteriorly-operated means substantially as described for regulating the size of the exposure-opening, which means comprise the shaft for the roller of the curtain, the shaft being mounted to slide in the roller and turn therewith, a winding mechanism for the roller, with which the shaft has clutch connection, and an indicator rotated by the movement of the shaft.

9. In a camera, a curtain-shutter having a plurality of curtains forming an exposure-opening, and exteriorly-operated means for regulating the size of the exposure-opening, which means comprise a shaft mounted to slide in one of the curtain-rollers and turn therewith, a winding mechanism for the curtain-rollers, a clutch at one end of the shaft, arranged for engagement with the winding mechanism, a pinion at the opposite end of the shaft, a toothed indicator-wheel exteriorly mounted on the shutter-frame and meshing with the said pinion, and provided with a scale indicating distances, and stop devices for the indicator-wheel, limiting its movement, substantially as described.

10. In a camera, a curtain-shutter having a plurality of curtains forming an exposure-opening, upper and lower sets of rollers for the curtains, a train of gearing connecting the upper set of curtain-rollers, the lower set being tension-controlled, a locking device connected with one end of the shaft of one of the tension-rollers, and an indicator at the exterior of the shutter-frame, operated by the said shaft, for the purpose set forth.

11. In cameras, a curtain-shutter having a plurality of curtains forming an exposure-opening between adjacent ends, an upper set of plain rollers located one above the other, and a lower set of tension-controlled rollers also located one above the other, one curtain being connected with the outer rollers of the two sets and the other curtain with the inner rollers of the sets, all of the rollers having the same diameter with the exception of the lower roller of the upper set which is of increased diameter, a winding mechanism for the upper rollers, a releasing device for the winding mechanism, and a device for indicating the width of the exposure-opening in the shutter, operated by the said winding mechanism, substantially as described.

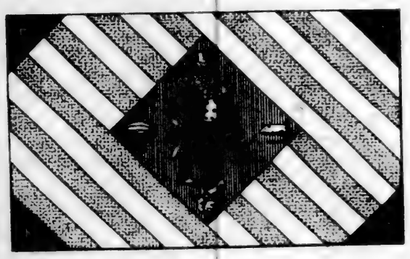
12. In cameras, a curtain-shutter having a plurality of curtains forming an exposure-opening between adjacent ends, an upper set of gear-controlled rollers connected with one of the ends of the curtains and arranged one above the other, a lower set of tension-controlled rollers also arranged one above the other, all of the rollers being of the same diameter with the exception of the lower roller of the upper set which is of increased diameter, exteriorly-operated means, substantially as described, for regulating the size of the exposure-opening in the shutter, which means comprise a shaft for a roller of the upper set, the shaft being mounted to slide in the roller and turn therewith, a winding mechanism for the roller, with which the shaft has clutch connection, and an indicator rotated by the movement of the shaft, substantially as described.

13. In cameras, a curtain-shutter having a plurality of curtains forming an exposure-opening between adjacent ends, an upper set of gear-controlled rollers connected with one of the ends of the curtains, arranged one above the other, a lower set of tension-controlled rollers also arranged one above the other, all of the rollers being of the same diameter with the exception of the lower roller of the upper set which is of increased diameter, exteriorly-operated means, substantially as described, for regulating the size of the exposure-opening in the shutter, which means comprise a shaft for a roller of the upper set, the shaft being mounted to slide in the roller and to turn therewith, a winding mechanism for the roller, with which the shaft has clutch connection and an indicator rotated by the movement of the shaft, a shaft for one of the tension-controlled rollers, operated from the exterior of the shutter-frame, a stop for the said shaft, a dial adapted to indicate the amount of tension on the roller to which the shaft belongs, which dial is mounted at the exterior of the shutter-frame, and means, substantially as described, for operating the said dial from the said shaft of the tension-controlled roller, for the purposes specified.

14. In a camera-shutter, a frame for the shutter, a releasing device for the shutter, consisting of a sleeve mounted on the frame, being in communication with the interior thereof, a plunger mounted to slide in the said sleeve, a trip device carried by the plunger, and a cap removably covering the said sleeve, the said cap having an apertured projection to receive the tube of a pneumatic apparatus, as and for the purpose set forth.

DESIGNS.

35,985. FLAG. A. REED COMER, Cynthiana, Ky. Filed June 9, 1902. Serial No. 110,935. Term of patent 7 years.



Claim.—The ornamental design for a flag, substantially as herein shown and described.

35,986. BADGE. MICHAEL J. KANE, Buffalo, N. Y. Filed May 6, 1902. Serial No. 106,232. Term of patent 3½ years.

Claim.—The ornamental design for a badge as herein shown and described.

35,987. RANGE. RICHARD H. WHITEFIELD, Keston, Ohio. Filed June 6, 1902. Serial No. 110,564. Term of patent 3½ years.

Claim.—The ornamental design for a range, as herein shown and described.

35,988. RANGE. RICHARD H. WHITEFIELD, Keston, Ohio. Filed June 6, 1902. Serial No. 110,565. Term of patent 3½ years.

Claim.—The ornamental design for a range, as herein shown and described.

35,989. RANGE. RICHARD H. WHITEFIELD, Keston, Ohio. Filed June 6, 1902. Serial No. 110,567. Term of patent 3½ years.

Claim.—The ornamental design for a range, as herein shown and described.

35,990. RANGE. RICHARD H. WHITEFIELD, Keston, Ohio. Filed June 6, 1902. Serial No. 110,568. Term of patent 3½ years.

Claim.—The ornamental design for a range, as herein shown and described.

TRADE-MARKS

REGISTERED AUGUST 5, 1902.

38,708. COLLAR-BUTTONS. WILLIAM J SMITH, New York, N. Y. Filed June 26, 1902.

SAMPSON

The word "SAMPSON." Used since January 15, 1902.

38,704. DOLLS. EDMUND ULRICH STEINER, New York, N. Y. Filed June 20, 1902.

MAJESTIC

The word "MAJESTIC." Used since 1894.

38,705. DOLLS. EDMUND ULRICH STEINER, New York, N. Y. Filed June 20, 1902.

A scroll with an eagle perched thereon and the word "LILIPUT" appearing on the scroll. Used since 1894.

38,706. RUBBER DRESS-SHIELDS HAVING A STOCKINET COVERING. THE CANFIELD RUBBER CO., Bridgeport, Conn., and New York, N. Y. Filed May 3, 1902.

MOLESKIN

The word "MOLESKIN." Used since January 1, 1902.

38,707. HATS. ROBB S. BARTLETT, Fall River, Mass. Filed Mar. 1, 1902.

The words "OLD COLONY" and a surrounding ornamental border. Used since May 10, 1902.

38,708. HATS. SAMPSON BROS., Dallas and Waco, Tex. Filed Mar. 6, 1902.

The word "BUCKHORN," associated with the antlers of a deer, the said word being inclosed in a rectangular panel resting on said antlers and the said panel being surmounted by a star. Used since October 18, 1899.

38,709. HATS. SAMPSON BROS., Dallas and Waco, Tex. Filed Mar. 6, 1902.

The words "GREAT AMERICAN" and the representation of an eagle with outspread wings, inclosed in a rectangular panel, with lines drawn across the four corners of said panel. Used since September 10, 1897.

38,710. FELT HATS. SAMPSON BROS., Dallas and Waco, Tex. Filed Mar. 6, 1902.

The words "THE BUCKSKIN" inclosed in the annular space between two concentric circles and the representation of a ram's head inside the inner circle. Used since December 5, 1899.

88,711. COLLARS AND CUFFS. CLUETT, PEABODY & Co., Troy, N. Y. Filed June 26, 1902.

The word "ORIENTAL" and the representation of a crescent partly inclosing a small circular dot. Used since June 22, 1899.

88,712. GLOVES AND MITTENS. SARANAC GLOVE Co., Littleton N. H. Filed June 27, 1902.

The representation of a horse. Used since March 27, 1902.

88,713. CERTAIN NAMED LEATHER FOOTWEAR. R. H. FITZ & Co., Detroit, Mich. Filed Jan. 24, 1902.

"Colonial"

The word "COLONIAL" in quotation-marks. Used since November 11, 1899.

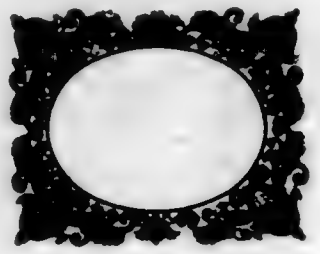
88,714. RIBBONS, SILKS, SATINS, AND VELVETS. J. KEISER, Sons & Co., New York, N. Y. Filed May 5, 1902.

A circular band or arc thereof traversed by a band or ribbon of rectilinear form longer than it is wide, terminated at the left-hand end by a fancy scrollwork and running into space at the right-hand end, the whole having for a background a mass of clouds with a spray of flowers and leaves on the left-hand side thereof. On the rectilinear band referred to appears the arbitrary combination of letters and numbers "PAT 100." Used since March 8, 1899.

88,715. COTTON AND SILK WOVEN TEXTILE FABRICS. DAVIES TEXTILE Co., New York, N. Y. Filed June 20, 1902.

The representation of a crescent having three stars thereon. Used since January 1, 1902.

88,716. TICKINGS. ARKWRIGHT MANUFACTURING COMPANY, Manchester, N. H. Filed Dec. 4, 1901.



The design, comprising an oval-shaped field surrounded by a rectangular border composed of scrolls with urn-like figures at the corners. Used since 1837.

88,717. CIGARS. MARGARET J. LOSS, Lebanon, Pa. Filed Apr. 22, 1902.

JOHN C. CALHOUN

The name "JOHN C. CALHOUN," accompanying a picture of John C. Calhoun and also a picture of the Calhoun homestead at Abbeville, South Carolina. Used since October 1, 1896.

88,718. CHOCOLATE CANDY. F. H. DOW & COMPANY, Boston, Mass. Filed June 21, 1902.

Utopian

The word "UTOPIAN." Used since February 1, 1902.

88,719. CERTAIN NAMED CONFECTIONERY. JOHN H. FAULKNER, Allegheny, Pa. Filed June 2, 1902.

U—NO

The hyphenated word "U-NO." Used since February, 1898.

88,720. MODIFIED MILK. Charles H. Pattison, New York, N. Y. Filed June 14, 1902.

CON-DE-LAC

The hyphenated word "Con-de-lac" inclosed in a diamond-shaped figure. Used since May 15, 1902.

88,721. PREPARED CEREAL FOOD. The American Cereal Co., Akron, Ohio; Chicago, Ill., and Cedar Rapids, Iowa. Filed June 27, 1902.

Apitezo

The word "Apitezo." Used since April 1, 1902.

88,722. WHEAT-FLOUR, WHEAT FOOD PREPARATIONS, AND WHEAT BREAKFAST-FOODS. James A. Neal, Boston, Mass. Filed Mar. 24, 1902.

RED ROBIN

The words "Red Robin" and the representation of a robin perched upon a branch. Used since March 26, 1902.

88,723. BRAN, MIDDLINGS, (BROWN AND WHITE,) MIXED FEED, AND RED DOG. Lindsay Mill Company, La Crosse, Wis. Filed June 21, 1902.

ELMCO.

The word "Elmco." Used since April 10, 1902.

88,724. STOCK-FOOD. The American Cereal Co., Akron, Ohio, and Chicago, Ill. Filed June 27, 1902.

BELL COW

The words "Bell Cow" and the representation of the head of a cow with a bell about the neck. Used since April 1, 1902.

88,725. MEDICINE FOR CERTAIN NAMED DISEASES. Charles W. Bonar, Fort Wayne, Ind. Filed Dec. 14, 1901.

COM-SEL-SAR

The word "Com-sel-sar." Used since July 1, 1901.

88,726. PEPSIN COMPOUND. Bert Louis Maltbie, New York, N. Y. Filed June 21, 1902.

"FELSIN"

The word "Felsin" in quotation-marks. Used since May 26, 1902.

88,727. MEDICINAL PLASTERS. Raymond & Co., New York, N. Y. Filed June 19, 1902.

The words "The Alray," a representation of the sun and rays from the sun, on which latter the words are produced, and a border surrounding the words, the sun, and the rays. Used since May 23, 1902.

88,728. REMEDIES FOR TREATMENT OF THE HAIR AND SCALP. THE ALTHEIMER MEDICAL DISPENSARY, Cincinnati, Ohio. Filed May 12, 1902.

The representation of a woman's head having a luxuriant growth of hair, executed in gilt or gold, and with the words "NONE GENUINE WITHOUT THE GOLDEN HEAD" printed in plain capital letters, arranged in a semicircle above the same. Used since January 1, 1895.

88,729. FOOT-POWDER. JAMES W. MADDOX, Albany, Tex. Filed June 13, 1902.

A representation of the registrant's photograph. Used since May 1, 1902.

88,730. TALCUM POWDER. HARVEY H. EISENTRAUER, Spring-field, Ohio. Filed June 26, 1902.

QUEEN

The word "QUEEN." Used since March 20, 1896.

88,731. INSECT-POWDERS. WILLIAM F. STRIMMER, Philadelphia, Pa. Filed May 16, 1902.

The words "UNPLEASANT KUMPNER" printed on the back of the representation of a roach. Used since February 1, 1902.

88,732. CARBON-BLACK. CASTLE BRIDGE CARBON BLACK CO., Williamsport, Pa. Filed Jan. 31, 1902.

NAPTHOL-METHANE.

The compound word "NAPTHOL-METHANE." Used since January 24, 1901.

88,733. ROSIN-OIL. S. P. SHORTER COMPANY, Savannah, Ga.; Chicago, Ill.; New York, N. Y., and New Orleans, La. Filed Mar. 27, 1902.

MYSTIC

The word "MYSTIC." Used since August, 1868.

88,734. PAINTS AND CERTAIN NAMED PAINTERS' SUPPLIES. STANDARD VARNISH WORKS, New York, N. Y. Filed June 17, 1902.

LACQUERET

The word "LACQUERET." Used since June 10, 1902.

88,735. CLEANING AND POLISHING COMPOUND. AMERICAN POTTERY SUPPLY COMPANY OF BALTIMORE CITY, Baltimore, Md. Filed June 19, 1902.

SCOUR-IT

The hyphenated word "SCOUR-IT," having the upper portion of the letter "S" extending over the intermediate letters in a straight line and connecting with and forming part of the letter "T." Used since May, 1901.

88,736. LIQUID FURNITURE-POLISH. PHILIP LEVI, New York, N. Y. Filed June 24, 1902.

CHING FOW

The words "CHING FOW." Used since January 1, 1875.

88,737. FABRIC ROOFING. THE KANSAS CITY ROOFING & CORRUGATING CO., Kansas City, Mo. Filed May 15, 1902.

The word "ALLIGATOR" and the representation of an alligator standing behind a roll of roofing. Used since August, 1900.

88,738. CERTAIN NAMED SEALS. R. J. Brooks & Company, New York, N. Y., and Newark, N. J. Filed June 24, 1902.

TIN BUTTON.

The words "TIN BUTTON." Used since August 31, 1894.

88,739. PRESCRIPTION-BOTTLES. CEDAR RAPIDS GLASS COMPANY, St. Louis, Mo. Filed May 17, 1902.

Usona

The word "USONA." Used since May 5, 1902.

88,740. ELECTRIC SWITCHES. THE HART MFG. CO., Hartford, Conn. Filed June 26, 1902.

DIAMOND H

The word "DIAMOND" associated with the letter "H." Used since May, 1899.

88,741. GAS-FIXTURES. AMERICAN TANK & FIXTURE COMPANY, Chicago, Ill. Filed June 30, 1902.

LUMO

The word "LUMO." Used since November 13, 1901.

THE NORRIS PETERS CO.

LABELS

REGISTERED AUGUST 5, 1902.

9,341.—*Title:* "HERCULES RIP PROOF GLOVES." (For Gloves.) SCHWARTZ, SCHIFFER & COMPANY, New York, N. Y. Filed July 11, 1902.

9,342.—*Title:* "COLORADO ROCKY MOUNTAIN COUGH AND CATARRH ROOT." (For Medicine.) JEROME BLANCHARD and CHARLES H. MCINTYRE, Denver, Colo. Filed June 28, 1902.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE CLASSIC CORSET COMPANY.

Decided January 17, 1902.

TRADE-MARK—"GRECIAN"—GEOGRAPHICAL OR DESCRIPTIVE.

Held that the word "Grecian" should not be registered as a trade-mark, since it either conveys the idea that the articles to which it is applied came from Greece and is therefore geographical or that they are made in the Grecian style and is therefore descriptive.

ON appeal.

TRADE-MARK FOR CORSETS, ETC.

Application filed July 12, 1901, No. 63,761.

Mr. Clarence K. Chamberlain for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing to register as a trade-mark for bust-girdles and athletic and negligé corsets the word "Grecian."

Without doubt the word "Grecian" in its primary significance means "of or pertaining to Greece." (See *Century Dictionary.*) That is, the primary signification of the word is geographical. If this were its only meaning, it would under a practice which is well settled be unregistrable as a trade-mark. (*Ex parte Rome Textile Company*, 91 O. G., 820; *ex parte Manogue-Pidgeon Iron Company*, 97 O. G., 2084.)

In addition to its primary geographical meaning this word is used frequently in a descriptive sense to signify "characteristics of the Greeks, resembling what is Greek." Thus we may speak of Grecian architecture, meaning architecture in the Greek style, Greek or Grecian fire, Greek cross. In these cases, as in others similar thereto, the word "Grecian" is used not in a geographical sense, but as descriptive of the kind of architecture, fire, cross, or of whatever the subject may be. This descriptive significance of the word is not fanciful or arbitrary, however. It is a significance which conveys to the mind some characteristic or quality of the subject or article to which the word is applied. In fact, it may be said that this word has no fanciful or arbitrary significance. As applied to a bust-girdle, then, this word if used in any other than a geographical meaning must describe some characteristic or quality of the girdle as being like those worn by the Greeks; otherwise it is deceptive, and a purchaser thinking to obtain such a girdle would be misled.

That words descriptive of character or quality of an article are not registrable as trade-marks is too well settled to admit of discussion. (See *ex parte Birkhead*, 97 O. G., 749; *ex parte The Crescent Manufacturing Company*, 97 O. G., 750.)

Viewed from any standpoint the word "Grecian" fails to satisfy the requirements laid down as necessary for a registrable trade-mark. Registration, therefore, was properly refused.

The decision of the Examiner of Trade-Marks is affirmed.

EX PARTE HUENEFELD.

Decided February 13, 1902.

1. TRADE-MARK—"SUCCESS"—ARBITRARY AND FANCIFUL WORD.

Held that the word "Success" as a trade-mark for stoves and ranges is registrable, since it does not describe any quality or characteristic of the articles and would be understood by purchasers as arbitrary and fanciful.

2. SAME—DEFINITION OF DESCRIPTIVE WORDS.

The prohibition against the registration of descriptive words as trade-marks applies only to those words which state or define some quality or characteristic of the article or designate its class, grade, style, or quality or the ingredients of which it is composed.

ON appeal.

TRADE-MARK FOR COOKING AND HEATING APPARATUS.

Application of Ernst H. Huenefeld filed November 28, 1900, No. 62,201.

Mr. H. A. Seymour for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the decision of the Examiner of Trade-Marks refusing to register the word "Success" as a trade mark for stoves, ranges, furnaces, ovens, and heating-drums, exclusive of gas-stoves.

Registration has been refused on the ground that the word is a descriptive word used in a descriptive sense.

The law is well settled that words which are "merely descriptive of an article of trade, of its qualities, ingredients, or characteristics" are not registrable as technical trade-marks. (*Canal Company* v. *Clark*, 13 Wall., 311; *Lawrence Manufacturing Company* v. *Tennessee Manufacturing Company*, 138 U. S., 537.) The prohibition applies only to those words which state or define some quality or characteristic of the article or designate its class, grade, style, or quality or the ingredients of which it is composed.

The word "Success" cannot be said to describe any quality or characteristic of stoves. It may suggest that the stoves will operate as they are in-

tended to; but as was said in *ex parte Peck*, (96 O. G., 425:)

* * * It cannot be held to be one of those descriptive terms which any person has the right to use in describing similar articles and which therefore cannot be exclusively appropriated by one person. The mark would be recognized by purchasers as being arbitrary and fanciful.

The decision of the Examiner of Trade-Marks is reversed.

EX PARTE HUTCHINS.

Decided April 26, 1902.

TRADE-MARK—"TELEGRAPHONE" REFUSED REGISTRATION ON "TELEGRAPHOPHONE."

The word "Telegraphone" refused registration as a trade-mark for apparatus for recording and reproducing sounds in view of the descriptive word "Telegraphophone," which has long been in use to describe such apparatus.

ON appeal.

TRADE-MARK FOR APPARATUS FOR RECORDING AND REPRODUCING SOUNDS, SIGNALS, ETC.

Application of Stillson Hutchins filed June 1, 1901, No. 63,498.

Mr. Ellis Spear for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing to register the word "Telegraphone" as a trade-mark for apparatus for recording and reproducing sounds, signals, and the like.

This mark must be refused registration on the ground that it is descriptive, and therefore it is unnecessary to discuss the other reasons for refusal stated by the Examiner. It is a contraction of the descriptive word *telegraphophone*, which has long been used to describe machines of the same class as those to which the present mark is applied. The word *telegraphophone* was in use as a descriptive term long before the date of adoption alleged by this appellant, as will be seen by reference to the patent to Wheless, No. 410,305, September 3, 1889, and to the *Century Dictionary*, which defines its meaning as—

an apparatus for reproducing at a distance the sounds which produce a graphophonic record; also an apparatus for producing a graphophonic record at a distance by means of a telegraphic circuit.

The contraction of this word by the omission of one of its syllables does not produce a word so distinct from the original as to become an arbitrary and fanciful mark, but, on the contrary, the word retains its descriptive character and would be so understood by the public.

The decision of the Examiner of Trade-Marks is affirmed.

EX PARTE CASLER.

Decided April 29, 1902.

FINAL REJECTION—AMENDMENT NOT AFFECTING SUBSTANCE OF CLAIMS.

Where after the rejection of claims the applicant presented an amendment correcting the spelling of words positively including elements which were inferentially included before and transposing a descriptive phrase from one place to another, *Held* that the amendment is merely formal in character and does not prevent a final rejection.

ON petition.

WASHING-MACHINE.

Application of Alonzo A. Casler filed May 17, 1901, No. 60,733.

Mr. William N. Moore for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner refusing to enter and consider an amendment not presented under the provisions of Rule 68 and filed after the final rejection.

The petitioner contends that the final rejection was premature and that therefore the amendment should be entered and considered.

The records show that the claims were rejected on references on June 17, 1901. On July 13, 1901, certain amendments were made to the claims and a reconsideration was asked.

The amendments consisted in the correction of the spelling of certain words, in positively including elements which were already inferentially included, and by transposing a descriptive phrase from one place to another.

These amendments are merely formal in character. The claims as amended are the same in substance as before.

The Examiner finally rejected the claims on July 27, 1901. The petitioner thereafter filed an amendment limiting the claims in some respects and argued that the claims as then amended avoided the references of record and should therefore be allowed. The Examiner having twice refused to enter and consider the amendment, this petition is brought.

From the facts above stated it is clear that the Examiner's action of July 27, 1901, finally rejecting the claims was right, and it should not be disturbed. It follows that no amendments can be made to this application except as provided in Rule 68.

The petition is denied.

EX PARTE CASLER.

Decided May 10, 1902.

FINAL REJECTION—AMENDMENT—CLAIMS NOT THE SAME IN SUBSTANCE.

Where a claim including a "tub" as an element is rejected and the applicant presents an amendment including an "oscillating tub," *Held* that the claim is not the same in substance and that a final rejection is not in order.

ON petition.

WASHING-MACHINE.

Application of Alonzo A. Casler filed May 17, 1901, No. 60,736.

Mr. William N. Moore for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner finally rejecting the claims of the above-entitled application and refusing to enter a subsequent amendment unless presented under the provisions of Rule 68.

The record shows that the application as originally filed contained three claims. These claims were rejected on June 17, 1901. On July 13, 1901,

a formal amendment was made to claim 2, a new claim (numbered 4) was inserted, and a reconsideration of the three rejected claims was asked, reasons therefor being given.

On July 27, 1901, the Examiner finally rejected all the claims, holding that the new claim 4 was the same in substance as the original claim 3.

A comparison of these two claims discloses the fact that claim 3 includes the "tub" positively as an element and claim 4 includes this element as an "oscillating tub." This difference alone renders claim 4 more limited than claim 3. They therefore differ in scope. In view of this conclusion it follows that the final rejection of July 27, 1901, was premature.

The petition is granted.

EX PARTE ALMINANA.

Decided July 8, 1902.

1. DIVISION—WHEN REQUIREMENT SHOULD BE MADE—RULE 42.

Held that when the independence of the inventions is clear the requirement for division will be made before any action upon the merits, and when the independence of the inventions is not clear the requirement may be made at any time before the final action.

2. SAME—UMBILICAL-TRUSS STRUCTURE—BELT.

Where certain claims are drawn to an umbilical-truss structure and other claims are not so limited, but nevertheless cover the unitary structure of the invention, *Held* that the device covered by all the claims is a single invention and divison between the broad and narrow claims should not be required.

3. DRAWING—RULE 50—SECTIONAL VIEW OF ELEMENT.

Where an element is described and claimed, *Held* that said element should also be clearly shown in the drawing and that an illustration of said element by means of a sectional view where it does not completely illustrate the structure is not sufficient.

ON petition.

BABY BANDS OR BANDAGES.

Application of Louise Alminana filed March 31, 1902, No. 100,762.

Mr. James W. Bevans for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner requiring division between claims 1 and 2 and the remaining claims in the above-entitled application and also from his requirement that a certain feature be clearly shown in the drawings, which feature is specifically described and claimed.

It appears that the Examiner did not make the requirement of division in the first action, and the petitioner calls attention to this fact.

The Examiner has given careful consideration to this application. Rule 42 specifically provides that in cases where the independence of the invention is not clear the requirement of division—

may be made at any time before final action—

and when the independence of the invention is clear the—

limitation will be made before any action upon the merits.

This simply means that the Office will not make an action on several independent inventions for one fee; but if an applicant should be so fortunate as to receive an action on the merits as to several independent inventions before he is required to divide he surely has no ground of complaint.

It is of course desirable that all questions should be raised by an Examiner in the first action; but in the nature of things it is beyond human power to always raise every objection and cite every reference applicable to the claims in the first action.

The propriety of making the first action as complete as possible is fully appreciated by the Examiner, as shown by the statements in his answer to the petition. The Examiner is right in requiring the petitioner to clearly show the "disk" in the drawing. The disk is specifically described and claimed. Rule 50 is in part as follows:

The drawing must show every feature of the invention covered by the claims.

In view of the rule the Examiner would have been clearly in error had he not made this requirement. This disk is shown in section in one of the views; but a drawing in section when it does not clearly and completely illustrate a structure is not sufficient to show the invention described and claimed.

As suggested in the Office letter of June 14, 1902, the disk—

can be shown in dotted lines in the pocket K in Fig. 2.

Claims 1 and 2 are drawn specifically to an umbilical truss structure. Claims 3, 4, and 5 are not so limited; but they nevertheless cover the unitary structure of this invention. The device described and claimed in this application is a single invention, and there does not appear to be a clear line of division between the broad claims 3, 4, and 5 and the specific claims 1 and 2. The requirement of division should not be insisted upon.

The petition is granted to the extent indicated.

WILLIAMS v. LIBERMAN.

Decided July 5, 1902.

1. INTERFERENCE—PRELIMINARY STATEMENT—AMENDMENT.

Where a preliminary statement contains the allegation that no model was made and it is desired to amend it by adding the allegation that an experimental device was made and it appears that said device was in fact a model, *Held* that the amendment should not be permitted, since it would make the statement contradictory.

2. SAME—SAME—SAME.

Where there is no attempt to change the date of conception, disclosure, or reduction to practice, the reason for the strict rule against amendment does not apply.

3. SAME—AMENDMENT TO PRELIMINARY STATEMENT—MODEL.

Where it appears from the testimony that a model was in fact made which had been forgotten and motion to amend the preliminary statement to allege that fact is made before the opposing party's time for taking testimony is closed, *Held* that the amendment will be permitted.

APPEAL on motion.

COMBINED CIGAR-WRAPPER CUTTER AND ROLLING-TABLE.

Application of John R. Williams filed April 17, 1901, No. 56,200. Application of Isadore Liberman filed February 25, 1901, No. 48,669.

Mr. Chas. C. Gill and *Mr. Wm. G. Henderson* for Williams.

Mr. John P. Croasdale and *Mr. Wm. N. Cromwell* for Liberman.

ALLEN, *Commissioner:*

This is an appeal from a decision of the Examiner of Interferences denying a motion by Liberman for leave to amend his preliminary statement by adding thereto the following matter:

An experimental device was made by him prior to May 1st, 1900, embodying the principles of his invention.

It appears that Liberman filed his preliminary statement October 5, 1901. In this statement he alleges certain dates of conception, disclosure to others, and reduction to practice, and also—

that no model was made of the invention other than a complete machine.

This statement was executed October 3, 1901.

Liberman's testimony was begun January 6, 1902, and concluded January 20, 1902. At the taking of the testimony on the last-named date the attorney for Liberman gave notice on the record that he would move to amend Liberman's preliminary statement so as to include the matter which it is now sought to introduce. The present motion was filed in accordance with this notice February 4, 1902.

From the showing made in support of the motion it appears that when Liberman made his preliminary statement he had forgotten the experimental device and did not have it in mind when questioned by his attorney as to a model, that this device was afterward recalled to his memory by his friends after the filing of the preliminary statement, and that when found at his house it did not occur to him that it was a model in the meaning which he supposed that term had in his preliminary statement. He was reminded of this device the last of October or first part of November, 1901, and immediately called it to the attention of his attorney; but no motion was then made to amend the preliminary statement for the reason, above stated, that it was not regarded as a model. At the taking of Liberman's testimony, however, objection was made to the introduction of this experimental device and of evidence relating thereto because of Liberman's allegation in his preliminary statement that he had made no model. It was after this objection had been made that notice of the present motion was given and the motion brought in accordance therewith.

It appears, therefore, that Liberman does not now desire to change the allegation that no model was made. He does desire to add to this allegation the further allegation that he made an experimental device. An examination of the affidavits presented and Liberman's testimony, however, shows that the alleged experimental device is, in fact, a model. It was clearly designed and intended merely as an illustration of the invention and not as a complete machine adapted to do practical work. Liberman did not regard it as of importance, for the reason stated by him that—

I never could put it to do any cutting. (Q. 110.)

He states that after "playing with" this device for a while he put it away in a closet. (Q. 11.) It is evident that Liberman looked upon it as nothing more than what is in patent law and practice defined as a model; but he was apparently not aware of the meaning of the term "model." To permit him to say, therefore, that an experimental device embodying the principles of the invention was made is, in effect, to permit him to say that a model was made. The proposed amendment to Liberman's preliminary statement, therefore, in effect changes the allegation that no model was made to the allegation that a model was made prior to May 1, 1900. If this amendment were permitted, the statement would contain the contradictory allegations that a model was made and that a model was not made. Manifestly such a statement should not be received, since it would be impossible to take testimony in conformity therewith. The entry of the amendment was properly refused.

Should appellant, however, seek to amend the statement by erasing the allegation that no model was made and substituting therefor the allegation that a model was made prior to May 15, 1900, the amendment may be received and entered, for while it is true that there has been delay in bringing the motion to amend and that testimony has been taken it is also true that no attempt is made to change the dates of conception, disclosure, or reduction to practice. Furthermore, the amendment will make Liberman's preliminary statement conform to the facts brought out in his testimony and no substantial injury will be done to Williams, since he has yet to take his testimony in rebuttal.

Under the circumstances of this case it is not necessary to apply the strict rule laid down in *Franklin* v. *Morton* v. *Cooley* (93 O. G., 2063) and in *McDermott* v. *Hildreth*, (98 O. G., 1282;) but it is believed to be for the interest of all parties that such an amendment to Liberman's preliminary statement be permitted. If, therefore, Liberman should within ten days from this date present such a motion to amend his statement as has been indicated above, such motion may be favorably considered.

The decision of the Examiner of Interferences denying the present motion to amend is affirmed.

Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., August 4, 1902.

This Office has been advised by the Secretary of the Interior of the disbarment of the following attorneys from practice before the Department or any Bureau thereof:

Charles A. Gibson, Washington, D. C., August 2, 1902; John O'Laughlin, Alexandria, Va., formerly of Washington, D. C., August 2, 1902; James P. O'Laughlin, Lock Haven, Pa., formerly of Washington, D. C., August 2, 1902.

C. M. IRELAN,
Chief Clerk.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., August 8, 1902.

This Office has been advised by the Secretary of the Interior that Department order of May 10, 1902, disbarring Lindsay Steele, of Chester, Ill., from practice before the Department or its Bureaus was rescinded August 7, 1902.

C. M. IRELAN,
Chief Clerk.

Classification Bulletin.

CLASSIFICATION BULLETIN No. 7, containing the revision made during the months of May and June, 1902, has been published. Price, ten cents.

Photographic Copies of Drawings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 1, 1902.

The Patent Office is now prepared to furnish black line on white ground copies of any unbound drawing, foreign or domestic, which may be in its possession, instead of the blue-prints heretofore furnished. Only the 7x11 (patent) size and the full or 10x15 size prints will hereafter be furnished, at 15 and 25 cents per sheet, respectively.

Copies of drawings of pending, abandoned, forfeited, or informal cases and of caveats may be had in either of the above-named sizes except when they are to be certified, in which case they must be the 10x15 size.

Copies of United States or foreign patent drawings will be made only in the 10x15 size.

When ordering copies of foreign patent drawings, either the serial number of the applications in which they were cited as references or the class and subclass where they may be found must be given. The title of the invention or the number of the division will not be sufficient. Bound volumes cannot be used for making prints. Failure to give the fullest data whereby the mounted drawing may be found will result in delay and unnecessary correspondence.

The work will be much facilitated if a separate order be made for each drawing. The Office will furnish, gratuitously, blanks for this purpose on request.

As a result of abolishing the small (5x8) size the requirement that duplicate prints must be ordered in certain cases will no longer be enforced. The requirement that less than all the sheets of a case will not be printed unless there is already a full set in the file will not be insisted upon; but applicants or attorneys are strongly urged to file a set of prints or order them to be made by the Office at the time of filing an application. Such procedure will save delay later if correction of the drawing is desired or required.

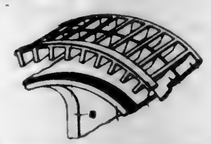
F. I. ALLEN,
Commissioner.

PATENTS

GRANTED AUGUST 12, 1902.

706,508. ARMATURE-WINDING FOR INDUCTION-MOTORS.

ALBERT H. ARMSTRONG, Schenectady, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Nov. 3, 1897. Serial No. 657,239. (No model.)



Claim.—1. In combination, a plurality of conductors of drawn metal, and end connections formed integral therewith uniting said conductors in closed-circuit relation.

2. In combination, a plurality of separately-formed conductors, and end connections cast integral therewith.

3. In an electrical apparatus, the combination of a body of toothed laminæ, a support for the laminæ, a winding having separately-formed conductors mounted in the laminæ-slots, and an end ring formed integral with the conductors.

4. In an induction-motor, the combination of a body of toothed laminæ, a support therefor, copper conductors mounted in the laminæ-slots, and end rings uniting the copper conductors in closed-circuit relation, formed by casting metal around the conductors.

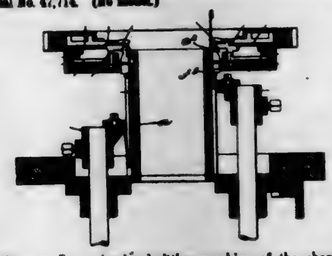
5. In a closed-circuited armature, the combination of a cast-metal spider, an end flange formed integral therewith, copper bars formed integral with the flange which unites them in closed-circuit relation, and a ring at the opposite end of the armature, also formed integral with said bars.

6. In a closed-circuit armature, in combination, a cast-metal spider, an end flange therefor, copper bars formed integral with the flange which unites them in closed-circuited relation, and a short-circuiting ring uniting the opposite ends of the said bars.

7. In a closed-circuit armature, the combination of a cast-metal spider, an end flange formed integral therewith, a body of toothed laminæ, a clamping-ring for holding the laminæ against the flange, copper bars formed integral with the flange which unites them in closed-circuit relation, and a ring at the opposite end of the armature also formed integrally with the conductors, so arranged that the laminæ can be assembled by slipping them inside the ring.

706,509. ATTACHMENT FOR AUTOMATIC CIRCULAR-KNITTING MACHINES.

JAMES F. BARR, Wayne, Pa. Filed Feb. 18, 1901. Serial No. 47,714. (No model.)



Claim.—1. In a circular-knitting machine of the character described, in combination with bearded needles and mechanism for operating the same, two sets of beard-closing jacks, of which one set is fixed and controls certain of the needles to form regular meshes and the other set is movable and adapted when withdrawn to clear the beards of certain other needles and prevent the formation of regular meshes thereon.

2. In a circular-knitting machine of the character described, a series of bearded needles and mechanism for operating the same, means for constantly closing the beards of certain of said needles at every downward movement of the same, a series of movable jacks controlling the beards of the remaining needles, and mechanism for elevating said jacks to prevent the closure of the beards during the downward movement of said remaining needles.

3. In a machine of the character described, a bearded needle, a needle-cylinder wherein the needle is adapted to be reciprocated, a sinker-bar bed adjacent to the needle-cylinder, a sinker-bar arranged to operate in said bed, and a beard-closing jack in fixed lateral relationship to the needle-cylinder and fulcrumed below the sinker-bar bed so as to oscillate toward and away from the beard of the needle, substantially as and for the purposes described.

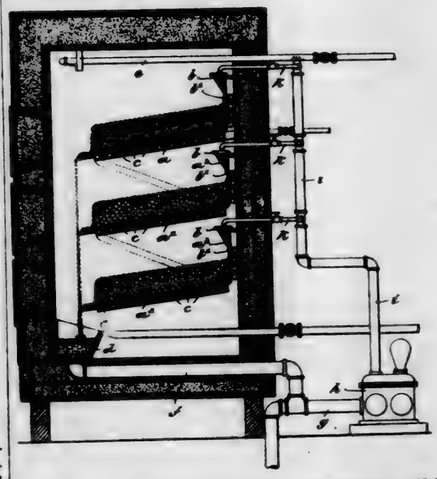
4. In a machine of the character described, a beard-closing jack having at one end a beard-closing nose and at the other end a tailpiece, said jack having a fulcrum intermediate of its ends, and a segmental cam-piece adapted to be oscillated and to be elevated and depressed adjacent to the tailpiece and when depressed adapted to impinge on said tailpiece to depress the same and to elevate and withdraw the nose of the jack from the beard of said needle.

5. In a circular-knitting machine of the character described, bearded needles, mechanism for operating the same and fixed and movable jacks for respectively closing regularly and intermittently the beards of said needles.

6. In a circular-knitting machine of the character described, bearded needles, mechanism for operating the same, two sets of jacks, whereof one set is adapted to continuously in one direction close and the other set intermittently in the same direction close the beards of said needles.

706,510. ART OF MANUFACTURING PLATE-ICE.

EDWARD BARRATH, Philadelphia, Pa., assignor of two-thirds to Augustus Buttney and John J. Keller, Philadelphia, Pa. Filed Nov. 27, 1901. Serial No. 83,963. (No specimens.)

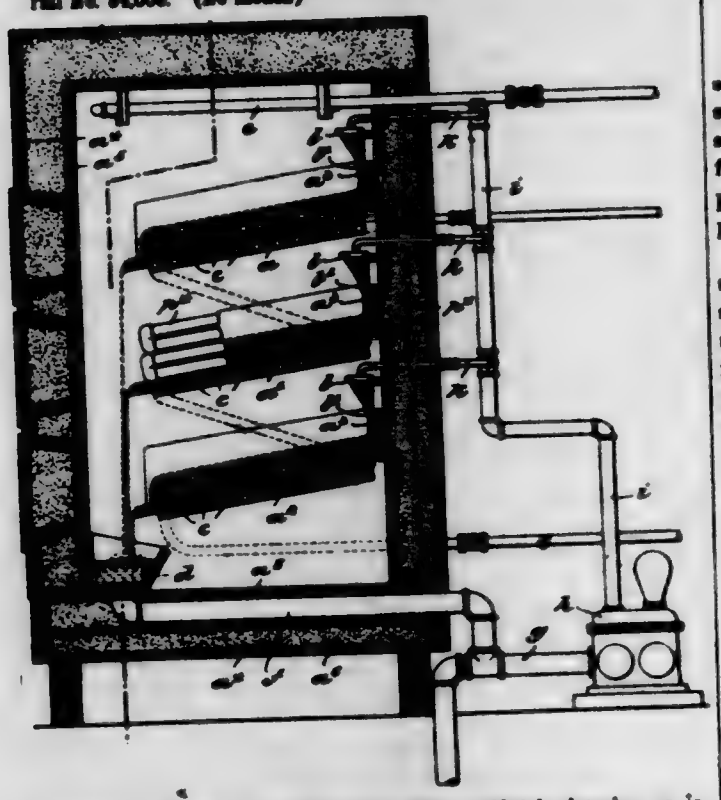


Claim.—1. The improvement in the art of manufacturing artificial plate-ice from constantly-flowing water, which consists in stilling the water, presenting the stilled water continuously in a film of substantially uni-

form thickness to an artificial freezing medium and causing the continuous flow of such films over the medium and over successive strata of ice, until a plate of ice has been built up by successive accretions.

2. The improvement in the art of manufacturing artificial plate-ice from constantly-flowing water, which consists in stilling the water, presenting the stilled water continuously in a film of substantially uniform thickness and causing the continuous flow of such films over an artificial freezing medium, under the influence of gravity.

706,511. APPARATUS FOR MANUFACTURING PLATE-ICE. EDWARD BARRATH, Philadelphia, Pa., assignor of two-thirds to Augustus Bettney and John J. Keller, Philadelphia, Pa. Filed Nov. 20, 1901. Serial No. 84,008. (No model.)



Claim.—1. In an apparatus for making artificial plate-ice, an inclined freezing surface or plate, a source of flowing-water supply discharging above the uppermost portion of the freezing surface or plate, and stationary means interposed between the water-supply and the surface or plate and arranged to receive the water and to present the same in film or sheet form to the uppermost portion of the freezing surface or plate.

2. In an apparatus of the character described, a series of superposed inclined freezing plates or surfaces, a source of water-supply for said plates and discharging at the uppermost portion of each plate, and a stationary means interposed between the water-supply and each plate and arranged to receive the water and to present the same in film or sheet form to the uppermost portion of each plate in series.

3. In an apparatus of the character described, a series of superposed, inclined plates having both upper and lower freezing-surfaces, a source of water-supply for each plate and discharging at the uppermost portion thereof, and a stationary means interposed between the water-supply and each plate and arranged to receive the water and to present the same in film or sheet form to the upper surface of each plate in series.

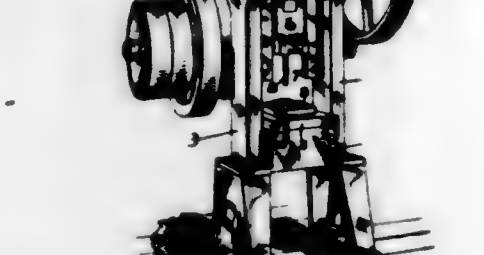
4. In an apparatus of the character described, an inclined freezing-plate, an extension projecting vertically from the uppermost portion of said plate, a wedge-shaped tank having for its vertical wall the extension on the freezing-plate, a contracted outlet formed at the base of the tank above the freezing-plate, and a source of water-supply discharging into said tank.

5. In an apparatus of the character described, an inclined freezing-plate, an extension projecting vertically from the uppermost portion of said plate, a tank having a narrow outlet leading to one side of the extension and arranged above the plate, a source of water-supply leading to said tank, and a releasing-coil arranged adjacent to the other side of said extension.

6. In an apparatus of the character described, an inclined freezing-plate, a corrugated extension projecting vertically from the uppermost portion of said plate, a tank having a narrow outlet leading to the extension above its corrugations, and a source of water-supply leading to said tank.

706,512. FOLDING OPERA-GLASS. EMILE BATAILLE, Geneva, Switzerland. Filed Mar. 11, 1902. Serial No. 97,701. (No model.)

Claim.—1. In a folding opera-glass, the combination with a band, two case-sections hinged to said band, bellows between said case-sections, and springs directly engaging said case-sections for normally separating the same, of a frame within the case-sections, eyepiece-lenses carried by said frame, and objectives pivoted to said frame, substantially as and for the purposes set forth.



2. In a folding opera-glass, the combination with a band, two case-sections hinged to said band, bellows between said case-sections, and springs directly engaging said case-sections for normally separating the same, of a frame within the case-sections, eyepiece-lenses carried by said frame, objectives pivoted to said frame, and means for adjusting the eyepiece-lenses with respect to the frame, substantially as and for the purposes set forth.

3. In a folding opera-glass, the combination with a band, two case-sections hinged to said band, bellows between said case-sections, and springs directly engaging said case-sections for normally separating the same, of a frame within the case-sections, eyepiece-lenses carried by said frame, objectives pivoted to said frame, and means for locking the objectives in line with the frame or in a position at right angles thereto, substantially as and for the purposes set forth.

706,513. MACHINE FOR MAKING TUBULAR TOOL-SHANKS. FRANKLIN P. BATES, Indianapolis, Ind., assignor to the Indianapolis Drop Forging Company, Indianapolis, Ind., a Corporation of Indiana. Filed Apr. 3, 1901. Serial No. 54,153. (No model.)

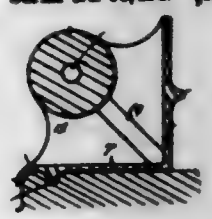
Claim.—1. The combination, in a machine for making tubular structures, of the reciprocating internal die or mandrel, a lower die composed of rollers surrounding the opening through which the metal is to be forced the faces whereof form the outside shape of the hollow structure being made, said several rollers being arranged in the same plane with their adjacent edges adapted to operate in close touch with each other, and adjustable supports in which said rollers are mounted, substantially as set forth.

2. The combination, in a machine for making tubular structures, of a reciprocating internal die or mandrel, a lower die composed of rollers surrounding the opening through which the metal is to be forced the faces whereof form the outside shape of the tubular structure being made, said several rollers being arranged in the same plane with their adjacent edges adapted to operate in close touch with each other, whereby a rotary internal die is provided with a practically continuous circular face and adjustable housings wherein said rollers are mounted, whereby an accurate adjustment thereof is provided.

3. The combination, in a machine for making tubular structures, of a reciprocating internal die or mandrel an outer die composed of rollers arranged in the same plane and formed with concave faces set around and bounding the die-opening through which metal is to be forced, means for adjusting said rollers, and strippers for removing the tubular structure when formed from the internal die or mandrel.

4. The combination, in a machine for making tubular structures, of a reciprocating internal die or mandrel, a bottom die-plate, housings adjustably mounted thereon, and rollers framed with concave faces mounted in said housings and forming the lower die through which the metal is forced in being formed in the tubular structure, said several parts being combined, arranged and operating substantially as shown and described.

706,514. TROWEL. ERNEST A. BRETTENDORFER, Hamilton, Ohio. Filed July 15, 1901. Serial No. 68,432. (No model.)

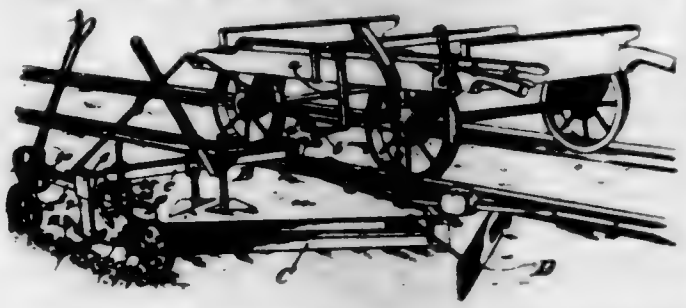


Claim.—1. As a new article of manufacture, a trowel having two blades formed integral and at substantially a right angle to each other, and a handle permanently mounted parallel with the blades and in the angle formed between them, the one of said blades having a longitudinal rib formed on its surface and the other terminating at one edge in a curved longitudinal flange.

2. As a new article of manufacture, a trowel consisting of two blades formed integral and at an angle to each other, one of said blades being formed with a longitudinal groove on its surface, and a handle permanently mounted parallel with the blades and within the angle between them.

3. As a new article of manufacture, a trowel consisting of two blades formed integral and at an angle to each other, one of said blades being formed with a longitudinal rib on the middle portion of its surface, and a handle mounted parallel with and in the angle formed between the blades.

706,515. SOD-LINE-CUTTER MECHANISM FOR RAILWAY-TRACK APPLIANCES. VICTOR BERTRAM, Tara, Canada. Filed June 10, 1901. Serial No. 63,936. (No model.)



Claim.—1. In an apparatus of the class described, the combination with a carriage, and a framework extending outwardly therefrom, of a horizontal carrier-bar, suitable wheel-supports connected adjustably to said carrier-bar and each having a ground-wheel, and sod-line-cutter devices mounted on the carrier-bar between the connection of the wheel-supports thereto, substantially as set forth.

2. In an apparatus of the class described, the combination with a carriage, and a framework extending outwardly therefrom, of a carrier-bar, wheel-supports connected to the fore and after ends of the bar and adjustable independently of each other, suitable wheels mounted in the wheel-supports, and sod-line-cutter devices mounted on the carrier-bar, substantially as set forth.

3. In a sod-line-cutter mechanism for railway-track appliances, the combination with a wheeled car, and a suitable frame extending outwardly therefrom, of weed-cutter devices on the frame, a carrier-bar lying substantially parallel to the length of the car and attached to the frame, a caster-wheel having adjustable connection with said carrier-bar and sod-line-cutter devices mounted on the carrier-bar beyond the operative plane of the weed-cutter devices, substantially as set forth.

4. In an apparatus of the class described, the combination with a carriage and a suitable framework extending outwardly therefrom, of a carrier-bar, a standard attached to said carrier-bar and provided with a vertical share at one side of a moldboard, and suitable wheels for supporting the carrier-bar, substantially as set forth.

5. In an apparatus of the class described, the combination with a carriage and a suitable framework extending outwardly therefrom, of a carrier-bar having sod-line-cutter devices mounted thereon, a lever fulcrumed on the carrier-bar and provided with a caster-wheel, and means for locking the lever in adjustable relation to the carrier-bar, substantially as described.

6. In an apparatus of the class described, the combination with a carriage and a suitable framework extending outwardly therefrom, of a carrier-bar having sod-line-cutter devices attached thereto, a lever mounted on the carrier-bar and provided with a caster-wheel, and a trailing hanger supporting a trailing wheel and connected adjustably with the carrier-bar, substantially as described.

7. In an apparatus of the class described, the combination with a suitable framework, of a standard attached to said framework and provided with a moldboard and with a vertical share, a toothed yoke disposed on the framework in advance of the standard, a lever having a pivotal connection with the framework and carrying a caster-wheel, and a latch mechanism mounted on the lever and arranged for engagement with the yoke, substantially as set forth.

8. In an apparatus of the class described, the combination with a suitable framework, of a standard provided with suitable sod-line-cutter devices, a caster-wheel having adjustable connection with the framework and disposed in advance of said cutter devices, a trailing hanger pivoted on the framework in rear of the cutter devices and provided with a curved arm, a clamping-yoke for adjustably fastening said arm to the framework, and a trailing wheel mounted in the hanger, substantially as set forth.

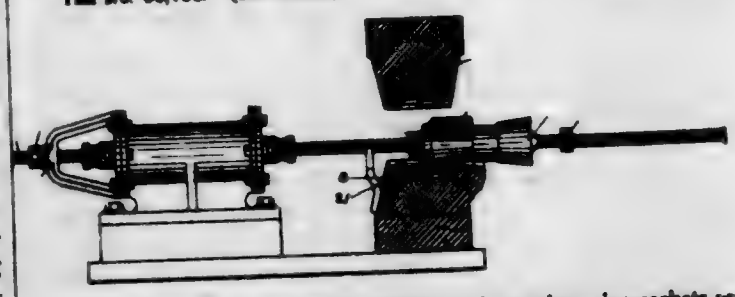
9. In an apparatus of the class described, the combination with a suitable framework, of a standard fastened adjustably to the framework and provided with a moldboard and with a vertical share, a lever fulcrumed on the framework in advance of the standard and supporting a caster-wheel, means for locking the lever in adjustable relation to the framework, a trailing hanger pivoted to the framework in rear of the share and supporting a trailing wheel, and means for adjustably holding the trailing hanger with relation to the framework, said lever and said hanger being adjustable independently with respect to one another, substantially as set forth.

706,516. RAILWAY-GATE. JOHN BOWMAN, Wennington, S. D. Filed Dec. 4, 1901. Serial No. 84,694. (No model.)

Claim.—1. In a device of the class described, the combination with a trackway and a rail thereof, of a supporting-post, a gate pivoted upon the post, links pivotally connected at their adjacent ends, one of said links being hinged to a support and the other link being free for slidable movement, said links being disposed to project with their connecting ends above a rail of the trackway, a lever pivoted beneath the links and disposed with its free end thereabeneath, said lever being inclined in the direction of sliding movement of the second link when the links are depressed, connections between the lever and the gate for levering the latter, and a counterbalance upon the gate for raising it and returning the lever and links.

2. The combination with a trackway and a rail thereof, of a supporting-post having a gate pivoted thereon, an angular lever pivoted to the post, a shaft on which the gate is mounted, said shaft having a crank-arm, connections between the angular lever and the crank-arm for operating one from the other, links pivotally connected at their adjacent ends and adapted to lie with said adjacent ends above and close to the rail, one of the links having its outer end hinged to a support whereby when the connected ends of the links are depressed the other link will be moved bodily from the post, a lever pivoted beneath the links, said lever being inclined in the direction of sliding movement of the bodily-movable link when the links are depressed and having its free end in contact with the links for operation thereby, and a connecting-rod between the angular lever and the lever beneath the links, the gate having a weighted end for returning it to move the links to their normal positions to project above the rail.

706,517. APPARATUS FOR WELDING AND TAPERING SOCKETS. PETER BOYD, Pittsburg, Pa., assignor to National Tube Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Dec. 21, 1901. Serial No. 86,766. (No model.)



Claim.—1. In apparatus for welding and tapering pipe sockets or couplings, the combination of a mandrel, and a die having a welding-cavity and a stripping-shoulder in front of and above the same.

2. In apparatus for welding and tapering pipe sockets or couplings, the combination with a mandrel, of a die having a welding-cavity and a

stripping-shoulder in front of and above the same, and a plunger in line with said shoulder.

3. In apparatus for welding and tapering pipe sockets or couplings, the combination with a mandrel having a tapered portion, of a die having a welding-cavity and a stripping-shoulder in front of and above the same, and a plunger in line with said stripping-shoulder, said plunger having a tapered portion.

4. In apparatus for welding and tapering pipe sockets or couplings, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder in front of and above the same, a plunger in line with said stripping-shoulder, and a stripper adjacent to said plunger and to the rear of the stripping-shoulder.

5. In apparatus for welding and tapering pipe sockets or couplings, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder in front of and above the same, a plunger in line with said shoulder, and power mechanism for actuating said plunger.

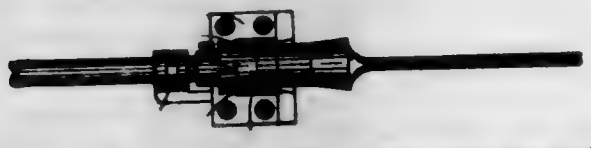
6. In apparatus for welding and tapering pipe sockets or couplings, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder in front of and above the same, and a fulcrum-support for the mandrel in front of the die.

7. In apparatus for welding and tapering pipe sockets or couplings, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder in front of and above the same, of a fulcrum in front of the die upon which the mandrel rests, and a stripping-plunger in line with the stripping-shoulder, said plunger being inclined to bring it in line with the mandrel.

8. In apparatus for welding and tapering pipe sockets or couplings, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder in front of and above the same, a fulcrum-support for the mandrel in front of the die, and a shoulder or collar on the mandrel arranged to engage said support to position the mandrel in the die.

706,518. APPARATUS FOR WELDING AND TAPERING SOCKETS.

PETER BOYD, Pittsburg, Pa., assignor to National Tube Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Dec. 21, 1901. Serial No. 86,764. (No model.)



Claim.—1. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a tapered portion on which the coupling is welded and tapered internally, of means for engaging the coupling and holding it stationary, and a plunger having a tapered portion and adapted to abut against the mandrel, force it out of the coupling and simultaneously expand the smaller end of the coupling and taper it internally.

2. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and tapered internally at one end, of means for holding the coupling stationary, and a plunger having a tapered portion and adapted to expand the opposite end of the coupling and taper it internally.

3. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and tapered internally at one end, of a stripping-die provided with a shoulder against which the enlarged end of the coupling may rest, and a plunger having a tapered portion and adapted to abut against the mandrel, force it out of the coupling and simultaneously expand the opposite end of the coupling and taper it internally.

4. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a tapered portion on which the coupling is welded and tapered internally, of a stripping-die provided with a cavity adapted to receive the coupling and having a shoulder at both ends, and a plunger having a tapered portion and adapted to abut against the mandrel, force it out of the coupling and simultaneously expand the opposite end of the coupling and taper it internally.

5. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a tapered portion on which the coupling is welded and tapered internally, of means for welding and shaping the coupling on said mandrel, means for holding the coupling stationary, and a plunger having a tapered portion and adapted to abut against the mandrel, force it out of the coupling and simultaneously expand the smaller end thereof and taper it internally.

6. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and tapered internally at one end, of dies having suitably-shaped cavities for welding and shaping the coupling on said mandrel, and a plunger having a tapered portion and adapted to expand the opposite end thereof and taper it internally.

7. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and simultaneously tapered internally at one end, of dies having suitably-shaped cavities for welding and shaping the coupling on said mandrel, a stripping-die provided with a shoulder against which the expanded end of the coupling may rest, and a plunger having a tapered portion and adapted to abut against the mandrel, force the latter out of the coupling, and simultaneously expand and taper internally the opposite end of the latter.

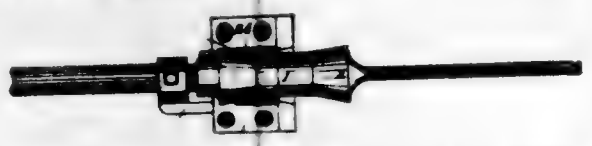
8. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and simultaneously tapered internally at one end, of dies having suitably-shaped cavities for welding and shaping the coupling on said mandrel, and a stop or gage for positioning the mandrel with reference to the blank.

9. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and simultaneously tapered internally at one end, of dies having suitably-shaped cavities for welding and shaping the coupling on said mandrel, and a stop on said dies and adapted to contact with the mandrel for positioning the latter with reference to the blank.

10. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and simultaneously tapered internally at one end, of dies having suitably-shaped cavities for welding and shaping the coupling on said mandrel, an arm or bracket secured to the die and provided with a fork adapted to embrace the mandrel, and a collar or shoulder on the mandrel adapted to coöperate with said fork.

706,519. METHOD OF WELDING AND TAPERING SOCKETS.

PETER BOYD, Pittsburg, Pa., assignor to National Tube Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Dec. 21, 1901. Serial No. 86,767. (No model.)



Claim.—1. The method of welding and tapering pipe couplings or sockets, which consists in heating the blank, welding the same on an internal support and simultaneously tapering it internally toward one end, and then removing the same from the internal support and simultaneously expanding the smaller end thereof and tapering it internally.

2. The method of welding and tapering pipe couplings or sockets, which consists in heating the blank, welding the same on a mandrel having a tapered portion, thereby simultaneously tapering the coupling internally toward one end, and then stripping the same from the mandrel and simultaneously expanding and tapering the other end thereof internally.

3. The method of welding and tapering pipe couplings or sockets, which consists in welding a blank on a mandrel having a straight and a tapered portion, said blank extending onto both of said portions, whereby the blank is welded and tapered internally at one end, then stripping the coupling from said mandrel and tapering the other end thereof internally.

4. The method of welding and tapering pipe couplings or sockets, which consists in welding a blank on a mandrel having a tapered portion, whereby the coupling is tapered internally toward one end, and then forcing the mandrel out of the coupling by a tapered plunger, thereby expanding the smaller end of the coupling and tapering the same internally.

5. The method of welding and tapering pipe couplings or sockets, which consists in welding a blank on a mandrel having a straight and a tapered portion, said blank extending onto both of said portions, whereby it is welded and tapered internally at one end, and then forcing the mandrel out of the coupling by a tapered plunger, thereby expanding the other end of the coupling and tapering the same internally.

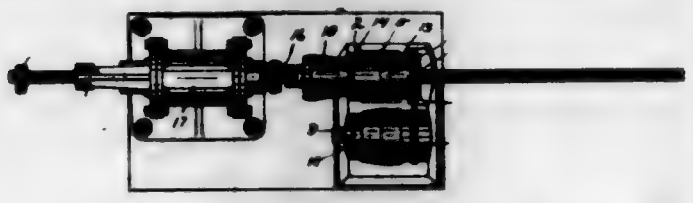
706,520. APPARATUS FOR WELDING AND TAPERING SOCKETS.

PETER BOYD, Pittsburg, Pa., assignor to National Tube Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Dec. 21, 1901. Serial No. 86,795. (No model.)

Claim.—1. In apparatus for welding and tapering pipe couplings or sockets, the combination of a mandrel, and a die having a welding-cavity and a stripping-shoulder independent of said welding-cavity.

2. In apparatus for welding and tapering pipe couplings or sockets,

the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder, and a plunger in line with said stripping-shoulder.



3. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a tapered portion, of a die having a welding-cavity and a stripping-shoulder, and a plunger in line with said shoulder, said plunger having a tapered portion.

4. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder at one side thereof.

5. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder at the side thereof, and a plunger in line with said stripping-shoulder.

6. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion, of a die having a welding-cavity and a stripping-shoulder at the side thereof, and a plunger in line with said stripping-shoulder, said plunger having a tapered portion.

7. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel, of an anvil-die having a welding-cavity and a stripping-shoulder, a top die having a welding-cavity, and a plunger in line with said stripping-shoulder.

8. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel, of an anvil-die having a welding-cavity and a stripping-cavity, a top die having corresponding welding and stripping cavities, and a plunger in line with said stripping-cavity.

9. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a tapered portion, of a die having a cavity formed therein provided with a shoulder at its front end, and a power-actuated plunger in line with said cavity and provided with a tapered head.

10. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel, of a die having a welding-cavity and a stripping-shoulder, of a plunger in line with said stripping-shoulder, power mechanism for actuating said plunger, and a stop for limiting the forward movement of said plunger.

11. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel, of a die having a stripping-cavity, of a plunger in line with said stripping-cavity, a power-cylinder for actuating said plunger, the piston-rod of said cylinder extending through the rear head thereof, and a stop on said piston-rod.

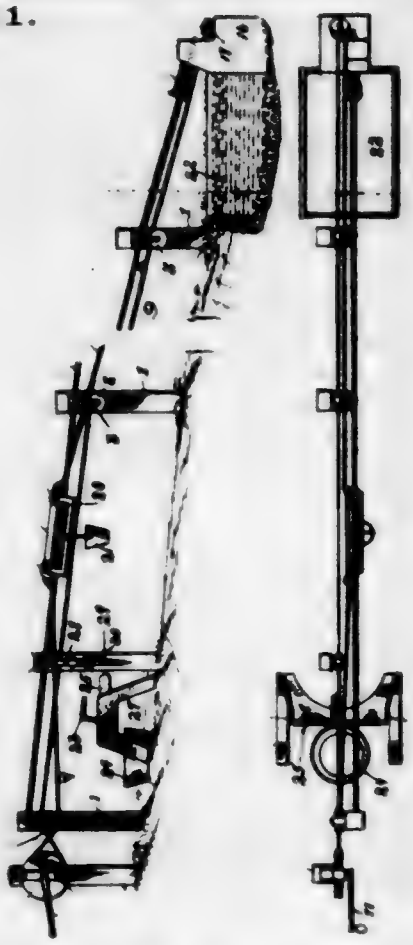
12. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel, of a die having a welding-cavity and a stripping-cavity at the side thereof, said stripping-cavity having front and rear shoulders, and a plunger in line with said cavity and adapted to force the mandrel out of the coupling and in turn to have the coupling stripped therefrom by the rear shoulder of said cavity.

13. In apparatus for welding and tapering pipe couplings or sockets, the combination with a mandrel having a straight and a tapered portion on which the coupling is welded and simultaneously tapered internally at one end, of dies having suitably-shaped cavities for welding and shaping the coupling on said mandrel, and an arm or bracket secured to the die and having its end projecting into the die-cavity in position to have the end of the mandrel abut thereagainst to properly position the mandrel in the dies.

706,521. SUSPENDED CARRIER. REUBEN A. ERDOS, Columbia, Va. Filed May 7, 1902. Serial No. 106,212. (No model.)

Claim.—The herein-described suspended carrier comprising a plurality of supporting-posts; a trackway operatively supported on said posts; a plurality of pulley-wheels and a controlling-cable passing over said pulley-wheels and a vessel-carrier forming a link in said controlling-cable and adapted to move upon said trackway, in combination with a suitable buffer-spring located at the terminal of said trackway and a discharging apparatus located at the other end of said trackway and comprising suitable standards and a movable holster carried by said standards and provided with a hook adapted to engage the bucket or other vessel whereby the bucket will be tilted and disposed upon said holster and thereby discharged of its contents into a receptacle placed to receive it, all combined substantially as specified and for the purpose set forth.

706,521.



706,522. CLASP. CHARLES A. BRYANT, Wakefield, Mass., assignor to Consolidated Safety Pin Company, Bloomfield, N. J., a Corporation of New Jersey. Filed Mar. 17, 1902. Serial No. 98,536. (No model.)

Claim.—1. A clasp comprising a U-shaped frame, a clamping-lever pivoted on one member of the frame and having a clamping-jaw to cooperate with the other member and directly engage the fabric and a handle, and a spring secured to said frame and coöperating with said clamping-lever to hold it in either its open or closed position, substantially as described.

2. A clasp comprising a U-shaped frame having one member provided with teeth, a clamping-lever pivoted on one member of the frame and having a clamping-jaw to coöperate with the toothed member and directly engage the fabric, and a handle, and a spring secured to said frame and coöperating with said clamping-lever to hold it in either its open or closed position, substantially as described.

3. A clasp comprising a U-shaped frame, a clamping-lever pivoted on one member of the frame and having a clamping-jaw to coöperate with the other member, and a handle, and a presser-foot pivoted on said clamping-jaw on an axis parallel with the axis of the clamping-jaw, substantially as described.

4. A clasp comprising a U-shaped frame, a clamping-lever pivoted on one member of the frame and having a clamping-jaw to coöperate with the other member, and a handle, a presser-foot pivoted on said clamping-jaw on an axis parallel with the axis of the clamping-jaw, and a spring secured to said frame and coöperating with said clamping-lever to hold it in either its open or its closed position, substantially as described.

5. A clasp comprising a U-shaped frame having on one member two longitudinal, parallel series of teeth, a clamping-lever pivoted on the other member of the frame and having a clamping-jaw and a handle, and a presser-foot pivoted on said clamping-jaw on an axis parallel with the axis of the clamping-jaw and adapted to enter between said series of teeth.

6. A clasp comprising a U-shaped frame having on one member two longitudinal, parallel series of teeth, a clamping-lever pivoted on the other member of the frame and having a clamping-jaw and a handle, a presser-foot pivoted on said clamping-jaw on an axis parallel with the axis of the clamping-jaw and adapted to enter between said series of teeth, and a spring secured to said frame and coöperating with said clamping-lever to hold it either in its open or its closed position, substantially as described.

706,528. CROSS-TIE. JOHN E. BURNS, Northport, N. Y. Filed May 20, 1902. Serial No. 108,486. (No model.)

Claim.—1. A cross-tie comprising a trough-like body portion, having side and end walls provided with concave faces, and rail-chairs arranged between the side and end walls, substantially as described.

2. A cross-tie comprising a trough-like body portion having side and end walls and provided with depending bottom flanges, and rail-chairs arranged between the side flanges, substantially as described.

3. A cross-tie comprising a trough-like body portion, having side and end walls, and the upwardly-extending hollow rail-chairs, substantially as described.

706,524. CARD-HOLDER FOR TYPE-WRITERS. LEE S. BURRIDGE, New York, N. Y., and STEPHEN T. SMITH, Stamford, Conn., assignors to the Wagner Typewriter Company, New York, N. Y., a Corporation of New York. Filed Sept. 5, 1901. Serial No. 74,944. (No model.)

Claim.—1. The combination, with a platen having ends, of a card-holder comprising a holder proper arranged to extend lengthwise of the platen, and fastening arms or members projecting from the holder proper exteriorly of the platen ends and provided with inwardly-projecting fingers engaging the platen ends at points about diametrically opposite that portion at which the holder proper is arranged.

2. The combination, with a platen, of a card-holder comprising a holder proper extending lengthwise of the platen, and fastening members projected from the holder proper exteriorly of the platen ends and having securing engagement with the platen ends at a distance from the platen-trunnions and on the side of the platen axis or center opposite to that on which the holder proper is arranged.

3. A card-holder for type-writers, comprising a card-holder proper and spring members projecting from the end portions of the holder, said members having forked portions arranged to pass on both sides of the axle or trunnions of the platen.

4. A card-holder for type-writing machines, provided with two continuous plates or strips both curved in the direction of their width and spaced from each other to form a pocket for the reception of the card edge.

5. A card-holder for type-writing machines, provided with two rigidly-connected curved members which are parallel with each other and spaced apart to form a pocket for the reception of the card edge.

6. A card-holder for type-writers, having two members curved conformably with the platen and spaced from each other to form a pocket, the inner member being tapered on its outer surface at the entrance of said pocket.

7. The combination with the platen having an axle or trunnions provided with flat surfaces, of a card-holder provided with arms engaging the said flat surfaces to prevent a circumferential movement of the holder on the platen.

8. The combination with the platen having an axle or trunnions with flattened surfaces, of a card-holder provided with forked arms arranged for sliding engagement with the said flat surfaces.

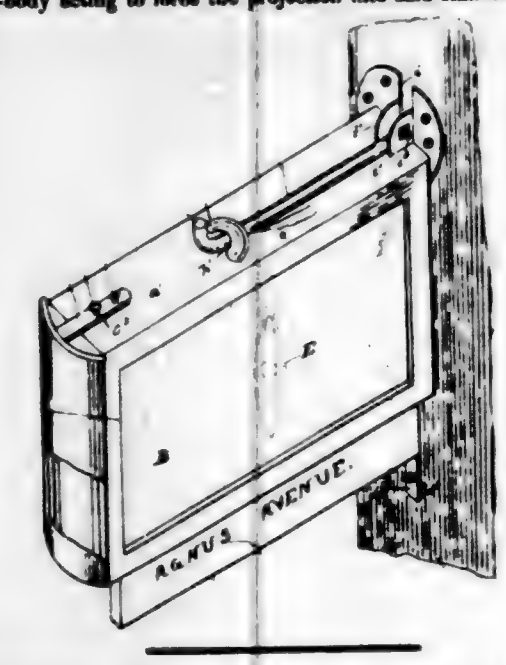
706,525. ADVERTISING DEVICE. WILLIAM D. BUTT, Kansas City, Mo. Filed Dec. 4, 1901. Serial No. 84,902. (No model.)

Claim.—1. In advertising devices a case, a pendent sign connected with the under surface of the bottom of said case, said bottom having perforations and a luminous body within said case.

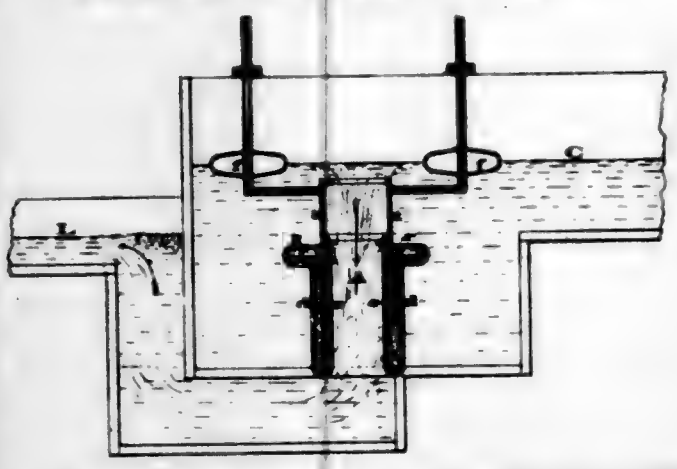
2. An advertising-case, a suspension rod or bolt, a lug connecting the forward end of the case with the said rod, and a notched plate upon the rear end of said case, perforate lugs extending from the forward sides of said plate, and a bolt extending through said lugs.

3. An advertising-case and a pendent sign connected with the bottom of said case, a standard, a suspension-rod upon said standard for said case, a lug connecting the forward end of said case with said rod, and a downward extension of said sign connected with said standard.

4. A structural advertising device, comprising a penetrable standard, and a suspension-rod upon said standard, an advertising-sign body, a perforate leg on said body connecting said case with said rod, a projection upon the rear end of said sign-body, and a stamping device upon said sign-body acting to force the projection into said standard.



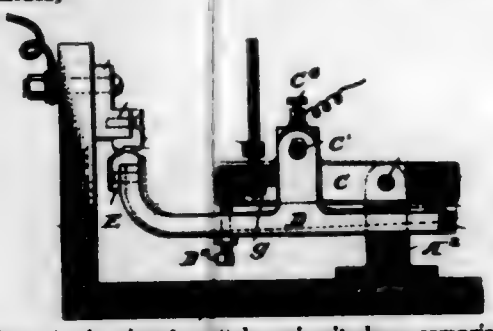
706,526. SELF-ADJUSTING WEIR. CHARLES C. CARLISLE, near Kamiah, Idaho, assignor of one-half to Frank Bond, Cheyenne, Wyo. Filed Jan. 4, 1902. Serial No. 88,447. (No model.)



Claim.—1. The combination of a float, a movable inlet-conduit suspended from said float, a fixed outlet-conduit leading to service telescoping freely within the movable conduit having a gland or pocket around the extremities of both conduits and a liquid packing of greater specific gravity than water in said pocket.

2. The combination with an automatically-adjustable inlet-conduit and a fixed outlet-conduit having a liquid joint between them of an air-duct leading below the crest of the weir into said inlet-conduit substantially as described.

706,527. ELECTRIC SWITCH. EUGENE R. CARICHOFF, East Orange, N. J., assignor to the Otis Elevator Company, East Orange, N. J., a Corporation of New Jersey. Filed Feb. 3, 1901. Serial No. 46,564. (No model.)



Claim.—1. An electric switch or circuit-closer, comprising a contact constituting one terminal of a circuit, a second contact constituting the other terminal of the circuit, and a movable jointed contact-carrier supporting the said second contact, means for moving said carrier to initially close the circuit between the second contact and a portion of the first contact, and means for subsequently rotating the second contact bodily about the first contact on the face of the same, and simultaneously therewith sliding said second contact along the face of the first contact to a

new portion of the face of the same entirely clear of the portion of said face upon which circuit was initially closed, substantially as described.

2. An electric switch or circuit-closer comprising two contacts, a contact-carrier supporting one of the contacts, and means for operating the same to initially close the circuit between the contact supported by the carrier and a portion of the other contact, and means for subsequently rotating the contact supported by the carrier bodily about the other contact on the face of the same and simultaneously therewith sliding said contact supported by the carrier along the face of the other contact to a new portion of the face of the same entirely clear of the portion of said face upon which circuit was initially closed, substantially as described.

3. An electric switch or circuit-closer, comprising a circuit-terminal having a contact-piece, another circuit-terminal having a second contact-piece, a toggle-acting contact-carrier for the second contact, means for moving said carrier to initially close the circuit between the second contact and a portion of the first contact, means for subsequently sliding the second contact along the face of the first contact to a new portion of the face of the same entirely clear of the portion of said face upon which circuit was initially closed, and means for maintaining the circuit closed upon said new portion of the face, substantially as described.

4. An electric switch or circuit-closer, comprising two contacts, a contact-carrier for one of the contacts including two members joined together and normally under stress applied by means acting at one side of the point of jointure tending to hold the members in certain relations to each other, and means on one of the members for limiting the relative movement of the members in one direction, substantially as described.

5. An electric switch or circuit-closer, comprising two contacts, a contact-carrier for one of the contacts including two members joined together, one of which members is pivotally mounted and the other of which members supports a contact, and means acting at one side of the point of jointure tending to hold the members in certain relations to each other, and means on one of the members for limiting the relative movement of the members in one direction, substantially as described.

6. An electric switch or circuit-closer, comprising two contacts, a contact-carrier including two members joined together and a spring interposed between the members to one side of the point of jointure tending to hold them in certain relations to each other, and means on one of the members for limiting the relative movement of the members in one direction, substantially as described.

7. An electric switch or circuit-closer, comprising two contacts, a contact-carrier including two members joined together, a spring interposed between the members at one side of the point of jointure tending to hold them in certain relations to each other and to soften the blow when the contacts come together, and a stop to limit such tendency, substantially as described.

8. An electric switch or circuit-closer, comprising two circuit-terminals, a toggle-acting carrier for one of the terminals, means for moving said carrier to initially close the circuit between one of the terminals and a portion of the other, means for subsequently sliding said terminal along the face of the other to a new portion of the face of the same entirely clear of the portion of said face upon which circuit was initially closed and means for maintaining the circuit closed upon said new portion of the face, substantially as described.

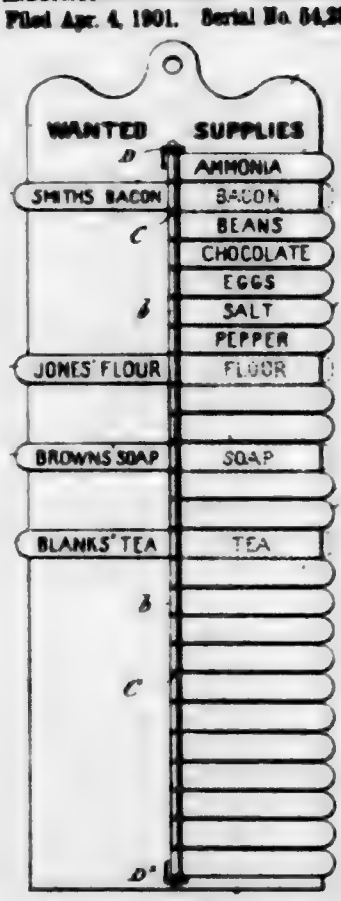
9. An electric switch or circuit-closer comprising two contacts, one of which is relatively fixed and the other movable, a contact-carrier for said movable contact, including two members, one of which is pivotally mounted and the other of which supports a contact, means for moving said carrier to initially close the circuit between the movable contact and a portion of the relatively fixed contact, and means for subsequently sliding the second contact along the face of the first contact to a new portion of the face of the same, entirely clear of the portion of said face upon which circuit was initially closed and means for maintaining the circuit closed upon said new portion of the face, substantially as described.

10. An electric switch or circuit-closer comprising two contacts, one of which is relatively fixed and the other movable, a contact-carrier for said movable contact including two members one of which is pivotally mounted and the other of which supports the contact, electromagnetic means for moving said carrier to initially close the circuit between the movable contact and a portion of the relatively fixed contact means for subsequently sliding the movable contact along the face of the relatively fixed contact to a new portion of the face of the same entirely clear of the portion of the said face upon which circuit was initially closed, substantially as described.

11. An electric switch or circuit-closer, comprising a plurality of relatively fixed contacts constituting one terminal or terminals of an electric circuit, a plurality of movable contact-carriers or contacts constituting the other terminal or terminals of the electric circuit, each of said contact-carriers being pivoted to a movable member, means for moving said contact-carriers to initially close the circuit between the movable contacts and portions of the relatively fixed contacts, means for subsequently sliding the movable contacts along the faces of the relatively fixed contacts to new portions of the faces of the same entirely clear of those portions of said faces upon which circuit was initially closed, and means for maintaining the circuit closed upon said new portions of the faces, substantially as described.

12. An electric switch or circuit-closer comprising two contacts, one of which is relatively fixed and the other movable, a contact-carrier for the movable contact, means for operating the same to initially close the circuit between the movable contact and a portion of the relatively fixed contact means for subsequently sliding the movable contact along the face of the relatively fixed contact, to a new portion of the face of the same entirely clear of the portion of said face upon which circuit was initially closed, and means for maintaining the circuit closed upon said new portion of the face, substantially as described.

706,528. INDICATING DEVICE. CHARLES A. CHRISTIAN, East Orange, N. J. Filed Apr. 4, 1901. Serial No. 54,286. (No model.)



Claim.—1. In an indicating device in combination a support, a row of indicators attached thereto, each of said indicators having the name of a commodity on an exposed face and also on a concealed face thereof said indicators being movable on said support independently of each other whereby said formerly-concealed faces having the names of the commodities thereon may be exposed in another row.

2. In an indicating device in combination a support, a row of indicators attached thereto, each of said indicators having the name of a commodity on an exposed face and also on a concealed face thereof, said indicators being pivoted to said support independently of each other whereby said formerly-concealed faces with the names of the commodities thereon may be exposed in another row.

3. In an indicating device in combination a support, a row of indicator-arms, each of said arms having the name of a commodity on the front face and also on the rear face thereof but reading in the contrary direction, each of said arms being pivoted at one side only to said support whereby said arms may be turned on their pivots independently of each other and caused to lie in another row with the rear faces thereof exposed.

4. In an indicating device in combination a support, a row of indicator-arms, each of said arms being pivoted at one side only to said support whereby said arms may be turned on their pivots independently of each other and caused to lie in another row with the rear faces thereof exposed, each of said arms having the name of a commodity on the front face thereof and the name of the same commodity on the rear face but reading in the contrary direction whereby the names of said commodities will be exposed in either position of said arms.

5. In an indicating device in combination a base, a support thereon, a row of indicator-arms, each of said arms having the name of a commodity on the front face and also on the rear face thereof, each of said arms being pivoted at one side only to said support and at the opposite end extending beyond said base, whereby said arms may be grasped and

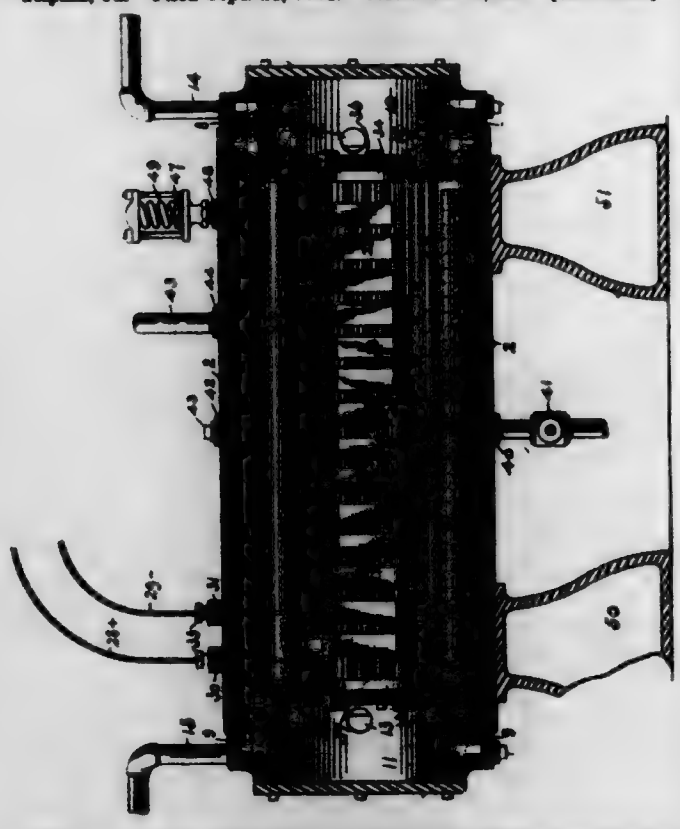
turned on their pivots independently of each other and caused to lie in another row with the rear faces thereof exposed.

6. In an indicating device in combination a support, a row of indicators attached thereto, each of said indicators having the name of a commodity without the name of a vender on an exposed face thereof, some of said indicators also having on a concealed face thereof the name of the same commodity together with the name of a vender of said commodity, said indicators being movable on said support independently of each other whereby said formerly-concealed faces may be exposed in another row.

7. In an indicating device in combination a support, a row of indicator-arms, each of said arms having the name of a commodity without the name of a vender on the front face thereof, and some of said arms also having on the rear face the name of the same commodity but reading in the contrary direction together with the name of a vender of said commodity, each of said arms being pivoted at one side only to said support whereby said arms may be turned on their pivots independently of each other and caused to lie in another row with said rear faces thereof exposed.

8. In an indicating device in combination a base of sheet metal, a row of arms, a support for said arms consisting of a wire held on said base, each of said arms being pivoted at one side only to said wire and at the opposite end extending beyond said base whereby said arms may be grasped and turned on said pivots independently of each other and caused to lie in another row with the rear faces thereof exposed, each of said arms having the name of a commodity without the name of a vender on the front face thereof, and some of said arms also having on the rear face thereof the name of the same commodity together with the name of a vender of said commodity, whereby merely the names of the commodities appear in one row, and the names of said commodities together with the names of the venders of the same appear in the other row when said arms are turned on said pivots as specified.

706,529. ELECTROCHEMICAL APPARATUS. CHAUNCEY G. CLARK, Philadelphia, Pa., assignor of one-half to James G. Carson, Philadelphia, Pa. Filed Sept. 20, 1901. Serial No. 75,728. (No model.)



Claim.—1. In an electrolytic apparatus, two cylinders, one surrounding the other, and an inclosed space between the cylinders, a chamber at each end of the cylinders, means of communication from each chamber to the space between the cylinders, a fluid-inlet to one chamber, a fluid-outlet from the other chamber, means of communication from chamber to chamber through the surrounded cylinder, and a series of electrodes within the said cylinder.

2. In an apparatus for electrolysis, an inclosed cylinder having means for the introduction and the withdrawal of the electrolyte, a series of electrodes within the cylinder, electrical conductors therefor, means to surround the cylinder by a cooling fluid, diametrally, and at its ends, a series of tubes passing through the cylinder for the circulation of cooling fluid, means to introduce the cooling fluid and to permit it to flow from the apparatus, and means for its flowing to the parts surrounding the cylinder diametrally, at its ends, and to the tubes therethrough, to enable a free and uninterrupted flow of the cooling fluid about and through the electrolyte to neutralize the heat generated by the electrodes.

3. In an electrochemical apparatus, two cylinders, one within the other and an intervening space between the cylinders, a chamber at each end of the cylinders, means of communication from the chambers to the intervening space, means of communication from chamber to chamber through the inner cylinder; tube-sheets formed on the chambers, a series of electrodes within the inner cylinder, and means for their removable suspension to the tube-sheets aforesaid.

4. In an electrochemical apparatus, an interior and an exterior cylinder forming an intervening space, a series of electrodes within the inner cylinder, electrical connections therefor, and sleeves tapered and screw-threaded upon their exterior surface and adapted to be screwed into the two cylinders, to tie and connect them, and afford communication from the exterior of the outer cylinder to the interior of the inner cylinder through the intervening space.

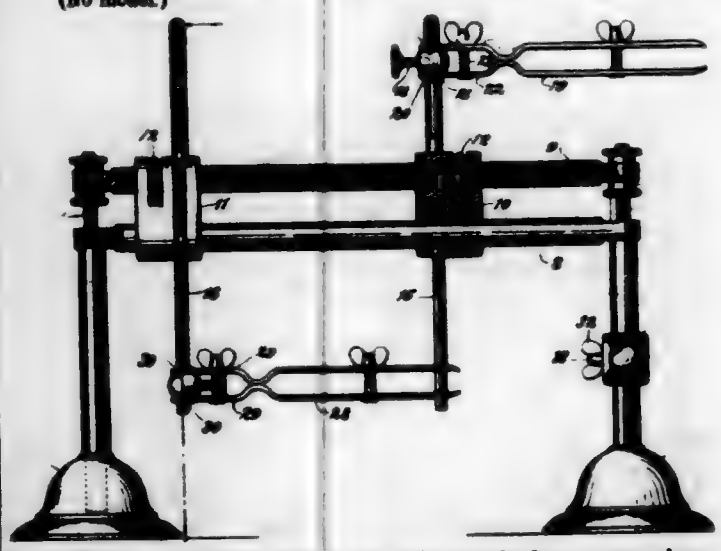
5. In an electrochemical apparatus, an inner closed cylinder, an outer closed cylinder, a series of electrodes within the inner cylinder, electrical conductors therefor, and tapered and screw-threaded stuffing-boxes screwed into the inner and outer cylinders and having means for the passing of the electrical conductors therethrough, and for the prevention of liquid flow outward from the cylinders.

6. In an electrochemical apparatus, an inner and an outer closed cylinder, a series of electrodes within the inner cylinder, electrical conductors therefor, and a perforated drain-pipe therefor reaching from end to end of the cylinder, and having a central outward discharge adapted to communicate with the inner cylinder only.

706,530. DUST-CAP FOR HUBS. SAMUEL T. COPENHAVER, Losantville, Ind. Filed Mar. 26, 1902. Serial No. 100,100. (No model.)

Claim.—The combination with an axle and a hub, of a dust or sand cap comprising a polygonal sleeve conforming to the configuration of the axle and provided with means for securing it to the same, a disk provided with a central opening and secured to the outer end of the sleeve and fitted against the inner end of the hub and closing the same, and an annular flange extending from the periphery of the disk and fitting over the sand-band or inner end band of the hub, substantially as described.

706,531. WORK-HOLDER. EVERETT G. COUCH and NELSON D. WELLS, Southern Pines, N. C. Filed Nov. 4, 1901. Serial No. 81,120. (No model.)



Claim.—1. A work-holder, comprising standards, a screw-rod connection between the upper ends of the standards, a carrier-block movable on said rod, a nut engaging with the rod and with the block for moving the block along the rod, an arm attached to the block, and tweezers having universal-joint connection with said arm, substantially as specified.

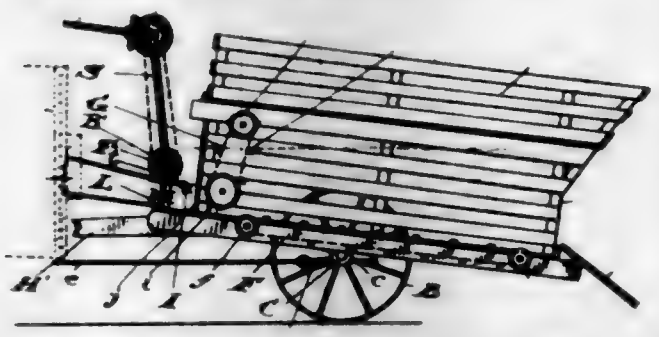
2. A work-holder, comprising standards, a screw-rod connecting the upper ends of said standards, a block movable along said rod, means for causing movements of said block, an arm extended upward and then downward from said block, a ball-joint member adjustable vertically on said arm, and tweezers having jaw members provided with depressions for receiving said ball member, substantially as specified.

3. A work-holder, comprising standards, two rods connecting the upper portions of said standards, one of said rods being screw-threaded, blocks movable along said rods, nuts on the screw-rod and engaging with said blocks, arms carried by the blocks, and tweezers having universal-joint connection with said arms, substantially as specified.

4. A work-holder, comprising standards having reduced screw-threaded upper portions, parallel rods removably placed on said reduced portions, one of said rods being screw-threaded, jam-nuts for holding the screw-rod as adjusted on said reduced portions, carrier-blocks engaging with and movable along said rods, means engaging with the screw-rod for causing the movements of said blocks, arms carried by the blocks, and tweezers having universal-joint connection with said arms, substantially as specified.

5. A work-holder, comprising standards, a rod connection between the upper ends of said standards, work-holding devices adjustable along said rod, a plate adjustable on one of the standards, and clamping-plates adjustable on said first-named plate, substantially as specified.

706,532. **AUTOMATIC FEEDER FOR STRAW-BURNING FURNACES.** JOHN A. COWAN, Calgary, Canada. Filed July 15, 1901. Serial No. 68,387. (No model.)



Claim.—1. In an automatic feeder for straw-burning furnaces, the combination of a straw-cage; means for moving the straw to the front part of the bottom; a spiked roller suitably supported and driven above the bottom in front of the point to which the straw is moved; suitably supported and driven transverse conveyers in front of, and below the said roller, and adapted to carry the straw to the center; and a feed-box adapted to receive straw from the said conveyers, substantially as described.

2. In an automatic feeder for straw-burning furnaces, the combination of a straw-cage; means for moving the straw to the front part of the bottom; a spiked roller suitably supported and driven above the bottom in front of the point to which the straw is moved, the spikes of the rollers being inclined outwardly on each side of the center; suitably supported and driven transverse conveyers in front of, and below the said roller and adapted to carry the straw to the center; and a feed-box adapted to receive straw from the said conveyers, substantially as described.

3. In an automatic feeder for straw-burning furnaces, the combination of a straw-cage; means for moving the straw to the front part of the bottom; a spiked roller suitably supported and driven above the bottom in front of the point to which the straw is moved; suitably supported and driven transverse conveyers in front of, and below the said roller, and adapted to carry the straw to the center; and a feed-box adapted to receive straw from the said conveyers, the said feed-box being contracted at the throat where it receives the straw and flaring toward the delivery end, substantially as described.

4. In an automatic feeder for straw-burning furnaces, the combination of a straw-cage having a feed-box contracted at the throat and flaring toward the delivery end, and mechanism adapted to draw straw from the cage and force it into the throat of said contracted and flaring feed-box, substantially as described.

5. In an automatic feeder for straw-burning furnaces, the combination of a straw-cage; means for moving the straw to the front part of the bottom; a vertically-movable spiked roller supported and driven above the bottom and in front of the point to which the straw is moved; means operated by the vertical movement of the said roller for stopping the mechanism moving the straw from the cage; suitably supported and driven transverse conveyers in front of and below the said roller and adapted to carry the straw to the center; and a feed-box adapted to receive straw from the said conveyers, substantially as described.

6. In an automatic feeder for straw-burning furnaces, the combination of a box or cage for straw; a transverse conveyer arranged in communication with the front part of the bottom of the cage; means to move straw in the cage to the conveyer; a suitably supported and driven spiked roller located behind the transverse conveyer and adapted to rest on the upper surface of the straw passing to the conveyer; and a feed-box adapted to receive straw from the conveyer, substantially as described.

7. In an automatic feeder for straw-burning furnaces, the combination of a straw-cage having an opening at the bottom of its front side; an endless conveyer suitably supported and driven to move straw to the front of the cage; a suitably supported and driven endless upright conveyer adapted to discharge the straw through the opening at the front of the cage; suitably supported and driven endless conveyers adapted to take the straw and move it to the center; and a feed-box into which the said transverse conveyers force the straw, substantially as described.

8. In an automatic feeder for straw-burning furnaces, the combination of a straw-cage having an opening at the bottom of its front side; an endless conveyer suitably supported and driven to move straw to the front of the cage; a suitably supported and driven endless upright conveyer adapted to discharge the straw through the opening at the front of the cage; suitably supported and driven endless conveyers adapted to take the straw and move it to the center; a suitably-supported roller vertically movable and adapted to rest on the straw passing from the upright conveyer to the transverse conveyers; means operated by the rise and fall of the said roller for throwing the horizontal conveyer into and out of gear; and a feed-box into which the said transverse conveyers force the straw, substantially as described.

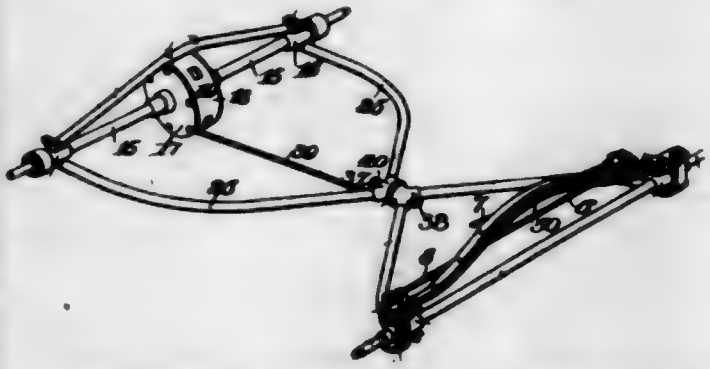
9. In an automatic feeder for straw-burning furnaces, the combination of a box or cage for straw; a transverse conveyer arranged in communication with the front part of the bottom of the cage; means to move straw in the cage to the conveyer; a feed-box arranged to receive straw from the conveyer, the said transverse conveyer comprising a chain running on sprocket-wheels, swinging hooks pivoted on the said chain, tailpieces on the said hooks, and a backboard with a groove therein to engage the tailpieces, said groove decreasing in depth from the end from which the hooks are moving toward the opposite end, substantially as described.

10. In an automatic feeder for straw-burning furnaces, the combination of a box or cage for straw; a feed-box; transverse conveyers arranged in communication with the front part of the bottom of the cage and arranged to draw straw to the middle and force it into the feed-box; and means to move the straw in the cage to the transverse conveyers, the transverse conveyers comprising chains running on sprocket-wheels, swinging hooks pivoted on the said chain, tailpieces on the said hooks, and a backboard with a groove therein to engage the tailpieces, said groove decreasing in depth from the end from which the hooks are moving toward the opposite end, substantially as described.

706,533. **ARTIFICIAL FUEL.** GEORGE M. DALLAS, Chicago, Ill., assignor of one-half to William R. Chittenden, Chicago, Ill. Filed May 2, 1902. Serial No. 105,687. (No specimens.)

Claim.—The herein-described artificial fuel consisting of first treating the culm or coal-dust to a temperature which will raise it to the point of ignition and afterward mixing the heated dust with a mixture composed of fifty gallons of paraffin residuum, ten pounds borax, twenty-five pounds antimony, three pounds acetic acid, one peck oil-cake meal, two hundred pounds clay, five pounds crude potash boiled in thirty gallons water, twenty-five pounds salt, to twenty-five tons of coal-dust, all combined in the manner specified and for the purpose set forth.

706,534. **VEHICLE-FRAME.** JAMES DAWSON, Rochester, N. Y. Filed May 22, 1901. Serial No. 61,571. (No model.)



Claim.—1. In a vehicle-frame, the combination with a forward axle having reach members extending rearwardly from its ends and united in a swivel member, and a rear axle having similar reach members extending forwardly and united in a second swivel member adapted to cooperate with the first member, of a bolt extending through the two members having a shoulder thereon engaging one side of one of the members and means on the bolt for engaging the opposite side of said member to secure it rigidly thereon and a nut on the bolt engaging the outer side of the other member to secure it in position.

2. In a vehicle-frame, the combination with the forward and rear axles having the projecting ears or lugs provided with the projecting

faces, of the reach-frame extending between the axles adapted to abut against the lugs and having the recessed ends receiving the faces on the lugs and detachable connections between the latter and the reach members.

3. In a vehicle-frame the combination with the forward and rear axles having the lugs thereon provided with the projecting faces, of the reach-frame extending between the axles having the recessed ends adapted to abut against the lugs and receive the projecting faces thereon, and securing devices extending through the lugs and engaging the interior of the reach members.

4. In a vehicle-frame the combination with the axles having lugs thereon, of a reach-frame having its ends abutting against the lugs, cooperating projections and recesses between the ends of the reach members and the proximate faces of the lugs, and securing devices projecting longitudinally through the latter and engaging the reach members.

5. In a vehicle-frame, the combination with the axles having the lugs thereon, of a swivel arranged between the axles composed of the separate pivoted members, forwardly and rearwardly extending reach members attached to the parts of the swivel provided at their outer extremities with recesses in which the lugs on the axles engage and securing devices passing through the lugs and engaging the interior of the reaches.

6. In a vehicle-frame, the combination with the axles, and the swivel located between them composed of the separate members, of the forwardly and rearwardly extending reach members threaded into the parts of the swivel and diverging therefrom and removable connections securing them at their outer extremities to the axles.

7. In a vehicle-frame, the combination with the axles, the heads or castings at their ends having the lugs, and threaded tapered connections between said parts, of the reach members having their ends abutting against the lugs, coöperating projections and recesses between the ends of the reaches and the faces of the lugs, and connections extending longitudinally through the latter and engaging the interior of the reaches.

8. In a vehicle-frame, the combination with the axles, the heads or castings at their ends having the lugs, threaded tapered connections between the axles and heads, and an enlarged box or casing provided in one of the axles, of the reach members extending between the axles having the recessed ends adapted to receive the lugs on the heads and provided with a threaded interior, and the bolts projecting longitudinally through the lugs and engaging the threaded interior of the reaches.

9. In a vehicle-frame the combination with the axles having tapered and threaded ends, the heads having the threaded apertures, and secured on the axles, and lugs formed on the heads, of a swivel composed of cooperating pivoted members having tapered and threaded recesses, reach members having tapered and threaded ends engaging the recesses in the swivel members and bolts extending longitudinally through the lugs on the axle-heads and engaging the interior of the reach members.

706,535. APPARATUS FOR HARVESTING PEAT. ALEXANDER DOMSON, Beaverton, Canada, assignor to Peat Machinery Supply Company, Limited, Toronto, Canada, a Corporation of Canada. Filed Nov. 21, 1901. Serial No. 83,188. (No model.)

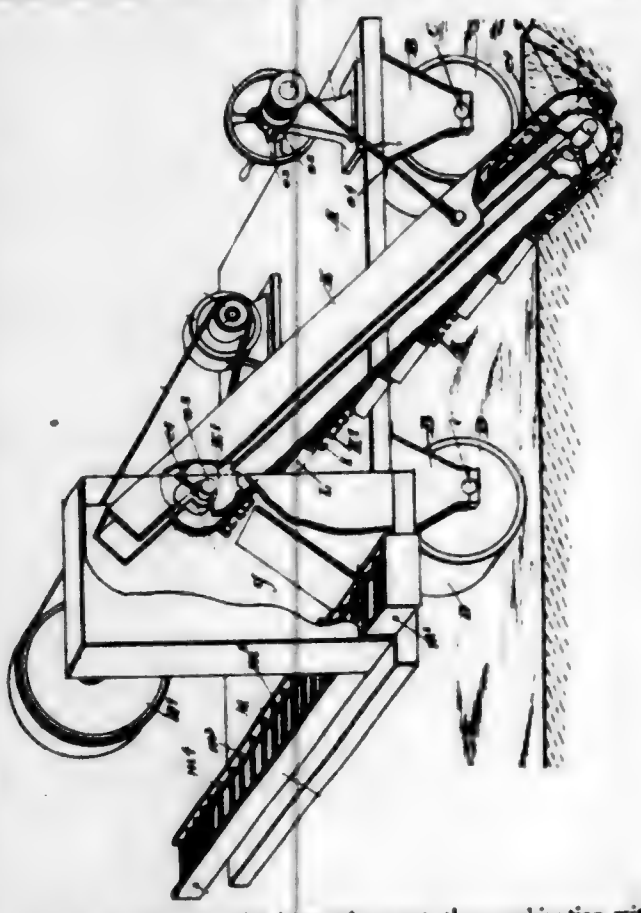
Claim.—1. In an apparatus for harvesting peat, a wagon or car, a peat excavating and elevating device at one side thereof, a closed box or receptacle to receive said elevated peat and means for conveying the commingled peat from said box to the opposite side of the car, substantially as described.

2. In an apparatus for harvesting peat, a wagon or car, a peat excavating and elevating device at one side thereof, a closed box or receptacle to receive said elevated peat and an endless conveyer extending through the bottom of said box and to the opposite side of the car, substantially as described.

3. In an apparatus for harvesting peat, in combination a wagon or car, an inclined conveyer-box provided with a suitable bottom, chain conveyers having one side passing over such bottom, suitable sprockets and shafts for supporting the ends of the conveyers, suitable knives and elevating-buckets secured to the conveyer-chains, a depositing box at the upper end of the conveyer-box, and means for conveying the intermingled peat from such box over the far side of the wagon onto the surface of the bog as and for the purpose specified.

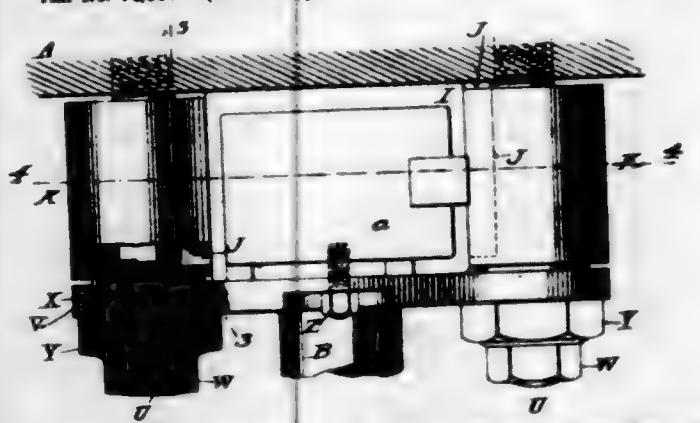
4. In an apparatus for harvesting peat, in combination a wagon or car, an inclined conveyer-box provided with a suitable bottom, chain conveyers having one side passing over such bottom, suitable sprockets and shafts for supporting the ends of the conveyers, suitable knives and elevating-buckets secured to the conveyer-chains, a depositing-box at the upper end of the conveyer-box, a directing-board located in the box, and the conveyer-box and endless conveyer-chains provided with cross-slats for conveying the intermingled peat from the conveyer-board over the far side of the wagon as and for the purpose specified.

5. In a device of the class described, the combination with the conveying means, of knives comprising a cross-bar, the intermediate L-shaped knives suitably held in the bar and provided with crosswise-extending top cutting edges and the side knives also L-shaped in form and provided with the side and cross cutting edges as and for the purpose specified.



6. In an apparatus for harvesting peat, the combination with the cross-conveyer extending over the side of the car, of the bottom board thereof also extending over the side of the car and obliquely cut away at the end overhanging the ground as shown and for the purpose specified.

706,536. STUFFING-BOX FOR PISTON-RODS. DAVID W. DOUGAN and FRANK C. WATSON, Philadelphia, Pa. Filed Sept. 3, 1901. Serial No. 74,157. (No model.)



Claim.—1. In combination with a two-part stuffing-box, clamps to secure said parts together; and means for securing the box in position, said means likewise acting on the clamps and causing the same to become effective, substantially as described.

2. In combination with a cylinder; bolts extending out therefrom; a longitudinally-separable packing-box; clamps for securing the box together; and nuts mounted on the bolts, said nuts bearing on the clamps and serving to hold the box in position.

3. In combination with a cylinder, bolts extending out therefrom; a longitudinally-separable packing-box; wedging-clamps for securing the parts thereof together; and nuts mounted on the bolts acting to force the clamps to place and to hold the box in position.

4. In combination with a cylinder; bolts extending out therefrom; a longitudinally-separable packing-box, each section thereof having abutting flanges which when the parts are assembled form dovetailed wedges; wedging-clamps fitting on said flanges, and nuts mounted on the bolts acting to force the clamps to place and to hold the box in position.

5. In combination with a cylinder, bolts extending out therefrom; a longitudinally-separable stuffing-box; each section thereof having outwardly-projecting ribs adapted to abut with those of the adjacent section; wedge-shaped clamps longitudinally movable on the ribs; and nuts mount-

ed on the bolts and bearing on the clamps moving the same inwardly thereby drawing the sections together and at the same time securing the box in place.

6. In combination with a cylinder; bolts extending out therefrom; a longitudinally-separable stuffing-box; wedging-clamps for securing the sections of the box together; nuts mounted on the bolts and bearing on the clamps; a face-plate for the box; and means for securing the face-plate in position.

7. In combination with a cylinder; bolts extending out therefrom; a longitudinally-separable stuffing-box; wedging-clamps for securing the sections together; nuts mounted on the bolts and bearing on the outer ends of the clamps; a face-plate for the box, said plate having openings through which the bolts and nuts pass; and a second set of nuts secured upon the outer threaded face of the first set, said second set bearing on the face-plate and holding the same in position.

8. In combination with a cylinder; a sleeve mounted therein; having passages for steam; a spring mounted in the end of the sleeve; a stuffing-box; means for securing said box in position; an oil-reservoir formed in the box; and metallic packing interposed between the rounded inner face of the box and the outer end of the sleeve.

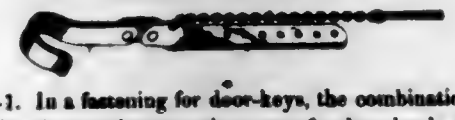
9. In combination with a cylinder; a sleeve mounted therein and having passages for steam therethrough; a spring mounted in the outer end of the sleeve; a stuffing-box secured to the cylinder over the sleeve; and a metallic packing interposed between the rounded inner face of the box and the end of the sleeve.

10. In combination with a cylinder; a longitudinally-separable stuffing-box; means for securing it together; metallic packing mounted in the outer ends of said box; sections Q and R mounted in the box and forming an oil-reservoir intermediate the same; fibrous packing adjacent to said sections; and means for securing the box to the cylinder.

11. In combination with a cylinder; a longitudinally-separable stuffing-box; means for securing it together and to the cylinder; an oil-chamber formed in said box; and a sliding cover mounted on the box, said cover being provided with means for preventing its entire removal and likewise with means for maintaining it in a normally closed position.

12. In combination with a cylinder; a longitudinally-separable stuffing-box; wedging-clamps for securing the sections together; bolts extending out from the cylinder and passing freely through the clamps; a bushing-collar T; a face-plate; nuts mounted on the bolts and bearing on the clamps; and a second set of nuts mounted on the threaded exterior of the first set of nuts and serving to clamp the face-plate in position.

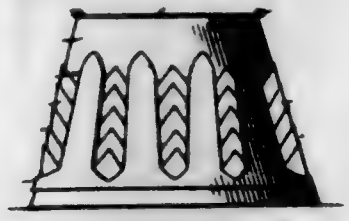
706,537. KEY-FASTENER. BYRON B. DOWBARD, Milwaukee, Wis. Filed Nov. 15, 1901. Serial No. 82,337. (No model.)



Claim.—1. In a fastening for door-keys, the combination of a hook or clip adapted to be caught upon the stem of a door-knob, a perforated bar having a jointed connection at one end with the shank of said hook, and a pin or cotter having a flexible connection with a part of the device and adapted to pass through any of the holes in said bar, substantially as described.

2. In a fastening for door-keys, the combination of a hook made of a flat metal strip and a flat bar connected at one end with the shank of said hook by a link and having a quarter-twist close to said link, substantially as described.

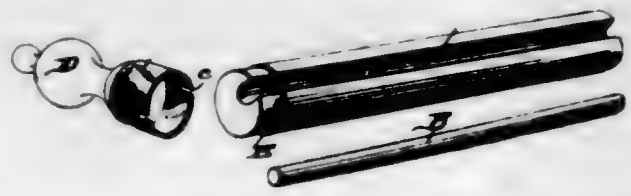
706,538. CUSPIDOR. SPENCER H. DUNCAN, Nashville, Tenn. Filed May 21, 1901. Serial No. 61,261. (No model.)



Claim.—1. In a device of the character described, the combination, with a casing provided with a plurality of carton-receiving pockets, of a receptacle removably seated in said casing and a slotted cover for said receptacle.

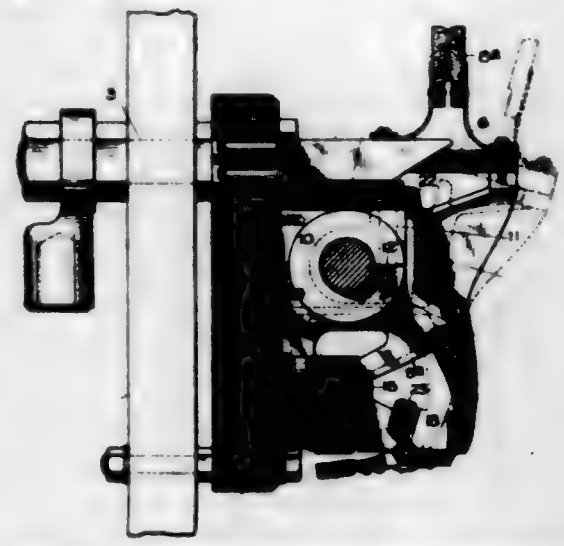
2. In a device of the character described, the combination with a casing, of a ring arranged on the exterior thereof and provided with a plurality of upwardly-projecting fingers to form grooved pockets, adapted to support a plurality of cartons in each pocket in overlapping series, and a receptacle arranged within the casing, for the purpose described.

706,589. RINGLESS CURTAIN-POLE. HENRY H. EDGELY, Altoona, Pa. Filed Aug. 24, 1901. Serial No. 73,116. (No model.)



Claim.—A curtain-holder comprising a solid pole having its ends reduced and a groove circular in cross-section produced therein throughout its length, pins arranged on the reduced ends of the pole, knobs having sleeve portions formed integral therewith, the said sleeves having bayonet-slots formed therein that are adapted to receive the pins for holding the said knobs in position, and a pole adapted to rest within the groove and held in position by the sleeves of the knobs, substantially as shown and described.

706,540. ELECTRICALLY-CONTROLLED SWITCH. WILLIAM L. R. EMMET, Schenectady, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Nov. 3, 1899. Serial No. 735,702. (No model.)



Claim.—1. A magnetically-controlled switch comprising fixed contact-terminals, an armature carrying a bridging-contact, auxiliary shunting-contacts to absorb the spark of rupture, a switch-operating magnet housed between the armature and the base, and a releasing-magnet and tripping devices between the plane of the switching-armature and the base.

2. A magnetically-controlled switch comprising a circuit-closing armature, an operating-magnet, the armature being journaled to move to and from the field-poles over a wide air-gap and having a curved face near the journal to maintain a continuously-varying short air-gap thereat throughout its entire range of motion.

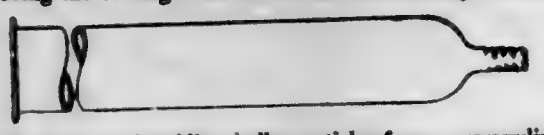
3. The combination of a magnet having split pole-pieces firmly engaging the ends of its core, and an armature coöperating with the said pole-pieces pivoted near the face of the pole-piece and provided with a curved edge to maintain a short air-gap in part of the magnetic field throughout the entire range of motion of the armature.

4. A magnetically-controlled switch comprising a setting-magnet, an armature moving in a plane at right angles to said magnet's axis and coöperating with both its poles, main and shunt contacts for an electric circuit, a magnetically-controlled trip, and a spring-pressed pin to assist withdrawal of the armature, said pin being mounted so as to engage the armature only after the latter is close to the poles of the magnet.

5. A magnetically-controlled switch comprising a magnetically-controlled armature carrying the movable contacts supported for movement to and from the base, a controlling-magnet between it and the base, an extension-arm to the armature, magnetically-controlled tripping devices for the armature between the extension and the base, a stop to arrest the armature when released, and a spring arc-rupturing device strained when the switch is closed, but permitting free movement of the armature while the air-gap is long and the torque weak.

706,541. PROCESS OF MAKING COLLAPSIBLE TUBES, &c. LEON FEVAL, New Brunswick, N. J., assignor, by mesne assignments, to Transparent Cellulose Products Company, New Brunswick, N. J., a Corporation of New Jersey. Filed Jan. 2, 1902. Serial No. 88,107. (No specimens.)

Claim.—1. The process of molding hollow articles from a pyroxylin composition, consisting in dipping a non-collapsible former in a solution of the pyroxylin composition and drying the coating thereon, then subjecting the former and its coating to the action of a moist heat at least equal to that of boiling water to loosen the coating from the former, and then removing the coating from the former, substantially as set forth.



2. The process of molding hollow articles from a pyroxylin composition, consisting in dipping a non-collapsible former in a solution of the pyroxylin composition and drying the coating thereon, then immersing the former and its coating in boiling water to loosen the coating from the former, and then removing the coating from the former, substantially as set forth.

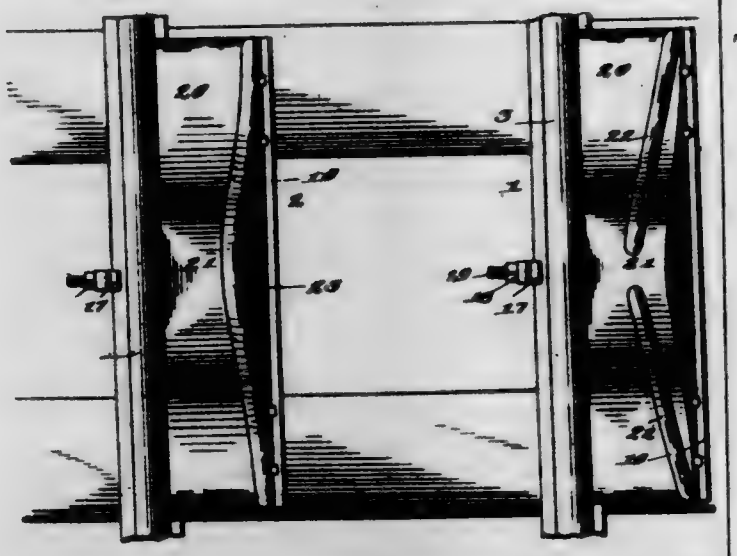
3. The process of molding hollow articles from a pyroxylin composition, consisting in dipping a non-collapsible former in a solution of the pyroxylin composition and drying the coating thereon, then subjecting the former and its coating to the action of a moist heat at least equal to that of boiling water to loosen the coating from the former, then removing the coating from the former, and then subjecting the removed coating to the action of heat to evaporate the pyroxylin solvent, substantially as set forth.

4. The process of molding hollow articles from a pyroxylin composition, consisting in dipping a non-collapsible former in a solution of the pyroxylin composition and drying the coating thereon, then subjecting the former and its coating to the action of a moist heat at least equal to that of boiling water to loosen the coating from the former, then removing the coating from the former, and then boiling the removed coating in water to evaporate the pyroxylin solvent, substantially as set forth.

5. The process of molding hollow articles from a pyroxylin composition, consisting in dipping a non-collapsible former in a solution of the pyroxylin composition and drying the coating thereon, then immersing the former and its coating in boiling water to loosen the coating from the former, then in removing the coating from the former, and finally subjecting the removed coating to the action of heat to evaporate the pyroxylin solvent, substantially as set forth.

6. The process of making collapsible tubes or other tubular articles, consisting in dipping a non-collapsible former of suitable form in a solution of pyroxylin composition and drying the coating thereon, then in immersing the former and its coating in boiling water to loosen the coating from the former, then removing the coating from the former, and finally boiling the removed coating in water to evaporate the pyroxylin solvent, substantially as set forth.

706,542. CAR OR ENGINE REPLACER. FREDERICK J. FEWINGS, Duluth, Minn. Filed Dec. 5, 1901. Serial No. 84,902. (No model.)



Claim.—1. A car or engine replacer comprising an inner and an outer replacing-block, each having its upper face from end to end formed upon a reverse compound curve gradually rising to and from the center of the upper face of each of the said blocks and forming thereby a ridge of convex curvature transversely and longitudinally.

2. A car or engine replacer comprising an inner and an outer replacing-block and each having its upper face formed with a ridge of convex curvature transversely and longitudinally, said ridge extending from one side of the block to the other, a pair of diagonally-extending ribs of concave curvature longitudinally integral with the upper face of said outer block, said ribs terminating at their upper end in said ridge, and a diagonally-extending rib of concave-convex curvature longitudinally integral with the upper face of said inner block.

3. A car or engine replacer comprising an inner and an outer replacing-block, each of which having the upper face carved in contour, a pair of ribs of concave curvature longitudinally integral with the upper face of said outer block, and a rib of concave-convex curvature longitudinally integral with the upper face of the inner block.

4. A car or engine replacer comprising an inner and an outer replacing-block, both of which have their upper face formed upon a reverse compound curve, a pair of diagonally-extending ribs integral with the upper face of said outer block, and a rib integral with the upper face of said inner block.

5. In a car or engine replacer, an outer replacing-block having its upper face formed on a compound curve rising from each end to the center forming thereby a ridge of convex curvature transversely and longitudinally, and a pair of ribs integral with the upper face of said block and each extending from one corner of one end of the block and terminating in said ridge.

6. In a car or engine replacer, an outer replacing-block having its upper face formed upon a reverse compound curve, and a pair of ribs of concave curvature longitudinally integral with the upper face of said block and each extending from one corner of one end of the block diagonally toward the center thereof.

7. In a car or engine replacer, a hollow replacing-block having its upper face formed upon a reverse compound curve, a vertical web-brace arranged within said block, and a pair of inclined web-braces arranged within said block at each side of said vertically-extending web-brace.

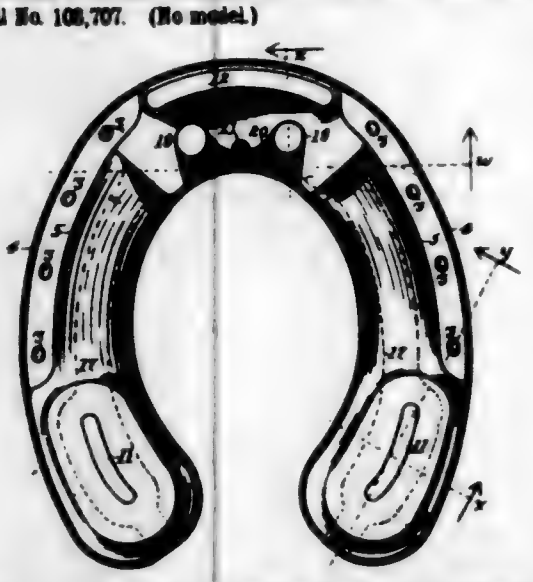
8. In a car or engine replacer, a hollow replacing-block having a countersunk opening in one side thereof, a vertical web-brace arranged within the said block, a pair of inclined web-braces arranged within said block at each side of the said vertical web-brace, a hook-bolt extending in the said block in the said opening, an L-shaped connecting-arm attached to said bolt, and means carried by the said arm for connecting the same to a rail thereby securing the block in position.

9. In a car or engine replacer, a hollow replacing-block having one side formed with depressed portions and its opposite sides with an opening, a flange integral with the said side having depressed portions and provided with openings registering with the recesses formed by the said depressed portions, a vertical web-brace arranged within said block, a pair of inclined web-braces arranged within said block at each side of said vertical web-brace, a bolt extending in the said block through the said opening, an L-shaped connecting-arm connected to said bolt, and means carried by the said arm for connecting the block to a rail.

10. In a car or engine replacer, a replacing-block, having its upper face of reverse compound curvature rising from both ends to the center.

11. In a car or engine replacer, an inner replacing-block having its upper face of reverse compound curvature rising from both ends toward the center, and a rib of convexo-concave curvature longitudinally integral with the upper face of said block.

706,548. HORSESHOE. JOHN W. FISHER, Akron, Ohio, assignor of one-half to Frank Reifsnyder, Chicago, Ill. Filed Apr. 19, 1902. Serial No. 103,707. (No model.)



Claim.—1. An improved cushion-horseshoe consisting of a metal shoe to be secured to the hoof having means for securing thereto an independent underimposed vulcanized-rubber tread-surface inclosing a metal frame provided as described with a rubber coating, excepting at the toe and arranged to be detachably secured to said shoe and means for connecting said shoe and frame, substantially as shown and described.

2. An improved cushion-horseshoe consisting of a metal shoe to be

secured to the hoof having means for securing thereto an underimposed vulcanized-rubber tread-surface, in combination with a metal frame having integral toe and heel calks and provided with a rubber coating, and a rubber envelop inclosing said frame and thickened at the heel substantially even with the heel-calks, and means for detachably uniting said frame and shoe, substantially as shown and described.

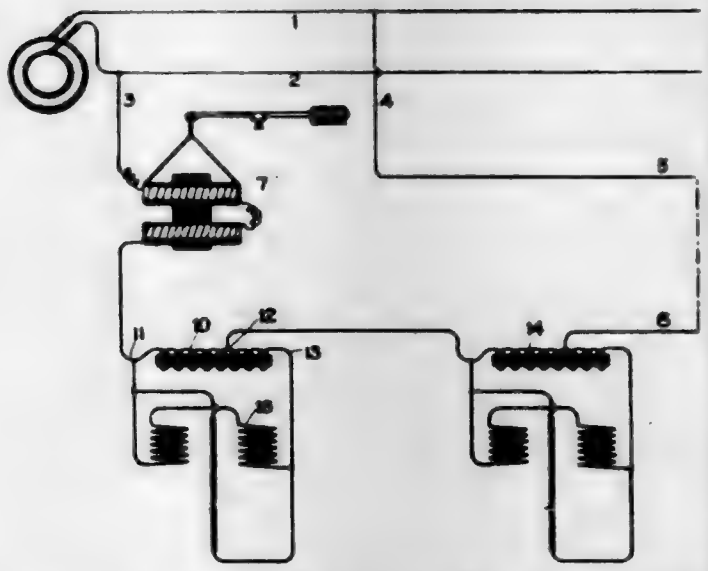
3. An improved cushion-horseshoe consisting of a metal shoe to be fastened to the hoof having on its under face, flanges to form a seat for an underimposed cushion and means for securing said cushion thereto, in combination with a metal frame having integral toe and heel calks and a rubber envelop, arranged to lie within said flanges, thickened at the heel about said heel-calks, and means for uniting said frame and envelop, with said metal shoe, substantially as shown and described.

4. An improved cushion-horseshoe consisting of a metal shoe to be fastened to the hoof having notches in the heel with bands over the back ends of said notches, in combination with a metal frame having integral toe and heel calks with offset pins to enter said notches and rest under said bands, and means for detachably securing the toe of said frame to the shoe, and a rubber envelop inclosing said frame back of the toe portion, and thickened at the heel about said heel-calks, substantially as shown and described.

5. An improved cushion-horseshoe consisting of a metal shoe 1, to be fastened to the hoof having means at the heel for securing a rubber-covered frame, and a hole 6, at the toe with lateral narrower branches 7, and posts 18, to enter said hole having grooves to fit said branches 7, in combination with a frame 10, having integral means 16, for securing it to the heels of said shoe 1, and holes to register with and receive said posts 18, a rubber envelop 17, on said frame, and means for holding the toe of said frame on said posts, substantially as shown and described.

6. The herein-described cushion-horseshoe consisting of a metal shoe 1, to be secured to the hoof, having flanges to form a retaining-seat for an underimposed cushion, with notches in the heel with bands 9, over their back ends, a hole 6, at the toe with lateral narrower branches 7, and posts to enter said hole having grooves to fit said branches, and other grooves for a binding-wire 20, in combination with a metal frame 10, having integral toe and heel calks, with offset pins 16, to enter said notches and rest under said bands 9, and holes to register with and receive said posts at the ends of said branches and a recess at the toe back of and between said holes, a rubber envelop 17 inclosing said frame 10 back of the toe portion and thickened about said heel-calks, and a wire 20, to rest across said recess and in the grooves 19 thereof, and in the grooves 23 of said posts 18, to retain the toe of said frame, substantially as shown and described.

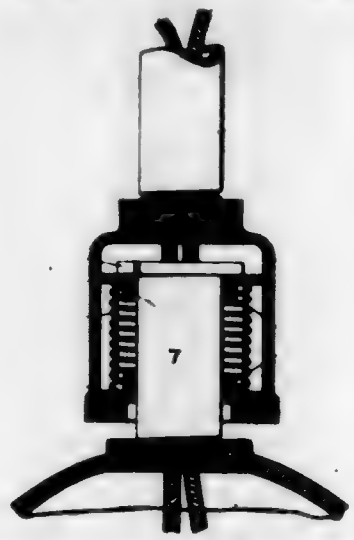
706,544. SYSTEM OF ELECTRICAL DISTRIBUTION. RICHARD FLEMING, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed Jan. 28, 1900. Serial No. 2,230. (No model.)



Claim.—1. The combination of an alternating-current circuit, means for maintaining a substantially constant current in said circuit, a plurality of compensators in series in said circuit, the points of connection of said circuit to each compensator being such as to include less than the whole length of the compensator-coil, and a translating device supplied from each compensator and connected thereto so as to include the whole length of the compensator-coil.

2. The combination of an alternating-current circuit, means for maintaining a substantially constant current in said circuit, a plurality of compensators in series in said circuit, the points of connection of said circuit to each compensator being such as to include less than the whole length of the compensator-coil, and a translating device supplied from each compensator and connected thereto so as to include more of the compensator-coil than that between the connections of said circuit.

706,545. ELECTRIC-ARC LAMP. RICHARD FLEMING, Swampscott, Mass., assignor to General Electric Company, a Corporation of New York. Filed Nov. 23, 1901. Serial No. 83,401. (No model.)



Claim.—1. In a suspension device for arc-lamps, the combination of a support which is secured to the lamp, a fixed support, a spring located between the supports and arranged to sustain the weight of the lamp, and insulating-bushings which prevent current from being transferred from one support to the other, at the same time permitting the parts to move slightly with respect to each other.

2. In an arc-lamp, the combination of a tube which is secured to the lamp, a second tube capable of being secured to a fixed support, a casing secured to one of the tubes, a lamp-supporting spring which surrounds one of the tubes and is located within the casing, and a body of insulation which separates the metallic parts of the lamp from the support, and also acts as a guide to direct the movements of the tubes.

3. In a suspension device for an arc-lamp, the combination of a support secured to the lamp which has an enlarged head, a casing which surrounds the support, and is provided with a seat, insulating-bushings which surround one of the supports, and act as guides for the parts as they move with respect to each other, and a lamp-supporting spring which is located between the bushings.

4. In a lamp-supporting device, the combination of a supporting-tube, a casing secured thereto, a perforated disk mounted on the lower end of the casing, a lamp-tube having a head, a pair of oppositely-disposed insulating-bushings, each bushing having a flange which engages the inner wall of the casing, one of said bushings resting on the head, the other on the disk, and a lamp-supporting spring which surrounds the lamp-tube and engages with the bushing and is prevented by them from making electrical contact with the tubes.

5. In a lamp-supporting device, the combination of a lamp-cover, a tube secured thereto, a supporting-tube, a casing secured thereto, a disk which is perforated centrally for closing the bottom of the casing, a head formed on the lamp-tube which is greater in diameter than the opening in the disk, and a coiled compression-spring located between the head and the disk.

706,546. SQUARE SHAKING-GRATE. FRANK W. POTTER, Melrose, Mass. Filed Dec. 2, 1901. Serial No. 84,256. (No model.)

Claim.—1. In a rocking grate, the combination of notched side frames, a notched rocker-bar, the side frames and rocker-bar mutually embraced by the notches in the rocker-bar and side frames, respectively, the side-frame notches being wider than the rocker-bar is thick, to give play to the rocker-bar to rock in the side-frame notches, the sides of said notches serving as stops to the rocker-bar motion.

2. In a rocking grate, the combination of notched side frames, a rocker-bar, notched to embrace the side frames, the rocker-bar embraced by the side-frame notches, said notches being wider than the rocker-bar is thick, to give play to the rocker-bar, the rocker-bar held from lateral movement by the side frames in the rocker-bar notches, substantially as described.

3. In a rocking grate, the combination of notched side frames, a rocker-bar, the rocker-bar embraced by the side-frame notches, which are wider than the rocker-bar is thick, to give play to the rocker-bar, the rocker-bar provided with filler-lugs which occupy substantially the entire width of the said notches at the bottom thereof.

4. In a rocking grate, the combination of notched side frames, a notched rocker-bar, the side frames and rocker-bar mutually embraced,

each by the notches of the other, the side-frame notches being wider than the rocker-bar is thick, to give the rocker-bar play to work, the rocker-bar provided with filler-lugs which occupy substantially the entire width of the side-frame notches at the bottom thereof.

5. In a rocking grate, the combination of a plurality of parallel grate-bars, mounted to reciprocate longitudinally, means for longitudinally agitating the grate-bars, end fingers on the grate-bars, stationary sectional extension-pieces each consisting of a cross-head from which project upwardly fingers which dovetail with the end fingers of the grate-bars, and provided with a depending stem, and a support for the said sectional extension-bars provided with sockets for the said stems.

6. In a grate, the combination of side frames, front and rear end beams, both vertically slotted to slide over the side frames, grate-bars, rocker-bars, and a stationary cross-beam whereon the grate-bars rest and slide, said cross-beam provided with vertical slots to embrace the side frames, and lugs on the side frame to confine the front and rear end beams and cross-beam when in position on the side frames, substantially as described.

706,547. ELECTRIC-ARC LAMP. FREDERICK A. GILBERT, Brookline, and EMIL O. LUNDIN, Beachmont, Mass., assignors to the General Electric Company, a Corporation of New York. Filed Mar. 24, 1898. Serial No. 674,963. (No model.)

Claim.—1. An electric-arc lamp provided with a contact device for the movable carbon, means for connecting and disconnecting the same from the carbon, and a rigid lever yieldingly mounted on the contact device and effecting a sliding frictional contact between the carbon-follower and the circuit-terminal.

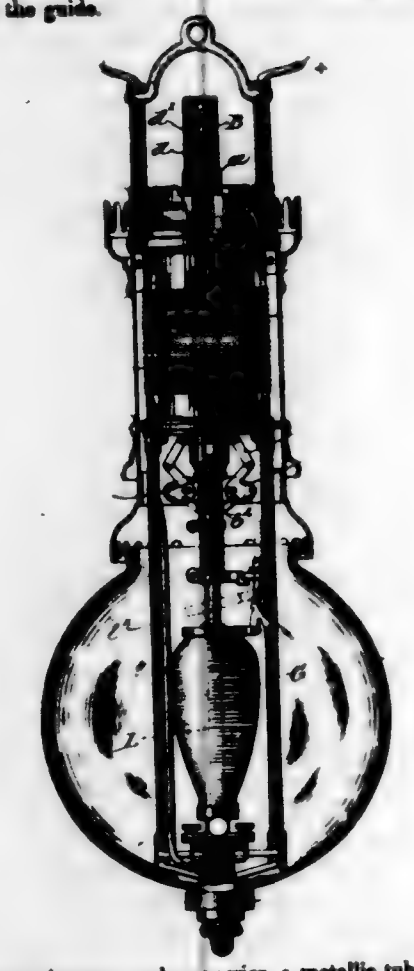
2. An arc-lamp provided with a device for maintaining contact between the movable carbon and a circuit-terminal, means permitting the carbon to be connected and disconnected therefrom, and a plurality of levers mounted on one of the parts and held in elastic or yielding frictional engagement with the other part.

3. A contact device for the movable carbon of an arc-lamp, comprising a support, a plurality of independently-movable, laterally-separable contact members mounted thereon and electrically connected with the carbon, said members having elongated contact-faces and interior cam portions, and means to engage said cam portions of the contact members and positively spread them laterally into operative position.

4. A contact device for the movable carbon of an arc-lamp, comprising a support, a plurality of independently-movable, laterally-separable contact members mounted thereon and electrically connected with the carbon, said members having elongated contact-faces and interior cam portions, a spreader inclosed and supported by the contact members, and means to move said spreader to positively separate and maintain the contact members in operative position.

5. A contact device for the movable carbon of an electric lamp, comprising a plurality of inflexible, separable contact-levers electrically connected and bodily movable with the carbon and means to positively separate or laterally extend the free ends of said levers in operative position.

6. In an arc-lamp, a carbon-carrier, a tubular metallic guide therefor, a plurality of separable contact-levers mounted on the carrier in electrical connection with the carbon, and means to positively separate or laterally extend the free ends of said levers and maintain them operatively in contact with the guide.



7. In an arc-lamp, a carbon-carrier, a metallic tube through which it travels and in the lamp-circuit, a plurality of separable contact-levers mounted on the carrier and electrically connected with the carbon, and a spreader to act upon the lever-arms and positively separate or laterally extend them and maintain them in operative contact with the tube.

8. In an arc-lamp, a metallic tube in the lamp-circuit and within which the movable carbon travels, a carbon-carrier, pivoted contact-levers in electrical connection with the carbon, and means to positively engage and move said contact-levers into operative position and to maintain them in yielding sliding engagement with said tube.

9. In an arc-lamp, a metallic carbon-carrier having side openings therein, a plurality of depending contact members pivotally mounted on the carrier, a spreader within and supported by the said members, and means to move said spreader to positively separate said contact members and maintain them in operative position projecting laterally through the openings in the carrier.

10. A contact device for the movable carbon of an arc-lamp, comprising a plurality of movable contact-levers electrically connected with the carbon, and means to positively maintain said contact-levers in operative position.

11. In an arc-lamp, a carbon-carrier, a tubular metallic guide therefor, a plurality of movable contact-levers mounted on the carrier in electrical connection with the carbon, and means to positively maintain said levers in operative contact with the guide.

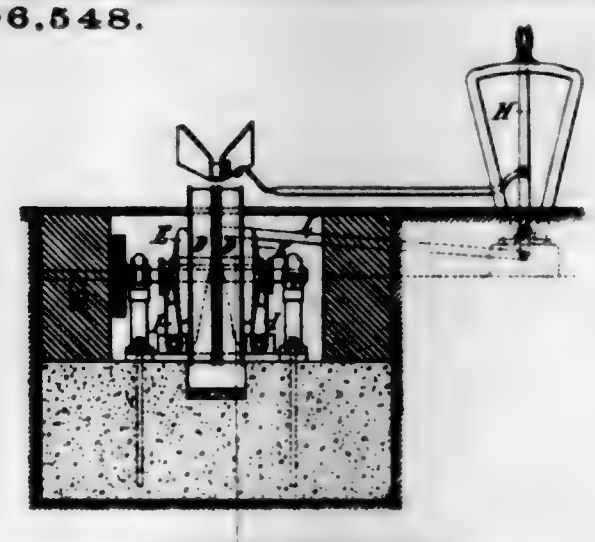
12. In an electric-arc lamp, a movable carbon, a tube wherein the same is adapted to slide, a contact for the movable carbon comprising a series of arms bent inwardly and each pivoted at one end in the holder for the carbon, and means surrounded by said arms for maintaining the same in expanded position.

13. In an electric-arc lamp, a contact for the upper carbon comprising a series of arms bent inwardly and each pivoted at one end in the carbon-holder, and a spherical weight surrounded by, and normally adapted to expand, said arms.

706,548. ROLLING-MILL. PIERRE GIRIN, Paris, France, assignor to Ste. Ame. de Commentry-Fourchambault et Decazeville, Paris, France. Filed Apr. 28, 1902. Serial No. 104,311. (No model.)

Claim.—The combination with finishing-cylinders of a rolling-mill, of a plurality of conveyors, means for directing a bar from said cylinders to either of said conveyors at will, driving mechanism, and means for simultaneously actuating said directing means and clutching to the driving mechanism the conveyor to which said bar is directed.

706,548.



706,549. COASTER-BRAKE. CHARLES GLOVER, New Britain Conn., assignor to P. & F. Corbin, a Corporation of Connecticut. Filed June 11, 1901. Serial No. 64,096. (No model.)

Claim.—1. In a brake mechanism for coaster-brakes and the like, a stationary block having two recesses therein, two curved brake-shoes, one end of each of said brake-shoes being adapted to fit within said recesses and means to operate said brake-shoes, substantially as described.

2. A brake mechanism for coaster-brakes and the like, comprising a plurality of hinged brake-shoes, a stationary support therefor, a double-acting cam pivotally mounted between the ends of said brake-shoes, an arm projecting from said cam, a shoulder on said arm, a wheel-hub, an axle, said axle being located in the path of movement of the shoulder on said cam-arm and means for operating said cam, substantially as described.

3. A brake mechanism for coaster-brakes comprising an axle, a wheel-hub, bearings therefor, brake-shoes adapted to coact with said wheel-hub or an extension thereof, said brake-shoes being hinged upon a stationary support, a pivotally-mounted cam located between the ends of said brake-shoes and adapted to operate both of said brake-shoes, an arm projecting from said cam and a shoulder on said arm adapted to impinge against said axle and means to operate said cam, substantially as described.

4. In a brake mechanism for coaster-brakes and the like, a stationary block having two recesses therein, two curved brake-shoes, one end of each of said brake-shoes being adapted to fit within said recesses, and a spring for holding said brake-shoes in their retracted position, and means to operate said brake-shoes, substantially as described.

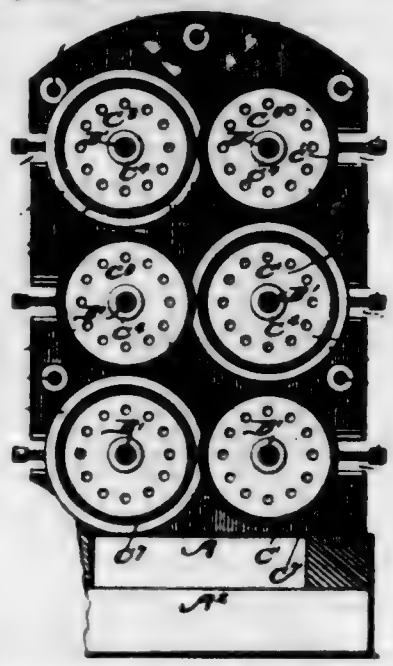
5. In a brake mechanism for coaster-brakes and the like, a stationary block having two recesses therein, two curved brake-shoes, one end of each of said brake-shoes being adapted to fit within said recesses, and a spring for holding said brake-shoes in their retracted position, said spring engaging said brake-shoes near the ends thereof and means to operate said brake-shoes, substantially as described.

6. In a brake mechanism for coaster-brakes and the like, a stationary block having two recesses therein, two curved brake-shoes, one end of each of said brake-shoes being adapted to fit within said recesses, and a spring for holding said brake-shoes in their retracted position, said spring engaging said brake-shoes near the ends thereof and bearing against the said stationary block and means to operate the brake-shoes.

7. In a brake mechanism for coaster-brakes and the like, a stationary block having two recesses therein, two curved brake-shoes, one end of each of said brake-shoes being adapted to fit within said recesses, and a spring for holding said brake-shoes in their retracted position, said spring engaging said brake-shoes near the ends thereof and means for operating said brake-shoes consisting of a pivoted cam and actuating-arm.

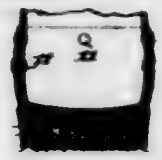
706,550. GLASS-MAKING MACHINE. HENRY GOLLINER, Oak Station, Pa. Filed Sept. 16, 1901. Serial No. 75,563. (No model.)

Claim.—1. In a glass-making machine, the combination of a frame composed of the side plates, each of which having slots or raceways arranged in the edges thereof, the said slots having ratchet-teeth formed therein, boxes arranged in the said slots and having shafts journaled therein, cylinders held upon said shafts, blocks carrying pawls that are adapted for engagement with the said ratchet-teeth, and a screw operating in the said blocks and adapted to engage the said boxes whereby the said cylinders may be adjusted laterally, and means for revolving the said cylinders, substantially as shown and described.



2. In a glass-making machine, the combination of a frame comprising the side plates and supports, a hopper fixedly arranged between the plates at the upper end thereof, the said plates having a series of slots arranged in their edges, the slots of one edge being arranged opposite and parallel with those of the opposite edge, and each having ratchet-teeth formed upon the inner and outer edges thereof, boxes arranged in the said slots, shafts journaled in the boxes, cylinders held upon the shafts and arranged in pairs in the frame, one cylinder of each pair having end plates that overlap the ends of the opposite cylinder, thereby producing a slot between the cylinders, blocks arranged in the grooves and having pawls for engagement with the ratchet-teeth, screws operating within the blocks and adapted to bear against the boxes, whereby the width of the slot between the cylinders may be increased or decreased, the said shafts of the cylinders having ports arranged therein, and one end provided with stuffing-boxes through which pass pipes, gears mounted upon the opposite ends of the shafts, and idlers journaled in the frame and adapted to mesh with the gears of the shafts, and means for revolving the cylinders, substantially as shown and for the purpose set forth.

706,551. BOOT OR SHOE. WILLIAM GORDON and GEORGE E. WARREN, Boston, Mass., assignors to Metallic Heel and Counter Company, Kittery, Me., a Corporation of Maine. Filed Dec. 17 1900. Serial No. 40,151. (No model.)



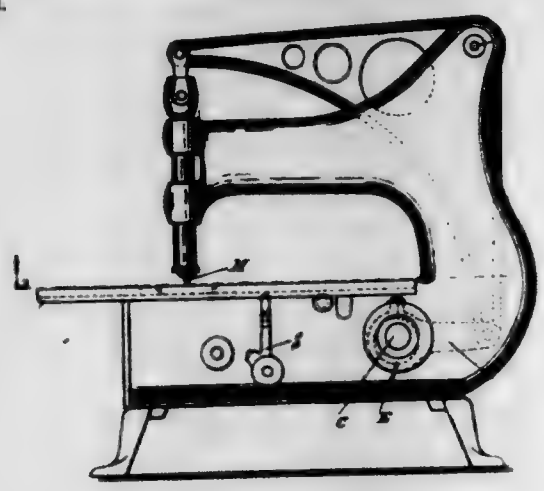
Claim.—An article of manufacture consisting of a metallic heel and counter-protector, a tread-plate and a heel-block, said tread-plate and heel-block being provided with a series of registering holes through which fastening devices may be driven into the sole of a boot or shoe after the heel and counter-protector, tread-plate and heel-block are in position thereon, substantially as described.

706,552. PUNCHING-MACHINE. BENJAMIN F. HALL, Salem, Mass., assignor of one-half to Ezra Goodell, Salem, Mass. Filed Sept. 21, 1901. Renewed July 9, 1902. Serial No. 114,959. (No model.)

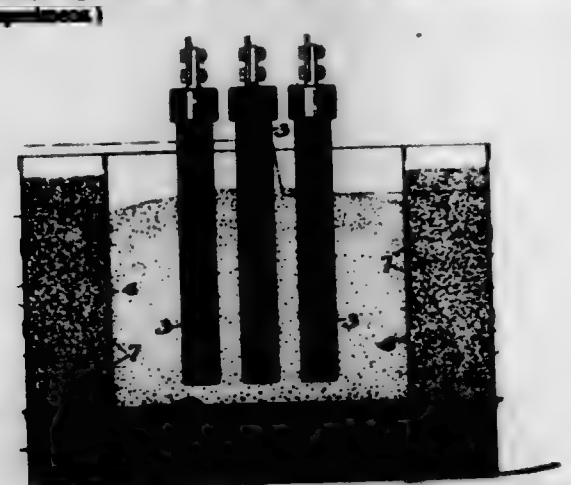
Claim.—1. In a punching or perforating machine, in combination, a rotary driving-shaft and mechanism for imparting a reciprocating motion to a die-carrier, a rocking feed-point and carrier, means for positively actuating and controlling the amount of feed of the latter, a rock-lever actuated by a cam or eccentric on the rotary driving-shaft, and pivotally connected to the rocking feed-point carrier, said rock-lever being pivotally arranged upon an adjustable eccentric-pin for the purpose of adjusting the vertical movement of the feed-point carrier substantially as and for the purpose set forth.

2. In a punching or perforating machine, a four-motion positive and adjustable feed device, consisting in combination a rotary driving-shaft, an eccentric thereon, a pivoted grooved segment actuated by said eccen-

trio, a block adjustable in said segment, a rocking feed-point carrier, pivotally connected to said block, means for adjusting the latter in the segment, a rock-lever actuated by an eccentric on the driving-shaft and pivotally connected to the feed-point carrier, and an adjustable eccentric-pin upon which said lever is hung for the purpose of adjusting the vertical motion of said feed-point carrier substantially as herein set forth and described.



706,558. PROCESS OF MANUFACTURING ALUMINA. CHARLES M. HALL, Niagara Falls, N. Y. Filed Aug. 10, 1901. Serial No. 71,639. (No specimens.)



Claim.—1. The method herein described of purifying bauxite or other impure oxid of aluminium, which consists in heating the same in admixture with a reducing agent by means of an electric current without substantial fusion, thereby reducing the contained impurities in whole or in part, removing the mass so treated and afterward fusing it in an electric furnace and causing the impurities to agglomerate; substantially as described.

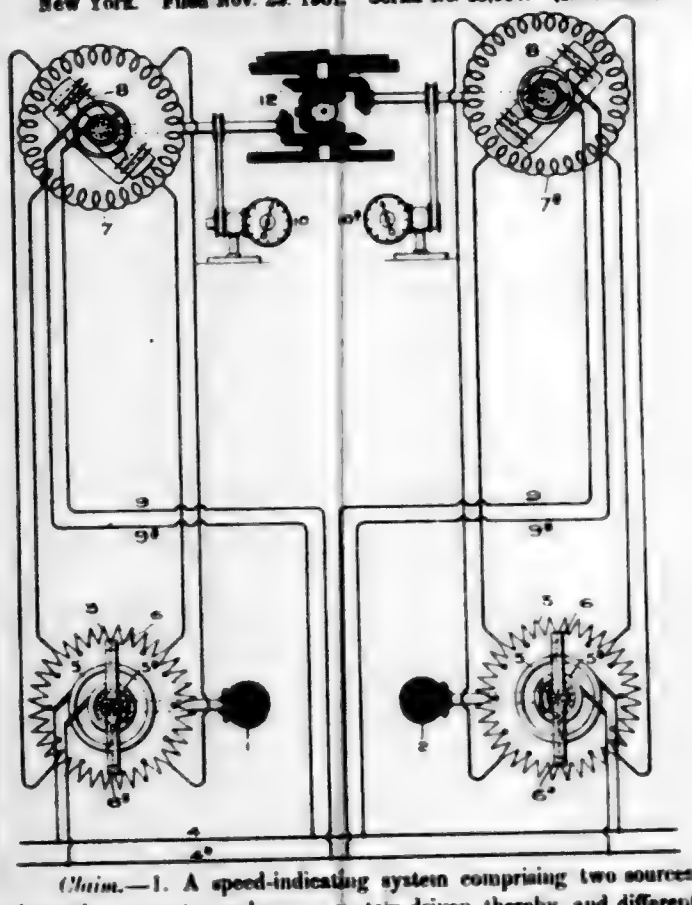
2. The method herein described of purifying bauxite or other impure oxid of aluminium, which consists in heating and fritting the same in admixture with a reducing agent by means of an electric current, without substantial fusion, reducing thereby the contained impurities in whole or in part, removing the mass so treated and afterward fusing it in an electric furnace and causing the reduced impurities to agglomerate; substantially as described.

3. The method herein described of purifying bauxite or other impure oxid of aluminium, which consists in surrounding a mass containing such oxid with a mixture of like oxid and carbon, subjecting it to heat generated by an electric current, fusing it thereby and causing the impurities thereof to unite in a fused alloy, and by the waste heat so developed effecting a reduction, in whole or in part, of the surrounding mixture without substantial fusion of such mixture, then removing the purified central mass, and subsequently fusing such surrounding mixture to effect the removal of its impurities; substantially as described.

4. The method herein described of purifying bauxite or other impure oxid of aluminium, which consists in surrounding a mass containing such oxid with a mixture of like oxid and carbon, subjecting it to heat generated by an electric current, fusing it thereby and causing the impurities thereof to unite in a fused alloy, allowing said mass to cool slowly, and by the waste heat so developed effecting a reduction, in whole or in part, of the surrounding mixture without substantial fusion of such mixture, then removing the purified central mass, and subsequently fusing such surrounding mixture to effect the removal of its impurities; substantially as described.

5. The method herein described of purifying bauxite or other impure oxid of aluminium, which consists in surrounding a mass containing such oxid with a mixture of like oxid and carbon, subjecting it to heat generated by an electric current, fusing it thereby and causing the impurities thereof to unite in a fused alloy and by the waste heat so developed effecting a reduction in whole or in part, of the surrounding mixture without substantial fusion of such mixture, then removing the purified central mass, and subsequently fusing such surrounding mixture in like manner in the middle of a surrounding mixture of impure oxid and carbon; substantially as described.

706,554. SPEED-INDICATING SYSTEM. JOHN L. HALL, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Nov. 29, 1901. Serial No. 83,967. (No model.)



Claim.—1. A speed-indicating system comprising two sources of alternating current, synchronous motors driven thereby, and differential gearing driven by the joint action of the two motors to show the speed relation of the two machines.

2. A speed-indicating system comprising two alternating-current generators, polyphase circuits connecting therewith, and an indicator differentially driven by rotary fields set up by the polyphase currents.

3. A speed-indicating system comprising two alternating-current generators, synchronous motors, tachometers operated by the motors, differential gearing driven by the motor system, and an indicator operated thereby to show difference of speed.

4. A speed-indicating system comprising a resistance, a source of direct current, commutators for converting the direct into alternating currents, synchronous motors in the alternating-current circuits, and a differential indicator showing differences of speed of the motors.

706,555. ELECTRIC METER. CARYL D. HASKINS, Schenectady N. Y., assignor to General Electric Company, a Corporation of New York. Filed Feb. 13, 1901. Serial No. 47,092. (No model.)

Claim.—1. In an electric motor-meter, a starting-coil wound in halves symmetrically disposed with relation to the armature-shaft, and means for adjusting said coil angularly around said shaft.

2. In an electric motor-meter, a starting-coil having a plurality of sections, and a sleeve concentric with the armature-shaft supporting said sections within, and symmetrically related to, the field-coils.

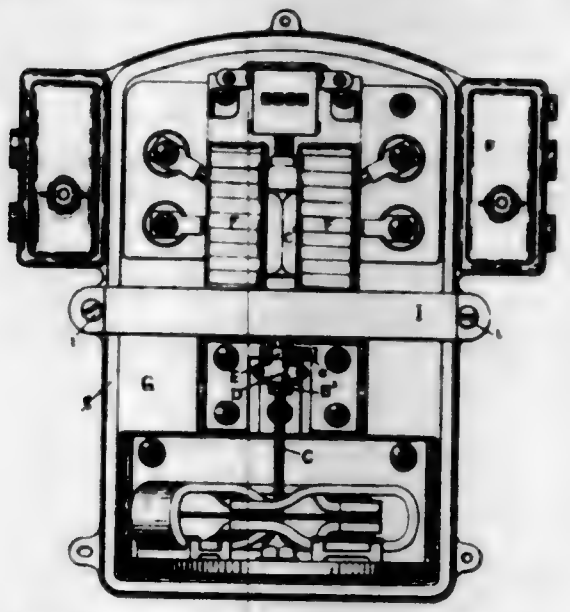
3. In an electric motor-meter, a sectional starting-coil, a rotatable sleeve concentric with the armature-shaft and carrying said coil, a bearing in which said sleeve is rotatable, and means for holding the sleeve and coils in any angular position with reference to the shaft.

4. In an electric motor-meter, a starting-coil, a rotatable sleeve concentric with the armature-shaft and carrying said coil, and a clamp between the sleeve and its support.

5. In an electric motor-meter, a starting-coil wound in halves on trough-shaped hoops located on each side of the armature.

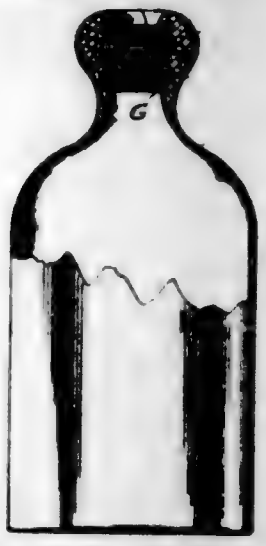
6. In an electric motor-meter, the combination with a sleeve, of a head mounted transversely thereon, and two hoops carried by said head in parallel planes symmetrically disposed on each side of the axis of the sleeve.

7. In an electric motor-meter, the combination with the armature-resistance, of a controllable shunt around part of said resistance.



8. In an electric motor-meter, the combination with two work-circuit terminals and two line-wire terminals, of a third line-wire terminal, an armature-resistance, a shunt around part of said resistance, and means for connecting said shunt with the third line-terminal.

706,556. BOTTLE-NECK. ROBERT HAY, Summit, N. J.; Julia Booth Hay executrix of said Robert Hay, deceased. Filed Apr. 16, 1901. Serial No. 56,083. (No model.)

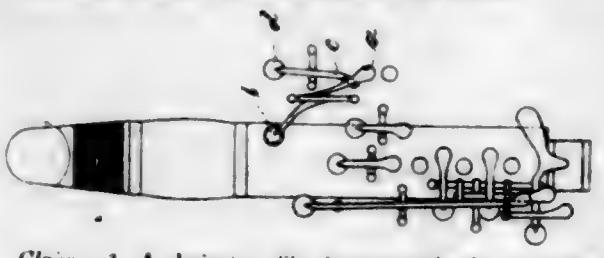


Claim.—1. The combination with a bottle-neck having a series of corrugations, contiguous to each other and forming edges between them, the said edges between the corrugations being all of equal internal diameter throughout the whole neck; a discharge-opening or mouth located above said corrugations of smaller diameter than the inner diameter of the said edges between the corrugations, and forming a flat shoulder beneath the said mouth, the said mouth being flared outwardly and upwardly on its upper surface; of a compressible stopper, of a diameter equal to about the inner diameter of the edges of the said corrugations, and of any available length which may be pressed through the said mouth, and beneath the said flat shoulder, and expand again to its normal size, only, and be forced upward by the internal pressure against the said flat shoulder, and hold there while the said internal pressure forces the body of the stopper outward against the edges of the said corrugations, and thereby cause a sealing of the bottle by means of the internal pressure only, substantially as specified.

2. A bottle-neck whose internal bore is of equal diameter throughout its length, and provided with a series of corrugations, contiguous to each other, and forming edges at their junction, the internal bore of the neck being surmounted, at its upper end, by an angular flange and centrally of said flange having a discharge-opening or mouth of less diameter than the internal diameter of the bottle-neck, the upper surface of said flange being tapered from its exterior diameter toward the said mouth; and a compressible stopper adapted to enter beneath said flange, and to seal the bottle by internal pressure only, substantially as specified.

3. As an article of manufacture a bottle having a neck with corrugations formed within it, the internal diameters of which are equal, and above said corrugations having a narrow flange turned inwardly, and a discharge-opening of smaller diameter than the inner edges of said corrugations, and above said flange having an upper surface flaring outwardly from said discharge-opening substantially as specified.

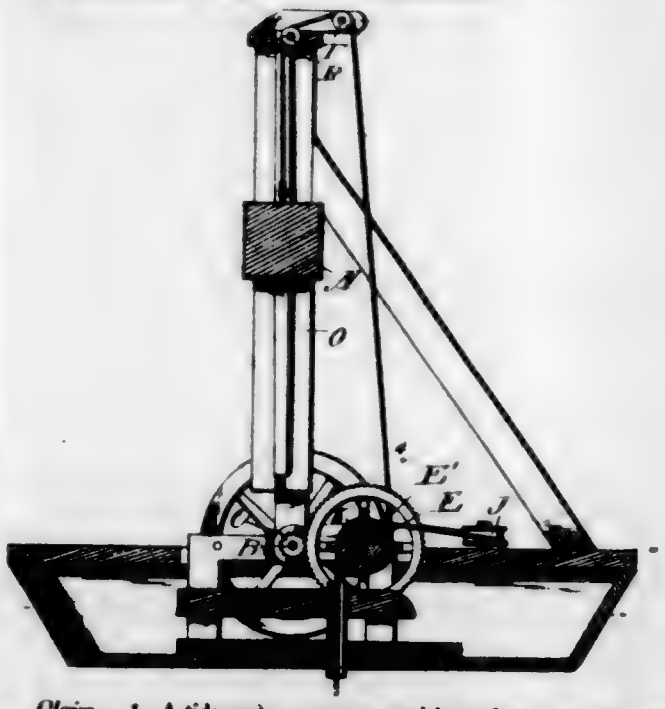
706,557. CLARINET. WILHELM HECKEL, Biebrich, Germany. Filed Aug. 27, 1900. Serial No. 28,242. (No model.)



Claim.—1. A clarinet or like instrument having two octave-holes *b*, *d*, arranged at the same height, *i. e.*, at the same distance from the mouthpiece, and opposite to each other, and means for simultaneously opening and closing said holes.

2. A clarinet or like instrument, provided with two octave-holes arranged at the same height, *i. e.*, at the same distance from the mouthpiece, and opposite to each other, in combination with a key adapted when pressed down to open one of said holes, and a second key arranged relatively to the first key, whereby when the latter is pressed down, the said second key will be operated to open the other hole simultaneously.

706,558. DEVICE FOR UTILIZING WAVE-POWER. JOHN C. HERSHMAN and CHARLES C. VON DER AHE, New York, N. Y. Filed Mar. 12, 1902. Serial No. 97,935. (No model.)



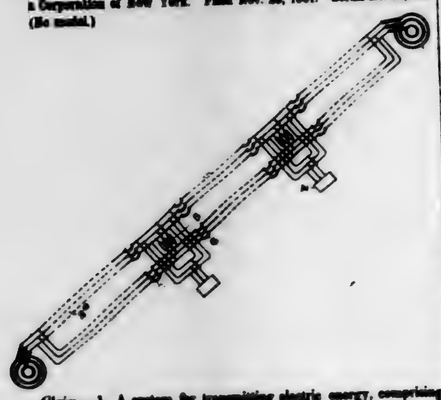
Claim.—1. A tide-motor power comprising a float, a winding-drum and shaft with gear-wheels rotating therewith and mounted upon said float, an anchor, a suspended weight carried by the float, a cable adapted for connection to said anchor, passing about said drum, and over suitable pulleys and suspending said weight, whereby as the float rises said suspended weight will be raised and cause the driving-shaft to be operated, as set forth.

2. A tide-motor power comprising a float, a shaft, a winding-drum loosely journaled on said shaft and mounted upon the float, a ratchet-wheel fastened to rotate with said drum, a gear-wheel keyed to rotate with said shaft, a pawl carried by the gear-wheel and designed to engage said ratchet-wheel, a counter-shaft carried by the float, a pinion-wheel keyed thereto and meshing with said gear-wheel, a cable, adapted for connection at one end to an anchor, and passing about said winding-drum, and pulleys carried by the float, a weight suspended on uprights carried by the float and to which suspended weight said cable is connected, as shown and for the purpose set forth.

3. A tide-motor power comprising in combination with a float, a shaft journaled therein, a pinion-wheel rotating with said shaft, a counter-shaft, a gear-wheel meshing with said pinion, drums on the counter-shaft, a horizontally-mounted pulley on the float, standards on said float provided with guide-strips on their adjacent faces, a suspended weight having grooves on its opposite faces to receive said guide-strips, pulleys at the upper ends of the standards, a cable fastened to said suspended weight

passing about axis pulleys and drums, and its other end adapted for attachment to an anchor, substantially as shown and described.

706,559. ELECTRIC TRANSMISSION OF POWER. EDWARD M. HEWLETT, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Nov. 23, 1901. Serial No. 83,410. (No model.)



Claim.—1. A system for transmitting electric energy, comprising duplicate transmission-mains connected in parallel at the substation or local distributing-point, and differential means responsive to both mains for automatically opening the damaged main in case the two sides become unbalanced.

2. An electrical transmission system comprising a generating-station, a distant distributing-station, multiple transmitting-mains, conductive ties between the multiple mains at one or more points, and a differential device at each points controlled by the mains jointly for opening a main which becomes disproportionately loaded.

3. An electrical transmission system containing multiple transmitting-mains traversing different geographical routes, conductive ties between the different mains at a protected point or points, and means responsive to an unbalancing of the mains for opening the defective main in the region of the disturbance.

4. An electrical transmission system comprising a source of energy and a distributing system containing duplicate transmitting-mains, a differential relay at or near a protected point controlled by the joint effect of the two mains, and a circuit-breaker in each main actuated by the relay when the main in which the circuit-breaker is connected carries a disproportionate load with respect to its companion main.

5. An electrical transmission system comprising a source of energy, duplicate transmitting-mains, one or more substations, conductive ties between the mains at the substations, relays controlled by the joint effect of the duplicate mains, circuit-breakers at each side of the conductive tie, and connections with the relays for opening the circuit of the disturbed main at that side of the tie in which the disturbance occurs.

6. An electrical transmission system comprising a polyphase alternating-current generator, duplicate distributing-mains traversing different geographical routes, conductive ties at different points between the termini of the system, circuit-breakers for the different phases on each side of a tie, and differential relays controlled by the joint effect of the duplicate mains at each side of a tie for opening the circuit of a disturbed section of the transmitting-main.

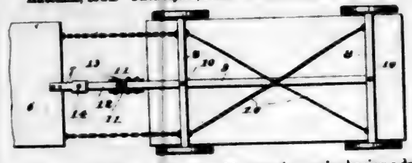
7. An electrical transmission system comprising a polyphase alternating-current generator, duplicate distributing-mains cross-connected by conductive ties at points between the termini of the system, current-transformers in different phases at or near each tie, and circuit-breakers in each main governed by the joint effect of cooperating transformers in the duplicate mains to open the main which becomes disproportionately loaded.

8. A polyphase transmission system comprising a generator, duplicate transmission-mains cross-connected by metallic ties at points between termini, series transformers in different phases of each main at or near a tie, differential relays controlled by the joint effect of the duplicate mains, and circuit-breakers in each main opened by the relay when the main in which the circuit-breaker is connected is disproportionately loaded.

9. An electrical transmission system comprising a source of energy, and a distributing system containing duplicate transmitting-mains, a differential relay at or near a protected point controlled by the joint effect of two corresponding mains, a circuit-breaker in each main tripped by the relay, and means for disabling the circuit-breaker in the duplicate line when its companion operates.

10. An electrical transmission system comprising a source of energy, and a distributing system containing duplicate transmitting-mains, a differential relay at or near a protected point controlled by the joint effect of two corresponding mains, a circuit-breaker in each main tripped by the relay, and a contact in each trip-circuit opened when the companion circuit-breaker operates.

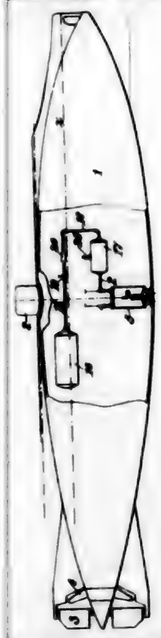
706,560. TRACTION-ENGINE TENDER. ALBERT HILDEBRAND, Hutchins, Iowa. Filed Apr. 8, 1902. Serial No. 101,893. (No model.)



Claim.—1. The combination with a traction-engine having a draw-bar, of a wheeled vehicle having pivoted front and rear axles, a draft-reach projecting before the body of the vehicle with horizontal rigidity, a coupling joining the draw-bar and reach, and flexible connections between the rear end of the engine and the front axle retaining them in parallelism.

2. The combination with a traction-engine having a draw-bar at the rear end thereof, of a tender having pivoted front and rear axles and wheels thereon, a draft-reach rigid with the body of the tender and projecting in advance thereof, a joint in the reach permitting vertical but preventing horizontal play, a coupling between the end of the reach and the draw-bar, and flexible guide connections between the rear end of the engine and the front axle retaining them in parallelism.

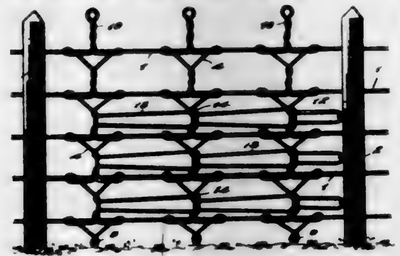
706,561. SUBMARINE BOAT. JOHN P. HOLLAND, Newark, N. J. Filed Aug. 7, 1901. Serial No. 71,132. (No model.)



Claim.—1. A submarine boat having the usual water-ballast tanks, an independent special tank to contain a predetermined quantity of water, a valve controlling the admission of water thereto from the outside, manually-operable means for opening said valve from the interior of the boat, a manually-operable stop-valve controlling communication between the top of said tank and the interior of the boat, a tank containing compressed air, a pipe connecting said tank with the said special tank, and a manually-operable stop-valve controlling said pipe.

2. A submarine boat having the usual water-ballast tanks, an independent water-ballast tank of fixed and predetermined capacity situated below the center of buoyancy of the boat when submerged, manually-controlled means of rapidly discharging the water from said tank to permit the boat to rise to the surface, and manually controlled and operable means for rapidly refilling said tank as soon as the conning-tower reaches the surface, substantially as and for the purpose set forth.

706,562. WIRE FENCE. LEONARD C. HOOVER, Clarkton, Ky. Filed Jan. 20, 1902. Serial No. 91,245. (No model.)

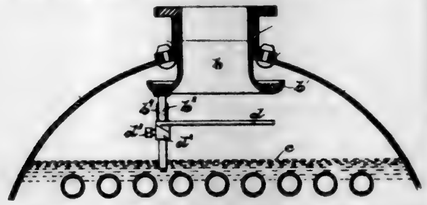


Claim.—1. In a fence, the combination of a plurality of runners, and stays having longitudinally oppositely extended parts provided with eyes to receive the runners and intermediate longitudinally-extending interlocked loops between the planes of the runners, substantially as described.

2. In a fence, the combination with runners, of stays having inverted triangular loops with opposite eyes to receive the runners and intermediate longitudinally-extending interlocked loops between the planes of the runners.

3. In a fence, the combination of a plurality of runners, and vertically-disposed stays or pickets having interlocking loops extending longitudinally from opposite sides thereof and located between the planes of the runners.

706,568. STEAM-BOILER. JOHN J. HOOVER, Springfield, Ohio. Filed Jan. 27, 1902. Serial No. 91,342. (No model.)



Claim.—1. In a steam-boiler, the combination with the steam-discharge outlet, of a nozzle extending in said boiler having at its lower end an outwardly-projecting flange-gutter, with a conduit-pipe extending from above the bottom of said gutter to below the water-line in said boiler, and a pan extending between said nozzle and said water-line, and means for holding said pan in position, substantially as specified.

2. In a steam-boiler, the combination with the steam-discharge outlet, the nozzle and a gutter on said nozzle with a conduit-pipe extending below the water-line as described, of a pan supported by said pipe extending between said nozzle and the water-line in said boiler, and having an outlet to said pipe, substantially as specified.

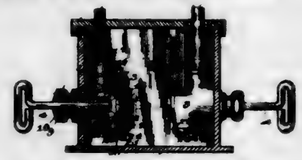
3. In a steam-boiler, the combination with the steam-discharge outlet, the nozzle and a gutter on said nozzle with a conduit-pipe extending below the water-line as described, of a pan journaled on said pipe with an outlet thereto, said pan normally extending between said nozzle and the water-line in said boiler, means to support said pan and automatically return it when it has been moved from its normal position, substantially as specified.

4. In a steam-boiler, the combination with the steam-discharge outlet, the nozzle and a gutter on said nozzle with a conduit-pipe extending below the water-line as described, of a pan journaled on said pipe with an outlet thereto, said pan extending between said nozzle and the water-line in said boiler, having the lower end of its journal beveled, and a supporting-collar on said pipe having a corresponding bevel, means to fix said collar on the pipe, and means to limit the movement of said pan toward the nozzle, substantially as specified.

5. In a steam-boiler, the combination with the steam-discharge outlet, of a pan extending between said outlet and the water-line in said boiler and a conduit from said pan extending below said water-line, substantially as specified.

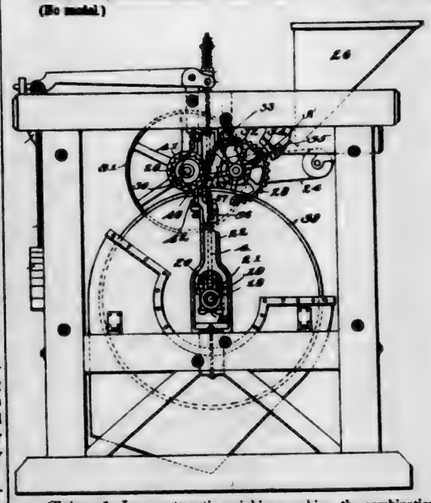
6. In a steam-boiler, the combination with the steam-discharge outlet, of a pan normally extending between said outlet and the water-line in said boiler, and a hollow support for said pan extending below the water-line in said boiler, said pan having an outlet to said hollow support, and means to automatically return said pan when moved from its normal position, substantially as specified.

706,564. PUMP. BARRY IVOR and JOHN S. WARD, Chicago, Ill. Filed Dec. 17, 1901. Serial No. 86,205. (No model.)



Claim.—The combination of an oil-reservoir, a pump-casing, a piston-chamber in said casing, a piston working in said chamber, an oil-passage in said casing extending across the inner mouth of said piston-chamber, an inlet and an outlet passage connecting with said transverse passage, at the lower and upper extremities thereof respectively, said inlet-passage extending backward beneath and in the general direction of said piston-chamber; a boss on said casing, a screw-threaded chamber in said boss, said chamber extending to a point near to but not entering said inlet-passage, a perforated wall formed of and integral with said casing constituting a strainer between said inlet-passage, and said threaded chamber; a valve-seat screwing into said threaded chamber, a ball coöperating with said seat, a valve-seat formed at the outer opening of said outlet-passage, a ball coöperating therewith, an opening in said casing opposite to said piston-chamber and connecting directly with said transverse passage, said inlet and outlet passages and with said piston-chamber, to afford ready access to all of said passages; and a nut or plug screwing into said last-mentioned opening for covering the same.

706,565. AUTOMATIC WEIGHING-MACHINE. ULYSSES S. JAMES, Anaconda, Mont., assignor of two-thirds to Charles M. Smith and Maurice S. Dean, Anaconda, Mont. Filed Oct. 24, 1901. Serial No. 79,851. (No model.)



Claim.—1. In an automatic weighing-machine, the combination of weighing mechanism including a rotary bucket, a frictional driving device supported independently of the weighing mechanism, a device carried by the bucket arranged for engagement with and operation by said frictional driving device to effect the discharge of said bucket, a feeder for supplying material to said bucket, a driving member, a driven member actuated by said driving member, a universal connection between said driven member and feeder, a shiftable carrier for said driven member, and means con-

trolled by the weighing mechanism for normally maintaining said driving and driven members in operative relation.

2. In an automatic weighing-machine the combination of weighing mechanism including a basket, a feeder for supplying material to said basket, a driving member, a driven member actuated by said driving member, a universal connection between said driven member and the feeder, a shiftable spring-actuated carrier for said driven member, and detent means operative with the weighing mechanism for normally holding the carrier in position to maintain the driving and driven members in operative relation.

3. In an automatic weighing-machine, the combination of weighing mechanism including a rotary basket having a disk, a shaft provided with a disk for coöperating with the disk on the basket to rotate the latter, a toothed gear carried by said shaft, a second toothed gear meshing with the other one, a feeder for supplying material to the basket, a universal connection between said second toothed gear and the feeder, a spring-actuated carrier for said second toothed gear, and detent fingers carried by the basket for engaging said carrier and normally holding the said toothed gears in mesh.

4. In an automatic weighing-machine, the combination of weighing mechanism including a basket, a feeder for supplying material to said basket, a driving member, a driven member actuated by said driving member, a universal connection between said driven member and the feeder, a shiftable carrier for said driven member, and means controlled by the weighing mechanism for normally maintaining said driving and driven members in operative relation.

5. In an automatic weighing-machine, the combination of weighing mechanism including a basket, a feeder for supplying material to said basket, a driving member, a driven member actuated by said driving member, and operatively connected with the feeder, a rock-shaft having an arm carrying said driving member, means connected with said rock-shaft and tending normally to shift the same, a second arm on the rock-shaft, and a detent operative with the weighing mechanism for engaging said arm.

6. In an automatic weighing-machine, the combination of weighing mechanism including a basket, a feeder for supplying material to said basket, coöperating power-transmitting members, a rock-shaft having an arm carrying one of said power-transmitting members, a spring connected with said arm, a second arm on said rock-shaft, and a detent adjustably engaging said second rock-arm.

7. In an automatic weighing-machine, the combination of weighing mechanism including a basket, a feeder for supplying material to said basket, coöperating power-transmitting members one of the latter being operatively connected with the feeder, a shiftable spring-actuated carrier for the driven member, and detent means operative with the weighing mechanism for holding said carrier.

8. In an automatic weighing-machine, the combination of weighing mechanism including a basket, a feeder for supplying material to said basket, intermeshing gears, a shiftable carrier for one of the gears, the gear that is supported by said carrier being operatively connected with the feeder, a spring connected with said carrier, and a detent on the weighing mechanism for holding the carrier.

9. In an automatic weighing-machine, the combination of weighing mechanism including a basket, an endless conveyer, a hopper over said conveyer, intermeshing gears, a shiftable carrier for one of the gears, the gear on said carrier being operatively connected with said conveyer, a spring connected with said carrier, a detent controlled by the weighing mechanism for holding said carrier, and a discharge-hopper to receive the material from said basket.

10. In an automatic weighing-machine, the combination of weighing mechanism having a basket, a continuously-operable shaft, a feeder for delivering material to said basket, coöperating driving and driven elements connected respectively with the shaft and the feeder, a spring-actuated carrier for the driven element, means controlled by the weighing mechanism for holding said carrier in position to maintain said elements in working relation, and means actuated by said shaft for positively discharging the basket.

11. In an automatic weighing-machine, the combination of weighing mechanism having a basket, a continuously-operable shaft, a feeder for delivering material to said basket, coöperating driving and driven elements connected respectively with the shaft and the feeder, a spring-actuated carrier for the driven element, means controlled by the weighing mechanism for holding said carrier in position to maintain said elements in working relation, a pair of driving-wheels carried by said shaft, and driven wheels upon opposite sides of the basket adapted for engagement by the driving-wheels and having notches in proximity to the respective driving-wheels.

12. In an automatic weighing-machine, the combination of a beam, a basket, hangers connected to the basket, bezes on the beam through which said hangers project such portions of the hangers being threaded, nuts on the threaded portions of the hangers having heads inclosed by said bezes, coiled springs on the threaded portions of the hangers resting on the bezes, and relatively fixed means on the hangers engaging the upper ends of the springs.

706,566. URINAL. HERMAN D. JAMES, Saginaw, Mich. Filed May 11, 1901. Serial No. 59,723. (No model.)

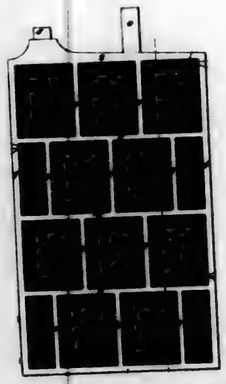
Claim.—1. A hood for urinals having a curved top for supporting the body of the user; inclosing sides; and substantially horizontal flaring portions at the lower ends of the inclosing sides, said flaring portions having curved front edges, for the purposes set forth.

2. A hood for urinals having a top provided with a curved front edge; inclosing sides having substantially vertical front edges; and substantially horizontal flaring lower portions having curved front edges, for the purposes set forth.

706,567. TELEPHONE-CABLE CONNECTION. THOMAS P. JOHNS, Olyphant, Pa. Filed June 27, 1901. Serial No. 66,261. (No model.)

Claim.—In a device of the character described, the combination of a casing comprising two tubular parts adapted to receive the spliced wires and contracted portions on the outer ends of the tubular parts, of a covering wrapped around the wires and occupying the space between the wires and the interior of the tubular parts, and means carried by the tubular parts whereby the other ends thereof may be brought together and the covering compressed, substantially as described.

706,568. ELECTRODE FOR STORAGE BATTERIES. CHARLES W. KEMMERT, Rutledge, Pa. Filed July 30, 1901. Serial No. 70,240. (No model.)



Claim.—1. As a new article of manufacture, a grid for storage-battery electrodes comprising a frame provided with recesses to receive the material to become active and having series of horizontal and vertical members forming said recesses, each of said vertical members being disposed opposite one or more of said recesses and serving to resist the pressure caused by the expansion of the active material during the "forming" period.

2. As a new article of manufacture, a grid for storage-battery electrodes comprising a frame provided with recesses to receive the material to become active, a series of horizontal cross-bars carried by said frame, and a series of vertical connecting-pieces forming with said cross-bars, the recesses for the active material, each series of vertical pieces being so disposed that those of no two adjacent series are directly opposite each other, substantially as and for the purpose set forth.

3. As a new article of manufacture, an electrode for storage batteries comprising a frame provided with recesses to receive the material to become active, horizontally-disposed strips forming the material to become active arranged in said recesses and spaced apart to permit expansion, and horizontal bars and vertical pieces connected with the frame and forming said recesses, said vertical pieces being arranged opposite the spaces adapted to contain the masses of active material and serving to resist the pressure due to the expansion of the same when "forming."

4. As a new article of manufacture, an electrode for storage batteries comprising a frame having recesses for the reception of the material to become active, horizontal and vertical members carried by said frame and forming said recesses, the vertical members being disposed opposite the spaces above and below the same, horizontally-disposed lead strips arranged in said spaces and forming the material to become active, and means carried by the vertical members whereby said strips may be retained in position within the frame, but free to expand during the "forming" period.

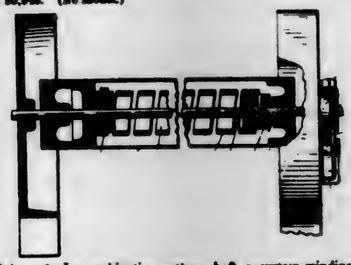
5. As a new article of manufacture, an electrode for storage batteries, comprising a frame having recesses for the reception of the material to become active, and lead strips arranged in sets or groups and forming the material to become active, said strips comprising pieces of different thickness horizontally arranged within the electrode, and so confined therein as to permit expansion during the "forming" period, substantially as described.

6. The combination in an electrode for secondary batteries of the frame having recesses to receive the material to become active, vertical members forming the side walls of said recesses, said members having grooves on their inner sides and projecting portions upon one outer face, and lead strips forming the material to become active and having projections at their ends adapted to the grooves of the vertical members, said strips being held in place by the bending over of the projecting portion of the vertical members of the frame.

7. In combination with an electrode of the character described, a lead strip bent or shaped to form a supporting-trough and adapted to have its surface acted upon by a chemical agent whereby it may be rendered active, and a thinner lead strip capable of being entirely reduced by electrochemical action to form the active material and carried by the bent strip, the walls of said bent strip being perforated for the passage of the electrolyte.

8. Material to become active for use in electrodes wherein such material is rendered active by electrochemical action, comprising strips of lead arranged in series of different thickness and alternating with each other throughout said electrodes, the thinner strips being entirely reduced during the electrochemical action, while the thicker strips, alternating with the same, have only their surfaces acted upon and serve as a supporting medium for the rest of the active material.

706,569. SPRING-ROLLER FOR FIREPROOF BLINDS, &c. WILLIAM B. KINNEAR, Columbus, Ohio. Filed Dec. 13, 1901. Serial No. 85,948. (No model.)



Claim.—1. In combination with a shaft, a curtain-winding drum supported to revolve thereon, a spring secured between the drum and the shaft for counterbalancing the curtain in its normal raising and lowering, means fusible on a dangerous rise of temperature for holding said shaft stationary until released by such dangerous rise of temperature without interfering with the normal raising and lowering of the curtain.

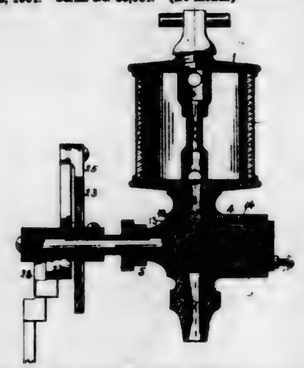
2. In combination with a shaft, a curtain-winding drum supported to revolve thereon, a spring between the drum and the shaft to counterbalance the curtain in its normal raising and lowering, and fusible means for automatically liberating said drum upon a dangerous rise of temperature, said fusible means when in place not interfering with the normal raising and lowering of the curtain.

3. In combination with the shaft of a spring-roller for fire-resisting curtains, an arm fixed to said shaft, a movable abutment for said arm and means fusible on a dangerous rise of temperature to liberate said abutment.

4. In combination with the shaft of a spring-roller for fire-resisting curtains, an arm fixed to said shaft, a movable abutment for said arm, a support for said abutment and fusible means for liberating said support upon a dangerous rise of temperature.

5. In combination with the shaft of a spring-roller for fire-resisting curtains, an arm fixed to said shaft, a movable abutment for said arm, a fixed support for said abutment, a supplementary support for said abutment held by means fusible on a dangerous rise of temperature.

706,570. LUBRICATOR. OLIVER G. KIPP, Rochelle, Ill. Filed Apr. 15, 1901. Serial No. 55,961. (No model.)



Claim.—1. The combination of an oil-reservoir, an outlet-passage leading from the reservoir, a cylindrical opening having a communication with the outlet-passage, a discharge-opening leading from the cylindrical opening, a cap for the cylindrical opening, a head located within the cylindrical opening having a shaft extension, means for imparting an intermittent rotary movement to the shaft, the head having a series of lengthwise chambers each having an opening through the periphery of the head, each chamber having a plunger, a spring for each plunger moving it in one direction and a cam moving the plungers in the opposite direction.

2. The combination of an oil-reservoir, an outlet-passage leading from the reservoir, a cylindrical opening having a communication with the outlet-passage, a discharge-opening leading from the cylindrical opening, a cap for the cylindrical opening, a head located within the cylindrical opening having a shaft extension, means for imparting an intermittent rotary movement to the shaft, the head having a series of lengthwise chambers each having an opening through the periphery of the head, each chamber having a plunger, a spring for each plunger moving it in one direction and a cam moving the plungers in the opposite direction, the cam being adjustable.

706,571. COFFEE-ROASTER. FRANK KRUX, San Francisco, Cal. Filed Feb. 27, 1902. Serial No. 96,260. (No model.)

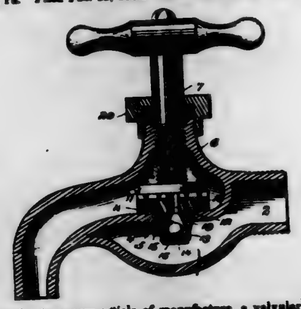
Claim.—In a coffee-roaster, a rotary drum having a feed-opening and a door therefor, of a shaft fixed in relation to the drum and turning

therewith, a wing secured to the shaft and disposed opposite the opening in the drum, another wing secured to the drum on the opposite side from the said opening, and inclined wings each located substantially a quadrant's distance from the wings aforesaid, said inclined wings extending from opposite ends of the drum toward each other and with their angles of inclination opposed and their respective ends being rounded and terminating short of opposite ends or heads of the drum.

706,572. LAMP-EXTINGUISHER. LEROY D. LAWRENCE, Parsons, Kans. Filed Mar. 5, 1902. Serial No. 96,869. (No model.)

Claim.—In combination with a burner having a perforated top, a wick-tube and wick-operating shaft, a flame-extinguishing plate having ears which are perforated and journaled on said shaft, said plate having a play in an elongated aperture in said perforated top of the burner, a perforated sliding plate having an elongated slot to receive said extinguishing-plate, and adapted to slide upon the perforated top of the burner, and a tubular key for throwing the extinguishing-plate over the wick-tube, and a spring for returning said extinguishing-plate to its normal position, as set forth.

706,578. COCK OR FAUCET. ROBERT F. LEDBAY, Greenville, S. C., assignor to Samuel C. Keenon, Clarksville, Pa., and John S. Leslie, Sharon, Pa. Filed Feb. 15, 1901. Serial No. 47,309. (No model.)



Claim.—1. As a new article of manufacture, a valvular device for controlling the exit of water from and the admission of air to the water-inlet side of a cock or faucet, formed separate from the key or stem of the cock or faucet and to have a non-threaded engagement therewith, said valvular device consisting essentially of a main body portion having a flange or head from which it depends, said flange or head being designed to rest upon the diaphragm of the cock or faucet and said body to extend through the opening therein and being formed relatively to the wall of said opening to leave a water-passage between it and said wall when it is elevated, said valvular device being also formed with longitudinal and lateral openings for the admission of air from the spout of the cock or faucet to the water-inlet side thereof and having a valve in said longitudinal opening arranged and constructed to be upheld to its seat therein by the pressure of water in the cock or faucet, substantially as described and for the purpose set forth.

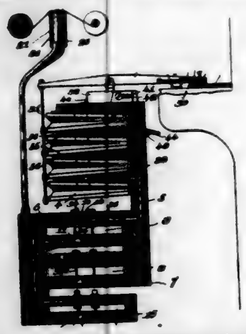
2. As a new article of manufacture, a valve for cocks or faucets, formed separately from the key-stem of the cock or faucet and comprising an externally-tapered body having a longitudinal opening, a flange projecting from said body and adapted to rest upon the diaphragm of the cock or faucet, said flange having openings through which the opening in said body communicates with the spout, and a valve seated in the opening in said body and adapted to be held to its seat therein by the pressure of water at the inlet side of the diaphragm of the cock or faucet, for the purpose specified.

3. The combination with a cock or faucet having a diaphragm formed to provide an opening and having its key-stem provided with a disk at its lower end, of a valve formed separately from said stem and adapted to close said opening, said valve having a valved inlet air-passage therethrough and a head formed with grooves leading to said passage, said head being engaged with said disk, substantially as described and for the purposes set forth.

4. The combination with the key-stem and body of a cock or faucet, said body having its diaphragm formed to provide an opening, of a valvular device for controlling the passage of water through said opening and for admitting air to the water-inlet side of cock or faucet from the spout thereof, said valvular device being formed separate from said key-stem and having a non-threaded engagement therewith, and consisting essentially of a main body portion having a head from which it depends and which rests upon said diaphragm, said body portion extending through said opening and being formed relatively to the wall thereof to provide a water-space between them, and having a longitudinal air-passage and a valve in said passage upheld to its seat therein by the pressure of water, said valvular device having openings through which its passage communicates with the spout of the cock or faucet, substantially as described and for the purposes specified.

5. The combination with the body of a cock or faucet, having its diaphragm formed to provide an opening, and a key-stem, provided with a disk at its lower end, of a valve formed separately from said stem and adapted to close said opening, said valve comprising a body portion of externally-tapered form projecting through said opening and having an air-passage through it, a valve in said passage held to its seat by the pressure at the water-inlet side of the cock or faucet, and a head having openings leading to said passage, said head being engaged with said disk and designed to be seated upon said diaphragm.

706,574. PNEUMATIC PIANO-PLAYER. SAMUEL B. LOCKLIN, Boston, Mass. Filed Aug. 10, 1901. Serial No. 71,560. (No model.)



Claim.—1. In an automatic piano-player, a series of fingers adapted to operate the keys of the piano, and automatic finger-operating mechanism, each of said fingers having integral therewith a yieldable projection carrying a hammer, and an adjusting device in the end of each finger constructed to adjust the said projection relative to the finger.

2. In an automatic piano-player, a series of fingers adapted to operate the keys of the piano, and automatic finger-operating mechanism, each of said fingers being divided at the hammer end, a hammer secured directly to one part of each of said fingers, and means to adjust that portion of the finger to which the hammer is attached relative to the body of the finger.

3. In an automatic piano-player, a series of fingers adapted to operate the keys of the piano, and automatic finger-operating mechanism, the hammer ends of each of said fingers being forked, a hammer secured directly to one arm of the fork, and an adjusting-screw in the other arm thereof and engaging the first-named arm, whereby the hammer may be adjusted vertically relatively to the finger.

4. In an automatic piano-player, a series of fingers adapted to operate the keys of a piano, and automatic finger-operating mechanism, the hammer end of each finger being forked, one arm of said fork having a hammer secured directly thereto, and an adjusting-screw in the other arm of the fork and engaging the first-named arm, whereby each hammer may be adjusted vertically relatively to its supporting-finger.

5. In an automatic piano-player, a series of fingers to operate the piano-keys, a hinged carrier to which said fingers are pivoted, means to positively turn said carrier about its pivot to raise all of the fingers bodily from the piano-keys, said means comprising an actuating-lever pivoted to a fixed support, and having a cam-slot eccentric to the pivot of the lever, and a stud on the carrier engaging said slot, the turning of the lever about its pivot operating to positively turn said carrier about its axis.

6. In an automatic piano-player, a series of fingers to operate the piano-keys, a hinged carrier to which said fingers are pivoted, means to positively turn said carrier about its pivot to raise all of the fingers bodily from the piano-keys, said means comprising an actuating-lever pivoted to a fixed support, and having a cam-slot eccentric to the pivot of the lever, and a stud on the carrier engaging said slot, said slot having a locking-recess at one end into which the stud enters, the construction being such that the turning of the lever about its pivot operates to positively turn said carrier about its axis, the said stud when the carrier is in its operative position entering the locking-recess to lock the carrier in such position.

7. In an automatic piano-player, a series of fingers to operate the piano-keys, a hinged carrier to which said fingers are pivoted, a lever having an inclined slot therein and pivoted to a fixed support, and a stud on the carrier engaging the slot, whereby the carrier may be turned to raise the hammer end of all the fingers from the keys simultaneously, said slot operating to lock the carrier in its operative position.

8. In an automatic piano-player, a series of fingers to operate the piano-keys, a hinged carrier to which said fingers are pivoted, and means to positively turn said carrier about its pivot to raise all of the fingers bodily from the piano-keys, said means comprising an actuating-lever pivoted to a fixed support and having a pin-and-slot connection with the carrier, the turning of the lever about its pivot operating to positively turn the carrier in either direction.

9. A pneumatic for a pneumatic piano-player, comprising two opposed side pieces of inflexible material movable toward and from each other, and a strip of flexible material secured to the edges of each of said side pieces and extending inwardly toward the center thereof, the inner edges of said strips being secured together, and a frame-like stiffener connected to said inner edges, said stiffener being smaller than the side pieces.

10. A pneumatic for a pneumatic piano-player, comprising two opposed side pieces of inflexible material hinged together at one end, a strip of flexible material extending around each side piece and secured to the edges thereof, said strips extending inwardly from their point of attachment with the side pieces, the inner edge of one strip being secured to that of the other strip, to make an inwardly-extending fold.

11. A pneumatic for a pneumatic piano-player, comprising two pieces of inflexible material hinged together at one end, a strip of flexible material extending around each side piece and secured to the edges thereof, said strips each being folded inwardly toward the center of the pneumatic, a part of the inwardly-extending portion of one strip being secured to that of the other strip, and an apertured stiffening-piece secured to the inward edges of said strips, said stiffening-piece being smaller than the side pieces.

12. In an apparatus of the class described, a series of pneumatics, a flat-faced support for the same, headed studs in the flat face of said support, a forked projection on one end of each pneumatic adapted to embrace one of said studs, a slotted clip on the other end of each pneumatic, to embrace the end of the support, and also a headed stud thereon, whereby each pneumatic may be detached from the said support.

13. In an apparatus of the class described, a series of pneumatics, means to support the same, each of said pneumatics having at one end forked projections embracing headed studs on the supporting means, and at the other end a clip to embrace the end of the support, whereby said pneumatics may be detached from the supporting means.

14. In an apparatus of the class described, a series of pneumatics, supporting means therefor, each of said pneumatics having at one end forked projections embracing headed studs on the supports, and at the other end a slotted clip embracing a stud in the end of the support, the end of said clip being bent over the upper edge of the support.

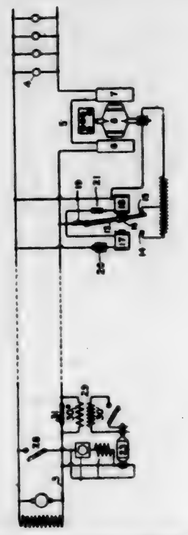
15. A valve for a pneumatic piano-player comprising a screw-threaded stem and a valve screw-threaded thereon, said valve comprising a facing of yielding material such as felt, and a backing of some suitable stiffened material, said backing being out of contact with the valve-stem, and an intermediate layer of tough flexible material which has a screw-threaded engagement with the stem, whereby said valve may have a bodily movement transversely to the stem.

16. A valve for a pneumatic piano-player comprising a screw-threaded valve-stem, and two independent valve-sections adjustably secured thereto, said valve-sections each comprising a facing of yielding material, a backing of stiffened material, said backing having an enlarged aperture through which the stem passes, and an intermediate layer of fibrous flexible material, said intermediate layer having a screw-threaded engagement with the valve-stem, whereby said valve may have a bodily movement transversely of the stem.

17. A compensating spool for perforated music comprising a body portion having screw-threaded ends, journal-pins extended from the ends thereof, and concavo-convex flanges or heads having screw-threaded sockets engaging said screw-threaded ends and central apertures through which said journal-pins project.

18. A compensating spool for perforated music comprising a body portion having screw-threaded ends, concavo-convex flanges or heads having screw-threaded sockets to receive said screw-threaded ends, and means independent from the heads for supporting the spool for turning movement.

706,575. MULTIRATE-METERING SYSTEM. ALEXANDER D. LOEB, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Jan. 31, 1901. Serial No. 46,488. (No model.)



Claim.—1. The combination of means for metering electric current of a given character, with means controlled by current of a different character for changing the rate of registration or metering.

2. The combination of a direct-current meter, and means controlled by an alternating electromotive force for changing the rate of the meter.

3. The combination of a circuit-changing switch, a magnet responsive to current of a given frequency for urging the switch in one direction, another magnet responsive to current of a different frequency for actuating the switch in the opposite direction, and a means operative at will for supplying said magnets with alternating current of either frequency.

4. The combination of an electric meter for measuring current of a given character, and means controlled by current of a different character for changing the rate of registration of the meter.

5. The combination of a direct current-distribution system, a switch-actuating circuit connected thereto, and means for impressing an alternating electromotive force on said system.

6. The combination of a direct-current-distribution system, a meter connected thereto, and a switch responsive to alternating electromotive force for altering the resistance of the armature-circuit of said meter.

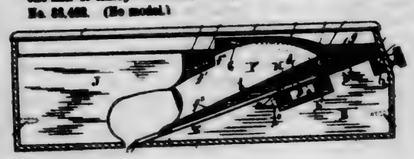
7. The combination of a distribution system, a meter connected thereto, a switch movable in opposite directions by alternating electromotive forces of respectively different frequencies, and means controlled by said switch for altering the rate of registration of said meter.

8. The combination of an electric meter, a device sensitive to alternating currents of different frequencies for changing the rate of the meter, and means for supplying alternating currents of selected frequencies to said device.

9. The combination of a direct-current-distribution system, means for impressing alternating currents of selected frequencies upon said system, and a circuit-changing switch responsive to said alternating current.

10. The combination of a distribution system, means for impressing alternating currents of selected frequency upon said system, and a circuit-changing switch responsive to said alternating current.

706,576. PLANE. AXEL L. LUNDGREN, Pullman, Ill., assignor of one-half to Harry W. Wirth, Chicago, Ill. Filed Jan. 4, 1902. Serial No. 88,468. (No model.)



Claim.—1. In a plane, having flat side walls and connecting end walls, inclosing the operative mechanism and having an escape-opening in its sides and a mouth in its sole, a bed having an inclined upper face, a bit resting against the inclined upper face of the bed and projecting through the mouth in the sole, a clamping lever-block lying between and in close contact with the side walls of the hollow stock, a flat spring connected to the clamping lever-block and projecting rearwardly therefrom having its free end in contact with the bed, an abutment for the upper face of the clamping lever-block extending between the side walls, and a cam-headed lever pivoted at the rear end of the clamping lever-block and operating within a slot in the top thereof to have its cam-head contact with the flat spring, whereby the spring under tension is forced against the bed raising the clamping lever-block against the abutment and forcing down the bit, substantially as described.

2. In a plane, the combination of a holder stock or frame having flat side walls and connecting end walls inclosing the operating mechanism and having an escape-opening in its sides and mouth and in its sole, a bed having an inclined upper face, a bit resting against the inclined face of the bed and projecting through the mouth in the sole, a clamping lever-block lying between and supported against lateral movement by the side wall of the stock having a forwardly-projecting bearing-plate attached to its bottom, a rearwardly-projecting spring attached to the bearing-plate, having its free end in contact with the bed, an abutment for the upper face of the clamping lever-block carried between the side walls of the stock, a bearing-screw, screw-threaded through the abutment for contact with the upper face of the clamping lever-block and a cam-headed lever pivoted at the rear end of the clamping lever-block and operating within a slot in the top thereof to contact with the spring whereby the spring under tension is forced against the bed, raising the clamping lever-block against the abutment forcing the forward end of the bearing-plate against the bit at a single point, substantially as described.

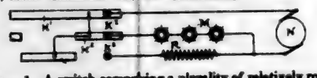
3. In a plane, the combination of a hollow stock or frame having an escape-opening in its sides and a mouth in its sole, a bed having an inclined upper face with a recess therein, an adjusting-screw projecting through the recess in the bed, a traveling nut carried by the adjusting-screw and operating within the recess, a bit resting against the inclined face of the bed and carried by the traveling nut, and projected through the mouth in the sole, a clamping lever-block supported against lateral movement by the side walls of the hollow stock having a bearing-plate attached to its bottom, a rearwardly-projecting flat spring attached to the bearing-plate and having its free end in contact with the bed an abutment for the upper face of the clamping lever-block, and a cam-headed lever pivoted to the lever-block and contacting with the spring whereby the spring under tension is forced against the bed and the clamping lever-block against the abutment and the bearing-plate against the bit at a single point, substantially as described.

4. In a plane, the combination of a hollow stock or frame, a bed having an inclined upper face with a recess therein, an adjusting-screw projecting through the recess in the bed, a traveling nut carried by the adjusting-screw and operating within the recess, a bit resting against the inclined face of the bed and carried by the traveling nut and projecting through the mouth in the sole, a clamping lever-block having a forwardly-projecting plate attached to its bottom, a rearwardly-projecting flat spring attached to the bearing-plate and having its free end in contact with the bed, an abutment for the upper face of the clamping lever-block, a bearing-set screw-threaded through the abutment for contact with the clamping lever-block, and a cam-headed lever pivoted at the rear end of the clamping lever-block and operated within a slot therein to contact with the flat spring whereby the spring under tension is forced against the bed raising the clamping lever-block against the abutment and the adjusting-screw and forcing the forward end of the bearing-plate against the bit at a single point, substantially as described.

5. In a plane, the combination of a hollow stock or frame having an escape-opening in its sides and a mouth in its sole, and having its upper rear corner inclined or beveled, a bed within the stock or frame having an inclined upper face with a forward recess therein, and a rear recess in the rear upper corner of the bed leaving a bearing-leg between the recesses, an adjusting-screw projecting through the beveled rear wall of the stock and the leg in the bed and through the recesses therein, a traveling nut provided with an upwardly-extending pin and carried by the adjusting-screw to operate within the forward recess, a bit resting against the inclined face of the bed and carried by the pin on the traveling nut, a clamping lever-block having a forwardly-projecting bearing-plate attached to its bottom, a rearwardly-projecting flat spring attached to the bearing-plate and having its free end in contact with the bed, an abutment for the upper face of the clamping lever-block, a bearing-screw screw-threaded through the abutment for contact with the clamping lever-block, and a cam-headed lever pivoted at the rear end of the lever-block and lying when forced down within a slot in the top of the lever-block and having its cam-head in contact with the flat spring whereby the spring under tension is forced against the bed raising the clamping lever-block against the bearing-screw and forcing the forward end of the bearing-plate against the bit at a single point, substantially as described.

6. In a plane, the combination of a hollow stock or frame having an escape-opening in its sides and a mouth in its sole, and having its upper rear corner inclined or beveled, a bed within the stock or frame having an inclined upper face with a forward recess therein, and a rear recess in the rear upper corner of the bed leaving a bearing-leg between the recesses, an adjusting-screw projecting through the beveled rear wall of the stock and the lug in the bed and through the recesses therein, a head on the adjusting-screw contacting with the outer face of the beveled corner, a traveling nut provided with an upwardly-extending pin and carried by the adjusting-screw to operate within the forward recess, a bit resting against the inclined face of the bed and carried by the pin on the traveling nut, a clamping lever-block supported against lateral movement by the side walls of the hollow stock having a forwardly-projecting bearing-plate attached to its bottom, a rearwardly-projecting flat spring having its free end in contact with the bed, an abutment for the upper face of the clamping lever-block, a bearing-screw screw-threaded through the abutment for contact with the clamping lever-block, a cam-headed lever pivoted at the rear end of the clamping lever-block and operating within a slot in the top thereof to contact with the flat spring whereby the spring under tension is forced against the bed raising the clamping lever-block against the bearing-screw and forcing the forward end of the bearing-plate against the bit at a single point, a filling-block in the forward end of the stock or frame, and a cap fitting within the top of the stock or frame, substantially as described.

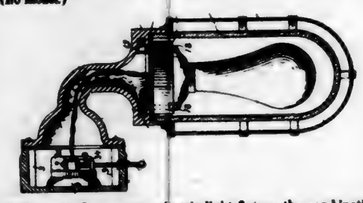
706,577. ELECTRIC SWITCH FOR FLASHING LIGHTHOUSE-LANTERNS. FREDERICK MACKINTOSH, Schenectady, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Jan. 9, 1899. Serial No. 701,676. (No model.)



Claim.—1. A switch comprising a plurality of relatively rotary contacts, a drive-shaft, a gear-train connecting the same with the rotary switch element, and an adjustable journal for one of the gear-wheels to permit changeable gearing to vary the rate of change in the control-circuit.

2. A switch comprising a rotary contact, a spring-brush bearing thereon, an offset at the end of the contact to permit the brush to snap out of engagement, and a cushion of yielding material on the rotary contact to arrest the snapping movement of the brush.

706,578. MARINE ELECTRIC-LIGHT FIXTURE. GEORGE I. MARTIN, New York, N. Y. Filed Dec. 10, 1900. Serial No. 39,414. (No model.)

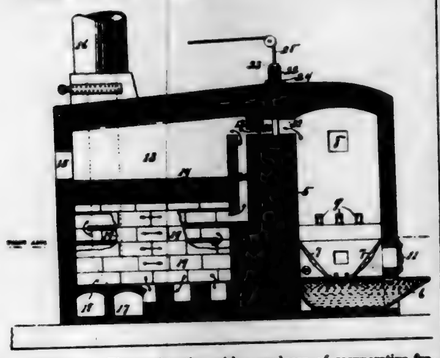


Claim.—1. In a marine electric-light fixture, the combination with an outlet-box of a bracket secured thereto in a water-tight manner, said bracket consisting of a base, a contracted neck, and a head formed of one piece of metal, said head being provided with a socket adapted to receive a globe, a seat for a gasket beneath said globe, and a seat for a lamp-socket, as and for the purpose set forth.

2. In a marine electric-light fixture, the combination with an outlet-box of a bracket consisting of a head, neck, and base formed of one piece of metal, said head being provided with an internal, integral flange, and with integral posts, as 19, extending from points adjacent to the neck and having the ends thereof in a plane parallel with said flange, as and for the purpose set forth.

3. In combination with a marine electric-light fixture, a switch comprising a base, a plate supported thereon by legs, a shaft rotatably mounted adjacent to one of said legs, a jointed shaft passing through a stuffing-box in the outlet-box, and through the other leg, and provided at the inner end with an inclined face adapted to bear against said first shaft, a spring adapted to hold said inclined face in contact with said first shaft, a block rotatably mounted on said second shaft, and plates on said base, provided with binding-posts, as and for the purpose set forth.

706,579. COMBINED GAS-PRODUCER AND RECUPERATIVE FURNACE. ARTHUR J. MASSEY, Martins Ferry, Ohio. Filed May 21, 1902. Serial No. 108,301. (No model.)



Claim.—1. The combination with a producer, of recuperative furnaces arranged at each side of the rear end thereof, combustion-chambers in each furnace, separate passages leading from said producer to said combustion-chambers for conveying the gases generated in the producer, and intake-flues for admitting heated air to said combustion-chambers at substantially the same points in which the gases are admitted, substantially as described.

2. The combination with a combined pair and finishing furnace, of a producer, combustion-chambers in each furnace, distributing-chambers intermediate the producer and the furnaces, dampers for regulating the supply of gases to the distributing-chambers, intake-flues for supplying heated air to the combustion-chambers, and escape-flues leading from said combustion-chambers and arranged intermediate the intake-flues to heat the air as it passes through said intake-flues, substantially as described.

3. The combination with a producer in which combustion of the fuel takes place slowly, of a longitudinal chamber 30 for receiving the combustible gases resulting from the decomposition of the fuel in the producer and adapted for distributing the said gases throughout its length, a combustion-chamber into which the combustible gases are directed through communicating ports, and passages for admitting heated air to the combustion-chamber, the said communicating gas-ports and the said air-passages converging at or near the top of the combustion-chamber so as to commingle the air and gases as they enter the combustion-chamber, substantially as described.

4. The combination with a producer for containing a bed of fuel and having stoke-holes through which said producer is fed, of longitudinal distributing-chambers arranged at the rear of the producer for receiving and distributing the combustible gases from said producer to different points along their lengths, combustion-chambers arranged at the rear of each distributing-chamber for receiving the gases therefrom through ports provided therein, escape-flues for the products of combustion leading from the combustion-chambers, and intake-flues arranged intermediate said escape-flues for admitting heated air to the combustion-chambers, the points of admission for said heated air being in juxtaposition to the gas-discharge ports so as to permit the air and gases to commingle as they enter the combustion-chambers, substantially as described.

5. The combination with a producer for driving off volatile gases from the fuel, of a pair and finishing furnace, a combustion-chamber in each furnace, communicating passages between the producer and said combustion-chambers, means for regulating and controlling the supply of gases from the producer to the combustion-chambers, a plurality of intake-flues for supplying heated air to said combustion-chambers, which intake-flues are arranged in parallel rows some distance apart, each row consisting of a number of tiers of fire-brick tiling, escape-flues leading from said combustion-chambers to the stack, said escape-flues being intermediate the intake-flues and adapted to heat the air as it passes through said intake-flues, substantially as set forth and described.

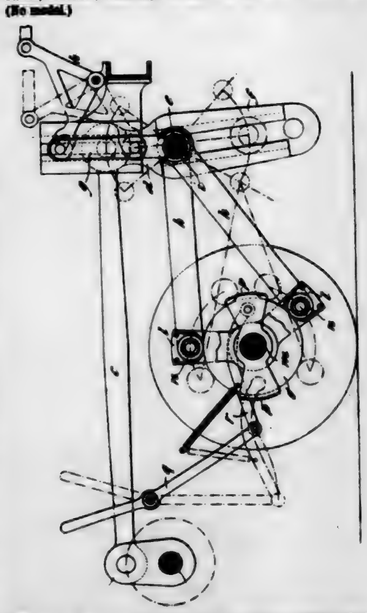
6. In a combined gas-producer and pair and finishing furnaces, the combination with the producer for driving off volatile gases from the fuel, of communicating chambers extending the entire lengths of the pair and finishing furnaces and adapted for distributing the gases throughout their lengths, combustion-chambers communicating with said first-mentioned chambers through a plurality of ports, and a plurality of passages for supplying heated air to the combustion-chambers, said air-passages opening into said combustion-chambers directly underneath the said communicating gas-ports so as to commingle the air and gases as they enter the combustion-chambers, substantially as described.

7. The combination with a recuperative pair and finishing furnaces, of a producer arranged in connection therewith at the rear thereof, combustion-chambers in each furnace, distributing-chambers arranged intermediate the combustion-chambers and the producer, dampers between the producer and the distributing-chambers for regulating the supply of gases from the producer, intake-flues in said furnaces for supplying heated air to the combustion-chambers, and escape-flues for the products of combustion leading from the combustion-chambers and arranged intermediate said intake flues, whereby the air passing through the intake-flues is heated in its passage, substantially as described.

8. The combination with a producer for generating combustible gases, and having means for regulating and controlling the admission of air to support combustion therein, of said producer having openings therein through which the fuel may be stabilized to secure slow combustion, a combustion-chamber, a distributing-chamber for receiving the combustible gases resulting from the decomposition of fuel in the producer, said distributing-chambers being located between said producer and combustion-chamber and provided with ports adapted for discharging the gases from the producer to the combustion-chamber at different points along its rear side, intake-flues for supplying heated air to the combustion-chamber, the intake-flues and the gas-ports discharging their contents together so as to commingle the air and gases as the enter the combustion-chamber, substantially as described.

9. The combination with two separate furnaces having a common dividing-wall, and a stack in common between them, of a gas-producer arranged in connection therewith and adapted for supplying combustible gases resulting from the decomposition of fuel therein to both furnaces; a longitudinal chamber located at the rear of each of said furnaces and communicating with said producer, said longitudinal chamber adapted for distributing the gases supplied thereto throughout its entire length; a combustion-chamber in each of said furnaces, into which the combustible gases are discharged through a plurality of ports from the distributing-chamber; and intake-flues in each furnace for supplying heated air to the combustion-chamber, said intake-flues discharging the heated air directly underneath the ports for the entrance of the gases so as to mix the air and gases as they enter said combustion-chamber, substantially as shown and described.

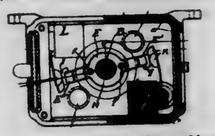
706,580. DRIVING-GEAR FOR VARYING SPEED AND REVERSING. WILLIAM MESSMER-SMITH and GEORGES F. MESSMER-SMITH, Dresden, Germany. Filed Jan. 10, 1902. Serial No. 89,159. (No model.)



Claim.—Gear for varying speed comprising a driving-shaft having a crank, a rocking shaft and arms operated by said crank, an adjustable pin in slots of the rocking arms, arms connected to the adjustable pin and arranged to rock free on a driven shaft, cams on the latter arms arranged

to engage with and drive by friction a disk on the driven shaft, toothed segments loosely mounted on the driven shaft, means for swinging said segments, and teeth on the cam-rollers arranged to reverse the movement substantially as described.

706,581. ELECTRIC SWITCH. FRANK A. MERRICK, Johnstown, Pa., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed June 26, 1901. Serial No. 66,105. (No model.)



Claim.—1. In an electrical switch, the combination of an inclosing casing having vent-openings in one wall thereof, a rotary drum of conducting material journaled in said casing and insulated therefrom, said drum having two sets of contacts, and a set of contact-fingers for connection with each set of said contacts, the fingers of each set being connected in multiple with each other, and those fingers of each set nearest the vent-openings being set to retain their contact engagement longer than the other fingers of each set.

2. In an electrical switch, the combination with a rotary body or drum of conducting material carrying two sets of contacts, of two sets of contact-fingers, one set for engagement with each set of contacts, the fingers of each set being all connected in multiple in the switch-circuit, and means for actuating the said drum, said fingers being so arranged that one or more of each set will retain their contact engagement momentarily longer than the remaining fingers.

3. In an electrical switch, the combination with a rotary body or drum having two sets of contacts thereon, of two sets of relatively stationary contact-fingers, one set for engagement with each set of contacts, the fingers of each set being all connected in multiple, and an actuating-handle secured to the shaft or spindle which carries said body or drum, the contact-fingers of each set which are most distant from the said handle being placed to retain their contact engagement momentarily after the others.

4. In an electrical switch, the combination of a casing or inclosure, a shaft or spindle journaled therein, a body or drum of conducting material secured to the said shaft and carrying two sets of contacts, relatively stationary fingers for engagement with each set of contacts, the fingers of each set being connected in multiple, and a handle secured to an exteriorly-projecting end of the shaft or spindle, the wall of the casing at the opposite end thereof from the handle having vent-openings therein, and the contact-fingers adjacent to said openings being set to retain their contact engagement momentarily after the other fingers.

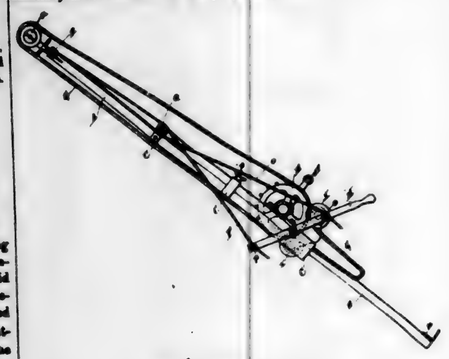
5. In an electrical switch, the combination of a box or casing, a shaft or spindle journaled therein, heads secured to the end portions of said shaft or spindle, a body or drum of conducting material secured to said heads and insulated therefrom and from the shaft or spindle, said body or drum having two radiating contact-carrying wings, a plurality of contact-fingers for engagement with the contacts of said wings, the fingers of each set being connected in multiple, and an actuating-handle for said shaft or spindle.

706,582. BORING-MACHINE. ROBERT R. MILLER, Toledo, Ohio. Filed Sept. 12, 1901. Serial No. 75,141. (No model.)

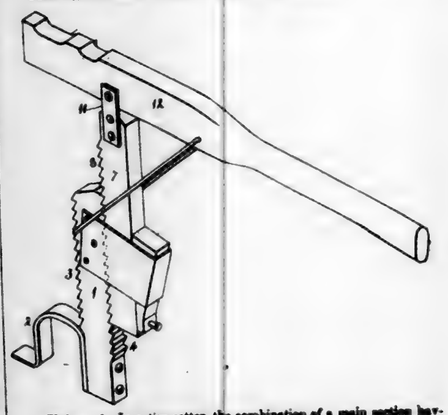
Claim.—1. In a boring-machine for overhead work, the combination of an extensible standard, a sprocket-wheel, E, with guide-wheels I, a sprocket-wheel and cylinder H containing the jaws *f* and mounted in the collar A, a belt-chain connecting the sprocket-wheels, a lever N connected by the cords O and P with the sliding bar W bearing the clamps V and X and the bar U sliding in the lower extension of the clamp V, bearing the idler R, having a right-angled extension through which the bar W slides and which supports the bit-holder and bit, all substantially as set forth.

2. In a boring-machine for overhead work, the combination of an extensible standard A B, a hinged floor-plate M, a lever N attached to cords O and P which pass up over idlers Q and R and are attached to pins S inserted in the clamp V and T inserted in the bar W, a bar U with an upright portion at right angles thereto supporting the boring-bit with its holder and having a slot through which the bar W slides, and a bar W supporting the clamps V and X with a slot in the lower extension of the clamp V through which the bar U slides, all substantially as set forth.

3. In a boring-machine for overhead work the combination of a sprocket-wheel and cylinder H, made to revolve in a collar A and held therein by the disk *c* and screws *d*, having antifriction ball-bearings *i*, and having a rectangular opening two sides of which approach each other toward the disk *c* made to receive the jaws *f*, with the screw *e* and nut *r*, substantially as set forth and for the purposes specified.



706,583. TIRE-SETTER. FRANK W. MITCHELL, Leaf River, Ill. Filed Apr. 14, 1902. Serial No. 102,809. (No model.)



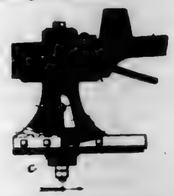
Claim.—1. In a tire-setter, the combination of a main section having teeth on both edges, an adjustable section having teeth engaging the teeth of one of the edges of the main section, a loop secured to the main section encircling the adjustable section, a wedge located in the loop and resting against the adjustable section, a lever having a pivotal connection with the adjustable section, and a bail pivotally connected to the lever and engaging the teeth on one edge of the main section.

2. In a tire-setter, the combination of a main section having teeth on both edges, an adjustable section having teeth engaging the teeth on one of the edges of the main section, a loop secured to the main section encircling the adjustable section, a wedge located in the loop and resting against the adjustable section, a lever having a pivotal connection with the adjustable section, a bail pivotally connected to the lever and engaging the teeth on one edge of the main section, and a foot connected to the lower end of the main section.

3. In a tire-setter, the combination of a main section having teeth, an adjustable section having teeth engaging the teeth of the main section, a loop secured to one of the sections and encircling the other section, a wedge located in the loop, a lever having a pivotal connection with the adjustable section, and a bail forming a connection between the lever and one of the sections.

706,584. CAR-TRUCK. GEORGE C. MURRAY, Chicago, Ill. Filed Mar. 8, 1902. Serial No. 97,253. (No model.)

Claim.—1. In a car-truck of the class described, the combination of transom or bolster columns connected by and with the usual arch-bars, a bolster movably mounted between the same, a spring-seat, rocking levers mounted between the transom-columns and supporting the spring-seat, and spring mechanism interposed between the spring-seat and the ends of the bolster, substantially as described.



2. In a car-truck of the class described, the combination of transom or bolster columns provided with a platform inside the base thereof, a bolster movably mounted between such columns, a spring-plate, spring mechanism interposed between the spring-plate and the ends of the bolster, and independent rocking-lever arms mounted on the base at the bottom and inside the bolster-columns and pivotally engaged with the spring-plates, substantially as described.

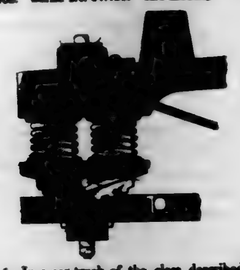
3. In a car-truck of the class described, the combination of transom or bolster columns provided with a platform inside of the base thereof, a bolster movably mounted between such columns, a spring-plate, spring mechanism interposed between the spring-plate and the ends of the bolster, and rocking-lever arms on the base portions of the bolster-columns pivotally engaged with the spring-plates and provided with rocking curved surfaces of greater radius than the distance between the pivots and the curved surfaces, substantially as described.

4. In a car-truck of the class described, the combination of a pair of bolster-columns, toothed platforms arranged inside of such columns, a car-bolster movably mounted between such columns, a spring-plate arranged underneath the bolster and between the bolster-columns, toothed rocking levers mounted on the toothed platforms and pivotally engaged with the spring-plates, and spring mechanism interposed between the spring-plates and the lower surfaces of the ends of the bolster, substantially as described.

5. In a car-truck of the class described, the combination of a pair of bolster-columns, toothed platforms arranged inside of such bolster-columns at or near the base thereof, a car-bolster movably mounted between such transom-columns, spring-plates mounted between such bolster-columns, rocking-lever arms pivotally secured to such spring-plates and provided with curved toothed surfaces resting on the platform of greater radius than the distance between the pivotal points and such toothed surfaces, and spring mechanism interposed between the spring-plates and the lower surface of the bolster, substantially as described.

6. In a car-truck of the class described, the combination of a pair of bolster-columns, arch-bars connecting the same together at their upper and lower ends, toothed platforms arranged inside of such bolster-columns at their base portions, a bolster movably mounted between such transom-columns and provided with guides forming a channel of greater width than the bolster-columns to permit a limited movement thereof, spring-plates arranged underneath the bolster between the bolster-columns and provided with upwardly-extending side arms, toothed levers pivotally engaged by means of trunnions with the arms of the spring-plates and provided with curved toothed rocking surfaces engaging the toothed platforms and formed of curvatures, the radii of which are greater than the distance between such pivotal points and the curved surfaces, substantially as described.

706,585. CAR-TRUCK. GEORGE C. MURRAY, Chicago, Ill. Filed Mar. 11, 1902. Serial No. 97,730. (No model.)



Claim.—1. In a car-truck of the class described, the combination of bolsters or transom-columns, a bolster movably mounted between the same, a spring-plate under each end of the bolster and between the bolster-columns, a platform arranged between the lower ends of such columns under each spring-plate, a plurality of rockers extending parallel with each other transversely of the car arranged directly under and attached to the spring-plates supporting the same and supported on the platform, and spring mechanism interposed between the bolsters and the spring-plates, substantially as described.

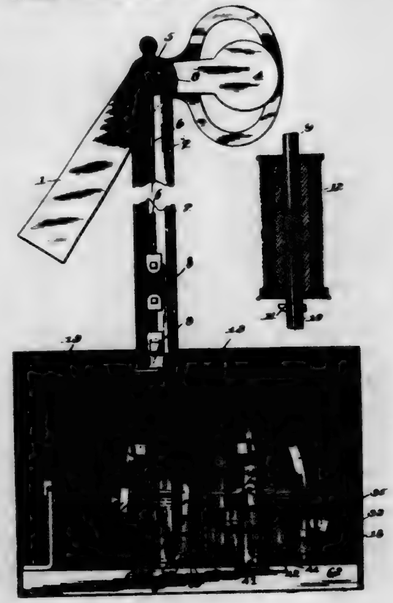
2. In a car-truck of the class described, the combination of bolsters or transom-columns, a bolster mounted between the same, spring-plates under the ends of the bolsters and between the bolster-columns, a toothed platform arranged between the lower ends of each pair of bolster-columns in fixed relation thereto, toothed rockers extending transversely of the car arranged directly under and pivotally attached to the spring-plate and supported on the toothed platform, and spring mechanism between the bolsters and the spring-plates and means for stepping the rocking movement of the rockers and thereby the end thrust of the bolster, substantially as described.

3. In a car-truck of the class described, the combination of bolsters or transom-columns, a bolster movably mounted between the same, spring-plates under each end of the bolsters and between the bolster-columns, spring mechanism between the bolsters and the spring-plates, platforms arranged underneath the spring-plates and between the bolster-columns, and rocker mechanism pivotally connected to the spring-plates mounted upon the platforms and provided with heeled ends which act as stops, substantially as described.

4. In a car-truck of the class described, the combination of bolsters or transom-columns, a bolster movably mounted between the same, spring-plates under each end of the bolster and between the bolster-columns, spring mechanism between the bolster and the spring-plates, a toothed platform under each spring-seat arranged between the lower ends of the bolster-columns, and a plurality of elongated toothed rockers pivotally connected with the under side of the spring-plates to rockingly support the same and act as stops to the movement thereof, substantially as described.

5. In a car-truck of the class described, the combination of bolsters or transom-columns, a bolster movably mounted between the same, spring-plates under each end of the bolster and between the bolster-columns, spring mechanism between the bolster and the spring-plates, a toothed platform under each spring-seat arranged between the lower ends of the bolster-columns, a plurality of elongated toothed rockers pivotally connected with the under side of the spring-plates to rockingly support the same and act as stops to the movement thereof, and shafts for pivotally connecting the spring-plates and rockers together, substantially as described.

706,586. AUTOMATIC ELECTROMECHANICAL SEMAPHORE-SIGNAL. JOHN J. MCGILL, Chicago, Ill., assignor of two-thirds to Eugene W. Richey and Samuel A. Johnson, Chicago, Ill. Filed Aug. 19, 1901. Serial No. 72,049. (No model.)



Claim.—1. In a railway-track signal the combination, of a mechanically-operated connection between said signal and a railway-track whereby said signal is released by the passing train, and mechanically moved to danger position, an electric switch-shifting magnet for controlling the electric circuits of said signal, a motor-magnet for moving and setting said signal to safety position when said magnet is energized, a circuit closed by the passing train for energizing the switch-shifting magnet, and a circuit subsequently closed by the said train for energizing said motor-magnet, substantially as set forth.

2. In a railway-track signal the combination, of a mechanically-operated connection between said signal and a railway-track whereby said signal is released by the passing train and mechanically moved to danger position, an electric switch-shifting magnet, and an electric motor-magnet, a circuit for each magnet, a track-circuit closer for each circuit, a switch for controlling both circuits and adapted to be shifted by the switch-shifting magnet, a means operated by the passing train for energizing the circuit containing the switch-shifting magnet to close the circuit at the switch containing the motor-magnet, and a means operated by the passing train for subsequently energizing said motor-magnet, whereby said signal is moved and set to safety position, substantially as set forth.

3. In a railway-track signal the combination, of a mechanical means, located at one end of a block for setting said signal to "danger" by the passing train, an electric motor-magnet for returning said signal to "safety," a circuit-closer operated by the passing train, located at the other end of the block, a circuit containing said motor-magnet and adapted to be closed by said circuit-closer, a switch-shifting magnet, a circuit containing said shifting-magnet, and a circuit-closer adapted to be operated by the passing train, located intermediate of the first-named circuit-closer and the said mechanical means, for setting the signal, and an electric switch for controlling both circuits operated by the switch-shifting magnet, substantially as set forth.

4. In a railway-track signal the combination, of a track pressure-bar, a semaphore, a motor-magnet adapted to move said semaphore to a position of safety, and to open its own circuit, when energized, a means for retaining the said semaphore in the position to which it is moved by said magnet, and a connection between said pressure-bar and said means adapted to release said semaphore when said pressure-bar is depressed by a passing train, substantially as set forth.

5. In a railway-track signal the combination, of a track pressure-bar, a semaphore adapted to automatically return to the danger position, a solenoid, an armature-core thereof connected to said semaphore and adapted to move it to the safety position, a detent carried by said armature, a lever adapted to engage said detent for retaining said semaphore in said position, a connection between said lever and said pressure-bar, whereby said lever is adapted to be disengaged from said detent, a latch for holding said lever and said detent separated, said latch adapted to be tripped by said armature when said solenoid is energized, and a means for bringing said lever and said detent again into engagement, substantially as set forth.

6. In a railway-track signal the combination, of an electric motor-magnet adapted to move a semaphore to safety position when energized, a retaining device for holding said semaphore in position to which it has been moved by said magnet, a semaphore adapted to automatically return to danger position when so released, a track-bar adapted to be moved by a passing train, and a connection between said bar and said retaining device, for releasing said semaphore, substantially as set forth.

7. In a railway-track signal the combination, of an electric motor-magnet adapted to move a semaphore to safety position when energized, a retaining device for holding said semaphore in position, to which it has been moved by said magnet, a semaphore adapted to automatically return to danger position when so released, a track-bar adapted to be moved by a passing train, a connection between said bar and said retaining device for releasing said semaphore, an electric circuit containing said motor-magnet, and a circuit-controller adapted to be operated by a passing train located near the track at a remote point from the semaphore, substantially as set forth.

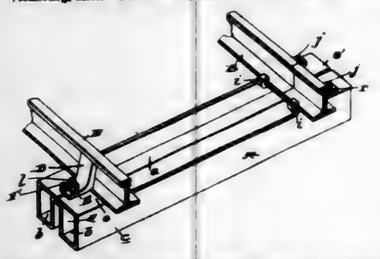
8. In a railway-track signal the combination, of a track pressure-bar adapted to release a semaphore, a semaphore adapted to automatically return to danger position when released, a circuit containing a switch-shifting magnet, adapted to be closed when said semaphore is released, an electric motor-magnet adapted to move said semaphore to safety position when energized, a means for energizing said switch-shifting magnet operated by the passing train, and a switch shifted by said switch-shifting magnet whereby its own circuit is broken, and the circuit containing said motor-magnet is closed and a means operated by the passing train for energizing said motor-magnet, substantially as set forth.

9. In a railway-track signal the combination, in a weatherproof case 12, a tubular support 2, a semaphore mounted upon a crank in the top of said support, an insulated bottom 14, mechanism for operating said semaphore in said case, and a connecting-rod between said semaphore-crank and said mechanism contained within said tubular support, substantially as set forth.

10. In a railway-track signal the combination, of a semaphore, a means for moving said semaphore to safety position, a track-bar adapted to be moved by a passing train, a connection between said track-bar and said semaphore for releasing said semaphore, and a means coacting with said bar to release said semaphore, and adapted to independently release said semaphore in the event of the connection between said bar and said semaphore becoming removed or otherwise inoperative, substantially as set forth.

11. In a railway-track signal the combination, of a track pressure-bar, a semaphore adapted to return to danger position when released, a rod connecting said semaphore and said pressure-bar and adapted to release said semaphore when moved in one direction, and to hold a retaining-lever in position when moved in the other direction, an electric motor for moving said semaphore to safety position, a retaining device for holding said semaphore in the said position, and a spring adapted to displace said retaining device when said bar is removed, substantially as set forth.

706,587. METALLIC SLEEPER OR TIE. JOHN I. NEWSOME, Vicksburg, Miss. Filed Dec. 16, 1901. Serial No. 86,107. (No model.)



Claim.—1. A sleeper or tie formed of sheet metal and comprising a longitudinal central portion of inverted-U shape in cross-section, bottom walls and side walls serving in conjunction with the longitudinal central portion to form channels, and a top wall supported by the longitudinal central portion.

2. A sleeper or tie formed of sheet metal, and comprising a longitudinal central portion of inverted-U shape in cross-section, bottom walls and side walls serving in conjunction with the longitudinal central portion to form channels, and top walls arranged at opposite ends of the sleeper or tie so as to expose the portions of the channels between them; said top walls having their meeting edges arranged on the longitudinal central portion, and being provided with openings to receive rail-fastening devices.

3. The combination of a sleeper or tie having a top wall, a rail arranged on said top wall, a chair-bolt disposed below the top wall and having an upwardly-extending, hook-shaped head at one end engaging one edge of the rail-base and one edge of the top wall, and an arm at its opposite end extending above the top wall at the opposite side of the rail-base with reference to the hook, and a combined rail holder and brace secured on the arm of the bolt and having its upper portion arranged against the under side of the head of the rail so as to support the same.

4. The combination of a sleeper or tie having a top wall provided with an opening, a rail arranged on said top wall, a chair-bolt disposed below the top wall, and having an upwardly-extending hook-shaped head at one end engaging one edge of the rail-base, and one edge of the top wall, and an arm at its opposite end extending upwardly through the opening in the top wall of the sleeper, and provided with a beveled upper edge and the reduced and threaded portion, a rail-holder resting over and beveled in conformity to the rail-base and the edge of the arm of the bolt, and having an aperture receiving the threaded portion of the bolt, and a nut securing the holder on the bolt.

5. The combination with a sheet-metal tie comprising a longitudinal central portion of inverted-U shape in cross-section having apertures *f g* in its top, bottom and side walls serving in conjunction with said longitudinal central portion to form channels, and top walls having their meeting edges arranged on the longitudinal central portion and provided with notches forming an aperture *h* coincident with the aperture *g;* of a rail arranged on the top walls of said sleeper, a chair-bolt arranged in the longitudinal central portion of the sleeper, and having an upwardly-extending hook-shaped head at one end extending through the aperture *f* and engaging the inner ends of the top walls of the sleeper, and one edge of the rail-base, and an arm at its opposite end extending through the apertures *g h* of the sleeper, a rail-holder arranged on said arm and resting over the rail-base, and means for securing said brace on the arm of the bolt.

6. The combination with a sheet-metal tie comprising a longitudinal central portion of inverted-U shape in cross-section having apertures *f g* in its top, bottom and side walls serving in conjunction with said longitudinal central portion to form channels, and top walls having their meeting edges arranged on the longitudinal central portion and provided with notches forming an aperture *h* coincident with the aperture *g;* of a rail arranged on the top walls of said sleeper, a chair-bolt arranged in the longitudinal central portion of the sleeper, and having an upwardly-extending hook-shaped head at one end extending through the aperture *f* and engaging the inner ends of the top walls of the sleeper, and one edge of the rail-base, and an arm at its opposite end extending through the apertures *g h* of the sleeper, and provided with a threaded portion, a rail-holder arranged on the threaded portion of the bolt, and provided with an aperture *n*, a nut on the threaded portion of the bolt above the holder, and a pin arranged at the side of the nut, and having the beveled end inserted between the meeting edges of the top wall of the sleeper.

7. A rail-fastening means comprising a chair-bolt having an upwardly-extending hook-shaped head at one end, and an upwardly-extending arm at its other end provided with a beveled upper edge and a reduced and threaded portion, a rail-holder resting over and beveled in conformity with the edge of the arm of the bolt, and a nut securing the holder in the bolt.

8. A rail-fastening means comprising a chair-bolt having an upwardly-extending hook-shaped head at one end provided at its inner side with a plurality of abutments, and also having an upwardly-extending arm at its other end provided at its inner side with a plurality of abutments, and a rail-holder secured on said arm of the bolt.

9. The combination of a sleeper or tie having a top wall provided with an opening, a rail arranged on said top wall, a chair-bolt disposed below the top wall and having an upwardly-extending hook-shaped head at one end provided with an abutment j^2 engaging one edge of the rail-base, and an abutment j^3 engaging one edge of the top wall, and also having an arm at its opposite end extending upwardly through the opening in the top wall of the sleeper and provided with an abutment j^1 engaging one edge of said wall, and an abutment j^3 engaging one edge of the rail-base, and a rail-holder resting over the rail-base and secured on said arm of the chair-bolt.

10. The combination of a sleeper or tie formed of sheet metal, and comprising a longitudinal central portion of inverted-U shape in cross-section, bottom walls and side walls serving in conjunction with the longitudinal central portion to form channels, and top walls arranged at opposite ends of the sleeper or tie so as to expose the portions of the channels between them; the top walls having their meeting edges arranged on the longitudinal central portion, and those at one end of the sleeper or tie being provided at either side of the longitudinal central portion with apertures *f'*, the meeting ends of two rails arranged on the said apertured top walls of the sleeper or tie, chair-bolts connecting said rails and top walls, and a plate bolted to and connecting said meeting ends of the rails and having a depending end portion or portions extending below the plane of the upper side of the sleeper or tie, and arranged to engage the same.

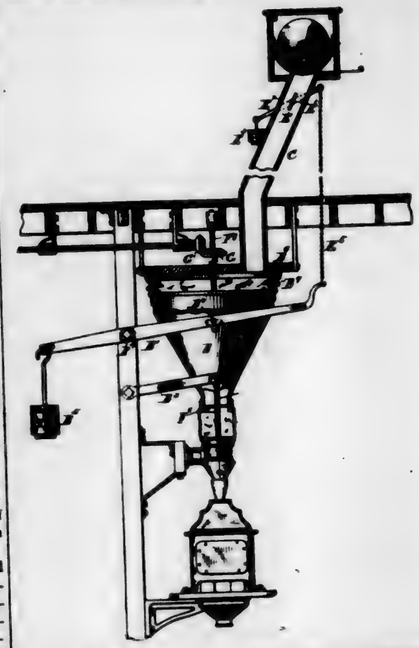
706,588. APPARATUS FOR FEEDING WEIGHING-MACHINES. WILLIAM R. HENDERSON, Cambridge, Mass., assignor to the New England Automatic Weighing Machine Company, Portland, Me., a Corporation of Maine. Filed Feb. 5, 1900. Serial No. 603,602. (No model.)

Claim.—1. In a feeding apparatus for weighing-machines, the combination of a chute adapted to receive a supply of material at its upper end, the height of said chute being greater than its transverse dimensions, a movable receptacle arranged to receive material from the lower end of said chute and to transmit the same to a weighing-machine, said receptacle being operated by the weight of a predetermined amount of said material, and means operative with the movements of said receptacle for controlling the admission of the material to the upper end of said chute.

2. In a feeding apparatus for weighing-machines, the combination of a chute adapted to receive a supply of material at its upper end, the height of said chute being greater than its transverse dimensions, a movable receptacle adapted to receive material from said chute and to transmit the same to a weighing-machine, said receptacle being provided with a counterbalance the weight of which is substantially equal to the weight of said receptacle together with a quantity of material sufficient to fill the same to a predetermined depth, a valve located at the upper end of said chute, and operating connections between said valve and receptacle.

3. In a feeding apparatus for weighing-machines, the combination of a movable receptacle arranged to be operated when partially filled with material, a positively-driven feeding device for transferring material from said receptacle to a weighing-machine, and means operated by the movements of said receptacle for controlling the admission of material thereto, and thereby maintaining a substantially constant depth of material above the feeding device.

4. In a feeding apparatus for weighing-machines, a stationary supply-chute, a stationary casing adapted to deliver material to a weighing-machine, a movable receptacle located between said stationary parts and connected thereto by flexible dust-proof connections, and means operative with said receptacle for controlling the admission of material to said chute.



5. In a feeding apparatus for weighing-machines, in combination, a positively-driven feeding device, a counterbalanced, vertically-movable receptacle located above the same, a chute adapted to supply material to said receptacle, flexible, dust-proof connections between said receptacle and the said chute and feeding device respectively, and a valve adapted to be operated by the movements of said receptacle and to control the admission of material thereto.

6. In a feeding apparatus for weighing-machines, a feeding device comprising in combination a casing containing a disk provided with one or more concentric, horizontal slots, an agitator located above and adjacent to said disk and adapted to rotate continuously, and means for rotating said agitator.

7. In a feeding apparatus for weighing-machines, a casing containing a disk provided with one or more concentric, horizontal slots, each slot forming a complete circle, in combination with an agitator adapted to rotate concentrically with said slots and provided with projections adapted to enter and move therein, and means for rotating said agitator.

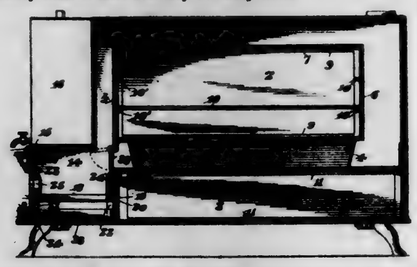
8. In a feeding apparatus for weighing-machines, a casing containing a disk comprising a number of concentric rings connected on their bottom faces by radial spokes and spaced apart to provide a series of slots between them, in combination with an agitator comprising a number of radial arms and adapted to be rotated adjacent to said disk, said arms and spokes being unequal in number, and means for rotating said agitator continuously.

9. In a feeding apparatus for weighing-machines, the combination of a casing containing a slotted disk, a vertically-movable receptacle located above said casing, a valve operated by the movement of said receptacle for controlling the admission of material thereto, a rotary agitator above said disk, and a shaft connected to said agitator and adapted to be rotated continuously, said shaft extending upward through said movable receptacle and having near the lower end thereof one or more projecting pins.

706,589. STOVE. WILLIAM H. HULL, Philippi, W. Va. Filed Sept. 4, 1901. Serial No. 74,200. (No model.)

Claim.—1. In a cooking-stove, the combination of a lower heating-oven, a cooking-oven located above the same and having a flue surrounding the top, bottom and opposite ends of the cooking-oven, the top of

the heating-oven and the bottom of the cooking-oven forming the walls of the flue portion between the two ovens, and the bottom of the lower oven being formed by the bottom of the stove, a fire-box projected in front of the heating-oven and having its top located below the main top of the stove and above the top of the lower oven to form a seat or support for a water-tank, the back of the fire-box being terminated substantially at the top of the lower oven, whereby a direct communication is had between the fire-box and the flue or space between the two ovens, and a vertically-swinging damper pivoted substantially at the intersection of the inner edges of the front and bottom flue portions and capable of swinging vertically toward the fire-box to open and close the lower end of the vertical flue and the front end of the horizontal flue, whereby either of these flues may be wholly closed.



2. In a stove, the combination with a fire-box, of an endwise-removable grate having legs, and an ash-pan inserted through an opening in the front of the fire-box and lying snugly between the legs to prevent accidental displacement of the grate.

3. In a stove, the combination with a fire-box having draft-openings formed in the front thereof, and a door at one end, of a grate insertible through the door and having draft-openings corresponding to the similar openings in the fire-box, and an ash-pan removably inserted through an opening in the front of the fire-box and having its outer end normally projected externally of the fire-box, and a slidable damper mounted upon the projected portion of the ash-pan.

706,590. VEHICLE-TIRE. FRED E. OSGOOD and FRANKLIN F. BRADLEY, Chicago, Ill., assignors of one-third to Richard A. Kent, Chicago, Ill. Filed Feb. 17, 1902. Serial No. 94,549. (No model.)

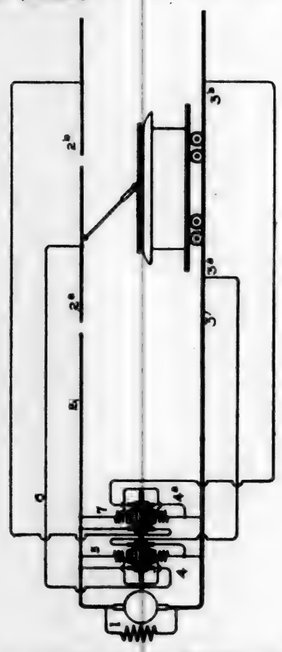
Claim.—1. The process of manufacturing vehicle-tires which consists in inclosing within an outer covering a core of less bulk than the space within the covering and composed of a mixture of an expansible material and a chemical capable of generating gas when heated, and heating said mixture to generate a gas and permanently expand the core to completely fill the space within the outer covering without expanding said covering the initial exterior diameter of which remains the same in the finished tire.

2. The process of manufacturing vehicle-tires which consists in inclosing within an outer covering a core of less bulk than the space within the covering composed of a mixture of rubber stock and ammonium carbonate, and subjecting the tire to heat whereby the ammonium carbonate is decomposed and the core expanded to fill the space within the outer covering without expanding said covering the initial exterior diameter of which remains the same in the finished tire.

3. The process of manufacturing vehicle-tires which consists in forming a tube of the size desired for the tire, inclosing within the tube a core of less bulk than the space within the tube composed of a mixture of expansible material and a gas-producing chemical, decomposing the chemical and thereby generating gas and expanding the core to fill the space within the tube without expanding said tube the initial exterior diameter of which remains the same in the finished tire, and expelling the air from the space within the tube as the core expands.

4. The process of manufacturing vehicle-tires which consists in forming a rubber tube of a diameter equal to the size of the tire, inclosing in the tube a core of less bulk than the space within the tube composed of a mixture of rubber stock and ammonium carbonate, subjecting the tire to sufficient heat to vulcanize the rubber tube and decompose the ammonium carbonate thereby generating a gas and expanding the core to fill the space within the tube without expanding said tube the initial exterior diameter of which remains the same in the finished tire, and expelling the air from the space within the tube as the core expands.

706,591. SYSTEM OF ELECTRIC DISTRIBUTION. HORACE F. PARSHALL, London, England, assignor to the General Electric Company, a Corporation of New York. Filed Dec. 7, 1898. Serial No. 739,457. (No model.)



Claim.—1. A system of electrical distribution, comprising a generator, a booster, and a motor driving the booster, said motor having a constant-field magnet, and an armature-current fluctuating with the load on the system.

2. A system of electrical distribution, comprising a generator, a feeder, a motor having an armature in the feeder branch, a field-magnet circuit independent of the feeder branch, and a booster operated by said motor.

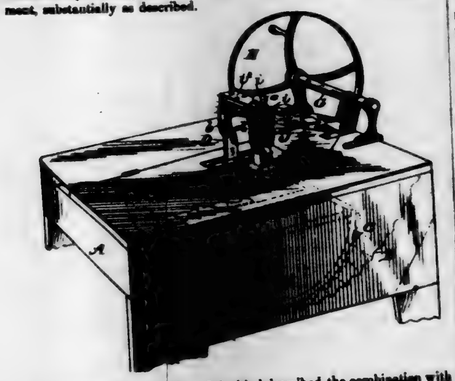
3. A system of electrical distribution, having its translating devices fed through a ground branch or earth-return and including metallic return-paths connecting with the return-feeder at different distances from the distributing-point, a motor having a constant-field magnet, an armature in the feeder branch, and a booster driven by the motor in a metallic return-path.

4. A system of electrical distribution, having its translating devices fed through a ground branch or earth-return, and including metallic return-paths connecting with the return-conductor at different distances from the distributing-point, a plurality of boosters connected in the several metallic return-paths, and motors for driving said boosters, having constant-field magnets and armatures in circuit with the several feeders, for the purpose described.

706,592. WASHING-MACHINE. LAURA B. PARKER, Ogden, Utah. Filed Nov. 14, 1901. Serial No. 82,397. (No model.)

Claim.—1. In a washing-machine of the kind described, the combination with the arm of the oscillating rubber having a projecting wrist-pin; of a bracket having perforated lugs receiving said wrist-pin, a pitman also perforated to receive the wrist-pin and lying between the lugs, and a spring-tension device connected to the bracket and also to the top of the washing-machine substantially as described.

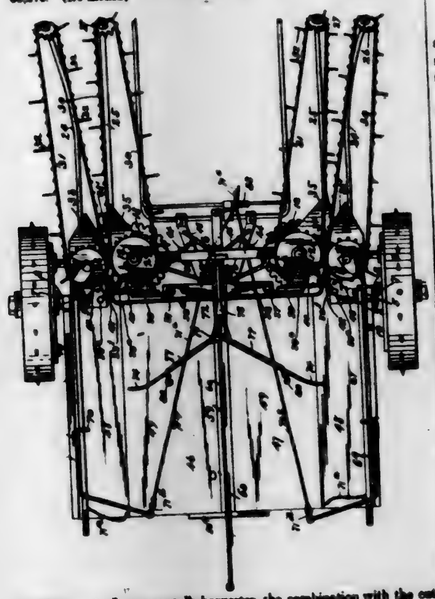
2. An attachment for washing-machines, consisting of a coupling adapted to be attached to the actuating devices for the rubber, a spring attached to the said coupling and having an anchorage on the top of the washing-machine case, said spring and coupling having a lateral snap connection for permitting quick and easy lateral engagement or disengagement, substantially as described.



3. In a washing-machine of the kind described, the combination with the arm and pitman of the oscillating rubber; of a bracket-coupling connected to the joint between said arm and pitman, spring-latches in the end of the said coupling, a helical spring having a diametrical claw and a screw passing through the same and also between the latches and an anchorage for the lower end of the spring, substantially as described.

4. In a washing-machine of the kind described, the combination with the arm and pitman of the oscillating rubber; of a coupling attached to the joint of said arm and pitman, a helical spring, having at one end a diametrical claw and a stem connecting it to the coupling, and at the other end a diametrical claw with a hinged clevis adapted to connect it to the top of the washing-machine substantially as described.

706,593. COMBINED CORNSTALK HARVESTER AND SHOCKER. HERMAN PECKMAN, Argentine, Kans. Filed June 20, 1901. Serial No. 65,273. (No model.)



Claim.—1. In a cornstalk-harvester, the combination with the cutting apparatus, of two dumping-platforms, one at the rear of each cutting apparatus, and a vertically-movable partition separating said platforms, and a shock-former, the parts of which are located above said platforms, said shock-former consisting of two hinged frames located at the side of the machine and capable of swinging inwardly, and annularly-curved frames mounted to slide upon said hinged frames, substantially as set forth.

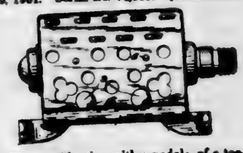
2. In a cornstalk-harvester, the combination with the cutting apparatus, of two dumping-platforms, one at the rear of each cutting apparatus, and a vertically-movable partition separating said platforms, a shock-former, the parts of which are located above said platforms, said shock-former consisting of two hinged frames located one at each side of the machine and capable of swinging inwardly, and annularly-curved frames mounted to slide upon said hinged frames, and a shock-compresser mounted above the partition, substantially as set forth.

3. In a cornstalk-harvester, the combination with the cutting apparatus carried at each side of the machine, a platform arranged at the rear of each cutting apparatus to receive the severed stalks in standing position, a hinged compresser-frame having its rearward end forked and slotted, a windlass, ropes passed through the slots in said forked ends of the compresser-frame and connected to the windlass, substantially as set forth.

4. In a cornstalk-harvester, the combination with the cutting apparatus, of two platforms mounted at the rear of each cutting apparatus, frames hinged at the outer side and above each platform and capable of swinging inwardly, and a bail-shaped frame mounted to slide upon the hinged frame longitudinally, substantially as set forth.

5. In a cornstalk-harvester, the combination with a cutting apparatus, of two platforms mounted at the rear of each cutting apparatus, frames mounted at the outer side and above each platform and capable of swinging inwardly, and a bail-shaped frame mounted to slide upon the hinged frame longitudinally, a friction device, and ropes connected to the bail-shaped frame and the friction device, whereby as the shock is being formed the density may be controlled by increasing the friction upon the rope as it slides past the friction device, substantially as set forth.

706,594. BICYCLE-PEDAL. ANTHONY PERRESS, Rochester, N. Y. Filed Sept. 10, 1901. Serial No. 74,838. (No model.)



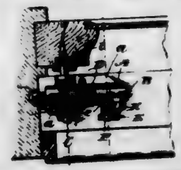
Claim.—1. The combination with a pedal; of a toe-clip comprising arms pivoted to the under side of the pedal to swing laterally thereof, means connecting the arms to move in unison, and means for clamping the arms in adjusted position, substantially as described.

2. The combination with a pedal; of pivot-pins upon the pedal, a toe-clip comprising arms formed with slots and open bearings, said bearings receiving the pivot-pins, clamping-bolts passing through the pedal and slots, and nuts upon said bolts, substantially as specified.

3. The combination with a pedal having a transverse rib; of a toe-clip comprising arms pivoted to the under side of the pedal to swing laterally thereof, means connecting the arms to move in unison, clamping-bolts passing through the pedal and arms and having their heads formed with flattened faces to engage said rib, and nuts upon said bolts, substantially as described.

4. The combination with a pedal, of a toe-clip comprising arms pivoted to the pedal and formed with slots and provided with grippers, interengaging members on the arms to adapt them to move in unison, bolts upon the pedal passing through said slots, nuts upon the bolts, and a bridge-plate connecting the nuts, substantially as specified.

706,595. WINDOW-FASTENER. WILLIAM W. POTTER, Pawtucket, R. I. Filed Nov. 12, 1901. Serial No. 82,040. (No model.)



Claim.—1. The combination of a casing or support, bolts mounted to move crosswise of each other, means for transmitting motion from one bolt to the other, and means to cause one of said bolts to move successively longitudinally and rotatably, comprising a guide that has a part

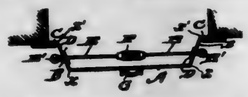
that extends parallel with the bolt and a part that extends crosswise thereof, and a part to coact with said guide, substantially as described.

2. The combination of a casing or support, bolts mounted to move crosswise of each other, a knob on one of the bolts, a guide composed of a right-angled slot in the casing or support, engaged by the knob-shank, and a rack-and-pinion connection between the two bolts, substantially as described.

3. The combination of a casing or support, spring-actuated bolts mounted to move crosswise of each other, a rack-and-pinion connection between them, and a spring-actuated knob having a sliding connection with one of the bolts, adapted to engage a cavity in the casing or support, substantially as described.

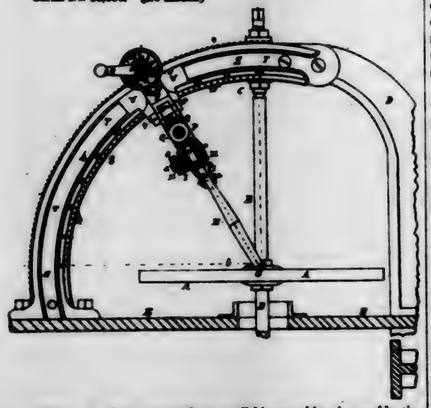
4. The combination of a casing or support, spring-actuated bolts mounted to move crosswise of each other, and adapted respectively to enter cavities in the window-frame and the sash, a motion-transmitting connection between them, the frame engaging one of said bolts being movable longitudinally and rotatably, and being situated above the other bolt, a knob having a sliding connection with said bolt, a guide composed of a right-angled slot engaged by the knob-shank, and a cavity at one extremity of the right-angled slot to coact with the sliding knob substantially as described.

706,596. **FIRE-SCREEN.** CLAUD POTTER, Martin, Tenn. Filed June 1, 1901. Serial No. 63,737. (No model.)



Claim.—A fire-screen formed of a single piece of sheet metal and comprising a body portion A bent at X to form the sides B, the free ends of the said sides being bent at X' to form lateral extensions parallel to but in the rear of the plane of the body portion of the screen, the said sides B, having apertures arranged therein, reinforcing-plates D, having apertures registering with the apertures in the said sides, rods projecting through the apertures and having their inner ends threaded, a turnbuckle engaging the threaded ends of the rods, handle portions formed upon the outer ends of the rods and adapted to bear against the said sides of the screen, and a bail-handle secured to the body portion of the screen, all arranged substantially as and for the purpose set forth.

706,597. **GEM-CUTTING MACHINE.** GODFREY PERPER, JAMES HOGAN, and REINHOLD DOEHLER, New York, N. Y. Filed Oct. 31, 1901. Serial No. 80,606. (No model.)



Claim.—1. In a gem cutting or polishing machine the combination with a lapidary-wheel having a horizontal grinding or polishing surface, in one or more vertical parallel planes with the axis of the spindle of the wheel, a stationary graduated quadrant arc-rail secured above said surface to the machine and having a slide guided and adjustable to all degrees of the said quadrant and connected to a radial jointed working arm and by it to a radial arm of a gem-stick socket and a holder to which is attached a radial gem-stick, placing the gem concentric with said arc-rail and its periphery in contact with said grinding-surface, and its axis longitudinal and central with the axis of said gem-stick which is revolubly in said socket to all degrees of a circle in a vertical plane across the gem's axis, and is adjustable for closely placing and grinding tangential facets upon the surface of the gem, substantially as and for the purpose set forth.

2. In a gem cutting or polishing machine the combination with a lapidary-wheel having a horizontal grinding or polishing surface in one or more vertical parallel planes with the axis of the spindle of the wheel, a stationary graduated quadrant arc-rail above the said surface and having a slide guided and adjustable to all degrees of said quadrant and connected to a working arm with a radial joint and vertical pivot on one end and with a vertical joint and horizontal pivots to connect with a radial gem-stick socket and holder and said socket and holder being provided with a gem-stick attached carrying a gem in the center of said arc-rail and said holder with the gem-stick and being held centrally and longitudinally with the axis of the gem and revolubly in said socket and adjustable to all degrees of a circle in a vertical plane and concentric to said axis of the gem for closely placing and grinding or polishing minute tangential facets over the surface of the gem and said socket and holder and gem-stick and gem being provided as aforesaid, are movable in a vertical plane for inspection of the gem and in a horizontal plane for grinding, substantially as herein shown and set forth.

3. In a gem cutting or polishing machine the combination with a lapidary-wheel having a horizontal grinding or polishing surface in one or more parallel planes with the axis of the spindle of the wheel, a stationary graduated quadrant arc-rail, above said surface and having an adjustable slide to all degrees of said quadrant and said slide connected and pivoted to a two-arm working lever in a radial plane and the loose arm of said lever attached by a horizontal pivot to a radial gem-stick socket in which is held and guided in line with it a tooth or notch and pawl graduated and numbered gem-stick holder with a longitudinal central gem-stick carrying a gem which is concentric with the said arc-rail and its periphery resting upon said grinding-surface and its axis in the same plane with the axis of said socket-holder and gem-stick, substantially as herein set forth.

4. In a machine for cutting gems the combination comprising a horizontal revolving lapidary-wheel, a quadrant guide-rail secured with one end to the bracket of the top bearing of the spindle of said wheel and the other end of said rail to the table of the machine to brace the machine rigidly, a slide in the groove of said rail with a radius center in the gem's center and a radial connection consisting of a gem-stick and gem-stick holder connected with a cross-head and the cross-head connected with a working arm and then pivoted to a radial arm carrying a pinion-arbor, a pinion engaging a toothed periphery on the said quadrant-rail, substantially as and for the purpose to move the said slide over the scale on said rail.

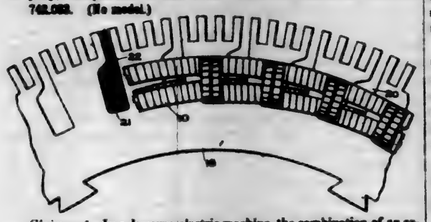
5. In a machine for cutting gems the combination comprising a radial revolvable gem-stick holder in the axis of the gem guided in a socket of a cross-head pivoted to a working arm and said gem-stick holder carrying a revolving spring-pawl around a stationary ratchet-wheel secured upon said cross-head socket, substantially as and for the purpose herein set forth.

6. In a machine for cutting gems the combination comprising a gem-stick holder with a socket-opening to receive a cylindrical shank of the gem-stick and said socket-opening having a longitudinal key-opening in which a loosely-pivoted key is held and filling in the removed portion of said opening, but slightly increasing the diameter on the outside periphery at this key, the outside periphery of the socket being threaded and a proper screw-cap placed over the socket by these means the gem-stick shank is clamped very rigidly in said socket.

7. In a machine for cutting gems a combination comprising a horizontal revolving lapidary-wheel, a quadrant guide-rail over it in a vertical plane and concentric with the gem upon the cutting-surface of the wheel and said gem held with a gem-stick held radial with a revolvable gem-stick holder guided in a socket, of a cross-head with a fixed ratchet-wheel and the gem-stick holder carrying a spring-pawl over the periphery of said ratchet, and said cross-head being pivoted to swing vertically on a working arm pivoted to a radial arm to swing laterally and said radial arm being connected to a slide guided in the groove of the quadrant guide-rail and said radial arm carrying a lateral pinion-arbor and pinion of which said pinion engaging in the peripherical gear-rim on the quadrant guide-rail, and of which the said pinion-arbor is furnished with a hand-crank to adjust said lever-arm with the said slide to any angle indicated on the scale upon said quadrant-rail, or indicated by the more reduced scale at the arbor of the pinion-gear, substantially as and for the purpose herein set forth.

8. In a gem-cutting machine, which consists of a radial gem-stick and gem-stick holder and a fixed stationary quadrant guide-rail both in vertical planes and with the center of the radius in the gem, and a working arm pivoted in the radius, turning in a lateral plane and the gem-stick holder pivoted to a working arm movable in a vertical plane and revolvable on its axis and provided for all turns and parts thereof controllable with pawl and tooth or notch graduations, substantially as and for the purpose herein set forth.

706,598. **ROTARY TRANSFORMING APPARATUS.** EDWIN W. RICE, Jr., Schenectady, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Dec. 20, 1899. Serial No. 742,083. (No model.)



Claim.—1. In a dynamo-electric machine, the combination of an armature-core having two sets of slots, one set consisting of numerous small slots and the other set of a fewer number of larger slots, an armature-winding located in the larger slots and adapted to be connected by suitable connections with alternating-current mains, another armature-winding located in the set of small slots, and a commutator connected to the last-mentioned winding.

2. In a rotary transforming device, a plurality of massed coils or windings, connected to the alternating-current terminals, a commutator, and a plurality of distributed coils or windings connected to the commutator.

3. In a rotary transforming device, a plurality of massed coils or windings of fine wire, connected to the alternating-current terminals, a commutator, and a plurality of distributed coils or windings connected to the commutator and overlying the massed windings.

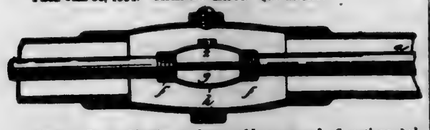
4. In a rotary transforming device a plurality of massed coils or windings of fine wire, connected to the alternating-current terminals, a commutator, and a plurality of distributed coils or windings connected to the commutator.

5. In a dynamo-electric machine, a distributed winding of formed insulated coils, in slots, connected to the direct-current terminals, and a smaller number of coils of finer wire, formed and separately insulated, connected to the alternating-current terminals.

6. In a dynamo-electric machine, a distributed winding of formed insulated coils, in slots, connected to the direct-current terminals, and a smaller number of coils of finer wire connected to the alternating-current terminals.

7. In a dynamo-electric machine, a distributed winding of formed insulated coils, in slots, connected to the direct-current terminals, and a smaller number of coils of finer wire, formed and separately insulated, wound in slots opening into the first-named slots, connected to the alternating-current terminals.

706,599. **ELECTRIC CABLE.** TITO RENATI, Florence, Italy. Filed Jan. 30, 1901. Serial No. 45,208. (No model.)



Claim.—In combination an inner cable composed of sections, hollow coupling-sleeves connecting the ends of said sections and having an opening therein, tube-sections encircling said cable-sections and having couplings connecting the adjoining ends thereof, said outer coupling-sleeves having an opening alining with the opening in the inner coupling-sleeve and means for closing said opening, substantially as described.

706,600. **CARBURETER.** JOHN ERNST, Waterloo, Iowa. Filed Feb. 26, 1901. Serial No. 48,989. (No model.)

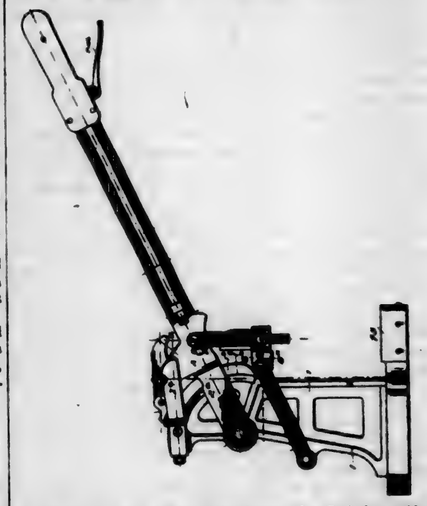
Claim.—1. In a carburetor for gas-machines, the combination with a mixing-tank having an oil-inlet and gas-outlet; of an air-inlet pipe entering the tank above the level of the gasolene, and a number of small tubes communicating with and depending from said pipe into the gasolene and each pierced with minute perforations.

2. In a carburetor for gas-machines, the combination with a mixing-tank having an oil-inlet and gas-outlet; of an air-inlet pipe entering the tank above the gasolene, a ring-shaped distributer-pipe communicating with said inlet-pipe and also standing above the level of the gasolene, and a number of small tubes communicating with and depending from said distributer into the gasolene and each pierced with minute perforations.

3. In a carburetor for gas-machines, the combination with a mixing-tank having an oil-inlet and gas-outlet; of an air-inlet pipe entering the tank, a distributer-pipe communicating with said inlet-pipe and standing within the tank above the level of the gasolene, and a number of small tubes leading from the distributer downward below the level of the gasolene and each pierced with a number of minute perforations in its side walls, as and for the purpose set forth.

4. In a carburetor for gas-machines, the combination with a mixing-tank, the gas-outlet and air and oil inlet pipes, a valve in the latter, a float, and adjustable connections between the float and valve-stem whereby the float operates the valve at varying levels of the oil; of a distributer-pipe connected with the air-inlet, and a series of small tubes depending from said pipe beneath the normal level of the oil and there provided with minute perforations, all as and for the purpose set forth.

706,601. **PUNCHING-MACHINE.** JOHN R. SCOTT, Philadelphia, Pa. Filed Aug. 20, 1901. Serial No. 73,315. (No model.)



Claim.—1. In a machine of the character described, the combination of a plunger for the thimble of a shoe-last spindle-socket of tubing, a punch having longitudinal movement independent of, and adapted to work laterally to, said plunger, and means for separately actuating said plunger-carrier and punch, substantially as set forth.

2. In a machine of the character described, the combination of a plunger for tubing, a punch having longitudinal movement independent of, and arranged to work laterally to said plunger, and means for separately actuating said plunger and punch, substantially as set forth.

3. In a machine of the character described, the combination of a plunger for tubing, having a longitudinal slot therethrough with a sloping bottom surface, a punch or cutter having a beveled heel and a point upon its forward side, at the lower end, and means for separately actuating said plunger and punch, substantially as set forth.

4. In a machine of the character described, the combination of a plunger for tubing, having a longitudinal slot with an inclined bottom surface, a punch having its shank provided with an inclined offset near its rear edge, and its lower end inclined forward and downward, and having a pyramidal point upon its forward side, at the lower end, and means for separately actuating said plunger and punch, substantially as set forth.

5. In a machine of the character described, the combination of a plunger for tubing, a punch having longitudinal movement independent

of said plunger with its outer or point adapted to work laterally to said plunger, and means for separately operating said plunger and punch, substantially as set forth.

6. In a machine of the character described, the combination of a plunger for tubing, a punch having longitudinal movement independent of said plunger with its effective edge adapted to work laterally to said plunger, a lever, and means for connecting said punch to said lever, substantially as set forth.

7. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective point adapted to work laterally to said plunger, a lever, and a second plunger or link connecting said punch to said lever, substantially as set forth.

8. In a machine of the character described, the combination of a plunger for tubing, a punch having longitudinal movement independent of said plunger with its effective edge or point adapted to work laterally to said plunger, a hand-lever, and means for connecting said hand-lever to said punch, substantially as set forth.

9. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective edge or point adapted to work laterally to said plunger, a hand-lever, and an additional plunger or link connecting said hand-lever and punch, substantially as set forth.

10. In a machine of the character described, the combination of a plunger for tubing, a punch having longitudinal movement independent of said plunger with its effective edge or point adapted to work laterally to said plunger, a lever connected to said punch, and means for lowering and raising said plunger, substantially as set forth.

11. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective point or edge adapted to work laterally to said plunger, means for actuating said punch, a lever, and a stock or guide carrying said plunger and connected to said lever, substantially as set forth.

12. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective point or edge adapted to work laterally to said plunger, a complex lever adapted to separately actuate said plunger and said punch, substantially as set forth.

13. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective point or edge adapted to work laterally to said plunger, a lever mechanism comprising a pivoted arm and a hand-lever pivoted to said arm, said arm being connected to said plunger and said lever being connected to said punch, substantially as set forth.

14. In a machine of the character described, the combination of a plunger for tubing, a punch having longitudinal movement independent of, and adapted to work laterally to, said plunger, a tubular stock or barrel for said plunger, a lever mechanism for carrying said stock or barrel and actuating said punch, substantially as set forth.

15. In a machine of the character described, the combination of a plunger for tubing, a punch, a lever mechanism connected to said plunger and punch, a dog with its shoe adapted to serve as a brake and said dog adapted to be acted upon by a member of said lever mechanism, substantially as set forth.

16. In a machine of the character described, the combination of a plunger for tubing, a punch, a lever mechanism, comprising a pivoted arm and a lever proper, a dog carrying a pivoted shoe, a stand having an arcuate surface engaged by said shoe, one member of said lever mechanism adapted to engage said dog and force said shoe upon said arcuate surface, substantially as set forth.

17. In a machine of the character described, the combination of a plunger for tubing, a punch, a lever mechanism comprising a pivoted arm and a lever proper connected to said arm, and said lever mechanism connected to said plunger and punch, and a keeper having spring-arms adapted to hold said parts elevated, substantially as set forth.

18. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective edge or point adapted to work laterally to said plunger, a tubular stock carrying said plunger, and a lever having link or plunger connection with said punch, moving through said stock, substantially as set forth.

19. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective edge or point working laterally through said plunger, a tubular stock carrying said plunger and linked to a suitable support, a lever linked to said stock, and means for actuating said punch, substantially as set forth.

20. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective edge or point adapted to work laterally through said plunger, a lever suitably connected to means carrying said punch, a pivoted arm connected to said lever and linked to said plunger, substantially as set forth.

21. In a machine of the character described, the combination of a longitudinally-slotted plunger for tubing, a punch, a tubular stock carrying said plunger, a pivoted arm connected to said stock, a lever connected to said arm, and an additional plunger connected to said lever and working in said stock, and connected to said punch, substantially as set forth.

22. In a machine of the character described, the combination of a longitudinally-slotted plunger for tubing, a punch, a tubular stock carrying said plunger, a collar or sleeve connected to said stock and linked to a suitable support, a pivoted arm connected to said collar or sleeve, and a lever connected to said arm and to said punch, substantially as set forth.

23. In a machine of the character described, the combination of a longitudinally-slotted plunger for tubing, a punch, a tubular stock carrying said plunger and linked to a support or fixture, a pivoted arm linked to said collar, a lever connected to said arm, an additional plunger working in said stock and loosely connected to said punch and similarly to said lever, substantially as set forth.

24. In a machine of the character described, the combination of a plunger for tubing, a punch, a pivoted arm having upstanding projections, a dog pivoted between said projections and carrying a pivoted shoe, a stand having an arcuate portion adapted to be engaged by said shoe, means for connecting said plunger to said pivoted arm, and a lever connected to said arm and to said punch, and means to effect a binding action between said lever and dog, substantially as set forth.

25. In a machine of the character described, the combination of a plunger for tubing, a punch, a lever having an upstanding projection, means for connecting said lever to said punch, a dog pivoted to said upstanding projection and carrying a pivoted shoe, and means to effect a binding action of said shoe, and means to secure a like action between said lever and dog, substantially as set forth.

26. In a machine of the character described, the combination of a plunger for tubing, a pivoted arm having upstanding projections, and connected to said plunger, a dog equipped with a pivoted shoe or brake adapted to effect a binding action with the arm-support, a keeper having spring or resilient arms, adapted to effect engagement with the ends of the pivot between said dog and arm, and means connected to said punch for the actuation of the last named, substantially as set forth.

27. In a machine of the character described, the combination of a plunger for tubing, a punch, a pivoted arm, means connecting said arm to said plunger, a lever connected to said arm and to said punch, a dog pivoted to upstanding projections of said arm and a keeper provided with spring-arms having in their upper edges notches adapted to receive the ends of the pivot between said dog and upstanding projections, substantially as set forth.

28. In a machine of the character described, the combination of a plunger for tubing, a punch, a pivoted arm connected to said plunger, and having upstanding projections, means connected to said arm and to said punch for the actuation of the last named, a dog pivoted to upstanding projections of said arm, and a keeper having its spring or resilient arms with inner forward beveled surfaces and in their upper edges with notches to receive the ends of the pivot between said dog and upstanding projections, substantially as set forth.

29. In a machine of the character described, the combination of a plunger for tubing, a punch with its effective edge or point adapted to work laterally through said plunger, a pivoted arm connected to said plunger, and having upstanding projections, said resilient arms having inner forward beveled surfaces and beveled recesses indenting said beveled surfaces, substantially as set forth.

30. In a machine of the character described, the combination of a plunger for tubing, a punch, a pivoted arm, means connecting said arm and plunger, a lever connected to said arm, means connecting said lever to said punch, a sliding handle arranged on said lever and sliding detents adapted to engage notches in the outer ends of the forward bifurcated portion of said pivoted arm, and a finger-lever pivoted upon said handle and connected to said detents, substantially as set forth.

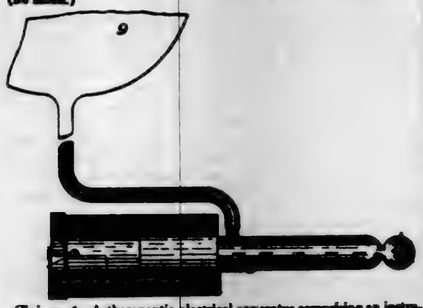
31. In a machine of the character described, the combination of a plunger for tubing, a punch arranged interiorly thereof, a pivoted arm carrying said plunger, a lever connected to said arm, a sliding handpiece or handle arranged on said lever and spring-acted-upon detents connected to said handpiece and adapted to engage one end of said arm, substantially as set forth.

32. In a machine of the character described, the combination of a plunger for tubing, a punch arranged interiorly thereof, a pivoted arm carrying said plunger, a lever connected to said arm, a sliding handpiece or handle arranged on said lever, detents or pawls arranged laterally of said lever and adapted to engage one end of said arm, and a finger-lever pivoted to said handpiece and adapted to engage said lever, substantially as set forth.

33. In a machine of the character described, the combination of a plunger carried by a pivoted arm, a punch arranged within said plunger, a lever connected to said arm and carrying said punch, a handpiece sliding upon said lever, detents arranged laterally of said lever and adapted to engage one end of said arm and acted upon by a spring and a finger-lever pivoted upon said handpiece and engaging said detents, substantially as set forth.

34. In a machine of the character described, the combination of a plunger carried by a pivoted arm, a punch arranged within said plunger, a lever connected to said arm and to said punch, a sliding handpiece arranged upon said lever and having bosses moving in elongated recesses in said lever, detents or pawls arranged laterally in said lever and adapted to engage said arm, and connected to said handpiece—and a spring connecting said detents or pawls and said lever, substantially as set forth.

706,602. THERAPEUTIC ELECTRICAL APPARATUS. IRA R. SHAFER, Mount Vernon, N. Y. Filed Nov. 27, 1901. Serial No. 83,944. (No model.)



Claim.—1. A therapeutic electrical apparatus comprising an instrument adapted to convey a liquid to the part of the body to be treated, means to electrically charge the flowing liquid, and a spherical terminal provided with perforations so disposed as to disperse the liquid over a large area, for the purpose set forth.

2. A therapeutic electrical apparatus comprising an instrument adapted to convey a liquid to the part of the body to be treated, means to connect one pole of a battery with the flowing liquid, and means to connect the other pole with a portion of the body, and a spherical terminal provided with perforations so disposed as to disperse the liquid over a large area, as and for the purpose set forth.

3. A therapeutic electrical apparatus comprising a syringe, a battery-holder connected with one end of the nozzle thereof, a battery mounted in said holder, a terminal mounted in the passage-way of said nozzle, and a second terminal mounted on the exterior of the battery-holder, as and for the purpose set forth.

4. A therapeutic electrical apparatus, comprising a syringe, a battery-holder connected with one end of the nozzle thereof, a battery mounted in said holder, a tube mounted in the passage-way of said nozzle, a conductor connecting one pole of said battery with said tube, a plate mounted on the exterior surface of said battery-holder, and a conductor connecting the other pole of said battery with said plate, as and for the purpose set forth.

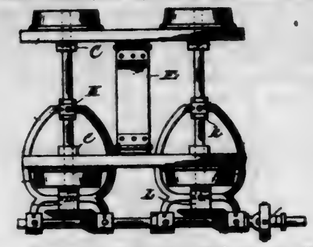
5. A therapeutic electrical apparatus comprising a syringe, a battery, a terminal mounted in the nozzle of said syringe, a second terminal exterior to said nozzle, the discharge end of the nozzle being composed of non-conducting material semispherical in form, and provided with a plurality of perforations, as and for the purpose set forth.

6. A therapeutic electrical apparatus comprising a syringe, a battery-holder, a battery mounted therein, a tube mounted in the nozzle of said syringe, a conductor connecting said tube with one pole of said battery, a plate mounted on said battery-holder, a conductor connecting said plate with the other pole of said battery, and a globular tip forming the discharge end of said nozzle, said tip being provided with a plurality of large orifices, as and for the purpose set forth.

706,603. GAME-CARDS. REED H. SHARP, Victoria, Tex. Filed May 20, 1901. Serial No. 62,490. (No model.)

Claim.—A pack of playing-cards made up of three suits of three groups each, each suit representing a country and comprising a group of consecutively-numbered similar cards, a second group of cards of different values, said values being indicated by pictures on the cards, and a third group of consecutively-numbered cards bearing similar pictures thereon.

706,604. LOCOMOTIVE-TRUCK. EPHRAIM SHAY, Harbor Springs, Mich. Filed Apr. 8, 1902. Serial No. 101,808. (No model.)



Claim.—1. In a truck for locomotives of the character described, the combination with the longitudinal driving-shaft, driving-wheels and axle, and intermeshing gears on said shaft and axle, of a rigid bridle-frame mounted on said axle having bearings at opposite sides of the gears in which the shaft is journaled and supported, substantially as described.

2. In a locomotive-truck, the combination with drivers and axle, a longitudinal driving-shaft at the side of the truck, and intermeshing gears on said shaft and axle, of a rigid frame or structure in which the driving-shaft is journaled inclosing the adjacent driver and mounted on the axle at opposite sides of said driver, substantially as described.

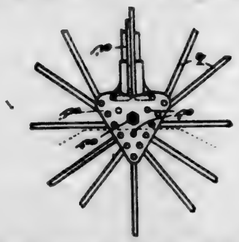
3. In a locomotive-truck, the combination with the drivers and axle, a longitudinal driving-shaft disposed at the side of the truck, and intermeshing gears on said shaft and axle, of a journal-box mounted in fixed position on the axle intermediate the drivers, a box mounted on the axle between said gearing and adjacent driver, a bridle-frame inclosing said driver and rigidly secured to said boxes, and similar boxes in which the driving-shaft is journaled secured to and supported by said bridle-frame; substantially as described.

4. In a locomotive-truck, the combination with the drivers and axle, a longitudinal driving-shaft disposed at the side of the truck, and intermeshing gears on said shaft and axle, of journal-boxes mounted on the axle at opposite sides of the driver, a bridle-frame inclosing said driver and rigidly secured to said boxes, said frame having outwardly-extending yoke-arms, and boxes at opposite sides of the gears in which the driving-shaft is journaled secured to and supported by said arms; substantially as described.

5. In a locomotive-truck, the combination with drivers and axle, a longitudinal driving-shaft, and intermeshing gears on said shaft and axle, of a rigid structure mounted on the axle and having bearings at opposite sides of the gears in which the driving-shaft is journaled, and a guard secured to said bearings beneath the gears, substantially as described.

6. In a locomotive-truck, the combination with a number of axles and drivers, of a longitudinal driving-shaft, intermeshing gears on said shaft and axles, and rigid structures mounted on each of the driver-axles at opposite sides of one set of drivers having bearings in which the shaft is journaled, said structures thereby fully supporting the shaft, substantially as described.

706,605. FOLDING CANOPY FOR VEHICLES. WILLIAM J. SLYKER, Troy, Ohio, assignor of one-half to Roman F. Douglas, Troy, Ohio. Filed Apr. 14, 1902. Serial No. 103,831. (No model.)



Claim.—1. The combination with a central support consisting of separable plates having a series of oppositely-disposed perforations, of a series of ribs having lateral oppositely-extending trunnions at their inner ends formed integrally therewith pivoted in said perforations and adapted

to swing in unison in a horizontal plane to open and close the canopy, and means for holding said plates in engaging position with said trunnions, substantially as specified.

2. The combination with a central support substantially heart-shaped consisting of separable plates having a series of oppositely-disposed perforations, of a series of ribs having lateral oppositely-extending trunnions at their inner ends formed integrally therewith pivoted in said perforations and adapted to swing in unison in a horizontal plane to open and close the canopy, means for holding said plates in engaging position in said trunnions and intersngaging projections on one of said ribs and plates to fix the radial position of said rib, said ribs further having flanges formed thereon and U-shaped parts adapted to fit over said flanges to form extensions for said ribs, substantially as specified.

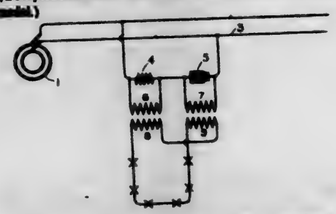
706,606. WIRE-TIGHTENER. THOMAS STINSON, Little River, Kans. Filed May 11, 1901. Serial No. 59,933. (No model.)

Claim.—1. As an improved article of manufacture a wire-tightener for direct application to a wire strand to be tightened, comprising a hub with opposite horizontally-disposed extremities and intermediate radially-arranged arms with one or more sets of terminal hooks to bear upon the wire, the arms having means at one point whereby the wire to be stretched or tightened may be carried transversely across the device to engage opposite portions of the hub, the hub, arms and hooks being of an integral immovable construction relatively to each other and the wire strand engaging the hub on opposite sides of the arms when the tightener is in operative position.

2. A wire-tightener comprising a hub with a plurality of arms radiating therefrom, the said arms being extended from an intermediate point of the hub and having means at one point whereby the wire to be stretched or tightened may be carried transversely across the device to engage opposite portions of the hub divided by the arms.

3. A wire-stretcher comprising a hub having longitudinal extensions, arms radiating from said hub intermediately between said extensions and provided with terminal hooks for engaging the wire, and means for engaging a loop of the wire and permitting it to pass transversely across the device for winding engagement with both hub extensions.

706,607. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES P. STEINMETZ, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Jan. 2, 1901. Serial No. 41,812. (No model.)



Claim.—1. The combination of reactances of opposite sign connected together, a consumption-circuit, and an inductive connection between said consumption-circuit and each of said reactances.

2. The combination of constant-potential mains, reactances of opposite sign connected so as to receive current from said mains, a constant-current circuit, and an inductive connection between said circuit and each of said reactances.

3. The combination of constant-potential mains, reactances of opposite sign connected so as to be traversed by current flowing in said mains, a constant-current circuit, and an inductive connection between said circuit and each of said reactances.

4. The combination of a condenser and an inductance device connected together, two transformers having a winding of one connected across the terminals of the condenser, and a winding of the other connected across the terminals of the inductance device, and a circuit including in series another winding of each of said transformers.

5. The combination of a condenser and an inductance device connected together, two transformers having a winding of one connected across the terminals of the condenser, and a winding of the other connected across the terminals of the inductance device, and a circuit including in series another winding of each of said transformers, the last-mentioned windings being reversely connected with respect to each other.

6. The combination of reactances of opposite sign connected together, a supply-circuit, operative connections between said reactances and said supply-circuit, and means for combining electromotive forces corresponding to those existing between the terminals of the respective reactances, and a consumption-circuit upon which the resultant electromotive force is impressed.

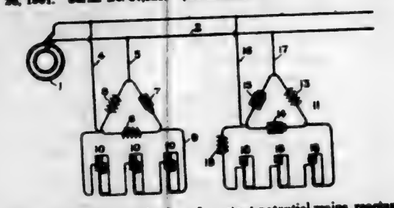
7. The combination of a condenser and an inductance device connected together, two transformers having a winding of one connected across the terminals of the condenser, and a winding of the other connected across the terminals of the inductance device, and a circuit including in series another winding of each of said transformers, the last-mentioned windings being reversely connected with respect to each other.

8. The combination of constant-potential mains, a condenser and an inductance device connected in series across said mains, transformers having a winding of one connected across the terminals of the condenser and a winding of another connected across the terminals of the inductance device, and a constant-current circuit including in series other windings of said transformers.

9. The combination of constant-potential mains, a condenser and an inductance device connected in series across said mains, transformers having a winding of one connected across the terminals of the condenser and a winding of another connected across the terminals of the inductance device, and a constant-current circuit including in series other windings of said transformers.

10. The combination of constant-potential mains, reactances of opposite sign in series across said mains, transformers having a winding of one connected across the terminals of one reactance, and a winding of another across the terminals of another reactance, and a constant-current circuit including in series a winding of each of said transformers.

706,608. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES P. STEINMETZ, Schenectady N. Y., assignor to General Electric Company, a Corporation of New York. Filed Jan. 2, 1901. Renewed Dec. 26, 1901. Serial No. 87,233. (No model.)



Claim.—1. The combination of constant-potential mains, reactances of opposite sign connected in series across said mains, a consumption-circuit operatively connected across one of said reactances, and an additional reactance operatively connected in shunt to said mains.

2. The combination of constant-potential mains, reactances of opposite sign connected in series across said mains, a consumption-circuit connected across one of said reactances of given sign, and a reactance of opposite sign connected in shunt to said mains.

3. The combination of supply-mains, reactances of opposite sign in series across said mains, a constant-current circuit in shunt to one of said reactances, and an additional reactance in shunt to said mains.

4. The combination of constant-potential mains, reactances of opposite sign in series across said mains, a constant-current circuit in shunt to one of said reactances, and an additional reactance in shunt to said mains.

5. The combination of a constant-potential circuit, a constant-current circuit, means for transferring energy between the two circuits, arc-lamps of the shunt type in series in the constant-current circuit, and an inductance device in series with said lamps.

6. The combination of a closed circuit including in series three reactances two of which are of the same sign and a remaining one of opposite sign, a constant-potential circuit shunted about one of said reactances, and a constant-current circuit in shunt to another of said reactances.

7. The combination of a closed circuit including in series three reactances two of which are of different sign from the third, a constant-potential circuit connected in shunt to one of the two reactances of the same sign, and a constant-current circuit in shunt to the other of said two reactances of the same sign.

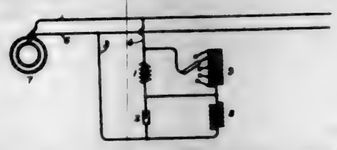
8. The combination of constant-potential mains, a condenser and an inductance device connected in series across said mains, a consumption-circuit operatively connected across said condenser, and an inductance device connected across said mains.

9. The combination of constant-potential mains, a condenser and an inductance device connected in series across said mains, a consumption-circuit operatively connected across said condenser, an inductance device in series in said consumption-circuit, and an inductance device connected across said mains.

10. The combination of a constant-potential circuit, reactances of opposite sign in series across said circuit, a consumption-circuit connected across one of said reactances and including arc-lamps of the shunt-type in series, and an inductance device in series in said consumption-circuit.

11. The combination of a constant-potential circuit, reactances of opposite sign in series across said circuit, a consumption-circuit connected across one of said reactances and including arc-lamps of the shunt type, and an inductance device in series in said consumption-circuit.

706,609. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES P. STEINMETZ, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Jan. 2, 1901. Serial No. 41,807. (No model.)



Claim.—1. The combination of constant-potential supply-mains, energy-consuming means supplied therefrom, and means for causing the consumption of power in said energy-consuming means to remain constant regardless of variation of the aggregate resistance of said energy-consuming means.

2. The combination of supply-mains, consumption-circuits fed therefrom, and means for automatically maintaining a constant consumption of power in said circuits regardless of variation of the aggregate resistance of said circuits.

3. The combination of constant-potential mains, reactances of opposite sign in series across said mains, a non-inductive energy-consuming device operatively connected across one of said reactances, and another energy-consuming device operatively connected across another of said reactances.

4. The combination of constant-potential mains, reactances of opposite sign in series across said mains, and non-inductive resistances in shunt respectively across said reactances.

5. The combination of constant-potential mains, reactances of opposite sign in series across said mains, a circuit in shunt to one of said reactances and containing an approximately constant resistance, and a circuit in shunt to another of said reactances and containing a variable resistance.

6. The combination of constant-potential mains, reactances of opposite sign in series across said mains, a resistance arranged to receive current transmitted through a circuit in shunt to one of said reactances of the same value in ohms as the resistance, and another resistance receiving energy from a circuit in shunt to another of said reactances.

7. The combination of constant-potential mains, reactances of opposite sign in series across said mains, a resistance arranged to receive current transmitted through a circuit in shunt to one of said reactances of the same value in ohms as the resistance, and a variable resistance receiving energy from a circuit in shunt to another of said reactances.

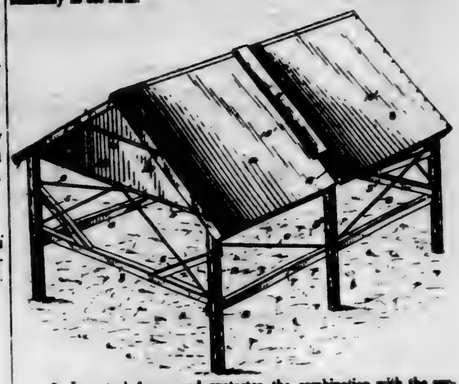
706,610. STACK FORMER AND PROTECTOR. EDWIN M. STIFF, Leakey, TEX. Filed Nov. 5, 1901. Serial No. 81,621. (No model.)

Claim.—1. In a stack former and protector, the combination with the surrounding framework, of a roof composed of sections hinged to the framework to swing outwardly and downwardly and form vertical walls for the framework during the formation of the stack, substantially as set forth.

2. In a stack former and protector, the combination with the surrounding framework, of a pitched roof consisting of hinged sections capable of swinging outwardly and downwardly parallel with the sides of the framework, and gables hinged to swing outwardly and downwardly, substantially as set forth.

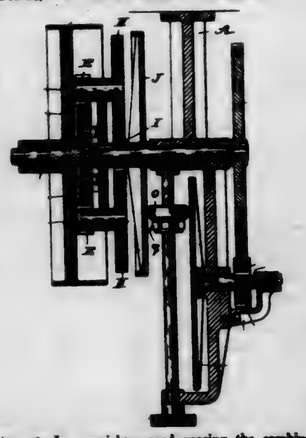
3. In a stack former and protector, the combination with the surrounding framework, of hinged roof-sections adapted to swing outwardly and downwardly, one of said roof-sections consisting of two independent parts, substantially as set forth.

4. In a stack former and protector, the combination with the surrounding framework, of hinged roof-sections adapted to swing outwardly and downwardly, one of said sections consisting of two independent parts, one part being provided with a batten-strip to overlap the other, substantially as set forth.



5. In a stack former and protector, the combination with the surrounding framework, of pitched roof-sections hinged to the framework and adapted to swing outwardly and downwardly, one of said sections being provided with longitudinal cleats to engage the upper edge of the other section when in their pitched or inclined position, gables hinged to the framework and adapted to swing outwardly and downwardly and when in vertical position adapted to be held in such position by cleats carried by the roof-sections, and means for connecting the pitched roof-sections and holding them in their inclined positions, substantially as set forth.

706,611. VARIABLE-SPEED GEARING. CLARENCE STOKE, Philadelphia, Pa., assignor of one-half to Albert R. Grover, Philadelphia, Pa. Filed Dec. 21, 1901. Serial No. 86,753. (No model.)



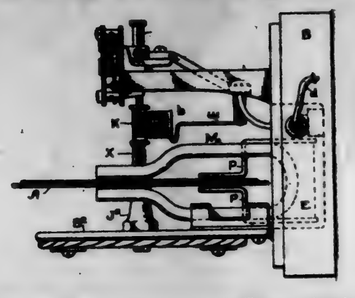
Claim.—1. In a variable-speed gearing, the combination with a power-shaft and a pulley thereon, of a friction-wheel on said shaft, planetary gearing between said wheel and pulley, a second friction-wheel, gearing between the latter and the counter-shaft, a friction-disk interposed between the faces of said friction-wheels, and means for adjusting said disk radially in respect to said wheels, substantially as described.

2. In variable-speed gearing, the combination with a power-shaft and a pulley thereon, of a gear-wheel on said pulley, pinions meeting with said gear-wheel, and shafts for said pinions, a support for said stud-shafts affixed to the power-shaft, spur-wheels on said stud-shafts, a friction-wheel loose on the power-shaft, the hub of said wheel including a pinion in gear with the spur-wheels last named, a spur-wheel fast on the power-shaft, a pinion in gear therewith, a shaft for said pinion, a friction-wheel on the latter shaft, a friction-disk interposed between the faces of said friction-wheels, and means for adjusting said disk radially in respect to said wheels, substantially as described.

3. In variable-speed gearing, the combination with a power-shaft and a pulley thereon, of a friction-wheel on said shaft, planetary gearing

between said wheel and pulley, a second friction-wheel, gearing between the latter and the counter-shaft, a friction-disk interposed between the faces of said friction-wheels, a shaft for said disk, a screw-shaft a nut thereon, and a connection between said nut and disk, substantially as described.

706,612. ELECTRIC METER. ELIHU THOMSON, Swampscott, Mass., assignor to the General Electric Company, a Corporation of New York. Filed Jan. 18, 1900. Serial No. 1,962. (No model.)



Claim.—1. In an electric meter, a retarding-magnet system, the magnetization of which gradually increases with the load on the meter up to a certain point and thereafter remains substantially constant.

2. In an electric meter, a retarding-magnet system comprising one or more permanent magnets producing a constant magnetization, and an electromagnet having its windings supplied with a current which varies with the load on the meter.

3. In an electric meter, a retarding-magnet system, comprising one or more magnets producing a substantially constant magnetization, and an electromagnet, the magnetization of which is produced by a current which varies with the load on the meter, the said electromagnet being so calculated that it will become substantially saturated by the time that the meter-current rises to its full-load value.

4. In an electric meter, a retarding-magnet system comprising one or more magnets producing a substantially constant magnetization and an electromagnet, the winding of which is connected in the meter-circuit, the said magnet being so proportioned that at or near full load, its magnetization will become substantially constant.

5. In a retarding-magnet system for an electric meter, an electromagnet having its energizing-winding included in the meter-circuit, the said magnet being so proportioned that its magnetization will vary with the load on the meter up to a certain point and will therefore remain substantially constant.

6. In an electric meter-motor, a suitable retarding means in combination with means for increasing the effect of said retarding means at a rate which decreases as the load on the meter increases.

7. In an electric meter-motor, a retarding means, the effect of which is substantially constant, and an auxiliary retarding means, the effect of which increases with the load on the meter but at a constantly-diminishing rate.

8. In an electric meter-motor, a retarding means, the effect of which is substantially constant, and an auxiliary retarding means, the effect of which increases with the load on the meter up to a certain point and thereafter becomes substantially constant.

9. In an electric meter-motor having its armature shunted by a low resistance, a retarding-magnet system including an electromagnet connected in the low-resistance shunt and wound for saturation at heavy loads.

10. An electric meter composed of a register, a meter-motor, and a retarding-magnet wound for saturation at heavy loads.

11. An electric meter comprising a register, a meter-motor, a damping device for slowing the meter, and a retarding-magnet wound for weak magnetization at low load, and saturation at heavy loads.

12. An electric meter comprising a register, a meter-motor having field-magnets of constant strength and an armature in the consumption-circuit, and a compounding retarding-magnet symmetrically located between the field-magnets, as described, wound for saturation at heavy loads.

13. A meter for an electric meter provided with a commutator-brush formed of a plurality of silver contacts thinner at their point of connection with the support than at the points of contact, for the purpose described.

14. In an electric meter, a commutator-brush comprising a comparatively long spring-pressed arm mounted upon a suitable pivot and terminating in a plurality of relatively small and independently elastic members thinner and more flexible than the arm to which they are attached, and adapted to suitably engage the commutator of the meter-armature.

15. A commutator-brush comprising a plurality of flexible and independently elastic members, and a spring-support for said members, the support being thicker and more inflexible than the members attached thereto.

16. A commutator-brush comprising a plurality of relatively small and independently elastic members, and a common support for said members consisting of a long arm thicker and more inflexible than the members attached thereto, and having its end coiled about a supporting-stud so as to form a spring.

17. A commutator-brush comprising a plurality of relatively small and independently elastic members, and a relatively large and long arm pivotally mounted at one end and constituting a common support for all of said members, the said arm being thicker and more inflexible than the members attached thereto.

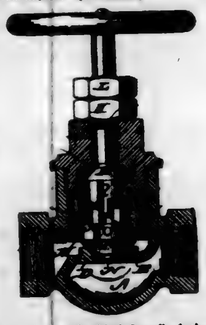
18. A commutator-brush comprising a comparatively long supporting-arm, and a plurality of relatively small wires supported therefrom, the said wires being flattened for the purpose of increasing their flexibility and rendering them independently elastic.

19. A commutator-brush comprising a relatively thin portion made up of a plurality of independently elastic members and a relatively thick, heavy portion acting as a support for said members.

20. A commutator-brush comprising a relatively thin portion made up of a plurality of independently elastic members, and a thick, heavy arm, spring-supported at one end, acting as a support for the said members.

21. A commutator-brush comprising a relatively thin portion made up of a plurality of independently elastic members, and a relatively thick, heavy portion rotatably mounted and acting as a support for the said members.

706,613. STEAM-VALVE. HENRY W. WAITE, Wollaston, Mass., assignor of one-half to William H. Cox, Wollaston, Mass. Filed May 4, 1901. Serial No. 58,797. (No model.)

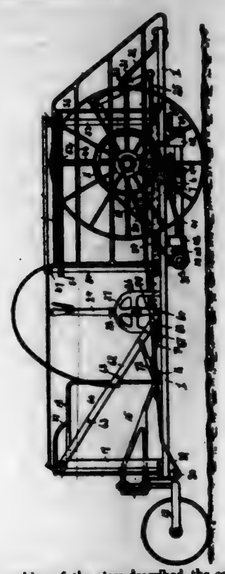


Claim.—1. In a valve of the kind described, the combination with a case having a bonnet provided with an interior valve seat, of a valve arranged within the case and having inclined projections upon its upper side, a valve-stem enlarged at its lower end and having inclined projections adapted to mate with the projections carried by the valve, the upper end of said enlarged portion being essentially conical in form and adapted to engage the seat of the bonnet, and a central guide-pin carried by the valve and projecting upwardly into the enlarged portion of the stem for the purpose described.

2. In a globe-valve, the combination with the casing, of a valve arranged therein and having radially-arranged incline-faced projections upon its upper side, said valve having a central and side guide-pins, the stem enlarged at its lower end and having radially-arranged depending projections corresponding with the projections carried by the valve, the shoulder of the enlarged portion being inclined and adapted to engage the seat upon the bonnet for the purpose of making a tight joint when the valve is either opened or closed, substantially as shown and described.

706,614. CORN-HARVESTER. EDWARD D. WALLS, Hammond, Kans. Filed June 22, 1901. Serial No. 65,671. (No model.)

Claim.—1. In a machine of the class described, the combination of a main frame, an oscillating supporting-axle, having cranks on which the supporting-wheels are mounted and provided further with an operating-crank, a rocking arm, a supporting-wheel carried thereby, a lever, and connections between said lever and said rocking arm and operating-crank, whereby said rocking arm and oscillating cranked axle may be simultaneously operated, to raise or lower said main frame, substantially as described.



2. In a machine of the class described, the combination of a main frame, an oscillating supporting-axle having cranks on which the supporting-wheels are mounted and provided further with an operating-crank, a rocking arm, a supporting-wheel carried thereby, a link-lever connected to said operating-crank and to said rocking arm, a lever connected to said link-lever, and means to lock said lever at any desired adjustment, substantially as described.

3. In a corn-harvester, the combination with a cutter, carrier, and guides for the cut cornstalks, of a dump-carrier to receive the cut stalks, said dump-carrier being pivotally mounted at its inner side and having a depending rock-arm, a foot-lever and connections therebetween whereby upon the downward pressure of the foot-lever said rock-arm is thrust outward, for the purpose set forth, substantially as described.

706,615. MACHINE FOR MAKING PIECED SOLES. GEORGE E. WARREN, Boston, Mass., assignor to Metallic Heel and Counter Company, Kittery, Me., a Corporation of Maine. Filed Apr. 30, 1901. Serial No. 57,982. (No model.)

Claim.—1. A machine for making pieced soles, having, in combination, means for holding the main piece and heel piece or pieces of the sole in proper relative position to each other in the same plane, and means for securing a uniting device or uniting devices in the abutting edges of the pieces of the sole, substantially as described.

2. A machine for making pieced soles, having, in combination, means for holding the main piece of the sole and means for holding the heel piece or pieces of the sole in proper relative positions to each other in the same plane, and means for securing a uniting device or uniting devices in the abutting edges of the pieces of the sole, substantially as described.

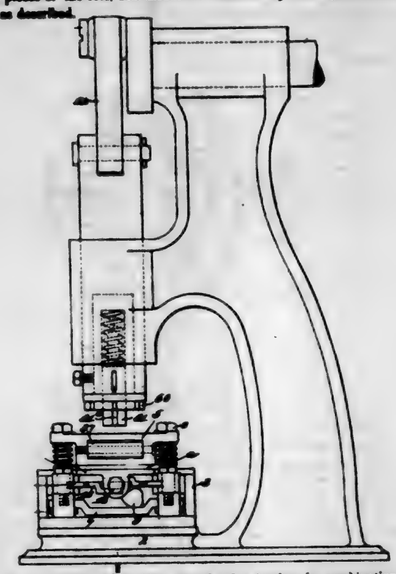
3. A machine for making pieced soles, having, in combination, devices for bringing the heel piece or pieces of the sole into a correct predetermined position with relation to the machine, and devices for bringing the main piece of the sole into correct position with relation to the heel piece or pieces in the same plane, substantially as described.

4. A machine for making pieced soles, having, in combination, a support, stops for determining the positions of the lines of juncture of the pieces of the sole, and means for securing a uniting device or uniting devices in the pieces of the sole, substantially as described.

5. A machine for making pieced soles, having, in combination, a support, stops for determining the positions of the lines of juncture of the pieces of the sole, and means for pressing the pieces of the sole against the stops, substantially as described.

6. A machine for making pieced soles, having, in combination, a support, and stops for determining the position of the lines of juncture of the pieces of the sole constructed to engage internal edges of each piece, substantially as described.

7. A machine for making pieced soles, having, in combination, a support, stops for determining the positions of the lines of juncture of the pieces of the sole, means for securing a uniting device or uniting devices in the pieces of the sole, and means for withdrawing the stops, substantially as described.



8. A machine for making pieced soles, having, in combination, a support, stops for determining the positions of the lines of juncture of the pieces of the sole, clamping means for clamping the pieces of the sole on the support, substantially as described.

9. A machine for making pieced soles, having, in combination, a support, clamping means for clamping the main piece and heel piece or pieces of the sole on the support and in the same plane, and means for securing a uniting device or uniting devices in the pieces of the sole, substantially as described.

10. A machine for making pieced soles, having, in combination, a support, means for holding the main piece of the sole on the support, means for pressing the heel piece or pieces of the sole against the main piece, and means for holding the heel piece or pieces on the support, substantially as described.

11. A machine for making pieced soles, having, in combination, a support, stops for determining the positions of the lines of juncture of the pieces of the sole, means for pressing the heel piece or pieces against the stops and against each other and the main piece and means for clamping the pieces to the support, substantially as described.

12. A machine for making pieced soles, having, in combination, a support, stops for determining the positions of the lines of juncture, clamping means for clamping the pieces of the sole against the support, and means for withdrawing the stops, substantially as described.

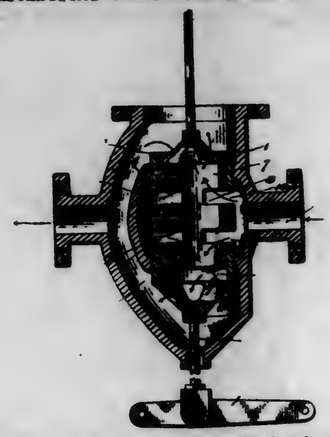
13. A machine for making pieced soles, having, in combination, a support, clamping means for clamping the main piece of the sole on the support, means for pressing the heel piece or pieces together, clamping means for clamping the heel piece or pieces on the support and mechanism for actuating both the heel-piece pressing and clamping means, substantially as described.

14. A machine for making pieced soles, having, in combination, means for pressing the pieces together in the same plane, means for clamping them in position and connected mechanism for actuating the pressing and clamping means, substantially as described.

15. A machine for making pieced soles, having, in combination, devices for bringing the heel piece or pieces of the sole into correct position with relation to the machine, centering devices for bringing the main piece of the sole into correct position with relation to the heel piece or pieces, and clamping means for holding said pieces in position, substantially as described.

16. A machine for making pieced soles, having, in combination, devices for bringing and holding the pieces of the sole into correct position with relation to each other in the same plane and means for securing a uniting device or uniting devices in the abutting edges of the pieces of the sole, substantially as described.

706,616. GOVERNOR-VALVE. LESLIE J. WARNER, Port Huron, Mich., assignor of one-half to George F. Gunner, Port Huron, Mich. Filed June 27, 1901. Serial No. 66,261. (No model.)



Claim.—1. In a governor-valve, the combination of a casing provided with admission and delivery ports, a valve-guide formed integrally with the casing and open only at top and bottom and on the side communicating with said admission-port, the opposite closed side of said guide being spaced apart from the casing to form a passage communicating with the delivery-port and the body of the guide enlarged to form a steam-space, a hollow cylindrical valve-seat slidably mounted in the guide and provided with ports, a hollow cylindrical valve slidably mounted in said seat and provided with coöperating ports, a stem connected to the valve and extending to the exterior through one end of the casing for connection with a governor, a stem connected with the valve-seat and extending to the exterior through the opposite end of said casing, and an adjusting-lever connected to the outer and lower end of said valve-seat stem substantially as described.

2. In a governor-valve, the combination of a casing provided with admission and delivery ports, an open-ended valve-guide in communication with the admission-port and spaced apart from the casing at the other side to form a passage communicating with the delivery-port, a hollow cylindrical valve-seat slidably mounted in the guide and provided with ports, a hollow cylindrical valve slidably mounted in said seat and provided with coöperating ports, a stem connected to the valve and extending to the exterior through one end of the casing adapted to be connected to a governor, a stem attached to the valve-seat and extending to the exterior through the opposite end of the casing, and an adjusting-lever connected with the valve-seat stem, substantially in the manner set forth.

706,617. ANIMAL-POKE. SAMUEL F. WEBB and WILLIS R. HUFF, Wichita, Kans. Filed Nov. 26, 1901. Serial No. 83,736. (No model.)

Claim.—1. An animal-poke comprising two sections, bolts pivoting the sections and interlocked with one of the sections, and arms mounted on one of the sections and arranged to be engaged by the other to limit the pivotal movement of the sections, said arms being also extended to points adjacent to the nuts of the bolts and forming nut-locks to prevent the nuts from unscrewing, substantially as described.

2. An animal-poke comprising two sections provided with opposite sides arranged adjacent to each other, bolts pivotally connecting the sections, and the approximately L-shaped arms mounted on one of the sections and forming stops for limiting the movement of the other section and extended to points contiguous to the nuts of the bolts and forming nut-locks, substantially as described.

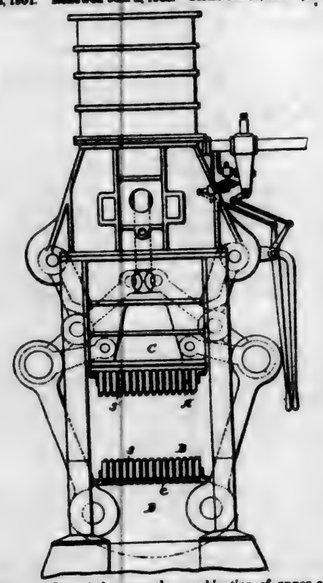
3. An animal-poke comprising two approximately Y-shaped sections, one of the sections being provided at opposite sides with approximately L-shaped arms arranged to be engaged by the other section to limit the movement thereof, and bolts pivotally connecting the sections and interlocked with the sections having the arms and provided with nuts arranged contiguous to the latter, substantially as described.

4. An animal-poke comprising two pivotally-connected sections provided with means for engaging an animal, and a locking rod or bar hinged to one of the sections and extending therefrom to the other section and detachably engaging the same, whereby the sections are locked rigid with each other substantially as described.

5. An animal-poke comprising two approximately V-shaped sections pivotally connected with each other, one of the sections being provided with an opening, and a locking rod or bar hinged to the other section and provided with a projection detachably engaging the opening, substantially as described.

6. An animal-poke comprising two sections, bolts pivoting the sections and provided with nuts, and arms mounted on one of the sections and limiting the movement of the other section and forming nut-locks when the sections are in alinement, said arms being arranged to be swung away from the nuts to permit the latter to be unscrewed when the sections are arranged at an angle to each other, substantially as described.

706,618. BALE-PRESS. SAMUEL J. WEBB, Hinden, La. Filed Feb. 23, 1901. Renewed Jan. 3, 1902. Serial No. 88,132. (No model.)



Claim.—1. In a bale-press, the combination of upper and lower platens, and means for moving the platens to and from each other, with means whereby the pressure at each end of each platen is changed from a vertical to an inclined direction to first compress the whole bale vertically and thereafter to compress the side portions of the bale to a greater extent than the central portion until two faces at about right angles to each other are formed at each side, substantially as described.

2. The combination in a bale-press, of means for applying pressure first vertically to reduce the height of a bale, and devices whereby to thereafter compress the side portions to a greater extent than the center until each side portion is brought to conform to two faces substantially at right angles to each other, substantially as described.

3. A press having upper and lower platens, each platen consisting of sections pivoted to the platen-support nearest the outer ends and extending inward toward each other, and means for maintaining the sections normally with their working faces approximately in the same horizontal plane but capable of yielding under high pressure to permit the sections to gradually assume a position with their faces at right angles to each other as the pressure is completed, substantially as described.

4. The combination in a press-platen, of two sections pivoted nearest their outer ends and back of their working faces, means for supporting and maintaining the sections normally with their working faces in approximately a horizontal plane, and means for permitting the sections to yield under heavy pressure until their working faces are at right angles to each other, substantially as described.

5. A press-platen, consisting of two rocking sections pivoted nearest their outer ends to assume positions with their working faces either approximately on a horizontal plane or at right angles to each other, and yielding means arranged to normally maintain the sections with their faces horizontal, substantially as described.

6. The combination with the platen-supports of a press, of sections pivoted thereto to present substantially flat faces to the bale at the beginning of the pressure and to present faces at a right angle as the pressure is completed, substantially as described.

7. The combination with the platen-supports of a press, of sections pivoted to present substantially flat faces to the bale at the beginning of the pressure and to present faces at a right angle as the pressure is completed, with means for resisting the movement toward the final position, substantially as described.

8. The combination with the platen-supports of a press, of sections pivoted thereto to present substantially flat faces to the bale at the beginning of the pressure and to present faces at a right angle as the pressure is completed, with springs for resisting the movement toward the final position, substantially as described.

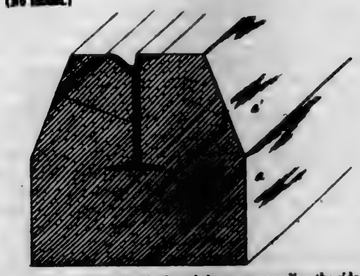
9. The combination in a press, of a press-platen having rocking sections pivoted to rock as the platens are brought together, and yielding means for resisting the rocking movement, substantially as described.

10. The combination in a press, of a press-platen having rocking sections pivoted to rock as the platens are brought together, and yielding means for resisting the rocking movement constructed to prevent such movement until the maximum pressure is approximated, substantially as described.

11. The combination in a press-platen, of two pivoted sections connected to rock together, and means for resisting the rocking motion, substantially as described.

12. The combination in a press-platen, of two sections each consisting of a series of independent sectors pivoted to assume positions with their faces approximately horizontal or at right angles, and means for supporting the sectors yieldingly with the working faces in horizontal position, substantially as described.

706,619. BEAM FOR RAILROAD-TRACK FOUNDATIONS. LAWRENCE R. WEST, Cincinnati, Ohio. Filed Dec. 14, 1901. Serial No. 86,004. (No model.)



Claim.—1. A longitudinal track-beam surrounding the sides and bottom of a rail and composed of asphalt, coal-tar or other bituminous products mixed with sand, crushed stone and like material.

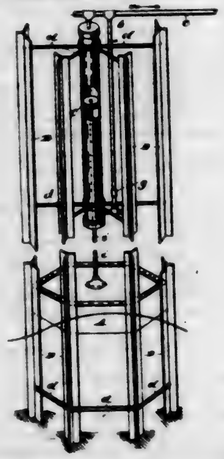
2. A longitudinal track-beam composed of asphalt, coal-tar or other bituminous products mixed with sand, crushed stone and like material laid at the sides and beneath the rail and tamped, so that said rail will be embedded and supported therein.

3. A longitudinal track-beam composed of asphalt, coal-tar or other bituminous products mixed with sand, crushed stone and like material, and laid at the sides and beneath the rail and tamped so that said rail will be embedded and supported therein, the said beam being wider at the base than at the top.

4. A longitudinal track-beam composed of asphalt, coal-tar or other bituminous product mixed with sand, crushed stone or like material laid at the sides and beneath the rail, the top of the beam being flush with the top of the rail.

5. In a longitudinal track-beam for railways, the combination with the rail having a base-flange, of a beam composed of asphalt, coal-tar or other bituminous products mixed with sand, crush stone or similar material, and laid and tamped at the sides and beneath the base-flange of the rail, so that the said rail will be embedded in the beam.

706,620. WAVE-MOTOR. ESBEY WILLIAMS, Wilbur, Or. Filed Dec. 17, 1901. Serial No. 86,303. (No model.)



Claim.—1. The combination with a vertical, double-acting air-pump, of a vertically-movable float having non-corrosive friction-plates on the lateral sides thereof, and operating between vertical guide-bars having non-corrosive friction-strips attached thereto; said float being attached to the piston-rod of said pump, all substantially as described and for the purpose set forth.

2. The combination with a vertically-movable float adapted to operate a vertical, double-acting air-pump, of one or more other similar air-pumps and floats, the said floats being arranged to operate between several three-way vertical guide-bars D substantially as described and for the purposes specified.

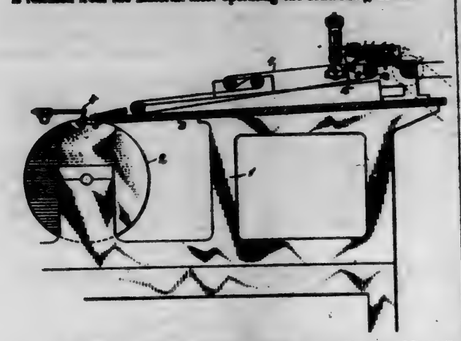
706,621. SINK-STRAINER. SAMUEL F. WILLIAMS, San Francisco, Cal. Filed Sept. 3, 1901. Serial No. 74,174. (No model.)

Claim.—A sink-strainer of the character described, comprising a perforated plate or disk having a central opening with a screw-threaded edge and a screw-threaded pendent sleeve in continuation of said opening, having upon its outer surface a flange, a second perforated plate or disk arranged upon said sleeve below said first plate and carried by said flange, and means for retaining said second plate, substantially as set forth.

706,622. CONTROLLING MECHANISM FOR PRINTING-PRESSES. WILLIAM C. WILLIAMS, Brooklyn, N. Y., assignor to William H. Klein, Chicago, Ill. Filed Sept. 3, 1901. Serial No. 74,169. (No model.)

Claim.—1. In a device of the character specified, the combination with a suitable backing member, of a contact member journaled adjacent

to said backing member, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a suitable controlling device constructed to be operated by said contact member, and means whereby the contact member is released from the material after operating the controlling device.



2. In a device of the character specified, the combination with a suitable backing member, of a contact member journaled adjacent to said backing member, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a suitable controlling device constructed to be operated by said contact member, means for normally withholding said contact member from engagement with said controlling device, and means whereby the contact member is released from the material after engaging the controlling device.

3. In a device of the character specified, the combination with a suitable backing member, of an unbalanced contact member journaled adjacent to said backing member, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a suitable controlling device constructed to be operated by said contact member, and means whereby the contact member is released from the material after operating the controlling device.

4. In a device of the character specified, the combination with a suitable backing member, of a support movably mounted adjacent to said backing member, a contact member journaled on said support, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, and a controlling device constructed to be operated by said contact member, the construction being such that the contact member is released from the material after operating the controlling device.

5. In a device of the character specified, the combination with a suitable backing member, of a support movably mounted adjacent to said backing member, a contact member journaled on said support, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a controlling device constructed to be operated by said contact member, and means for limiting the movement of the contact member whereby the support is operated to release the contact member from the material after the controlling device is operated.

6. In a device of the character specified, the combination with a suitable backing member, of a support movably mounted adjacent to said backing member, a contact member journaled on said support, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a controlling device connected to said support, and a stop for limiting the movement of the contact member whereby the support is caused to operate the controlling device and to release the contact member from the material.

7. In a device of the character specified, the combination with a backing-roller, of a lever pivoted adjacent to said roller, an unbalanced contact-wheel journaled on said lever, said wheel having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a controlling device connected to said lever, and a stop carried by said lever for limiting the movement of the contact-wheel whereby said lever is caused to operate the controlling device and to release the contact-wheel from the material.

8. In a device of the character specified, the combination with a suitable backing member, of a contact member journaled adjacent to said backing member, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a fluid-operated controlling mechanism, a device for controlling the operating fluid constructed to be operated by said contact member, and means whereby the contact member is released from the material after operating the controlling device.

9. In a device of the character specified, the combination with a backing-roller, of a lever pivoted adjacent to said roller, an unbalanced contact-wheel journaled on said lever, said wheel having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, a fluid-operated controlling mechanism, a valve for controlling the operating fluid connected to said lever, and a stop carried by said lever for limiting the movement of the contact-wheel whereby said lever is caused to operate the controlling device and to release the contact-wheel from the material.

10. In a device of the character specified, the combination with a fluid-operated controlling mechanism, of a valve for controlling the operating fluid, and means for operating said valve comprising a suitable backing member, a contact member movably mounted adjacent to said backing member, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device and means whereby the contact member is released from the material after the valve has been operated.

11. In a device for feeding sheets of paper or similar material to a printing-press or other machine having front gages the combination with means for conveying the sheet to the machine, of means independent of the machine for timing the passage of the sheets to the machine, and a sheet-operated device for controlling the machine located between said timing means and the sheets when the latter are in position against the front gages of the machine.

12. In a device for feeding sheets of paper or similar material to a printing-press or other machine having front gages the combination with means for conveying the sheet to the machine, of means independent of the machine for timing the passage of the sheets to the machine, and a device operated by an abnormal thickness of material for controlling the machine located between said timing means and the sheets when the latter are in position against the front gages of the machine.

13. In a device for feeding sheets of paper or similar material to a printing-press or other machine having front gages the combination with means for conveying the sheet to the machine, of means independent of the machine for timing the passage of the sheets to the machine, and a sheet-operated device for controlling the machine located between said timing means and the sheets when the latter are in position against the front gages of the machine, said sheet-operated device consisting of a backing member, and a contact member movably mounted adjacent to said backing member and having a bearing-surface arranged to be gripped by an abnormal thickness of material passing through the device.

14. In a device for feeding sheets of paper or similar material to a printing-press or other machine the combination with means for conveying the sheet to the machine, of means independent of the machine for timing the passage of the sheets to the machine, and a sheet-operated device for controlling the machine located between said timing means and the machine, said sheet-operated device consisting of a backing member, and a contact member movably mounted adjacent to said backing member and having a bearing-surface arranged to be gripped by an abnormal thickness of material passing through the device, and means whereby the contact member is released from the material after the controlling device has been operated.

15. In a device of the character specified, the combination with a fluid-operated controlling mechanism including a tube mounted transversely to the path of the paper in the machine and an arm adjustably mounted on said tube, said arm having a valve-port connected to said tube by a flexible pipe, of a controlling-valve mounted on said arm, and means rendered operative by an abnormal thickness of material for operating said valve.

16. In a device of the character specified, the combination with a fluid-operated controlling mechanism including a tube mounted transversely to the path of the paper in the machine and an arm adjustably mounted on said tube, said arm having a valve-port connected to said tube by a flexible pipe, of a controlling-valve mounted on said arm, and means for operating said valve comprising a suitable backing member and a contact member movably mounted adjacent to said backing member, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device.

17. In a device of the character specified, the combination with a fluid-operated controlling mechanism including a tube mounted transversely to the path of the paper in the machine and an arm adjustably mounted on said tube, said arm having a valve-port connected to said tube by a flexible pipe, of a controlling-valve mounted on said arm, and means for operating said valve comprising a suitable backing member and a contact member movably mounted adjacent to said backing member, said contact member having a bearing-surface arranged to be gripped by an abnormal thickness of the material passing through the device, and means whereby the contact member is released from the material after the device has been operated.

706,623. CONTROLLING MECHANISM FOR PRINTING-PRESSES. William C. Williams, Brooklyn, N. Y., assignor to William M. Klein, Chicago, Ill. Filed Sept. 3, 1901. Serial No. 74,104. (No model.)

Claim.—1. In a printing-press or similar paper-manipulating machine the combination with a fluid-operated controlling mechanism including an arm having a valve-port, of a controlling-valve pivoted on said arm, and a contact-finger connected to said valve and arranged in such relation to the path of the paper in the machine that a crumpling of the paper will operate said controlling-valve.

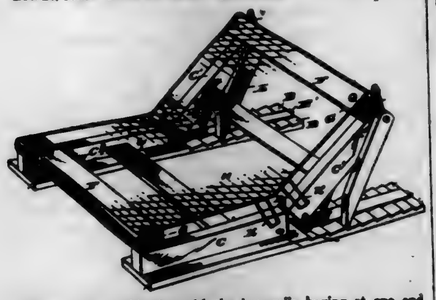
2. In a printing-press or similar paper-manipulating machine the combination with a fluid-operated controlling mechanism including an arm having a valve-port, of a valve pivoted on said arm and constructed to open and close said port by a movement transverse thereto, and a contact-finger connected to said valve and arranged in such relation to the path of the paper in the machine that a crumpling of the paper will operate said controlling-valve.

3. In a printing-press or similar paper-manipulating machine, the combination with a fluid-operated controlling mechanism including a tube mounted transversely to the path of the paper in the machine and an arm adjustably mounted on said tube, said arm having a valve-port connected to said tube by a flexible pipe, of a controlling-valve pivoted on said arm, and a contact-finger connected to said valve and arranged in such relation to the path of the paper that a crumpling of the paper will operate said controlling-valve.

4. In a printing-press or similar paper-manipulating machine the combination with a fluid-operated controlling mechanism including a tube mounted transversely to the path of the paper in the machine and an arm adjustably mounted on said tube, said arm having a valve-port connected to said tube by a flexible pipe, of a valve constructed to open and close said valve-port by a movement transverse thereto, and a contact-finger connected to said valve and arranged in such relation to the path of the paper that a crumpling of the paper will operate said controlling-valve.

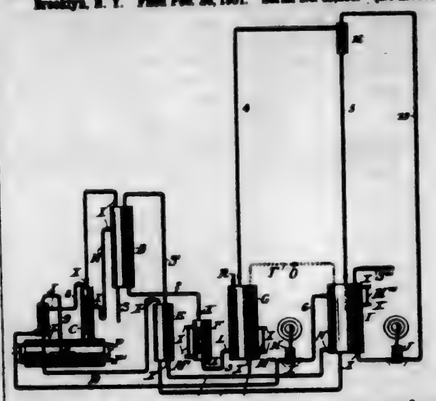
5. In a printing-press the combination with an impression-cylinder and a set of automatically-operated fingers for stripping the sheets therefrom, of a fluid-operated controlling mechanism, a controlling-valve therefor and a contact-finger connected to said valve and arranged in such relation to said stripping-fingers that a crumpling of the paper will upon the movement of said stripping-fingers operate said controlling-valve.

706,624. BED-SPRING. Hyrum Western, Atlanta, Ga. Filed Nov. 27, 1901. Serial No. 83,202. (No model.)



Claim.—The combination with the base-rails, having at one end double racks, of the rigid strips at one end of said rails, the movable strips hinged to said rigid strips, the latches for holding said hinged strips in line, cross-strips, a wire fabric secured to said cross-strips, fastenings upon opposite sides of the hinges connecting the wire fabric to the hinged and rigid strips to secure the wire fabric to the said strips, pivoted detents carried by the free end of the movable section to engage said racks, and means for connecting one of the sections with the other at their hinge-joint, substantially as shown and described.

706,625. REFRIGERATING-MACHINE. Willard J. Woodside, Brooklyn, N. Y. Filed Feb. 26, 1901. Serial No. 49,398. (No model.)



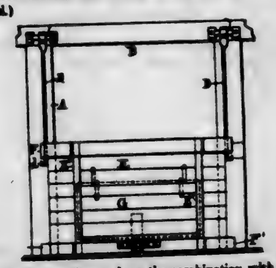
Claim.—1. In combination, an absorber having an entrance for gas, a reception vessel having an entrance for weak liquor, and an exit for strong liquor, means for withdrawing weak liquor from the reception vessel and delivering it to the absorber, means for returning enriched liquor from the reception vessel adapted to maintain a low pressure in the absorber, substantially as specified.

2. In combination, an absorber having an entrance for gas, a reception vessel having an entrance for weak liquor, and an exit for strong liquor, means provided to cool the liquor circulated, means for withdrawing weak liquor from the reception vessel and delivering it to the absorber, means for returning enriched liquor from the absorber to the reception vessel adapted to maintain a low pressure in the absorber, substantially as specified.

3. In combination, an expansion-chamber having an entrance for liquid and exit for gas, connections to conduct the gas to an absorber having an entrance to receive it, a reception vessel having an entrance for weak liquor and exit for strong liquor, means for withdrawing weak liquor from the reception vessel and delivering it to the absorber, means for returning enriched liquor from the absorber to the reception vessel adapted to maintain a low pressure in the expansion-chamber, substantially as specified.

4. In combination, an expansion-chamber having an entrance for liquid and exit for gas, connections to conduct the gas to an absorber having an entrance to receive it, a check-valve placed in said connection, a reception vessel having an entrance for weak liquor, and an exit for strong liquor, means for withdrawing weak liquor from the reception vessel, and delivering it to the absorber, means for returning enriched liquor from the absorber to the reception vessel adapted to maintain a low pressure in the absorber, substantially as specified.

706,626. GRAIN-DOOR FOR RAILROAD BOX-CARS. John W. Wess, Terre Haute, Ind. Filed June 27, 1901. Serial No. 66,311. (No model.)

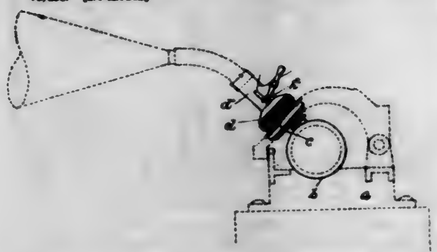


Claim.—1. In a grain-car door, the combination with two hangers having hooks at their lower ends and pivoted at their upper ends at each

side of the door-frame, of a door provided near each side edge with upper and lower eyes, the former in constant engagement with the adjacent hanger and the latter adapted to pass over said hanger when the door is raised; and be engaged by the hooked end of said hanger.

2. A grain-car door, comprising two hangers having hooks at their lower ends and pivoted at their upper ends to the frame of the car, a main door provided at its inner side near each edge with a small upper eye engaging said hanger above the hook and a large lower eye adapted to pass over said hook when the door is raised, a small door hinged to said main door and closing an opening therein, cooperating fastening devices on said small door and on the lower part of the main door, and a fastening device in the car-roof for suspending the door when raised on the hangers and turned up against the roof.

706,627. ATTACHMENT FOR PHONOGRAPHS. MARSH M. WOOLVERTON, New London, Conn. Filed Aug. 5, 1901. Serial No. 71,021. (No model.)



Claim.—1. In a phonograph, a sound-modifying chamber adapted to be interposed between the diaphragm and the trumpet, and means within said chamber for varying the size thereof, substantially as described.

2. In a phonograph, a sound-modifying chamber adapted to be interposed between the diaphragm and the trumpet, and means within the chamber and operable from the exterior thereof for varying its size, substantially as described.

3. In a phonograph, a sound-modifying chamber adapted to be interposed between the diaphragm and the trumpet, and means within said chamber independent of the diaphragm for varying its size, substantially as described.

4. In a phonograph, a sound-modifying chamber adapted to be interposed between the diaphragm and the trumpet, a longitudinally-movable abutment in said chamber of substantially the same size as the internal diameter thereof, and means for moving said abutment to vary the size of the chamber, substantially as described.

5. In a phonograph, a sound-modifying chamber adapted to be interposed between the diaphragm and the trumpet, and means within said chamber for establishing or eliminating communication between the same and the trumpet, substantially as described.

6. In a phonograph, a sound-modifying chamber adapted to be interposed between the diaphragm and the trumpet, and means within the chamber for establishing or eliminating communication between the same and the trumpet while the machine is in operation, substantially as described.

7. In a phonograph, a sound-modifying chamber adapted to be interposed between the diaphragm and the trumpet, and means within and operable from the exterior of the chamber for establishing or eliminating communication between the same and the trumpet, substantially as described.

706,628. BOX-LID HOLDER AND LABEL-DISPLAYER. JOHN W. WRIGHT, Elk City, Kans. Filed Apr. 5, 1902. Serial No. 101,460. (No model.)

Claim.—1. A box-lid holder and label-displayer comprising a plate provided near one end with a hole for the insertion of a securing device, and having a portion of the other end of the plate rearwardly bent, and provided with a forwardly-extending tongue projecting from the plate near said bent portion, the said tongue being provided with a portion thereof disposed substantially parallel to the body of the plate, and the outer end of the tongue being bent away from the said plate, substantially as described.

2. A box-lid holder and label-displayer comprising a plate the body portion of which is provided with a rearwardly-projecting bent having a hole therethrough, and provided also with a tongue projecting away from the body and having a portion thereof disposed parallel with the body of the plate, substantially as described.

3. As an article of manufacture, a lid-holder and label-displayer consisting of a metallic plate having a bent formed on one side provided with a hole therethrough and having a tongue cut out from the body of the plate and extending forwardly therefrom and disposed in a portion thereof substantially parallel to the body of the plate, the said tongue being disposed upon the side of the plate opposite the said bent, substantially as described.

706,629. MACHINE-WRENCH. JOHN W. ALBRIGHT Kinsold, Kans. Filed Mar. 26, 1902. Serial No. 100,141. (No model.)

Claim.—1. In a wrench of the character described, a frame, bearings located at opposite ends of the frame and in line therewith, one of said bearings forming a handle, an operating-shaft journaled in the handle, a socket disposed at the end of the frame opposite the handle portion thereof, and a crank-handle adapted to be driven by the said operating-shaft at the outer end of the frame-handle by which the operating-shaft is turned, substantially as set forth.

2. In a device of the character described, in combination, a frame, bearings at opposite ends of the frame in line therewith and adapted to receive an operating-shaft journaled therein, one of said bearings forming a handle, a socket journaled with its axis about at a right angle with the axis of the operating-shaft and adapted to be rotated in the manner described, an arm pivoted intermediate the handle and socket ends of the frame and about parallel with the latter and adapted to carry a tool, and spring means for holding the said arm in an ascertained relation to the frame, substantially as described.

3. In a device of the character described, a frame, a handle located at one end of same and adapted in conjunction with a bearing at the opposite end of the frame to receive an operating-shaft rotatably journaled therein, an arm pivoted intermediate the ends of the frame about parallel therewith and adapted to carry a tool longitudinally slidable therein, the latter extending normally into the socket at the end of the frame, adjustable spring means for holding said arm in an ascertained relation to the frame and a set-screw adapted to limit the movement of the arm, substantially as set forth.

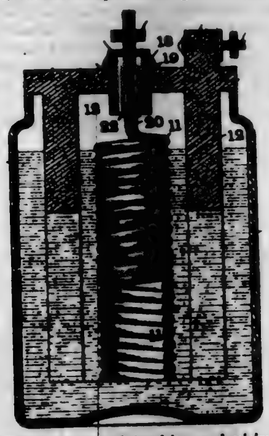
706,630. FILE. JOHN D. ALLEN, Athens, Ga. Filed Sept. 14, 1901. Serial No. 75,267. (No model.)

Claim.—A file composed of an outer case open at the bottom and closed at the top, an inner file-case open at the top and closed at the bottom and having tapered sides adjacent to said bottom, a hinged right-angled latch on the outer case to engage the bottom of the inner file-case, a vertical filing-pin within said inner file-case and a retainer for said filing-pin at the upper end thereof, substantially as described.

706,631. CHEMICAL GENERATOR OF ELECTRICITY. EDWARD L. ANDERSON, St. Louis, Mo., assignor to John A. Gillam, trustee, St. Louis, Mo. Filed Sept. 30, 1901. Serial No. 77,010. (No model.)

Claim.—1. In a single fluid-cell, an aluminium electrode, a negative electrode, and an electrolyte in contact with both of said electrodes containing a suitable halogen salt and nitric acid.

2. In a chemical generator of electricity, an aluminium electrode, a negative electrode, and an electrolyte containing a fluorid and nitric acid.



3. In a chemical generator of electricity, an aluminium electrode, a negative electrode, and an electrolyte containing calcium fluorid and nitric acid.

4. In a chemical generator of electricity, an aluminium electrode, a negative electrode, and an electrolyte containing a fluorid, a chlorid, and nitric acid.

5. In a chemical generator of electricity, an aluminium electrode, a negative electrode, and an electrolyte containing calcium fluorid, zinc chlorid, and nitric acid.

6. In a chemical generator of electricity, an aluminium electrode, a negative electrode, and an electrolyte containing a suitable halogen salt, nitric acid, and a depolarizing agent.

7. In a chemical generator of electricity, an aluminium electrode, a negative electrode, and an electrolyte containing a fluorid, an acid, and a depolarizing agent.

706,632. ARMATURE-WINDING FOR INDUCTION-MOTORS. ALBERT H. ARMSTRONG, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Original application filed Nov. 3, 1897, Serial No. 657,508. Divided and this application filed Jan. 17, 1901. Serial No. 43,615. (No model.)

Claim.—1. An induction-motor winding comprising a plurality of conductors united at their ends by webs integral therewith, the said winding being adapted to be wrapped around an armature-core and secured thereon.

2. As an induction-motor winding, a cast-metal grid comprising a plurality of conductors united by web connections at their ends, the said winding being adapted to be wrapped around an armature-core and secured thereon.

3. An induction-motor winding comprising a plurality of parallel bars connected at their ends by flexible integral intermediate portions.

4. An induction-motor winding comprising a plurality of parallel bars arranged side by side and connected at their ends by flexible integral webs arranged perpendicular to said bars.

5. In combination, a core comprising a body of toothed laminæ, a grid, constituting a closed-circuited winding, comprising a plurality of conductors having end connections formed integral therewith, and means for fastening said grid in position on the core.

6. A winding for an electric motor, consisting of a cast-metal grid composed of parallel bars and end webs perpendicular thereto, and provided at one end of the grid with an offset portion.

7. The combination in an induction-motor, of a toothed core and a winding consisting of a grid adapted to be wrapped around the core, the said grid being composed of parallel bars adapted to fit between the teeth of the core and connected by intermediate portions arranged to lie against the ends of the core.

706,688. GAS-BURNER. ADOLF BELOW, Pittsburg, Pa., assignor of two-fifths to Frederic Hartley, Pittsburg, Pa., and Charles H. Parsons, Sharon, Pa. Filed Jan. 31, 1902. Serial No. 91,031. (No model.)

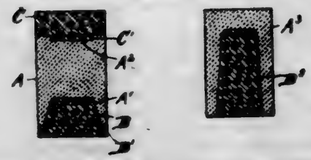
Claim.—1. A burner of the class described having a deflector and a narrow channel leading therefrom to the flame, a primary mixer open to the outer air and having its inner end disposed opposite the deflector, means to discharge a jet of gas against the deflector, through the primary mixer, whereby the commingled gas and air will be disposed in a thin film on the surface of the deflector, and a secondary mixer, to admit air to the surface of the deflector, at a point between the primary mixer and the intake of the channel, substantially as described.

2. In combination with an outer casing having a flared portion and a contracted tubular portion leading therefrom, said tubular portion having means to admit air; a deflector in said casing, disposed proximate to the flared portion and across the contracted portion thereof, a narrow channel being thereby formed between them; an air-intake funnel disposed in the contracted portion of the casing, opposite the deflector and open at its outer end for the admission of air, and a gas tip or nozzle disposed to discharge a jet through the air-intake funnel and directly against the deflector, the air-intake funnel forming a primary mixing-chamber, the space between said funnel and the contracted tubular portion of the casing forming a secondary mixing-chamber, at the surface of the deflector, from which secondary mixing-chamber the mixed gas and air pass through the narrow channel to the flame, substantially as described.

3. In combination with an outer casing having a flared portion and a contracted tubular portion leading therefrom, said tubular portion having air-inlet openings and means to vary the effective area thereof; a deflector in said casing, disposed proximate to the flared portion and across the contracted portion thereof, a narrow channel leading to the flame being thereby formed between them; an air-intake funnel, disposed in the contracted portion of the casing, opposite the deflector, and open at its outer end for the admission of air, and a gas tip or nozzle disposed to discharge a jet through the air-intake funnel and directly against the said deflector, for the purpose set forth, substantially as described.

4. In a burner, a mixing-chamber, a deflector therein and spaced therefrom to form a narrow channel between said mixing-chamber and said deflector and an annular flame-spreader disposed above the said channel and adapted to contain water, substantially as described.

706,684. STOPPER FOR BOTTLES. ARTHUR BLEIER, La Varenne, France. Filed June 3, 1902. Serial No. 109,510. (No model.)



Claim.—1. In a stopper for bottles, the combination with a gas and water proof cylindrical body portion formed from a solid piece of material consisting of powdered cork and nitrocellulose and having a longitudinal opening in its inner end, of a plug of natural cork fitted within the opening, the said plug being adapted to exert an outwardly-directed expansive action upon the annular walls of the body portion which is inserted in the neck of the bottle, in the manner and for the purpose described.

2. In a stopper for bottles, the combination with a gas and water proof body portion formed from a solid piece of material consisting of cork and nitrocellulose and provided with a longitudinal opening in its inner end, of a plug of natural cork fitted within the opening, the said plug being adapted to exert an outwardly-directed expansive action upon the annular walls of the body portion which is inserted in the neck of the bottle, and a flange on the plug lies against the face of the body portion at the inner end of the latter, and constituting an extension of said body portion, in the manner and for the purpose set forth.

3. In a stopper for bottles, the combination with a gas and water proof cylindrical body portion formed from a solid piece of material consisting of powdered cork and nitrocellulose and provided with a longitudinal opening in each end, of a plug B of natural cork fitted within one opening, a flange on said plug, a cap C of natural cork in the other opening, substantially as and for the purpose described.

4. In a stopper for bottles, the combination with a gas and water proof cylindrical body portion formed from a solid piece of material consisting of powdered cork and nitrocellulose, impregnated with paraffin, and provided with a longitudinal opening in each end, a plug of natural cork fitted within one opening, a flange on this plug, a cap of natural cork fitting within the opening in the other end of the body portion, substantially as and for the purpose described.

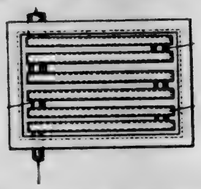
706,685. CAN AND METHOD OF ATTACHING A LABEL THERETO. THOMAS C. BOOTH, New Brunswick, N. J. Filed Nov. 30, 1900. Serial No. 38,943. (No model.)

Claim.—1. The combination with a metallic can having its edges united by an interlocked seam, of a label coextensive with the can-blank and included between the laps of the seam.

2. The combination with a metallic can having its edges united by an interlocked seam, of a label pasted to the exterior of the can and coextensive with the can-blank and included between the laps of the seam.

3. The herein-described method of securing a label to a metallic can, which consists first in pasting the label to the can-blank, the label to be coextensive with the blank, then bending the blank to the desired form, and then interlocking the edges of the blank to confine the label between the interlocked parts, substantially as and for the purpose specified.

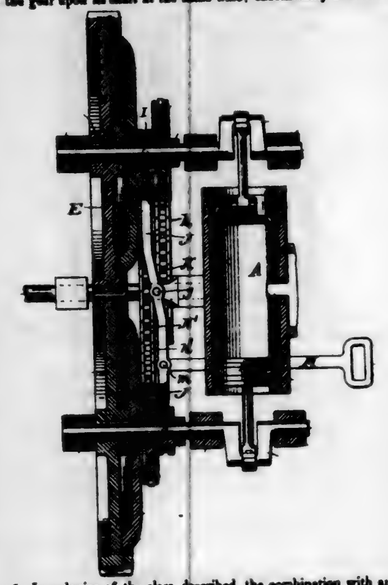
706,686. EXHAUST-MUFFLER. ROBERT E. BOURFIELD, Bay City, Mich. Filed Oct. 8, 1900. Serial No. 32,364. (No model.)



Claim.—In an exhaust-muffler for gas-engines the combination of a closed water-tight containing vessel having a water-inlet near its bottom and a water-outlet at its top; of a plurality of flat-sided water-tight cells spaced a short distance apart and arranged side by side within said containing vessel, the first cell of the series being connected at one end with the exhaust-pipe of the gas-engine, and connected near the lower part of its opposite end with the second cell of the series by means of a short tube; the remaining cells being connected alternately at their opposite ends, and the last cell having a discharge-outlet outside the containing vessel, substantially as described.

706,687. REVERSING-GEAR FOR ENGINES. VICTOR W. CLOUSE, Geneseo, Ill. Filed Mar. 3, 1902. Serial No. 96,517. (No model.)

Claim.—1. The combination with an engine having two pistons moving in opposite directions, two driven shafts suitably connected to said pistons, gears on said shafts mutually engaging one another and a third suitably-journaled drive-shaft, of a sprocket mounted on each of said driven shafts, friction-clutches connected to said sprockets, suitable means of connection between said sprockets and said driving-shaft and suitable means for throwing one of said friction-clutches into engagement with the gear upon its shaft and the other friction-clutch out of engagement with the gear upon its shaft at the same time; substantially as described.



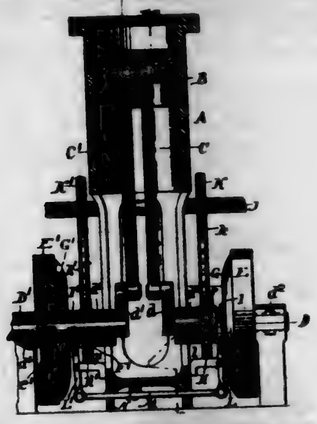
2. In a device of the class described, the combination with an engine having two gears moving synchronously in opposite directions, two shafts suitably connected to said gears, means of engagement between said shafts, whereby they are made to move synchronously in opposite directions and a suitably-journaled driving-shaft, of suitable gears loose upon said driven shafts, means of connection between said gears and said driving-shaft, and means for throwing either of said gears into engagement with its own shaft and at the same time releasing the other of them from similar engagement, substantially as described.

3. In a device of the class described, the combination with an engine having two pistons moving synchronously in opposite directions, two driven shafts suitably connected to said pistons, gears upon said shafts mutually engaging each other, and adapted to cause them to move synchronously in opposite directions and a third suitably-journaled driving-shaft, of loose collars upon said driven shafts, a friction-clutch adapted to engage its corresponding gear, a suitable sprocket-wheel and a grooved ring secured to each of said collars, a suitably-pivoted lever engaging both of said grooved rings and adapted to move said collars at the same time in opposite directions, suitable sprockets rigidly secured to said driving-shaft, and suitable means of connection between the sprockets mounted upon the collars and the sprockets mounted upon the driving-shaft; substantially as described.

4. In a device of the class described, the combination with two oppositely-driven shafts, gears thereon mutually engaging each other, and a suitably-journaled driving-shaft, of sprockets loosely mounted on each of said driven shafts, means of connection between said sprockets and said driving-shaft, and means whereby either of said sprockets may be thrown into engagement with the shaft on which it is mounted, the other sprocket being at the same time released from similar engagement with its shaft; substantially as described.

706,688. REVERSING-GEAR FOR ENGINES. VICTOR W. CLOUSE, Geneseo, Ill. Filed Mar. 3, 1902. Serial No. 96,518. (No model.)

Claim.—1. In a device of the class described, the combination with two oppositely-driven shafts substantially in line with each other, a suitably-journaled driving-shaft and gear-wheels thereon, of gears loosely mounted upon each of said driven shafts, means of connection between said gears, and the gears on said driving-shaft and means for securing engagement between one of said loosely-mounted gears and its shaft and at the same time for releasing the other of said loosely-mounted gears from similar engagement; substantially as described.



2. In a device of the class described, the combination with a cylinder and a piston therein, two connecting-rods pivotally connected to said piston, two suitably-journaled shafts adapted to be driven in opposite directions by said connecting-rods, and sprockets loosely mounted upon said shafts, of a suitably-journaled driving-shaft, sprockets secured thereon, means of connection between said sprockets and said loosely-mounted sprockets on said driven shafts, and means for producing engagement between one of said loose sprockets and its shaft, and at the same time for releasing the other of said loose sprockets from similar engagement; substantially as described.

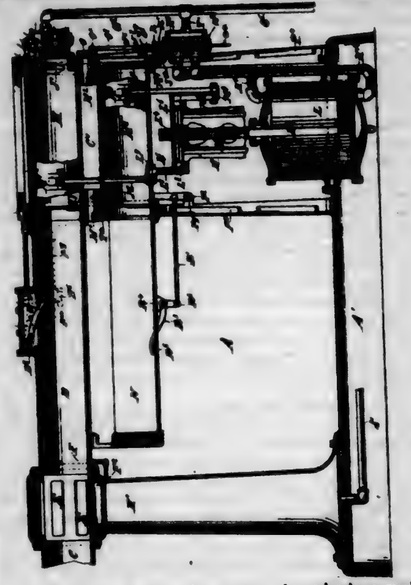
3. In a device of the class described, the combination with a cylinder, a piston therein, two connecting-rods pivotally connected to said piston, two suitably-mounted shafts adapted to be driven in opposite directions by said connecting-rods, fly-wheels on said shafts, sleeves loosely mounted on said shafts, a sprocket-wheel and a friction-clutch on each of said sleeves, and means for throwing one of said clutches into engagement with the contiguous fly-wheel, at the same time releasing the other clutch from similar engagement, of a suitably-journaled driving-shaft, sprockets thereon, and means of connection between said sprockets and the aforesaid sprockets mounted on said sleeves; substantially as described.

4. In a device of the class described, the combination with a cylinder, A, a piston, B, therein, connecting-rods, C, C', connected to said piston, shafts, D, D', adapted to be driven in opposite directions by said connecting-rods, fly-wheels, E, E', secured upon said shafts, sleeves, F, F', upon said shafts, clutches, G, G', sprockets, H, H', and grooves, I, I', upon said sleeves, forks, L, L', engaging said grooves and means whereby both of said forks can be simultaneously shifted in the same direction, of a suitably-journaled driving-shaft, J, sprockets, K, K', upon said shaft, and chains, *k*, *k'*, connecting said sprockets with the sprockets, H, H'; substantially as described.

706,689. PNEUMATIC-DESPATCH APPARATUS. JAMES T. COWLEY, Lowell, Mass., assignor to the American Pneumatic Service Company, Dover, Del., a Corporation of Delaware. Filed Nov. 27, 1899. Renewed Dec. 14, 1901. Serial No. 86,912. (No model.)

Claim.—1. In a pneumatic-despatch apparatus, a despatch-tube, a terminal, a receiver for the carriers consisting of two receiving-tubes, mechanism consisting of a shaft having arms for moving said tubes and connecting-rods engaging with said arms and with said tubes, the connections on said arms and on said tubes being of equal distances from the centers of revolution, and mechanism for operating said shaft and connecting-rods.

2. In a pneumatic-despatch apparatus, a despatch-tube, a terminal, a receiver for the carriers consisting of two receiving-tubes, mechanism consisting of a shaft having arms for moving said tubes and connecting-rods engaging with said arms and with said tubes, the connections on said arms and on said tubes being of equal distances from the centers of revolution, a gear-wheel fast on said shaft, a cylinder, a piston located on said cylinder and provided with a piston-rod to engage with said gear-wheel and operate the same upon the movement of the piston, and an air-supply for operating said piston.



4. In a pneumatic-despatch apparatus, a despatch-tube, a receiver, means for cushioning the carrier by the air compressed ahead of the traveling carrier, and means for releasing the compressed air ahead of the carrier after the carrier has been cushioned so that the pressure behind the carrier will move it to the end of the receiver.

5. In a pneumatic-despatch apparatus, a despatch-tube, a receiver, means for cushioning the carrier by the air compressed ahead of the traveling carrier, and means operated by the carrier for releasing the compressed air ahead of the carrier after the carrier has been cushioned so that the pressure behind the carrier will move it to the end of the receiver.

6. In a pneumatic-despatch apparatus, a despatch-tube, a receiver, means for cushioning the carrier, means operated by the air compressed ahead of the carrier for preventing the escape of the compressed air ahead of the carrier until the carrier has been cushioned, and means for releasing the compressed air ahead of the carrier after the carrier has been cushioned so that the pressure behind the carrier will move it to the end of the receiver.

7. In a pneumatic-despatch apparatus, a despatch-tube, a receiver for the carriers consisting of receiving-tubes, mechanism for moving one of said tubes out of alinement with the despatch-tube for the discharge of the carrier and for moving another tube into alinement with the despatch-tube to receive a carrier from said despatch-tube, and mechanism located in the path of the carrier and operated thereby to actuate the mechanism for moving the receiver to discharge a carrier.

8. In a pneumatic-despatch apparatus, a despatch-tube, a receiver for the carriers consisting of receiving-tubes, mechanism for moving one of said tubes out of alinement with the despatch-tube for the discharge of the carrier and for moving another tube into alinement with the despatch-tube to receive a carrier from said despatch-tube, mechanism located in the path of the traveling carrier and operated thereby to admit air for operating said receiver-moving mechanism, and an air-supply for operating said receiver-moving mechanism.

9. In a pneumatic-despatch apparatus, a despatch-tube, a receiver for the carriers consisting of receiving-tubes, mechanism for moving one of said tubes out of alinement with the despatch-tube for the discharge of the carrier and for moving another tube into alinement with the despatch-tube to receive a carrier from said despatch-tube, an air-supply for oper-

ating said receiver-moving mechanism, mechanism located in the path of the traveling carrier and operated thereby to actuate the receiver-moving mechanism by air from said supply, and means for discharging the carrier.

10. In a pneumatic-despatch apparatus, a despatch-tube, a receiver for the carriers consisting of receiving-tubes, mechanism for moving one of said tubes out of alinement with the despatch-tube for the discharge of the carrier and for moving another tube into alinement with the despatch-tube to receive a carrier from said despatch-tube, an air-supply for operating said receiver-moving mechanism, mechanism located in the path of the traveling carrier and operated thereby to actuate the receiver-moving mechanism by air from said air-supply, an air-supply for discharging the carrier, and means for admitting air to discharge the carrier.

11. In a pneumatic-despatch apparatus, a despatch-tube, a receiver for the carriers consisting of receiving-tubes, a source of compressed air, mechanism operated by compressed air from said source for moving one of said tubes out of alinement with the despatch-tube for the discharge of the carrier and for moving another tube into alinement with the despatch-tube to receive a carrier from said despatch-tube, an air-supply for operating said receiver-moving mechanism, mechanism located in the path of the traveling carrier and operating thereby to admit air to said receiver-moving mechanism for operating said receiver-moving mechanism, and means for discharging the carrier.

12. In a pneumatic-despatch apparatus, a despatch-tube, a receiver for the carrier, mechanism for removing said receiver out of alinement with the despatch-tube for the discharge of a carrier, an air-supply for operating said mechanism, mechanism located in the path of the carrier and operated thereby to actuate said mechanism for moving the receiver for the discharge of a carrier, an air-supply for discharging said carrier, means for admitting air from said air-supply to discharge a carrier, and means operated by the discharged carrier for cutting off the air-supply which discharges the carrier.

13. In a pneumatic-despatch apparatus, a transmission-tube for the carriers, a movable receiver, a source of air-pressure, a cylinder having a piston connected to said receiver, a valve controlling the flow of air-pressure into said cylinder to operate the piston therein, mechanism located in the path of the traveling carrier and operated thereby to actuate said valve to admit air to said cylinder to move the receiver from alinement with the transmission-tube for the discharge of the carrier, and a valve controlling the flow of air-pressure into said receiver to discharge the carrier and adapted to be operated by the movement of the receiver from alinement with the transmission-tube to admit air into said receiver to discharge the carrier.

14. In a pneumatic-despatch apparatus, a transmission-tube for the carriers, a movable receiver, a source of air-pressure, a cylinder having a piston connected to said receiver, a valve controlling the flow of air-pressure into said cylinder to operate the piston therein, mechanism located in the path of the traveling carrier and operated thereby to actuate said valve to admit air to said cylinder to move the receiver from alinement with the transmission-tube for the discharge of the carrier, an outlet from said receiver for the escape of the air compressed by the traveling carrier, and a valve actuated by the air compressed by the traveling carrier and adapted to close the escape of compressed air from the receiver to cushion the carrier in the receiver.

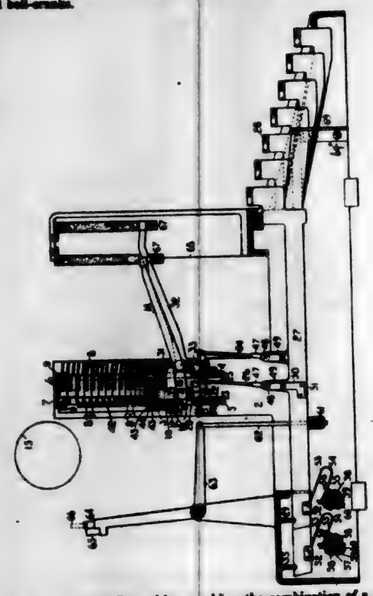
15. In a pneumatic-despatch apparatus, a transmission-tube for the carriers, a movable receiver, a source of air-pressure, a cylinder having a piston connected to said receiver, a valve controlling the flow of air-pressure into said cylinder to operate the piston therein, mechanism located in the path of the traveling carrier and operated thereby to actuate said valve to admit air to said cylinder to move the receiver from alinement with the transmission-tube for the discharge of the carrier, an outlet from said receiver for the escape of the air compressed by the traveling carrier, a valve actuated by the air compressed by the traveling carrier and adapted to close the escape of compressed air from the receiver to cushion the carrier in the receiver, and means for opening said valve after the carrier has been cushioned.

706,640. TYPE-WRITING MACHINE. EDWIN R. GRAY, Brooklyn, N. Y., assignor to Wyckoff, Seamans & Benedict, Ilion, N. Y., a Corporation of New York. Filed Apr. 27, 1901. Serial No. 57,767. (No model.)

Claim.—1. In a type-writing machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, and a series of outlying key-operated toothed bell-cranks having parallel axes and geared directly to the type-bar hubs.

2. In a front-strike writing-machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, and a series of key operated toothed bell-cranks having horizontal axes and mounted in an ascending series, and having at their inner ends upwardly-extending overlapping toothed arms geared directly to the type-bar hubs.

3. In a type-writing machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, a series of key-levers extending rearwardly beneath the type-bars, a series of bell-cranks having horizontal axes and arranged in ascending series, said bell-cranks having upwardly-extending toothed arms which are geared directly to said type-bar hubs, and connections extending upwardly from said key-levers to said bell-cranks.



4. In a front-strike writing-machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, a series of keys, and a series of bell-cranks connected to the keys and having horizontal axes arranged in ascending series, the axes at the lower portion of the bell-crank system being disposed end to end, and those at the sides of the system overlapping one another, said bell-cranks having upwardly-extending arms which are geared directly to the type-bar hubs.

5. In a front-strike writing-machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, and a series of keys connected thereto, the type-bars at the sides of the system being connected to their keys by means of toothed bell-cranks having overlapping axes and geared directly to the type-bar hubs.

6. In a front-strike writing-machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, a group or series of outlying bell-cranks, the width of the group of bell-cranks being greater than the width of the system of type-bars and each bell-crank engaging directly the toothed hub of a type-bar, said bell-cranks being of substantially uniform size and having substantially parallel pivots, and the type-bar-engaging arms of the bell-cranks at the sides of the system being offset, and a series of key-levers connected to said bell-cranks.

7. In a front-strike writing-machine, the combination of a segment, a series of rearwardly-striking type-bars mounted thereon and having toothed hubs, a series of outlying bell-cranks of substantially uniform size and having horizontal axes, a series of key-levers extending rearwardly beneath said bell-cranks, each bell-crank being directly connected to the toothed hub of a type-bar, and links extending upwardly from said key-levers to said bell-cranks.

8. In a front-strike writing-machine, the combination of a rearwardly-striking type-bar having a toothed hub, and a key-operated bell-crank having a prolonged axis or shaft and also having an inwardly-offset arm which is geared directly to the type-bar hub.

9. In a front-strike writing-machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, and a series of outlying bell-cranks having horizontal axes and pivoted in ascending series, the bell-cranks at the sides of the system being mounted at gradually-increasing distances from their type-bars and having upwardly-extending arms which are correspondingly offset, said arms being geared directly to the type-bar hubs.

10. In a type-writing machine, the combination of a series of rearwardly-striking type-bars, a segment upon which said type-bars are mounted, an outlying frame, and a series of bell-cranks having parallel axes mounted in ascending series upon said frame and directly gearing with said type-bars.

11. In a front-strike writing-machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, a segment upon which said type-bars are mounted, an outlying frame, a series of toothed bell-cranks having horizontal axes and directly geared to said type-bar hubs, and mounted in a series of brackets attached to said frame in ascending series, and keys for operating said bell-cranks.

12. In a front-strike writing-machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, and a series of keys connected thereto, the type-bars at the sides of the system being connected to their keys by means of bell-cranks having overlapping axes and inwardly-offset toothed arms which are directly geared to the type-bar hubs.

13. In a front-strike type-writing machine, the combination of a series of type-bars whose hubs have bevel-gears, and a series of upright operating-levers having substantially parallel axes arranged in different horizontal planes, said levers having bevel-gears which mesh with said type-bar gears.

14. In a type-writing machine, the combination of a series of type-bars whose hubs have bevel-gears thereon, a series of parallel bell-crank operating-levers provided with offset-gears in mesh with said type-bar gears, and independent key-levers operatively connected to said bell-crank operating-levers.

15. In a type-writing machine, the combination of a type-bar having a toothed hub, an operating-lever having a grooved portion, and a series of pins set into and extending across the grooved portion of said operating-lever for meshing with the teeth in the type-bar hub.

16. In a type-writing machine, the combination of a type-bar having a cupped hub, teeth formed upon said hub, and an operating-lever having an axis at an angle to the type-bar axis and also having a groove in which is inserted a series of transverse pins for meshing with the teeth upon the type-bar hub.

17. In a type-writing machine, the combination of a segment, two sets of hangers, the bases of which are secured upon opposite sides of said segment, and type-bars mounted in said hangers, the pivots of the type-bars in one set being in a different plane from the pivots of the type-bars in the other set, and the bases of all of said hangers extending inwardly from the arms which support the type-bar pivots toward the printing-center.

18. In a type-writing machine, the combination of a segment, two sets of hangers mounted upon opposite sides of said segment, the hangers of one set being staggered with relation to the hangers of the other set, and type-bars mounted in said hangers, the pivots of the type-bars in one set being in a different vertical plane from but in the same horizontal plane as the pivots of the type-bars in the other set, the bases of all of the hangers extending inwardly toward the printing-center, and the type-bars mounted in one set of hangers working between the hangers in the other set.

19. In a type-writing machine, the combination of a segment having vertically-disposed parallel faces, a set of elbow-hangers mounted upon one side or face of said segment and overhanging the outer edge thereof, type-bars pivoted in said hangers, a set of hangers mounted upon the other side or face of said segment, and type-bars mounted in the second set of hangers, the bases of all of said hangers extending inwardly from the type-bar pivots.

20. In a front-strike writing-machine, the combination of a segment having vertically-disposed parallel faces, a set of hangers mounted upon the front face thereof, forwardly-extending type-bars pivoted in said hangers, a second set of hangers mounted upon the rear face of said segment, and forwardly-extending type-bars mounted in said second set of hangers, the bases of all of said hangers extending inwardly from the type-bar pivots, and the type-bars in the rear set working between the hangers of the forward set.

21. In a front-strike writing-machine, the combination of a vertically-disposed segment, a set of hangers mounted upon the front face thereof, forwardly-extending type-bars pivoted in said hangers, a set of elbow-hangers mounted upon the rear face of said segment, and having type-bar-bearing arms which extend horizontally forward past the outer edge of said segment, and type-bars mounted in said arms and working between the forward hangers.

22. In a type-writing machine, the combination of a segment, two sets of hangers secured upon the opposite faces thereof face and aft of the machine by oppositely-directed screws, and type-bars mounted in said hangers, the bases of all of said hangers extending inwardly toward the printing-center.

23. In a front-strike machine, the combination of a segment having parallel faces, a set of hangers secured upon the rear face thereof, a second set of hangers secured upon the front face thereof, each of said hangers having both a forwardly-extending type-bar-bearing portion and also a base portion which extends radially inward therefrom, the bases of the two sets of hangers being parallel, and type-bars pivoted in said hangers.

24. In a front-strike type-writing machine, the combination of a segment having vertically-disposed parallel faces, a set of hangers which are spaced apart, type-bars pivoted thereon, a second set of hangers arranged to alternate with said spaced hangers and secured to the rear face of the segment, arms on said second set of hangers which extend forwardly past the outer edge of the segment and type-bars which are pivoted to said arms and are adapted to work between said spaced hangers.

25. In a type-writing machine, the combination of a segment, a series of type-bars pivotally mounted thereon, a curved bar secured upon the inner edge of said segment, perforations formed in said bar, and guiding-slots also formed in said bar at said perforations, said type-bars engaging said guiding-slots at points between their pivots and types.

26. In a type-writing machine, the combination of a segment, a series of hangers mounted upon the rear face thereof and having arms which project forwardly beyond the forward face of said segment and carry type-bars at their forward ends, and a bar secured to the inner edge of said segment and having guiding-slots which are engaged by the type-bars at points between their pivots and types.

27. In a type-writing machine, the combination of type-bars whose hubs have gears thereon, operating-levers having progressively-increasing heads and gearing with said type-bar gears, and the pivots of the operating-levers being progressively elongated.

28. In a front-strike writing-machine, the combination of a segment, a series of radiating hangers fastened thereto by screws, said hangers having forwardly-extending arms in which type-bars are pivoted, and independent projections extending from said hangers with guiding-slots formed in said projections and engaged by the type-bars between their pivots and types.

29. In a front-strike writing-machine, the combination of a segment, a set of hangers fastened upon the rear face thereof and having arms which extend forwardly and carry pivoted type-bars at their forward ends, a bar secured upon the inner edge of said segment and having guiding-slots which are engaged by said type-bars at points between their pivots and types, a set of hangers fastened upon the forward face of said segment and having forwardly-extending arms which carry pivoted type-bars, the said arms being more remote from the printing-point than the bases of the hangers, and guiding-slots formed upon the bases of said hangers and engaged by the forward type-bars between their pivots and types, the type-bars in the rear set working between the hangers in the forward set.

30. A folded sheet-metal forked type-bar hanger having a filling-block between its ends, a space being left at the base end of the hanger for a fastening-screw, and a space being also left at the other end of the hanger for receiving the hub of the type-bar.

31. A folded sheet-metal forked hanger having a base, and also having type-bar-carrying arms extending angularly from said base, a filling-block being secured between the base portions of said arms.

32. In a front-strike writing-machine, the combination of two sets of alternating type-bars striking rearwardly at a common center, the type-bars in one set being pivoted forwardly of the type-bars in the other set, and two sets of upwardly-extending key-operated levers having horizontal axes situated in different vertical planes and engaging said type-bars.

33. In a front-strike writing-machine, the combination of two sets of rearwardly-striking type-bars having toothed hubs and printing at a common center, the type-bars in one set being pivoted forwardly of the type-bars in the other set, and two sets of pivoted key-actuated bell-cranks, the pivots of each set being parallel one with the other, and said bell-cranks being geared directly to said type-bar hubs.

34. In a front-strike writing-machine, the combination of two sets of type-bars striking rearwardly at a common center, the type-bars in one set being pivoted forwardly of the type-bars in the other set, two sets of bell-cranks directly geared to said type-bars, a system of key-levers extending rearwardly beneath said bell-cranks, the pivots of each set of bell-cranks being progressively elongated, and two rows of connections extending from said bell-cranks to said key-levers.

35. In a front-strike writing-machine, the combination of a segment, two sets of type-bars pivoted thereon and striking rearwardly at a common center, one set being pivoted forwardly of the other set, two sets of bell-cranks directly geared to said type-bars, a system of parallel key-levers extending rearwardly beneath the bell-cranks, and two transverse rows of vertical connections extending from said bell-cranks to said key-levers.

36. In a front-strike type-writing machine, the combination of pivoted type-bars segmentally arranged, a series of bell-crank levers segmentally arranged and operatively connected to said type-bars, and a series of key-levers operatively connected to said bell-cranks, the vertical arms of the bell-cranks having progressively-increasing heads from the

middle of the segment upward, and the pivots of the bell-cranks progressively increasing in length from the middle of the segment upward.

37. In a front-strike writing-machine, the combination of a system of key-levers, two sets of alternating type-bars striking rearwardly at a common center, one set pivoted forwardly of the other, a set of bell-cranks having horizontal axes and geared directly to the type-bars in the forward set, connections extending downwardly from said bell-cranks to their key-levers, a second set of bell-cranks having horizontal axes and geared directly to the type-bars in the rear set, and connections arranged in rear of the forward set of bell-cranks and extending down from the rear bell-cranks to their key-levers, the bell-cranks in each set being arranged in ascending series.

38. In a front-strike writing-machine, the combination of two sets of alternating type-bars striking rearwardly at a common center, two sets of pivotal supports for said type-bars mounted in two vertical planes, two sets of key-operated bell-cranks geared directly to the type-bars and situated in substantially the same vertical planes as the pivots of the type-bars, and two sets of fixed brackets in which said bell-cranks are pivoted, the pivots of the bell-cranks of each set being parallel with each other and progressively elongated.

39. In a type-writing machine, the combination of a segment, two sets of alternating type-bars pivotally mounted thereon, and two outlying plates each carrying a set of bell-cranks directly engaging the type-bars.

40. In a type-writing machine, the combination of a segment, two sets of hangers thereon, type-bars having toothed hubs and mounted in said hangers, the pivots of one set of hangers being in a different plane from the pivots of the other set of hangers, the bases of all of the hangers extending inwardly from their pivots toward the printing-center, and the type-bars in one set of hangers working between the hangers of the other set, and two sets of bell-cranks mounted in individual hangers and directly engaging said type-bar hubs, the axes of said bell-cranks being substantially parallel.

41. In a front-strike writing-machine, the combination of a segment, a set of hangers mounted upon the front face thereof, forwardly-extending type-bars having toothed hubs pivoted in said hangers, a set of hangers mounted upon the rear face of said segment, forwardly-extending type-bars having toothed hubs mounted in said rear hangers, the bases of all of said hangers extending inwardly from the type-bar pivots, two sets of bell-cranks of nearly uniform size and having horizontal axes and geared directly to said type-bar hubs, and keys connected to said bell-cranks.

42. In a type-writing machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, and two sets of outlying key-operated toothed bell-cranks each set having pivots which are parallel with one another, said bell-cranks being geared directly to the type-bar hubs, the pivots of one set of bell-cranks being in a different plane from the pivots of the other set.

43. In a front-strike writing-machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, and two sets of key-operated toothed bell-cranks having horizontal axes mounted in ascending series and having at their inner ends upwardly-extending overlapping toothed arms geared directly to the type-bar hubs, the pivots of one set of bell-cranks lying in a different plane from the pivots of the other set.

44. In a type-writing machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, a system of horizontal key-levers lying side by side and extending rearwardly beneath the type-bars, two sets of bell-cranks having horizontal axes and arranged below the type-bars, said bell-cranks having upwardly-extending toothed arms which are geared directly to the type-bar hubs, and two rows of connections extending upwardly from said key-levers to said bell-cranks.

45. In a front-strike writing-machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, two sets of outlying bell-cranks having toothed arms to engage said hubs, the width of each set of bell-cranks being greater than the width of the system of type-bars and said bell-cranks being of substantially uniform size and having substantially parallel pivots, the type-bar-engaging arms of some of the bell-cranks being offset, and a system of key-levers connected to said bell-cranks.

46. In a front-strike writing-machine, the combination of a segment, two sets of type-bars mounted in different vertical planes thereon and having toothed hubs and striking rearwardly at a common printing-center, two sets of outlying bell-cranks geared to said hubs and of substantially uniform size and having horizontal axes, the said sets of said bell-cranks cooperating with said sets of type-bars and each set of bell-cranks being situated in substantially the same plane as the plane of the pivots of the cooperating set of type-bars, a system of key-levers extending rearwardly beneath said bell-cranks, and links extending upwardly from said key-levers to said bell-cranks.

47. In a front-strike writing-machine, the combination of a system of rearwardly-striking type-bars having toothed hubs, a segment upon which said type-bars are mounted, two sets of brackets fixed upon an outlying framing, bell-cranks mounted in said brackets and directly geared to said type-bar hubs, said bell-cranks having horizontal axes, and the axes of one set being in a different plane from the axes of the other set, and keys connected to said bell-cranks.

48. In a type-writing machine, the combination of two separate series of type-bars pivoted in different vertical planes and whose hubs have bevel-gears, two sets of operating-levers having substantially parallel axes, one set of operating-levers for each set of type-bars, said levers having bevel-gears in mesh with said type-bar gears and independent key-levers for actuating said operating-levers.

49. In a front-strike type-writing machine, the combination of two separate series of type-bars whose hubs have bevel-gears cut thereon, two sets of operating-levers having progressively-increasing heads and gearing with said type-bar gears, the pivots of each set of operating-levers being progressively elongated, and independent key-levers for actuating said operating-levers.

50. In a front-strike writing-machine, the combination of two sets of type-bars pivoted to strike at a common center, two sets of key-levers, the levers in one set being fulcrumed in rear of the levers in the other set, a set of bell-cranks geared directly to one set of type-bars and connected to one set of key-levers, and a set of bell-cranks geared directly to the other set of type-bars and connected to the other set of key-levers.

51. In a front-strike writing-machine, the combination of two sets of type-bars pivoted so as to strike rearwardly to a common center, two sets of key-levers, one set of said key-levers being fulcrumed in rear of the other set, a set of intermediate levers connected to one set of type-bars and one set of key-levers, and a separate set of intermediate levers connected to the other set of type-bars and the other set of key-levers.

52. In a front-strike writing-machine, the combination of two sets of type-bars pivoted to strike at a common center, the type-bars in one set being pivoted in rear of the type-bars in the other set, two sets of key-levers, the key-levers of one set having bearings forwardly of the key-levers in the other set and bearing keys at the rear portion of the keyboard, the other set of key-levers bearing keys at the front portion of the keyboard, a set of bell-cranks geared directly to the type-bars in the forward set and connected to the key-levers having the forward bearings, and a set of bell-cranks arranged in rear of the first-mentioned set and geared directly to the other set of type-bars and connected to the key-levers having the rear bearings.

53. In a front-strike writing-machine, the combination of a system of type-bars, two sets of bell-cranks connected thereto, the bell-cranks of one set being arranged in rear of the bell-cranks in the other set, a set of key-levers having keys at the rear portion of the keyboard and connected to the forward set of bell-cranks, and a set of key-levers fulcrumed in rear of the first-mentioned key-levers and having keys at the forward portion of the keyboard and connected to the rear set of bell-cranks.

54. In a type-writing machine, the combination with a type-bar and a fulcrumed operating-lever therefor, of a loop-spring fixed at one end to said lever and directed obliquely therefrom, and an abutment against which the other end of the loop bears, the loop lying between said lever and said abutment, and working in the plane of the lever.

55. In a type-writing machine, the combination of a type-bar, an operating-lever therefor, a loop-spring secured at one end to said lever, an abutment against which the free end of the loop bears, said loop lying between the abutment and the lever, and a device at said abutment for guiding the free end of said loop.

56. In a type-writing machine, the combination of a type-bar, an operating-lever therefor, a loop-spring secured at one end to said lever, an adjustable abutment against which the free end of the loop bears, said loop lying between the abutment and the lever, and a device at said abutment for engaging the free end of said loop.

57. In a type-writing machine, the combination with a series of types, of a series of operating-levers, a fixed bar extending transversely of said levers, a comb extending along said bar, a series of springs fixed to said levers and engaging said comb, and a series of screws tapped into said bar and bearing against the free ends of said springs for adjusting the tension of the latter.

58. In a type-writing machine, the combination of a series of types, a series of key-levers connected thereto, a bar arranged transversely beneath the key-levers, a series of loop-springs fixed at their ends to said key-levers and extending to said bar, a comb arranged along said bar and engaged by the free ends of said springs, and a series of screws tapped into said bar and bearing against the free ends of said springs for adjusting the tension of the latter.

59. In a type-writing machine, the combination of a series of types, a series of key-levers connected thereto, a bar extending transversely beneath said key-levers, inclined combs secured upon opposite faces of said bar, loop-springs fixed upon the bottom edges of said levers and extending obliquely therefrom and engaging said combs, and a series of screws tapped into said bar and bearing against said springs for adjusting the tension of the latter.

60. In a type-writing machine, the combination of a series of types, a series of operating-levers therefor, a series of loop-springs secured upon said levers, and means for adjusting the free ends of said springs.

61. In a type-writing machine, the combination of a type-bar, a key-lever, an ear formed upon said key-lever, a yielding keeper riveted to said key-lever and extending alongside of said ear, a turnbuckle detachably secured between said ear and said keeper, and a type-bar-connecting rod threaded into said turnbuckle.

62. In a type-writing machine, the combination of a type, a pivoted arm connected thereto, pins fixed upon said arm at different distances from its pivot, a link having at its upper end a slotted head for engaging said pins in succession, and a key-lever connected to the lower end of said link.

63. In a front-strike writing-machine, the combination of a rearwardly-striking type-bar, a bell-crank connected thereto, a key-lever, and a connecting-rod extending from said key-lever to said bell-crank for engaging the latter at different points so as to decrease the key-leverage during the printing stroke.

64. In a front-strike writing-machine, the combination of a rearwardly-striking type-bar, a bell-crank directly geared thereto, pins arranged at different distances from the pivot of said bell-crank, a link having a slotted head for engaging said pins in succession during the printing stroke, and a key-lever to which said link is attached.

65. In a type-writing machine, the combination of a type, an arm 25 for operating said type, pins 70 on said arm, pins 71 arranged between the said pins 70 and the pivot of the arm, link 26 having heads 72, slots 73 in said head adapted to engage pins 70 at the initial portion of the printing stroke, a slot 74 in said head adapted to engage pins 70 during the completion of the printing stroke, and a key-lever to which said link is attached.

66. In a front-strike writing-machine, the combination of a series of rearwardly-striking type-bars, a series of bell-cranks connected thereto and having horizontal axes, a series of key-levers extending rearwardly beneath said bell-cranks, a series of links extending upwardly from the key-levers and each provided with slots 73 and 74, and pins 70 and 71 arranged upon the bell-crank arms for engagement with the slots.

67. In a front-strike writing-machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, a series of bell-cranks directly engaging said toothed hubs, a series of key-levers extending rearwardly beneath the bell-cranks, and a series of rods attached to the key-levers and having a leverage-decreasing connection with said bell-cranks.

68. In a type-writing machine, the combination of a series of rearwardly-striking type-bars having toothed hubs, a series of bell-cranks geared directly to said hubs, a series of keys, and means for decreasing the leverage of the keys upon the bell-cranks during the printing stroke.

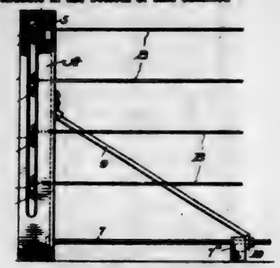
69. In a type-writing machine, the combination of a series of rearwardly-striking type-bars, a series of key-levers, a series of sublevers arranged between the type-bars and the key levers, and a series of links connecting the key-levers to the sublevers and having a leverage-changing connection to the latter.

70. In a front-strike writing-machine, the combination of a platen, a segment, a set of hangers fastened upon the rear vertical face of said segment and extending forwardly beyond the front vertical face thereof, a set of type-bars pivoted in the hangers, a set of bell-cranks pivoted in substantially the same vertical plane as said type-bars, a second set of hangers fastened upon the front face of said segment and extending forwardly therefrom, a set of type-bars pivoted in said second set of hangers, a second set of bell-cranks pivoted in substantially the same plane as said second set of type-bars, and key-levers extending rearwardly beneath all of the bell-cranks and connected thereto.

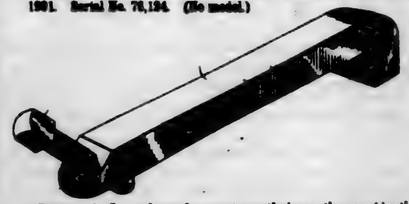
71. In a front-strike writing-machine, the combination of a platen, a segment, a set of hangers fastened upon its rear face and extending forwardly past its outer edge, a set of rearwardly-striking type-bars pivoted in the forward ends of said hangers, a set of bell-cranks directly engaged to said type-bars and pivoted in substantially the same vertical plane, a plate upon which said bell-cranks are supported by means of brackets, a second set of hangers fastened upon the front vertical face of said segment and extending forwardly therefrom, a second set of type-bars pivoted in said second set of hangers, a set of bell-cranks directly engaging said second set of type-bars and pivoted in substantially the same vertical plane, a second plate upon which said second set of bell-cranks is supported by means of brackets, key-levers extending rearwardly beneath the bell-cranks, and links connecting all the bell-cranks to the key-levers.

706,641. FENCE. WILLIAM CRAIG, San Francisco, Cal. Filed Oct. 8, 1901. Serial No. 77,662. (No model.)

Claim.—In a fence, a longitudinally-channeled post, said post having longitudinal slots in its side walls and perforations in the bottom of the channel, wires passing through said perforations, a shaft to which one end of each of said wires attach, said shaft having its journal ends slidably mounted in the longitudinal slots in the side walls of the post so as to be freely movable across one of said perforations, a ratchet upon said shaft, a block or plate having a pawl thereon, by which said ratchet is engaged, said plate adapted to be inserted in the channel of the post, and to be freely slidable in the bottom of said channel.



706,642. CLAMP FOR RETORT-MOUTHPIECES. JOHN C. DOAN, St. Louis, Mo., assignor to James Green, St. Louis, Mo. Filed Sept. 21, 1901. Serial No. 76,124. (No model.)

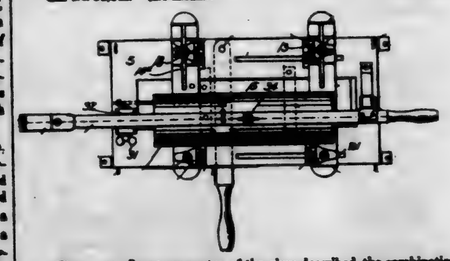


Claim.—1. In a clamp for retort-mouthpieces, the combination of a body having a straight outer end, a hook at its inner end and a screw movably seated in its outer end at an angle thereto, substantially as described.

2. In a clamp for retort-mouthpieces, the combination of a body having a hook at its inner end, and having a straight beveled forward end, and a screw passing through said forward end at an angle to the body of the clamp, substantially as described.

3. In a clamp for retort-mouthpieces, the combination of a body having a hook at its inner end, and having a beveled forward end and a screw passing through said beveled portion perpendicular thereto, whereby said screw receives a firm seat in said body.

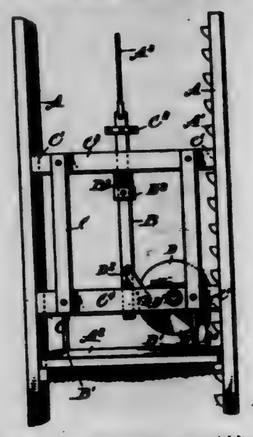
706,643. CELERY-BLEACHING DEVICE. LOUIS DOPPELHAYE, Valverde, and MARIUS WIBER, Denver, Colo. Filed Apr. 22, 1901. Serial No. 56,562. (No model.)



Claim.—1. In an apparatus of the class described, the combination of a platform having a central opening, a slide located in said opening, a cross-bar attached to the slide, standards attached to the cross-bar, a lever connected with the slide for adjusting the cross-bar, another cross-bar attached to the platform, standards attached to the cross-bar, and a vertically-swinging lever acting from above on the material embraced by the side standards.

2. The combination of a platform composed of two parts, one part being movable, cooperating side standards for embracing the material placed thereon, one set of standards being mounted on the movable part of the platform, a lever for adjusting the movable platform part and its standards, and another lever arranged to act from above on the material between the standards.

706,644. ELEVATOR-STOP. ELMER C. EDWARDS, Emporia, Kans. Filed May 16, 1902. Serial No. 108,716. (No model.)



Claim.—1. In an elevator-stop, a frame comprising parallel members, a reciprocating supporting-rod, a lifting-cable connected therein, a fixed rack, a dog pivoted between said members and provided with a lateral projection to engage said frame in one position, and a connecting-link pivoted at opposite ends to said rod and to said dog; substantially as specified.

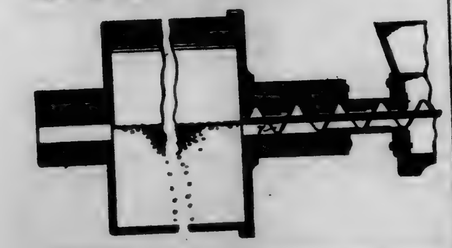
2. In an elevator-stop, a reciprocating supporting-rod, a lifting-cable connected therein, a fixed rack, a dog pivoted to engage said rack in one position, a connecting-link extending from said rod to said dog, a sliding frame in which said dog is mounted, and a stop-block carried by said dog to engage said frame; substantially as specified.

3. In an elevator-stop, a reciprocating supporting-rod, a lifting-cable connected therein, a fixed rack, a dog pivoted to engage said rack in one position, a connecting-link extending from said rod to said dog, a sliding frame in which said dog is mounted, a stop-block carried by said dog to engage said frame, a collar supported by said rod, and a spring extending between said frame and collar; substantially as specified.

4. In an elevator-stop, a sliding frame, a rotary dog mounted therein, a rack at one side of said frame, a peripheral point carried by said dog to engage said rack, a stop-block carried by said dog to engage said frame, and means for rotating said dog upon its pivot; substantially as specified.

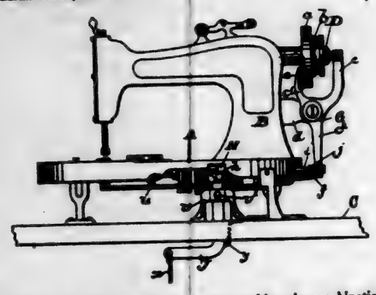
5. In an elevator-stop, a sliding frame, a rotary dog mounted therein, a rack at one side of said frame, a peripheral point carried by said dog to engage said rack, a stop-block carried by said dog to engage said frame, a car beneath said frame, a lifting-cable, a rod passing through said frame and connecting said cable and dog, and a supporting-head upon said rod; substantially as specified.

706,645. GRIT-MILL. CLIFFORD S. BOALER, Boston, Pa., and JAMES W. TREMAYNE, Shamokin, N. J. Filed Jan. 7, 1902. Serial No. 88,511. (No model.)



Claim.—The combination with a grit-mill and its hollow trunnion, of a feed-sleeve communicating with said trunnion and having an opening surrounded by said trunnion, and a ring of buckets rotating in unison with the trunnion and positioned to have their buckets successively register with the opening in the sleeve, and a feed-conveyer extending through said sleeve and designed to carry the material discharged by said buckets through said opening, into the mill, substantially as set forth.

706,646. AUTOMATIC STOP MECHANISM FOR BUTTONHOLE-MACHINES. PHILIP FARRIS, Baltimore, Md. Filed Oct. 21, 1901. Serial No. 79,208. (No model.)



Claim.—1. In a buttonhole-sewing machine, the combination with the feed-wheel, driving-shaft, and spring-released clutch mechanism adapted to drive said shaft, of a rod adapted to move said clutch mechanism against the action of its spring, into operative engagement with said shaft; a lever connected to said rod to move the same; a look-bar also adapted to be moved by said lever; a detent automatically moved into locking engagement with said bar when the latter and said rod are moved by said lever to throw the clutch mechanism into engagement with said shaft; and a tripping-dog adapted to retract said detent and arranged for actuation by said feed-wheel, as set forth.

2. In a buttonhole-sewing machine, the combination with a driving-shaft, feed-wheel, and spring-released clutch mechanism adapted to drive said shaft, of a rod adapted to move said clutch mechanism, against the action of its spring, into operative engagement with said shaft; a three-armed lever, H, having one arm connected to said rod to move the same; means connected to another arm of said lever for moving the latter; an oscillating toothed bar connected to the third arm of said lever; a reciprocating rack-bar meshing with said oscillating bar and provided with a notch; a pin spring-pressed toward said rack-bar and adapted to enter said notch to lock said rack-bar against movement; and a tripping-arm connected to said pin to retract the same from the said notch, and arranged for actuation by the feed-wheel, as set forth.

3. In a buttonhole-sewing machine, the combination with the driving-shaft, of spring-released clutch mechanism for driving said shaft; means including a lever, for throwing said clutch mechanism against the action of its spring, into operative engagement with said driving-shaft; an oscillating toothed bar connected to said lever; a reciprocating rack-bar meshing with said oscillating bar; a detent automatically moved into locking engagement with said rack-bar when the lever and oscillating bar are moved to throw the clutch mechanism into operative engagement with said driving-shaft; and a tripping-dog automatically actuated to retract said detent, as set forth.

4. In a buttonhole-sewing machine, the combination with the bed-plate, driving-shaft, feed-wheel, and spring-released clutch mechanism adapted to actuate said shaft, of a reciprocating bar; an oscillating bar movable with said reciprocating bar; means connected with said oscillating bar for holding said clutch mechanism against the action of its spring, in operative engagement with said driving-shaft; a detent spring-pressed into engagement with said reciprocating bar; and a tripping-dog connected with said detent and actuated by said feed-wheel to withdraw the detent from said reciprocating bar, as set forth.

5. In a buttonhole-sewing machine, the combination with a driving-shaft and feed-wheel, of spring-released clutch mechanism adapted to drive said shaft; a rod adapted to move said clutch mechanism, against the action of its spring, into operative engagement with said shaft; a lever connected to said rod to move the same; an oscillating toothed bar also connected to said lever; a reciprocating rack-bar meshing with said oscillating bar and provided with a notch; a pin spring-pressed toward said rack-bar and adapted to enter said notch to lock said rack-bar against movement; and a tripping-arm connected to said pin to retract the same from the said notch and arranged for actuation by the feed-wheel, as set forth.

6. In a buttonhole-sewing machine provided with a bed-plate, drive-shaft, and feed-wheel, means for driving said shaft; a casing secured to the bed-plate adjacent the feed-wheel and provided with a channel and a recess opening into said channel; a bar slidable in said channel and provided with a notch; a detent mounted in said recess and spring-pressed toward said bar, whereby when the bar is moved in one direction to bring its notch in registry with said detent, the latter will enter said notch and prevent the return movement of said bar; a tripping-dog pivoted to the bed-plate and adapted to automatically retract said detent; and a connection between said bar and the shaft-driving means, as set forth.

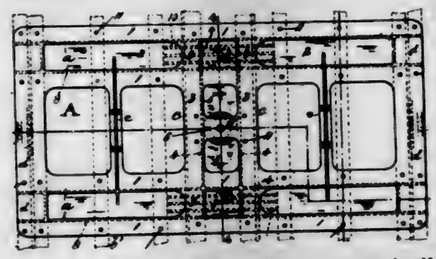
7. In a buttonhole-sewing machine, the combination with the drive-shaft, and spring-released clutch for the same, of means for locking said clutch in operative engagement with said drive-shaft, said means including a detent or locking-pin provided on one side with a recess; and a tripping-dog adapted to be moved by a shoulder on the feed-wheel of the machine and provided with an arm taking in said recess, whereby to move said pin, as set forth.

8. In a buttonhole-sewing machine, the combination with the drive-shaft, and spring-released clutch for the same, of means for locking said clutch in operative engagement with said drive-shaft, said means including a detent or locking-pin provided on one side with a recess; a tripping-dog adapted to be moved by a shoulder on the feed-wheel of the machine and provided with an arm taking in said recess, whereby to move said pin; and a rod, *x*, connected to said arm for moving said tripping-dog independently of the feed-wheel, as set forth.

9. In a buttonhole-sewing machine, the combination with the drive-shaft, and clutch mechanism therefor, of a rod for pressing said clutch mechanism into operative engagement with said drive-shaft; a lever connected to said rod to move the same, and provided with a toothed arm; means connected to said lever for automatically locking and releasing said rod respectively into and from pressing engagement with said clutch mechanism; and a lever, J, provided with teeth meshing with the toothed arm of said first-named lever whereby to move the latter and the said rod and said locking and releasing means, as set forth.

10. In a buttonhole-sewing machine, the combination with the drive-shaft clutch mechanism, of a clutch-pressing rod; an automatically-actuated locking mechanism for holding said rod into pressing engagement with said clutch mechanism; a lever for moving said rod and locking mechanism into operative position, said lever being provided with a toothed arm; and a foot-operated lever, J, provided with teeth meshing with the toothed arm of the first-named lever, as set forth.

706,647. CAR BODY-BOLSTER. CHARLES G. FLOYD, St. Louis, Mo., assignor to American Steel-Duly Double-Bolster Co., St. Louis, Mo., a Corporation of New Jersey. Filed June 11, 1902. Serial No. 111,163. (No model.)



Claim.—1. A car body-bolster, consisting of two opposite side beams, and a cross-beam intermediate to the side beams, the said beams, respectively, being a double-reversed-Z shape in cross-section, and adapted to bear against the car-sills, substantially as described.

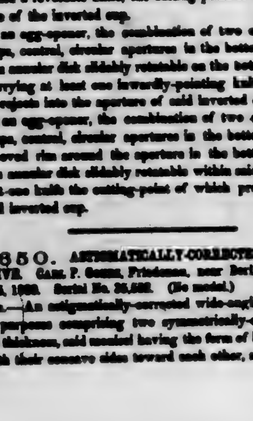
2. A car body-bolster, consisting of two opposite side beams, and a cross-beam intermediate to the side beams, the said beams, respectively, being a double-reversed-Z shape in cross-section, and adapted to bear against the car-sills, and the said cross-beam being integral with, and intersecting the side beams, substantially as described.

3. A car body-bolster, consisting of two opposite side beams, a cross-beam intermediate to the side beams, and united thereto at their middle portions, or thereabout, the said beams being, respectively, a double-reversed-Z shape in cross-section and intersecting each other, a cross-plate intermediate to and intersecting the side beams, and united thereto at their end portions, the said beams and plates being adapted to bear against the car-sills, and the said cross-beam and plates having, respectively, the body center-bearing, and the legs for the truss-rods, all the said parts being integral throughout, substantially as described.

706,648. TOBACCO-POUCH. GEORGE FRANK, Fremont, Ohio. Filed Dec. 26, 1901. Serial No. 87,209. (No model.)

Claim.—1. A tobacco-pouch comprising a flexible body portion, a rigid carrying-ring therefor, guiding-springs carried by said ring and projecting within the body of the pouch, and a plunger carried and guided by said spring, substantially as specified.

2. The combination in a tobacco-pouch, of a cup portion having a central discharge-opening, a spring-held lid or cover for said opening, a flexible pouch-body secured to the cup portion, a spring carried by the cup portion and extending within the body of the pouch, and a plunger guided by said spring, substantially as specified.

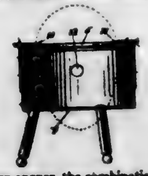


3. The combination in a tobacco-pouch, of a cup portion having a central discharge-opening, a lid or cover therefor, a swiveled spring carrying said lid or cover, a flexible pouch-body secured to the cup portion, and a plunger disposed within the bag in alinement with the discharge-mouth, substantially as specified.

4. The combination in a tobacco-pouch, of the cup portion comprising a ring having peripheral heads or flanges and a removable cap-piece having a central discharge-opening, a lid or cover for closing said opening, a flexible pouch-body, a securing-ring for confining the same to the cup portion, guiding-springs carried by the cup portion and extending within the body of the pouch, and a plunger carried by said springs, substantially as specified.

5. The combination in a tobacco-pouch, of a cup portion having a central discharge-opening, a flexible pouch-body secured thereto, a spring carried by the cup portion and extending within the body of the pouch and adapted to hold the same in spread or extended position, and a plunger carried by said spring, substantially as specified.

706,649. EGG-OPENER. ADA F. GARDANIER, Chicago, Ill. Filed Sept. 28, 1901. Serial No. 76,603. (No model.)



Claim.—1. In an egg-opener, the combination of two end-telescoping, cylindrical cups, central, circular apertures in the bottoms of both of said cups, and a revolvable knife, the cutting-point of which projects into the aperture of the inverted cup.

2. In an egg-opener, the combination of two end-telescoping, cylindrical cups, central, circular apertures in the bottoms of both of said cups, and an annular disk slidably retainable on the bottom of the inverted cup and carrying at least one inwardly-pointing knife the cutting-point of which projects into the aperture of said inverted cup.

3. In an egg-opener, the combination of two end-telescoping, cylindrical cups, central, circular apertures in the bottoms of both of said cups, a grooved rim around the aperture in the bottom of the inverted cup, and an annular disk slidably retainable within said groove and carrying at least one knife the cutting-point of which projects into the aperture of said inverted cup.

706,650. AUTOMATICALLY-CORRECTED WIDE-ANGLE OBJECTIVE. CARL P. GOERZ, Friedenau, near Berlin, Germany. Filed Nov. 5, 1900. Serial No. 35,582. (No model.)

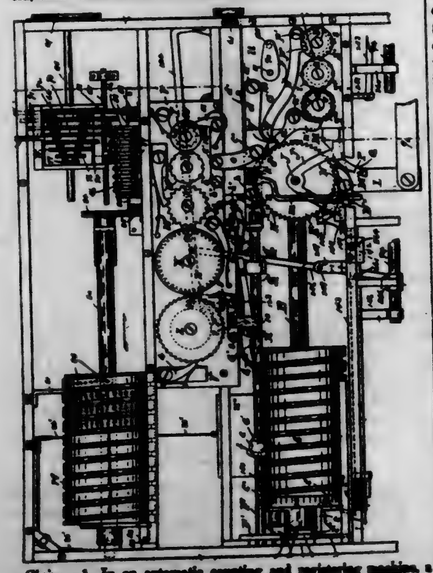
Claim.—An astigmatically-corrected wide-angle objective for photographic purposes comprising two symmetrically-arranged menisci of very small thickness, said menisci having the form of hollow hemispheres, located with their concave sides toward each other, and having the radii

of the convex and concave surfaces of substantially equal lengths: substantially as and for the purpose described.

706,651. MAGAZINE PLATE-HOLDER. CARL P. GOERZ, Friedenau, near Berlin, Germany. Filed Feb. 14, 1898. Serial No. 670,088. (No model.)

Claim.—In a magazine plate-holder the combination of a flat box, open at one of its narrow sides and having in its top side a window-like opening surrounded by a shoulder, a second flat box open at the top being inserted into the same, said box having arranged flat springs in its bottom, with a slide, sliding in grooves just under the top of said second box, said slide bearing in its top side flat springs; substantially as hereinbefore shown and described.

706,652. COUNTING AND REGISTERING MACHINE. CHARLES D. GRIESS, WILFRED W. SUMMERLAND, and BENJAMIN F. BILLESBACH, Dayton, Ohio. Filed Jan. 20, 1900. Serial No. 2,162. (No model.)



Claim.—1. In an automatic counting and registering machine, a plurality of sets of counters, independent of each other and registering the operations of the machine, with mechanisms for stopping said counters at predetermined intervals variable at will, and means for starting again said sets of counters, together, substantially as described.

2. In an automatic counting and registering machine, a set of counters to count and register one class of units, a second set of counters to count and register another class of units, both operated by the same mechanism, means for stopping one set of counters, when it has counted a predetermined number, the other set continuing to count until it has counted a certain fixed number, said predetermined number and said fixed number having no constant proportionate relation, and means for starting said first set of counters to counting again when said second set has finished a cycle, substantially as described.

3. In an automatic counting and registering machine, two sets of counters, one set counting all the time, the other set counting at intervals, and means for varying at will the intervals, at which the second set shall count, substantially as described.

4. In an automatic counting and registering machine, an oscillating arm, a set of registry-wheels for registering the oscillations of said arm up to a certain predetermined number, a mechanism for automatically throwing out of gear said set of registry-wheels, when said predetermined number has been reached, means for varying said predetermined number; a second set of registry-wheels counting all the oscillations of said arm, and a mechanism for automatically throwing into gear the first set of registry-wheels when a certain constant number of oscillations has been counted by the second set, substantially as described.

5. In an automatic counting and registering machine, an oscillating arm, a set of registry-wheels counting the oscillations of said arm in cycles, a second set of registry-wheels counting a predetermined number of said oscillations, for each cycle, means for varying said predetermined number, a mechanism for throwing out of gear said second set of counters when said predetermined number is reached and means for throwing into gear again said second set, when the first set of counters has completed a cycle, substantially as described.

6. In an automatic counting and registering machine, a set of counters counting pounds, means for stopping this set of counters when a predetermined number of pounds has been counted, mechanism for varying said predetermined number; a second set of counters counting a constant number of sheets, means for starting said first set of counters each time the second set completes said constant number of sheets, and a tripping mechanism which trips off packages containing a desired number of sheets, substantially as described.

7. In an automatic counting and registering machine, an oscillating arm, two pawls mounted thereon, a set of registry-wheels operated by the first pawl and indicating pounds, means for automatically throwing out said set of registry-wheels, when a predetermined number of pounds has been counted, means for varying said predetermined number; a second set of registry-wheels operated by the second pawl indicating sheets; the two sets of counters counting together until the first set is thrown out, the second set continuing to count until it has counted a ream; with means for starting the first set again when the second set has finished counting a ream, substantially as described.

8. A cylinder for counting, provided with means for giving it a combined longitudinal and rotary motion with reference to a gage, a mechanism for automatically throwing said cylinder out of gear at a predetermined point, and means for returning it to its initial position, substantially as described.

9. A cylinder for counting, provided with means for giving it a combined longitudinal and rotary motion with reference to a gage, a mechanism for automatically throwing said cylinder out of gear at a predetermined point, and means for returning it to its initial position, by a sliding motion, which returns it to its initial longitudinal position and by an independent rotary motion, which returns it to its original angular position, substantially as described.

10. A cylinder for counting in combination with a shaft adapted to give said cylinder a rotary as well as a longitudinal motion, a gage to adjust the extent of the rotary and longitudinal motion of said shaft and cylinder, and means for returning said shaft and cylinder to their initial positions, substantially as described.

11. A cylinder for counting, in combination with a shaft adapted to give the said cylinder both a rotary and a longitudinal motion, a gage to determine the extent of the rotary and longitudinal motion of said shaft and cylinder, and means for returning said shaft and cylinder to their initial positions, substantially as described.

12. A threaded cylinder slidingly keyed to a shaft, a dog to engage the thread of said cylinder, a pawl and ratchet to turn said shaft, a set of registry-wheels to record each part turn of said cylinder, a gage to determine a point, at which said cylinder shall cease to turn, with means for throwing out of gear said cylinder and its corresponding set of registry-wheels, a mechanism for returning said cylinder to its initial position; a second set of registry-wheels and a pawl operating the same, said second set of registry-wheels counting a constant number in cycles, with means for throwing into gear said cylinder and the first set of registry-wheels each time the second set finishes counting a cycle, substantially as described.

13. In an automatic counting and registering machine, a threaded cylinder slidingly keyed to a shaft, a dog to engage the thread on said cylinder, and cause it as it rotates to travel along said shaft, a gage to control the distance said cylinder shall travel along said shaft; a gear attached to said shaft and operated by a pawl and ratchet; a set of counters for registering each part turn of said cylinder, means for throwing out of gear said pawl and ratchet when a predetermined number has been counted, and returning said cylinder to its initial position, in readiness to count another lot substantially as described.

14. A threaded cylinder slidingly keyed to a shaft, a pawl and ratchet for turning said shaft, a dog adapted to engage the thread of said cylinder and cause it to travel along said shaft as said shaft is revolved, and means for throwing out of mesh said pawl and ratchet when said cylinder has traveled a certain predetermined distance along said shaft, substantially as described.

15. A cylinder for counting, operated by a pawl and ratchet, having an adjustable graduated ring carrying a lug, the graduations of said ring being equal to the angle through which said cylinder is turned for every operation of said pawl and ratchet, so that the number of operations of said pawl and ratchet that will bring the lug to a certain position, may be varied at will substantially as described.

16. A graduated rod carrying a sliding gage, said graduations being equal to the pitch of the thread on a cylinder bearing a lug which is adapted to engage with an arm on said gage, so that when the said cylinder has reached a certain position to be determined by the position of said gage upon said rod, said lug will strike said arm and rock it, substantially as described.

17. A threaded cylinder having a sliding and rotary motion, a lug mounted thereon, a dog adapted to engage the thread of said cylinder, a gage-rod, a cam secured to said gage-rod, said cam holding said dog in engagement with the thread of said cylinder, and a gage with an arm mounted thereon, adapted at a certain predetermined position of said cylinder, to be struck by said lug and rock said gage-rod, thus rotating said cam and permitting said dog to rise out of engagement with the thread on said cylinder, substantially as described.

18. A threaded cylinder for counting, a dog for engaging the thread of said cylinder, a rocking gage-rod, a sliding gage carrying an arm designed to engage with a lug on said cylinder, the time of striking to be determined by the position of said gage and a registry-wheel to register each time said lug rocks said gage-rod, substantially as described.

19. A cylinder with a worm, adapted to slide along its shaft, operated by a pawl and ratchet, a gage to determine a point at which this sliding motion shall cease, a set of registry-wheels for registering each operation of said pawl and ratchet and means for throwing out of gear and returning to its initial position, said cylinder and ceasing said registry-wheels to stop registering until said cylinder begins to count again, substantially as described.

20. A dog for preventing counter rotation in a ratchet-wheel having a notch and an extension designed to be raised by a lug on registry-wheel, a catch having a tooth designed to drop into said notch and hold said dog out of engagement, said catch having a downward extension designed to be struck and raised by a lug on another registry-wheel, at a certain interval after said dog has been raised, thus releasing said dog, substantially as described.

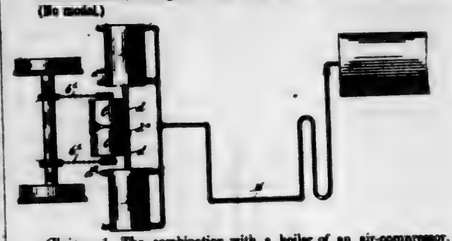
21. A spool having flanges operated by a pawl and ratchet, said flanges having lugs adapted to strike and oscillate up and down a rod carrying a series of pawls adapted to engage with a series of ratchet-wheels fixed to disks, said ratchet-wheels having a varying number of teeth, said disks having lugs adapted to engage with a lug on an arm which operates a tripping device, said arm being adjustable so that it may be caused to engage with any one disk, the others being inoperative, substantially as described.

22. A spool having flanges operated by a pawl and ratchet, said flanges having lugs adapted to strike and oscillate up and down a rod carrying a series of pawls adapted to engage with a series of ratchet-wheels, said ratchet-wheels having a varying number of teeth, and having lugs adapted to engage with a lug on an arm which operates a tripping device, said arm being adjustable, so that it may be caused to engage with the lug on any one of said series of ratchet-wheels, the others being inoperative, substantially as described.

23. A main counting-wheel and a series of auxiliary counting-wheels, said auxiliary counting-wheels having different number of teeth, means by which all of said auxiliary counting-wheels are made to turn one division for each turn of said main counting-wheel, and means by which any one of said auxiliary counting-wheels may be caused to register for any part of its revolution, substantially as described.

24. A main counting-wheel and a series of auxiliary counting-wheels, said auxiliary counting-wheels having different number of teeth, means by which all of said auxiliary counting-wheels are made to turn one division for each turn of said main counting-wheel, and means by which any one of said auxiliary counting-wheels may be caused to register for any part of its revolution, and mechanism for returning all of said wheels to their initial position, substantially as described.

706,658. MEANS FOR UTILIZING COMPRESSED AIR. EUGENE HAYWARD, Chicago, Ill., assignor of two-thirds to John T. Lauder and John B. Morris, Chicago, Ill. Filed Feb. 15, 1901. Serial No. 47,490. (No model.)



Claim.—1. The combination with a boiler of an air-compressor, means for operating the same, a metal-cased pipe located transversely in the fire-box and leading into the dome of the boiler and adapted to deliver thereinto heated and compressed atmospheric air.

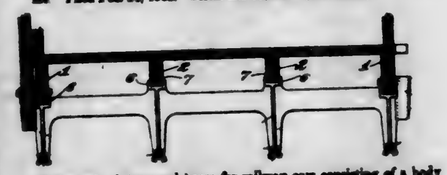
2. The combination with a steam-boiler of an air-compressor, means for actuating the air-compressor, the pipe leading therefrom to the dome of the boiler and a bend or bends of said pipe incased or jacketed in metal and extending into and transversely of the fire-box near the rear end thereof and exposed to the maximum direct heat.

3. The combination with a steam-boiler, of a double-acting air-compressor, means for actuating said compressor, a pipe connected therewith and adapted to deliver compressed air to the dome of said boiler and means for heating the compressed air before delivery in the dome, comprising a coil in said pipe located in and transversely of the furnace of said boiler and a valve in the connection acting to regulate the flow of said compressed air to the boiler.

4. In a device of the class described, the combination with a locomotive-boiler, of a compressor secured beneath the tender or the like, means operated from a truck-axle for actuating said compressor, a pipe leading therefrom through transversely of the fire-box of the boiler to the dome thereof, said pipe being cased in metal and exposed to maximum heat, whereby the air is first compressed then heated and then delivered within the boiler.

5. The combination with a steam-boiler of a coil located transversely in the fire-box or furnace thereof adjacent to and below the fire-door said coil comprising a tube bent to the desired shape and cased in cast metal and a protecting-covering in said coil.

706,654. TRUSS-ROD BEAM. ALFRED W. KINNEY, St. Louis, Mo. Filed Feb. 21, 1902. Serial No. 95,022. (No model.)



Claim.—1. A truss-rod beam for railway-cars consisting of a body portion extending continuously from side to side of the car and having seats on its upper edge for the longitudinal sills of a car, and projections extending downwardly from its lower edge, said projections having seats for the truss-rods of a car, said body portion, seats, and projections being formed in one piece; substantially as described.

2. A truss-rod beam for railway-cars consisting of a body portion having seats on its upper edge, and columns depending from its lower edge in alinement with the seats, all of said parts being made in one piece; substantially as described.

3. A truss-rod beam for railway-cars consisting of a web, overhanging seats on the upper edge of said web and integral therewith, and integral columns in alinement with said seats, the integral side walls of the seats at the ends of the beam being extended upwardly; substantially as described.

4. A truss-rod beam for railway-cars in the form of a casting comprising a body portion, seats for the longitudinal sills of the car, dowels in said seats, seats for the truss-rods, and reinforcing-webs; substantially as described.

5. A truss-rod beam for railway-cars in the form of a casting comprising a body portion extending continuously from side to side of the car and having seats for the longitudinal sills, and depending columns extending from said body portion, said columns being arranged at an angle other than a right angle, with relation to said seats; substantially as described.

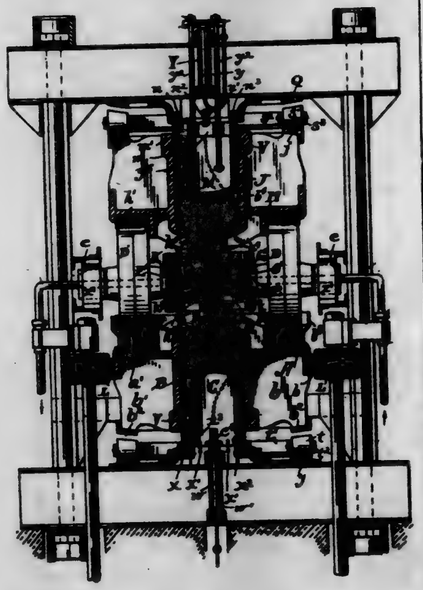
6. A truss-rod beam for railway-cars, in the form of a casting comprising a substantially vertical web extending continuously from side to side of the car, seats for the longitudinal sills of the car, said seats being arranged at the upper edge of said casting, and depending posts formed with seats in their lower ends, said posts being strengthened by reinforcing-webs; substantially as described.

7. The combination with a truss-rod beam, of stake-pockets carried thereby; substantially as described.

8. The combination with a truss-rod beam, of stake-pockets upon the ends thereof and integral therewith; substantially as described.

9. A truss-rod beam for railway-cars consisting of a body portion having a plurality of seats on its upper edge for receiving the longitudinal sills of the car, and columns depending from the lower edge, each of said columns being provided with a seat for a truss-rod, all of said parts being integral; substantially as described.

706,655. CRUSHING AND PULVERIZING MACHINE. LEWIS HERMAN, Cleveland, Ohio. Filed Feb. 23, 1901. Serial No. 48,441. (No model.)



Claim.—1. In a machine of the character described, the combination of a fixed cylindrical piston, a cylinder rotatively mounted thereon, means for admitting a fluid under pressure into said cylinder, a table secured to said cylinder, and rotatable crushing-wheels bearing upon said table, and means for yieldingly pressing said table and crushing-wheels against each other, substantially as described.

2. In a machine of the character described, the combination of a rotatable table, means for rotating it, a parallel table capable of being rotated, and rotatable grinding-wheels between said tables and in contact with both, hydraulic means for pressing both of said tables toward each other and against said grinding-wheels, substantially as described.

3. Two pistons fixed in axial alinement, two cylinders rotatively mounted on said pistons respectively, each cylinder having a table fixed to it, means for admitting fluid under pressure into both cylinders, mechanism for rotating one or both of said cylinders, and rotatable grinding-wheels located between said tables and in contact with both, substantially as described.

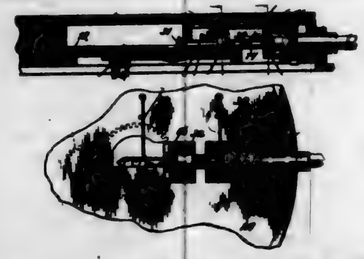
4. Two pistons fixed in axial alinement, two cylinders rotatively mounted on said pistons respectively, each cylinder having a table fixed to it, means for admitting fluid under pressure into one or both cylinders, two boxes, movable in paths parallel with the axes of the pistons, two shafts supported at their outer ends in said boxes, a member rigidly connected to the inner ends of said shafts, crushing-wheels rotatively mounted on said shafts and lying between and engaging with said tables, and mechanism for rotating one of said tables, substantially as described.

5. In a machine of the character specified, the combination of two tables rotatably mounted in axial alinement and capable of axial movement, crushing-wheels located between said tables and in contact with both, said wheels being rotatable about an axis at right angles to the axis of the tables and capable of movement in paths parallel with the axis of said tables, and yielding means for pressing said tables toward each other and against said crushing-wheels, substantially as described.

6. In a machine of the character specified, the combination of a cylindrical piston, a support therefor, dowel-pins engaging said two parts, and hooks preventing their separation, a cylinder rotatively mounted on said piston, a table fast to said cylinder, means for rotating it, and rotatable wheels which bear upon said table, substantially as described.

7. In a machine of the character specified, the combination of a piston, a fixed support therefor, and means for connecting and disconnecting said piston and its support, a cylinder rotatably mounted on the piston and having an internal annular packing-groove near its open end, a crushing-table secured to said cylinder, mechanism for rotating the same, crushing-wheels bearing upon the surface of said table, a fixed hydraulic cylinder, its piston, and means connecting said piston with the piston first named, substantially as described.

706,656. STEM-WINDING WATCH. CHARLES T. EISENBRUHAR, Springfield, Ill., assignor to Illinois Watch Company, Springfield, Ill., a Corporation of Illinois. Filed Oct. 3, 1901. Serial No. 77,408. (No model.)



Claim.—1. In a pendant-setting watch, the combination with a longitudinally-movable and rotatable arbor, of a rotatable member slidingly mounted thereon and held in constant yielding engagement with the winding-train, a rotatable setting member carried on said arbor and constantly engaged with the setting-train, and means for alternately connecting said arbor with and disconnecting the same from said rotatable and sliding member and said rotatable setting member, by the direct longitudinal movement of said arbor, substantially as described.

2. In a pendant-setting watch, the combination with a rotatable longitudinally-movable arbor, of a clutch rotatably mounted on said arbor, longitudinally movable thereon and normally held in constant yielding engagement with the winding-train, a pinion rotatably mounted on said arbor and in constant engagement with the setting-train, and means for causing the alternative engagement and disengagement of said arbor with said clutch and said pinion by the longitudinal movement of said arbor, substantially as described.

3. In a pendant-setting watch, the combination with a rotatable longitudinally-movable arbor having no positive connection with the cone-arbor, of a clutch rotatably mounted on said arbor, longitudinally movable thereon and normally held in constant yielding engagement with the winding-train, a pinion rotatably mounted on said arbor and in constant engagement with the setting-train, and means for causing the alternative engagement and disengagement of said arbor with said clutch and said pinion by the longitudinal movement of said arbor, substantially as described.

4. In a pendant-setting watch, the combination with a rotatable and longitudinally-movable arbor adapted to be moved longitudinally inward by the inward movement of a cone-arbor, but having no positive connection therewith, a spring adapted to move said arbor longitudinally outward and hold the same at the outer limit of its motion when left free by the outward movement of the cone-arbor, and means for limiting the longitudinal movement of said arbor in both directions, of a clutch rotatably mounted on said arbor, longitudinally movable thereon and normally held in constant yielding engagement with the winding-train, a pinion rotatably mounted on said arbor and in constant engagement with the setting-train, and means for causing the alternative engagement and disengagement of said arbor with said clutch and said pinion by the longitudinal movement of said arbor, substantially as described.

5. In a pendant-setting watch, the combination with a winding-train, a setting-train, a winding-pinion constantly in engagement with said winding-train and having ratchet-teeth on its inner face, and a setting-pinion having constant engagement with the setting-train, of a rotatable longitudinally-movable arbor having no positive connection with the cone-arbor and passing through said winding-pinion and said setting-pinion, rotatable in said winding-pinion and rotatable in said setting-pinion when at one limit of its longitudinal motion, a clutch member rotatably and slidingly mounted on said arbor, provided with ratchet-teeth, and normally held in constant yielding engagement with the ratchet-teeth on said winding-pinion, and means for causing the alternative engagement and disengagement of said arbor with said clutch member and with said setting-pinion by the longitudinal movement of said arbor, substantially as described.

6. In a pendant-setting watch, the combination with a winding-train, a setting-train, and a pinion in constant engagement with said setting-train and having a squared axial opening, of a rotatable longitudinally-movable arbor having no positive connection with the cone-arbor, passing through said setting-pinion and having two squared portions thereon, and a clutch rotatably mounted on said arbor, longitudinally movable thereon and normally held in constant yielding engagement with the winding-train and having a squared axial opening, said squared portions of said stem-arbor being adapted to alternately engage with and disengage from the squared axial openings on said clutch and on said setting-pinion, by the longitudinal movement of said arbor, substantially as described.

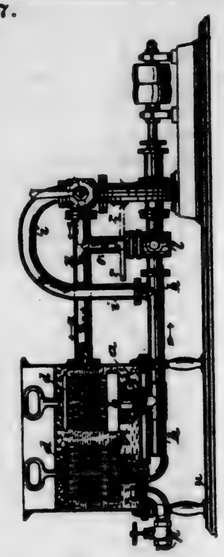
7. In a pendant-setting watch, the combination with a winding-train, a setting-train, and a pinion in constant engagement with said setting-train and having a squared axial opening, of a rotatable longitudinally-movable arbor having no positive connection with the cone-arbor, passing through said setting-pinion and having two squared portions thereon, a clutch rotatably mounted on said arbor, longitudinally movable thereon and normally held in constant yielding engagement with the winding-train and having a squared axial opening, said squared portions of said stem-arbor being adapted to alternately engage with and disengage from the squared axial openings on said clutch and on said setting-pinion, by the longitudinal movement of said arbor, and a spring adapted normally, when free to act, to force said arbor longitudinally outward to engage one of the squared portions thereon with the squared axial opening of said setting-pinion, substantially as described.

8. In a pendant-setting watch, the combination with a winding-train, and a setting-train, of a rotatable, longitudinally-movable arbor having no positive connection with the cone-arbor and having two squared portions thereon, a pinion rotatably mounted on said arbor and having constant engagement with the setting-train, and provided with ratchet-teeth upon its inner surface, a clutch rotatably mounted on said arbor, longitudinally movable thereon and having a squared axial opening, and provided with ratchet-teeth upon its outer surface, a spring adapted to normally and yieldingly hold said clutch in constant engagement with said winding-pinion, a setting-pinion rotatably mounted on said arbor in constant engagement with the setting-train and having a squared axial opening, one of the squared portions on said stem-arbor being adapted to engage with the squared axial opening of said clutch when said stem-arbor is moved longitudinally inward, and to be disengaged from it when said arbor is moved longitudinally outward, the other of said squared portions being adapted to engage with the squared axial opening in said setting-pinion when said stem-arbor is moved longitudinally outward and to be disengaged therefrom when said stem-arbor is moved longitudinally inward, and a spring bearing on said stem-arbor and adapted normally, when free to act, to move said stem-arbor longitudinally outward into engagement with said setting-pinion, substantially as described.

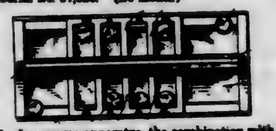
706,657. APPARATUS FOR DYEING, &c. EDWARD EDDLEY, SAMUEL WALKER, and MARSHALL BEBB, Stockport, England. Filed Oct. 28, 1901. Serial No. 80,373. (No model.)

Claim.—In apparatus for dyeing, scouring, bleaching and otherwise treating yarn in cop or other similar compact form, a liquor vessel having at the bottom and the side liquor connections, a pump having at the suction and delivery respectively a three-way tap, a pipe between the former tap and the said bottom connections having a branch leading to the said tap at the delivery end and a pipe between the latter tap and the said side connection having a branch leading to the said tap at the suction end of the said pump, all combined substantially as and for the purpose set forth.

706,657.



706,658. GAME APPARATUS. WILLIAM B. HOUK, Catasauqua, Pa., assignor of one-half to August Hohl, Catasauqua, Pa. Filed Dec. 31, 1901. Serial No. 87,092. (No model.)



Claim.—1. In a game apparatus, the combination with a box or receptacle; of movable bodies arranged therein, movable pockets or stalls, and a suction-tube accessible from without and adapted to hold one of the movable bodies in position to be received by one of the pockets or stalls, substantially as described.

2. In a game apparatus, the combination with a box or receptacle having an arched bottom; of movable bodies arranged within the box or receptacle, a suction-tube accessible from without and communicating with the box or receptacle at a point above its arched bottom, and movable stalls or pockets arranged within said box or receptacle and located upon opposite sides of a line drawn through the highest part of the arched bottom, substantially as specified.

3. In a game apparatus, the combination with a box or receptacle having an arched bottom; of movable bodies arranged within the box or receptacle, movable stalls or pockets arranged within said box or receptacle and located upon opposite sides of a line drawn through the highest part of the arched bottom, diagonally-arranged blocks projecting upwardly from the arched bottom between the two sets of stalls or pockets and a suction-tube accessible from without and communicating with the space between two of said blocks, substantially as and for the purpose described.

4. In a game apparatus, the combination with a box or receptacle, and a longitudinal row of diagonally-arranged blocks projecting upwardly from the bottom of the box or receptacle and a suction-tube accessible from without and communicating with the space between two of said blocks; of two sets of stalls or pockets connected together, one set being arranged upon one side of the box or receptacle and the other set upon the opposite side of the box or receptacle and capable of movement in unison, substantially in the manner specified.

5. In a game apparatus, the combination with a box or receptacle, and blocks projecting from the bottom thereof and spaced apart; of a suction-tube accessible from without and communicating with a space between two of the blocks, movable bodies adapted to be held by suction at a certain point on the bottom of the box or receptacle, and stalls or pockets movably mounted within the box or receptacle, substantially as set forth.

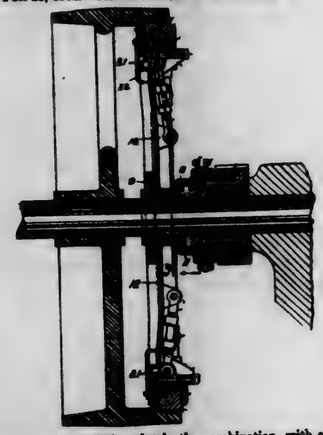
6. In a game apparatus, the combination with a box or receptacle having an arched bottom and provided with a transparent top or cover

and with a division-bar; of a longitudinal row of blocks arranged diagonally and projecting from the highest point of the bottom of the box upwardly and connected to the under side of the division-bar, said division-bar being provided with a bore having a mouth-slit and communicating with the space between two of the blocks, movable bodies arranged within the box or receptacle, and movable pockets arranged upon opposite sides of the box or receptacle, substantially as and for the purpose set forth.

706,659. ELASTIC STEEL SPOKE FOR VEHICLE-WHEELS. HENRY G. M. HOWARD, Kalamazoo, Mich. Filed Dec. 30, 1901. Serial No. 87,763. (No model.)

Claim.—Elastic metal spokes for vehicles, comprising as a continuous whole, a rigid T-head at outer end; a short straight portion immediately below and made from the elastic part of the spoke; a short bowed portion and a longer bowed portion below and bending in directions laterally and inversely to each other shown; and a short inward laterally-oblique portion at the lower end, substantially as set forth.

706,660. FRICTION-CLUTCH. EDWARD ESSER, Marion, Ohio. Filed Feb. 26, 1902. Serial No. 95,778. (No model.)



Claim.—1. In a friction-clutch, the combination, with a shaft, of a friction-wheel having an internal annular friction-surface, and means for limiting the motion of the shoes along the shaft toward the friction-wheel, a spider movable longitudinally on the shaft and having radial arms, means for moving said spider longitudinally of the shaft, shoes adapted to engage the friction-wheel, said shoes and radial arms being capable of independent movement, toggle-arms pivoted to the radial arms and to the shoes, and contripetally-acting springs connecting the radial arms and shoes and serving also to transmit to the shoes the movement of the radial arms longitudinally of the shaft, substantially as described.

2. In a friction-clutch, the combination, with a shaft, of a friction-wheel having an internal annular friction-surface, and means for limiting the motion of the shoes along the shaft toward the friction-wheel, a spider movable longitudinally of the shaft and having radial arms provided with terminal guiding-ways parallel with the shaft, means for moving said spider longitudinally of the shaft, shoes adapted to engage the friction-wheel and having guiding-ways fitting the guiding-ways of the radial arms, whereby the shoes are movably supported on said radial arms, toggle-arms pivoted to the radial arms and to the shoes, and contripetally-acting springs connecting the radial arms and shoes and serving also to transmit to the shoes the movement of the radial arms longitudinally of the shaft, substantially as described.

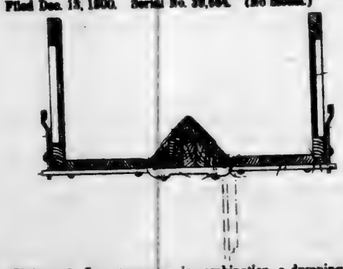
3. In a friction-clutch, the combination, with a shaft, of a friction-wheel secured thereon and having an internal annular friction-surface, and means for limiting the motion of the shoes along the shaft toward said friction-wheel, a spider loosely mounted on the shaft, provided with a clutch-collar and having radial arms, means for moving said spider longitudinally of the shaft, shoes adapted to engage the friction-wheel, said shoes and radial arms being capable of independent movement, toggle-arms pivoted to the radial arms and to the shoes, contripetally-acting springs connecting the radial arms and shoes and serving also to transmit to the shoes the movement of the radial arms longitudinally of the shaft, a pinion loosely mounted on the shaft and provided with a clutch member to engage the clutch-collar of the spider, and a spring interposed between the pinion and spider, substantially as described.

706,661. REFRIGERATOR-CAR. WILL J. HUGHES, St. Louis, Mo., assignor to Samuel Miles Hastings, trustee, Chicago, Ill. Filed Dec. 14, 1901. Serial No. 85,916. (No model.)

Claim.—1. In a refrigerator-car, a centrally-located vestibule, having outlets at both its ends through the side walls of the car, and inlets through the compartments formed on both its sides, said inlets and outlets being controlled by doors, ice-bunkers arranged in the side compartments, water-conduits leading downwardly from said bunkers, cold-air conduits arranged between said water-conduits, and pipes leading from said water-conduits to the exterior of the car, substantially as described.

2. In a refrigerator-car, a centrally-located vestibule, and storage-compartments on both sides thereof, ice-bunkers in said storage-compartments, water-conduits leading downwardly from said bunkers, a pipe or gutter having upwardly-projecting cups or tubes telescoping said water-conduits, and cold-air conduits arranged to alternate said water-conduits, substantially as described.

706,662. DUMP-CAR. FRANK S. INGOLSBY, St. Louis, Mo. Filed Dec. 13, 1900. Serial No. 39,664. (No model.)



Claim.—1. In a dump-car, in combination, a dumping-door which swings downward, and a car side with which said door is adapted to substantially engage, the cooperating edges of said door and side being beveled and rabbeted, and means for forcing the door and side snugly together whereby the bevels may normally engage forming a tight joint and if the door shrinks the horizontal face of the rabbet may still engage preventing leakage, substantially as described.

2. In a dump-car, in combination, a beam having a recess at its lower edge, a dumping-door pivoted to said beam by hinges which occupy said recess, and a shield carried by the door and adapted to extend into the recess over the hinge in various positions of the door, substantially as described.

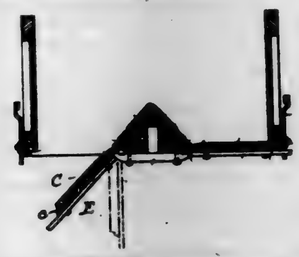
3. In a dump-car, the combination of a beam having a downwardly-sloping upper surface, said beam being recessed along its lower edge, a dumping-door pivoted to said beam substantially within such recess, and a metal shield carried by said door and extending over the hinges, said shield curving over the hinged pivot when the door is dumped and operating to substantially close the entrance to such recess in various positions of the door, substantially as described.

4. In a dump-car, in combination, a beam downwardly sloping in opposite directions on its upper surface, the lower edge of said beam being recessed, a strap extending across the under side of said beam and provided at its ends with hinge-eyes substantially at said recesses, a pair of dumping-doors having straps on their under surface, hinge-plates connecting the beam-straps with the door-straps, and shields carried by the doors and extending over the hinges into said recess, substantially as described.

5. In a dump-car, a central longitudinal beam having its lower edges formed in concave curves, combined with a pair of dumping-doors hinged to said central beam on pivots substantially concentric with such curves, and a shield carried by the upper surface of said doors and extending across the pivots thereof, said shield being curved so as to substantially contact with said concave edge in all positions of said doors, substantially as described.

6. In a dump-car, a beam having a concavely-curved edge, and a dumping-door hinged to said beam on pivots substantially concentric with such curve, the hinge members being spaced along the under sides of the beam and door and secured respectively thereto, and a shield carried by the upper surface of the door and extending along the inner edge thereof and curved over the hinge-pintles and confined between the curve of the beam and the ends of the hinge members secured to the door, substantially as described.

706,663. DUMP-CAR. FRANK S. INGOLSBY, St. Louis, Mo. Filed Feb. 24, 1902. Serial No. 95,212. (No model.)



Claim.—1. In a dump-car, in combination, a hinged door, a shield carried by the door and extending over the hinge thereof, and a cooperating member with which said shield abuts when the door is closed to make a tight joint, substantially as described.

2. In a dump-car, a hinged door, a shield carried thereby and extending over the hinge of the door, and a cooperating member with which said shield abuts when the door is closed, combined with straps carried by the door, and beveled hooks carried by the car-body and adapted to engage such straps to force the shield into contact with said cooperating member, substantially as described.

3. In a dump-car, in combination, a beam having a recess at its edge, a dumping door pivoted to said beam by hinges which occupy said recess, a shield carried by the door and extending into the recess over the hinge in various positions of the door, and a cooperating member carried by the beam which said shield engages in a closed position of the door but clears when the door is dropped, substantially as described.

4. In a dump-car, in combination, a beam, a plate carried thereby and extending over the edge of the beam, a door pivoted to said beam, and a shield carried by said door and extending over the hinge and adapted to abut the lower edge of said plate when the door is closed, substantially as described.

5. In a dump-car, in combination, a beam, a plate along the upper surface of said beam extending over its edge, a door pivoted to said beam, and a shield carried by said door and curving over the hinge and between said curve and the door receding from the center of revolution, whereby said shield abuts the lower edge of said plate when the door is closed and clears it when the door drops, substantially as described.

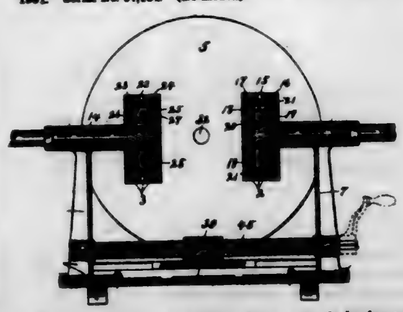
6. In a dump-car, the combination of a beam having its upper surface sloping downwardly in opposite directions, said beam being recessed along its edges, a pair of dumping-doors pivoted to said beam substantially within such recesses, the beam carrying projecting edges over said recesses, metal shields carried by said doors and extending over the hinges, said shield curving over the hinge-pivot but continuing tangentially to the door, the shields operating to abut said projecting edges when the door is closed and to clear the same when the door is dropped, substantially as described.

7. In a dump-car, the combination of a central longitudinal beam having an upper surface sloping downwardly in opposite directions, said beam being recessed along its lower edges, a metal protection on the upper surface of said beam overhanging said recesses at each side, dumping-doors pivoted to said beam substantially within said recesses, shields carried by said doors and extending over said hinges and adapted to abut said protection when the doors are closed, and beveled hooks carried by the side of the car and adapted to draw the door snugly into such engagement, substantially as described.

8. In a dump-car, the combination of a beam having its upper surface sloping downwardly, a dumping-door pivoted to said beam, a strip of metal carried by said beam and overhanging its edge, a protecting-plate on the upper surface of the beam overlapping said strip, a metal shield carried by said door and extending over the hinge, said shield curving over the hinge-pivot but continuing to the door and receding from such pivot, substantially as described.

9. In a dump-car, in combination, a beam downwardly sloping in opposite directions on its upper surface, the lower edges of said beam being recessed, a strap extending across the under side of said beam and provided at its ends with hinge-eyes substantially at said recesses, a protecting-plate on the upper side of said beam, separate plates extending from under said protecting-plate and overhanging said recesses, a U-shaped bolt lying over said plate and extending through said beam and said strap, a pair of dumping-doors having straps on the under surface, hinge-plates connecting said door-straps with the strap on the beam, and shields carried by the doors and extending over the hinges into said recess, said shields being adapted to abut the lower edges of the overhanging plates when the doors are closed, substantially as described.

706,664. DIFFERENTIAL-SPEED POWER-TRANSMITTING MECHANISM. SAMUEL JACKSON, Fayetteville, N. Y. Filed July 5, 1901. Serial No. 67,184. (No model.)



Claim.—1. A plurality of friction rings or wheels having a common axis, in combination with a friction member in contact with the rings or wheels and having a different axis, and means connecting the rings or wheels whereby the rotation of the contacting parts causes the rings or wheels to travel in the same direction at different rates of speed.

2. The combination with a rotary disk, of a rotating shaft, a plurality of friction wheels or rings in contact with the disk, and compensating gears connecting said wheels for permitting their rotation at variable speeds.

3. A revolving shaft, a plurality of friction rings or wheels mounted thereon, one being secured to the shaft, compensating gears connecting the other rings or wheels in combination with a friction-disk contacting with the peripheries of the rings or wheels.

4. The combination of two revolvable shafts or spindles having their axes arranged at an angle with each other, a friction-disk secured to one of the shafts, and a plurality of friction-rings mounted on the other shaft

and having peripheral contact with the end face of the disk, one of said rings being secured to the latter shaft, and the other ring being loose thereon, and compensating gears connecting the loose rings or wheels for the purpose set forth.

5. The combination of two rotary members having contacting friction-faces one being driven by the other, one of the members consisting of intermediate and opposite end friction rings or wheels of substantially the same diameter, a revolvable pinion carried by the intermediate wheel and a gear secured to each of the other wheels or rings and meshing with said pinion for the purpose described.

6. In a power-transmitting device, the combination of a rotary shaft or spindle, a plurality of friction rings or wheels mounted thereon, one of said wheels or rings being secured to the shaft and the others being loose thereon, compensating gears connecting the loose rings or wheels, and friction-disks contacting with different points in the peripheries of said rings or wheels for the purpose set forth.

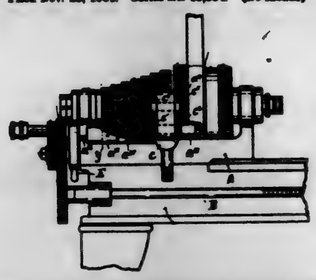
7. The combination with a rotary friction-disk, of a rotating shaft, a plurality of friction wheels or rings in contact with the disk, compensating gears connecting said wheels or rings for permitting their rotation at variable speeds, and means for moving one of the friction members across the face of the other for varying the speed of the driven member.

8. The combination of two revolvable shafts or spindles, a plurality of friction rings or wheels mounted on each of the shafts or spindles, one of said rings or wheels of each shaft being secured to the shaft and the others being loose thereon, and compensating gears connecting the loose rings or wheels of their respective shafts, for the purpose described, and a friction-disk in contact with the peripheries of the rings or wheels of each shaft.

9. A revolving shaft, a plurality of friction rings or wheels mounted thereon, one being secured to the shaft and the others being loose thereon and compensating gears connecting the loose rings or wheels, in combination with a friction-disk contacting with the peripheries of the rings or wheels and movable lengthwise of the axis of said shaft.

10. The combination of two revolvable shafts or spindles, a plurality of friction rings or wheels mounted on each of the shafts or spindles, one of said rings or wheels being secured to the shaft and the others being loose thereon, compensating gears connecting the loose rings or wheels of their respective shafts for the purpose described, and a friction-disk in contact with the peripheries of the rings or wheels of each shaft and means for moving the disks lengthwise of the axes of said shafts for the purpose specified.

706,665. **ENGINE-LATHE.** WILLIAM T. S. JOHNSON, Cincinnati, Ohio. Filed Nov. 23, 1901. Serial No. 83,264. (No model.)



Claim.—1. In a lathe in combination with the bed, carriage, lead-screw and head-stock thereof, the live-spindle mounted in the head-stock, a sleeve mounted rotatably upon the spindle, a pinion, means for securing it upon the sleeve, a gear-wheel secured to the spindle, means for coupling and uncoupling the sleeve with the spindle, back gear to be thrown into gear with the pinion on the sleeve and gear-wheel on the spindle when the sleeve and spindle are uncoupled from each other, means for throwing the back gear into gear with the sleeve and spindle and means for coupling the sleeve with the lead-screw, substantially as shown and described.

2. In a lathe in combination with the bed, carriage, lead-screw and head-stock thereof, the live-spindle mounted in the head-stock, a sleeve mounted rotatably on the spindle, a driving-pulley and a toothed pinion mounted rotatably upon the sleeve, a plate or disk secured upon the sleeve, a gear-wheel secured upon the spindle, means for coupling the plate with both the pulley and with the gear-wheel on the spindle, back gear, means for throwing it into gear with the sleeve and the spindle, and means for coupling the sleeve and the lead-screw.

3. In a lathe in combination with the bed, carriage, lead-screw and head-stock thereof, the live-spindle mounted in the head-stock, a sleeve mounted rotatably upon the spindle, a pinion, means for securing it upon the sleeve, a gear-wheel secured to the spindle, means for coupling and uncoupling the sleeve with the spindle, back gear to be thrown into gear with the pinion on the sleeve and the gear-wheel on the spindle when the sleeve and the spindle are uncoupled from each other, means for throwing the back gear into gear with the sleeve and spindle, an intermediate shaft mounted in the head-stock adjacent to the live-spindle, variable-speed mechanism coupling the sleeve and the intermediate shaft and means for coupling the intermediate shaft and the lead-screw, substantially as shown and described.

4. In a lathe in combination with the bed, carriage, lead-screw and head-stock thereof, the live-spindle mounted in the head-stock, a sleeve mounted rotatably on the spindle, a driving-pulley and a toothed pinion mounted rotatably upon the sleeve, a plate or disk secured upon the sleeve, a gear-wheel secured upon the spindle, means for coupling and uncoupling the plate with both the pulley and with the gear-wheel on the spindle, back gear, means for throwing it into gear with the sleeve and the spindle, an intermediate shaft mounted in the head-stock adjacent to the live-spindle, variable-speed mechanism coupling the sleeve and the intermediate shaft and means for coupling the intermediate shaft and the lead-screw, substantially as shown and described.

5. In a lathe in combination with the bed, carriage, lead-screw and head-stock thereof, the live-spindle mounted in the head-stock, a sleeve mounted rotatably upon the spindle, a pinion, means for securing it upon the sleeve, a gear-wheel secured to the spindle, means for coupling and uncoupling the sleeve with the spindle, back gear to be thrown into gear with the pinion on the sleeve and the gear-wheel on the spindle when the sleeve and the spindle are uncoupled from each other, means for throwing the back gear into gear with the sleeve and spindle, variable-sized toothed wheels secured upon the sleeve, a shaft mounted in the head-stock adjacent to the live-spindle, a slipping yoke upon the shaft carrying gear-wheels to put the shaft in gear with one or another of the toothed wheels upon the sleeve and means for coupling the shaft and the lead-screw, substantially as shown and described.

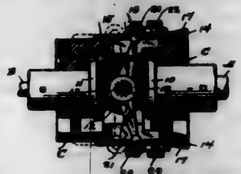
6. In a lathe in combination with the bed, carriage, lead-screw and head-stock thereof, the live-spindle mounted in the head-stock, a sleeve mounted rotatably on the spindle, a driving-pulley having a toothed pinion secured to it and both mounted rotatably upon the sleeve, a plate or disk secured upon the sleeve, a gear-wheel secured upon the spindle, means for coupling and uncoupling the plate with both the pulley and with the gear-wheel on the spindle, back gear, means for throwing it into gear with the sleeve and the spindle, variable-sized toothed wheels secured upon the sleeve, a shaft mounted in the head-stock adjacent to the live-spindle, a slipping yoke upon the shaft carrying gear-wheels to put the shaft in gear with one or another of the toothed wheels upon the sleeve and means for coupling the shaft and the lead-screw, substantially as shown and described.

7. In a lathe in combination with the bed, carriage, lead-screw and head-stock thereof, the live-spindle mounted in the head-stock, an intermediate shaft mounted in the head-stock adjacent to the live-spindle, variable-speed mechanism coupling the spindle and the intermediate shaft, loose pinions mounted upon the end of the shaft, a sliding spline for making any one of said pinions fast on the shaft, an adjustable support carrying a number of gear-wheels secured to one another and each in mesh with one of the pinions on the shaft, and a gear-wheel on the lead-screw in mesh with one of the gear-wheels of the adjustable support, substantially as shown and described.

706,666. **PORTABLE FIRE-ESCAPE.** MARY J. JOHNSTON, Milwaukee, Wis. Filed Feb. 3, 1902. Serial No. 92,985. (No model.)

Claim.—In a portable fire-escape, a spindle, a pair of spools mounted at either end thereof, a cable having its ends secured to the spools and adapted to be wound upon the latter, a slotted hollow handle loosely mounted upon the aforesaid spindle between the spools, a pawl secured to the handle, and a ratchet-wheel fast to the spindle whereby the handle and spindle are normally locked together, a brake-band projecting from one of the spools in the path of the pawl whereby when the latter is disengaged from the ratchet-wheel it will bear upon the brake-band, another cable secured to the spindle within the hollow handle and adapted to be wound upon the former in the opposite direction from the first-named cable, thimbles loosely mounted upon the aforesaid spindle and a stirrup suspended from the thimbles substantially as set forth.

706,667. **REVERSING-GEAR.** LUCIAN B. JAMES, Cornish, Conn., assignor to Charles A. Freeman, South Norwalk, Conn. Filed Mar. 26, 1902. Serial No. 99,132. (No model.)



Claim.—1. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing, bevel-gears carried by said casing and engaging the bevel-gears on the shafts, an operating-sleeve longitudinally movable on the casing and adapted to engage the casing and means intermediate said sleeve and the bevel-gears carried by the casing, whereby said bevel-gears may be locked against rotation and the shafts and casing will be locked together.

2. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing, a transverse shaft in said casing, bevel-gears on said shaft engaging the gears on the shafts in line with each other, an operating-sleeve longitudinally movable on the casing and adapted to engage the casing and means intermediate said sleeve and the bevel-gears on the transverse shaft, whereby the latter may be locked against rotation, so that without stopping the rotation of the driving-shaft the driven shaft may be driven in either direction or disconnected from the driving-shaft.

3. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing having an incline, bevel-gears carried by said casing and engaging the bevel-gears upon the shafts, an operating-sleeve longitudinally movable on the casing and adapted to engage the incline to lock the casing against rotation, and means intermediate said sleeve and the bevel-gears carried by the casing, whereby the bevel-gears may be locked against rotation.

4. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing, a transverse shaft in said casing, bevel-gears on said shaft engaging the gears on the other shafts, an operating-sleeve longitudinally movable on the casing and adapted to engage the casing and having an internal groove, connecting-sleeves 18 on the transverse shaft having arms engaging said groove and means whereby when said sleeves are oscillated they will be moved toward or from each other to lock or release the bevel-gears on the transverse shaft.

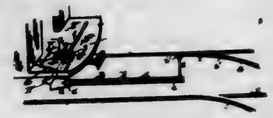
5. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing, a transverse shaft in said casing, bevel-gears on said shaft engaging the gears on the other shafts, connecting-sleeves on the transverse shaft having arms 19 and provided with means whereby they are moved toward or from each other when oscillated, and a longitudinally-movable operating-sleeve adapted to engage the casing and having an internal groove engaged by the arms, so that the driven shaft may be turned forward, reversed or disconnected without stopping the driving-shaft.

6. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing having slots 21, a transverse shaft in said casing, gears on said shaft engaging the other gears, connecting-sleeves on the transverse shaft having arms passing through the slots and having heads 20, and a longitudinally-movable operating-sleeve adapted to engage the casing and having an internal groove engaged by heads 20, substantially as shown, for the purpose specified.

7. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing having an incline, bevel-gears carried by said casing and engaging the other gears, a longitudinally-movable operating-sleeve having a taper adapted to engage the incline and means intermediate the operating-sleeve and the gears carried by the casing, whereby said gears may be locked against rotation.

8. A reversing-gear comprising two shafts in line with each other and having bevel-gears at their contiguous ends, a rotary casing, a transverse shaft in said casing, bevel-gears on said shaft engaging the other gears, connecting-sleeves on the transverse shaft having arms 19, and arms 24, and a longitudinally-movable operating-sleeve adapted to engage the casing and having an internal groove engaged by the arms, said operating when the operating-sleeve is moved in one direction to force the connecting-sleeves against the gears on the transverse shaft and lock said gears against rotation, substantially as shown, for the purpose specified.

706,668. **SWING-THROWING DEVICE.** THOMAS J. KING, Pittsburg, Pa., assignor of one-half to Samuel B. Charters and William H. Daughenbaugh, Pittsburg, Pa. Filed Mar. 4, 1902. Serial No. 96,602. (No model.)



Claim.—1. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with two pockets therein, a lever adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks, having one end connected to the switch-point, whereby by swinging the lever into one of said pockets the lower end thereof will engage the free end on the switch-bar and throw the switch-point to the position desired.

2. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks having one end connected to the switch-point and its opposite end provided with inclined faces thereon, whereby, by swinging the lever into one of the said pockets the lower end thereof will engage one of the inclined faces on the switch-bar and throw the switch-point to the position desired.

3. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with two pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks and having one end connected to the switch-point, whereby by swinging the lever into one of the said pockets the lower end thereof will engage the free end on the switch-bar and throw the switch-point to the position desired.

4. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with two pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks having one end connected to the switch-point and its opposite end provided with inclined faces thereon, whereby by swinging the lever into one of said pockets the lower end thereof will engage one of the inclined faces on the switch-bar and throw the switch-point to the position desired.

5. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with two pockets therein, a lever adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks and having one end connected to the switch-point, a plate having inclined flanges thereon around the free end of said switch-bar, whereby by swinging the lever into one of said pockets the lower end thereof will be directed by one of said flanges to engage the free end of said switch-bar and throw the switch-point to the position desired.

6. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks having one end connected to the switch-point and its opposite end provided with inclined faces thereon, a plate having inclined flanges thereon around the inclined face end of said switch-bar, whereby by swinging the lever into one of said pockets the lower end thereof will be directed by one of said flanges to engage one of the inclined faces on said switch-bar and throw the switch-point to the position desired.

7. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks and having one end connected to the switch-point, a plate having inclined flanges thereon around the free end of said switch-bar, whereby by swinging the lever into one of said pockets the lower end thereof will be directed to engage the free end of said switch-bar and throw the point to the position desired.

8. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, in combination with a pivoted switch-bar located between the tracks and

having one end connected to the switch-point and its opposite end provided with inclined faces thereon, a plate having inclined flanges thereon around the inclined face end of said switch-bar, whereby by swinging the lever into one of said pockets the lever and thereof will be directed by one of said flanges to engage one of the inclined faces on said switch-bar and throw the switch-point to the position desired.

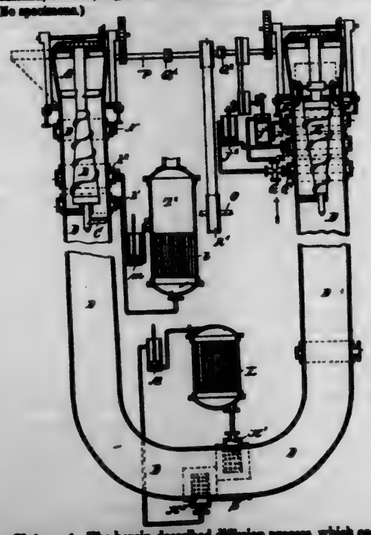
9. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, a spring connected to said lever and platform to hold the lever above the tracks, in combination with a pivoted switch-bar located between the tracks and having one end connected to the switch-point, whereby by swinging the lever into one of said pockets the lever and thereof will engage the free end of the switch-bar and throw the switch-point to the position desired.

10. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, a spring connected to said lever and platform to hold the lever above the tracks, in combination with a pivoted switch-bar located between the tracks having one end connected to the switch-point and its opposite end provided with inclined faces thereon, whereby by swinging the lever into one of said pockets the lever and thereof will engage one of the inclined faces on the switch-bar and throw the switch-point to the position desired.

11. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, a spring connected to said lever and platform to hold the lever above the tracks, in combination with a pivoted switch-bar located between the tracks and having one end connected to the switch-point, a plate having inclined flanges thereon around the free end of said switch-bar, whereby by swinging the lever into one of said pockets the lever and thereof will be directed to engage the free end of said switch-bar and throw the point to the position desired.

12. In railway-switch-operating mechanism, a car-platform having a guide in the floor thereof provided with pockets therein, a lever pivoted to said floor and adapted to fit within and swing in said guide, a spring connected to said lever and platform to hold the lever above the tracks, in combination with a pivoted switch-bar located between the tracks and having one end connected to the switch-point and its opposite end provided with inclined faces thereon, a plate having inclined flanges thereon around the inclined face end of said switch-bar, whereby by swinging the lever into one of said pockets the lever and thereof will be directed by one of said flanges to engage one of the inclined faces on said switch-bar and throw the switch-point to the position desired.

706,669. PROCESS OF CONTINUOUS DIFFUSION. FERNANDO KREMER, Rosario, Argentina. Filed May 11, 1901. Serial No. 59,746. (No specimens.)

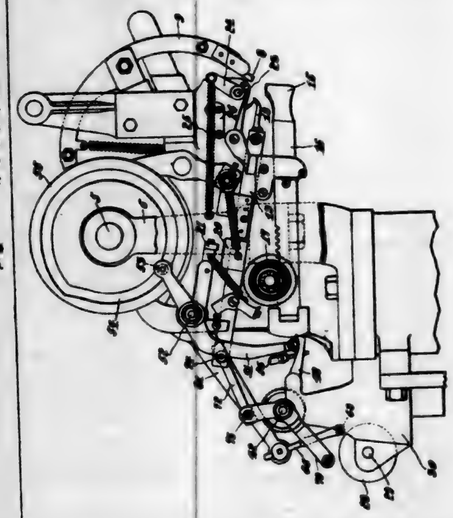


Claim.—1. The herein-described diffusion process, which consists in forming the material to be treated, into a continuous mass or column, imparting a practically continuous movement to said mass or column and exerting a gradually-increasing pressure thereon at both ends, introducing at a point situated at a distance from the delivery end of the column, an extracting or diffusing medium under a pressure smaller than that obtaining at the said delivery end, and causing said medium to travel in the opposite direction to the material.

2. The herein-described diffusion process, which consists in forming the material to be treated, into a continuous mass or column, imparting a practically continuous movement to said mass or column and exerting a gradually-increasing pressure thereon at both ends, introducing at a point situated at a distance from the delivery end of the column, an extracting or diffusing medium under a pressure smaller than that obtaining at the said delivery end, causing said medium to travel in the opposite direction to the material, in contact therewith, heating said medium at an intermediate point, out of contact with the material, and returning the heated medium into contact with the material.

3. The herein-described diffusion process, which consists in forming the material to be treated, into a continuous mass or column, imparting a practically continuous movement to said mass or column and exerting a gradually-increasing pressure thereon at both ends, introducing at a point situated at a distance from the delivery end of the column, an extracting or diffusing medium under a pressure smaller than that obtaining at the said delivery end, causing said medium to travel in the opposite direction to the material and in contact therewith, and withdrawing the said medium by suction at a point situated at a distance from the inlet of the material, so as to reduce the pressure at said point.

706,670. PULL-OFF MECHANISM FOR SEWING-MACHINES. JOSEPH L. KEEFER, Montreal, Canada. Original application filed Aug. 24, 1901, Serial No. 73,201. Divided and this application filed Nov. 14, 1901. Serial No. 82,262. (No model.)



Claim.—1. In a sewing-machine, of the class described, the combination of a cam carried by the shaft of the machine, a cam-lever operated thereby, a reciprocating needle-block connected to one end of said lever, pull-off mechanism carried by the opposite end of said lever, tension mechanism from which the thread is adapted to be drawn by said pull-off mechanism, and an adjustable stud movable to various positions across the path of the thread adjacent to said connecting with said pull-off mechanism.

2. In a sewing-machine the combination of a lever pivoted at an intermediate point, means for oscillating said lever, operative stitch-forming parts operated by the forward end of said lever, a pull-off device carried by the rear end of said lever and movable across the path of the thread to draw a loop therefrom upon the oscillation of said lever, a coöperating measuring-stud also movable across the path of the thread on the opposite side thereof from the pull-off device, and means for adjusting the position of said measuring-stud whereby the length of the thread-loop is regulated.

3. In a sewing-machine, the combination of a two-armed lever extending from front to rear of the machine and pivoted at an intermediate point, a needle-block connected to the front arm of the lever and operated thereby, a pull-off fork carrying a thread-engaging stud or roller through which the thread is looped and carried by the rear arm of said lever, a tension device from which the thread is drawn by said pull-off device, and a measuring device comprising a roller movable to variable positions across the path of the thread between said tension device and pull-off fork, said measuring device being connected to a spring presser-foot which presses against the work and causes said measuring device to assume a varying position in accordance with the thickness of the stock.

4. In a sewing-machine, a two-armed needle-lever pivoted at an intermediate point and having its front arm connected to the needle-block to operate the same, a pull-off fork carried by the rear arm and through which the thread is looped, an offset having a cam stud or roller on the forward arm of said lever, a rotary needle-cam with which said stud or roller engages, a tension device from which the thread passes to the pull-off fork, a ratchet-wheel held against backward rotation having a thread-retaining device to which the thread passes from the pull-off fork, and a measuring device comprising a spring presser-foot arranged to abut against the work being sewed, a bell-crank lever mounted on an axis in the rear of the machine a link connecting one end of said lever with the rear end of the presser-foot, and a stud 71 carried by the opposite end of said bell-crank lever and arranged to assume a position across the path of the thread between the tension device and pull-off fork, whereby the position of said presser-foot causes said stud to project more or less across the path of the thread.

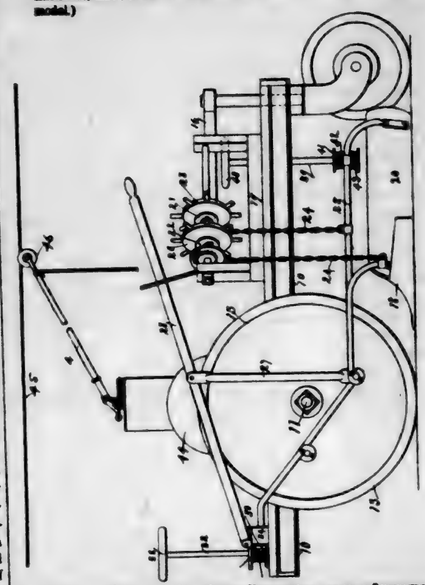
5. In a sewing-machine, a pull-off mechanism comprising a tension device, a thread-retaining device secured against backward rotation, a thread-engaging fork through which the thread is looped and which is adapted to reciprocate across the path of the thread, a bell-crank lever one arm of which carries a stud projecting into the path of the thread between the tension device and said fork, and which is also adapted to reciprocate across the path of the thread and assume variable positions, a presser-foot carried by a sliding bar, means for resiliently holding said presser-foot against the work, and a link connected with the rear end of said sliding bar and with the other arm of said bell-crank lever.

6. In a sewing-machine, a pull-off mechanism comprising a tension device, a thread-retaining device secured against backward rotation, a thread-engaging fork through which the thread is looped and which is adapted to reciprocate across the path of the thread, a bell-crank lever one arm of which carries a stud projecting into the path of the thread between the tension device and said fork, and which is also adapted to reciprocate across the path of the thread and assume variable positions, a presser-foot carried by a sliding bar, means for resiliently holding said presser-foot against the work, means for locking said sliding bar against motion during the formation of a stitch, and a link connecting said sliding bar with the other arm of said bell-crank lever.

7. In a sewing-machine, a pull-off and thread-measuring mechanism comprising a lever pivoted at an intermediate point and extending from front to rear of the machine, a needle-block connected by a link to the front end of said lever, a needle-cam and a cam-stud carried by said lever engaging the same to reciprocate said needle, a thread-engaging fork carried by the rear arm of said lever, a tension device from which the thread passes to said fork, a thread-retaining wheel to which the thread passes from said fork, a ratchet wheel and pawl carried by said thread-retaining wheel and adapted to prevent the backward rotation of the latter, a bell-crank lever mounted coaxially with said thread-retaining wheel and having a rearwardly-extending arm carrying a stud adapted to assume variable positions across the path of the thread between the tension device and said fork, a sliding bar projecting from front to rear of the machine and carrying at its front end a presser-foot, a spring causing said presser-foot and bar to be pressed into a forward position, a link connecting the rear end of said bar with the upright arm of said bell-crank lever, a serrated plate 20 carried by said sliding bar, and a serrated locking-dog 21 adapted to engage with said serrated plate during the formation of a stitch and simultaneous operation of the pull-off mechanism to retain the measuring device in place, substantially as described.

8. In a sewing-machine, the combination of a two-armed lever extending from front to rear of the machine and pivoted at an intermediate point, a needle-block connected to the front arm of the needle and operated thereby, a pull-off fork carrying a thread-engaging stud or roller through which the thread is looped and carried by the rear arm of said lever, a tension device from which the thread is drawn by said pull-off device, a measuring device comprising a roller movable to variable positions across the path of the thread between said tension device and pull-off fork, said measuring device being connected to a spring presser-foot which presses against the work and causes said measuring device to assume a varying position in accordance with the thickness of the stock, and stitch-forming mechanism acting in conjunction with the needle mechanism to form a chain-stitch.

706,671. ELECTRIC ROAD-GRADING MACHINE. JOHN W LAMBERT, Adel, Iowa. Filed June 20, 1901. Serial No. 65,608. (No model.)



Claim.—1. In a machine for grading roads, a carriage-frame mounted upon an axle having traction-wheels on its ends and a steering-wheel at the end and center of the frame and plows adjustably connected with the carriage to advance at the sides of the carriage, means for moving the plows laterally at the front ends of the beams, means for moving the plows laterally at the rear ends of the beams, and means for raising and lowering the plows, arranged and combined to operate in the manner set forth for the purposes stated.

2. In a machine for grading roads, a carriage-frame mounted upon an axle having traction-wheels on its ends and a steering-wheel at one end and center of the frame and plows adjustably connected with the carriage to advance at the sides of the carriage, means for raising and lowering the plows and means for adjusting the plows laterally relative to the carriage and the line of advance, arranged and combined to operate in the manner set forth for the purposes stated.

3. In a machine for grading roads, plows having scrapers extended laterally and rearward adjustably suspended at the sides of the carriage, slidable racks mounted on the front of the carriage and connected with the plow-beams and means for moving said racks simultaneously in reverse ways, arranged and combined to operate in the manner set forth for the purpose stated.

4. In a machine for grading roads, plows having scrapers extended laterally and rearward adjustably suspended at the sides of the carriage, slidable racks mounted on the front of the carriage and connected with plow-beams and means for moving said racks simultaneously in reverse ways, levers connected with the ends of the slidable racks and hangers pivotally connected with the central parts of said levers and also pivotally connected with the front ends of the plow-beams, arranged and combined to operate in the manner set forth for the purpose stated.

5. In a machine for grading roads, plows having scrapers extended laterally and rearward adjustably suspended at the sides of the carriage, slidable racks mounted on the front of the carriage and connected with plow-beams and means for moving said racks simultaneously in reverse ways, levers connected with the ends of the slidable racks and hangers pivotally connected with the central parts of said levers and also pivotally connected with the front ends of the plow-beams and means for retaining said levers at different points of elevation, arranged and combined to operate in the manner set forth for the purpose stated.

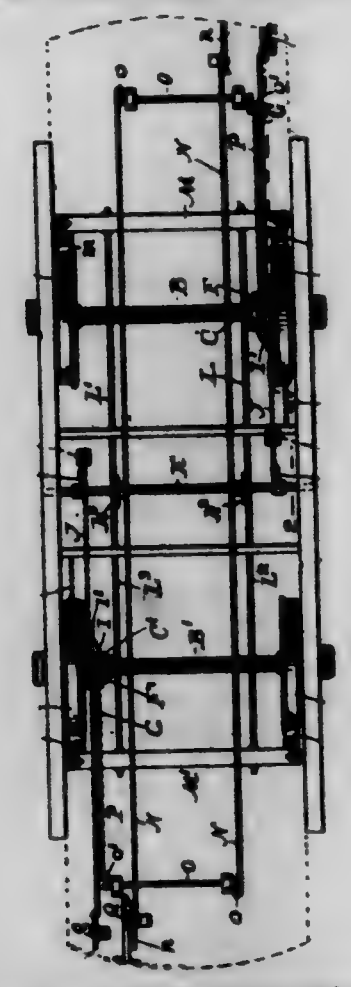
6. In a machine for grading roads, plows having scrapers extended laterally and rearward adjustably suspended at the sides of the carriage, slidable racks mounted on the front of the carriage and connected with the plow-beams and means for moving said racks simultaneously in reverse ways, levers connected with the ends of the slidable racks and hangers pivotally connected with the central parts of said levers and also pivotally connected with the front ends of the plow-beams, means for re-

taining said lever at different points of elevation and means connected with the carriage and the rear ends of the plow-beams for adjusting the plows laterally relative to each other and the carriage, arranged and combined to operate in the manner set forth for the purposes stated.

7. In a machine for grading roads, a carriage, a plow adjustably connected at each side of the carriage with the front of the carriage, a drum at the center and rear part of the carriage, ropes fixed to the drum and to the rear ends of the plow-beams, drums mounted on the rear part of the carriage, chains fixed to the drums and also fixed to the plows, and means for operating the drums for raising and lowering the plows, arranged and combined to operate in the manner set forth for the purposes stated.

8. A road-grading machine comprising a carriage-frame, an axle fixed to the front portion of the carriage, wheels mounted on the ends of said axle, a wheel-bearer pivotally connected with the rear end center, a wheel mounted in the bearer, means for adjusting said wheel-bearer and wheel, a motor on the front portion of the carriage connected with the front carriage-wheels by means of a driving-shaft having gear-wheels fixed to its ends and gear-wheels fixed to the carriage-wheels, plows suspended under the rear end portion of the carriage, means for raising and lowering the plows and means for adjusting the plows relative to the line of advance, arranged and combined to operate in the manner set forth for the purposes stated.

706,672. CAR-BRAKE. Reuben R. Lockwood, Chicago, Ill. Filed Apr. 3, 1902. Serial No. 101,158. (No model.)



Claim.—1. In a device of the class described, the combination with a rotatable car wheel and axle, of a block running loose upon said axle, a friction-shoe connected thereto, means for bringing said friction-shoe into contact with the periphery of said wheel, and means whereby the rotation of said block may set a brake-shoe; substantially as described.

2. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a friction-shoe connected to said block, a lever pivotally connected to said block, means of connection between said lever and said friction-shoe, means for actuating said lever to bring said shoe into contact with the periphery of said wheel, and means whereby rotation of said block may set a brake-shoe; substantially as described.

3. In a device of the class described, the combination with a rotatable wheel and axle, and block running loose upon said axle, of a friction-shoe connected to said block, means for bringing said shoe into engagement with the periphery of said wheel, means whereby the rotation of said block may set a brake, and means for holding said friction-shoe normally out of engagement with said shoe; substantially as described.

4. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a member longitudinally movable with respect to said block, a friction-shoe upon the end of said member, means for moving said member with respect to said block to bring said friction-shoe into engagement with the periphery of said wheel and means whereby the rotation of said block may set a brake-shoe; substantially as described.

5. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a member longitudinally movable with respect thereto, a friction-shoe upon the end of said member, a lever pivoted upon said block, means of connection between said lever and said member, means for actuating said lever to bring said friction-shoe into engagement with the periphery of said wheel, and means whereby the rotation of said block may set a brake-shoe; substantially as described.

6. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a member longitudinally movable with respect to said block, a friction-shoe upon the end of said member, a lever pivoted upon said block, a yoked link pivoted between the ends of said lever and running to said member, means for actuating said lever to bring said friction-shoe into engagement with the periphery of said wheel and means whereby the rotation of said block may set a brake-shoe; substantially as described.

7. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said forked member farthest removed from said block, means for moving said forked member with respect to said block to bring said shoe into engagement with said wheel and means whereby the rotation of said block may set a brake-shoe; substantially as described.

8. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said forked member, means for actuating said member to bring said shoe into engagement with the periphery of said wheel, means for holding said shoe normally out of engagement with said wheel and means whereby the rotation of said block may set a brake-shoe; substantially as described.

9. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said member farthest removed from said block, means for actuating said forked member to bring said shoe into engagement with said wheel, a bow-spring confined between said block and said forked member and adapted to hold said friction-shoe normally out of engagement with said wheel, and means whereby the rotation of said block may set a suitable brake-shoe; substantially as described.

10. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said member, a lever pivoted to said block, means of connection between said lever and said forked member, means for actuating said lever to bring said shoe into engagement with the periphery of said wheel and means whereby the rotation of said block may set a brake; substantially as described.

11. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a lever of the second order pivoted to said block, means of engagement between said lever and said forked member, means for actuating said lever to bring said friction-shoe into engagement with the periphery of said wheel, and means whereby the rotation of said block may set a brake-shoe; substantially as described.

12. In a device of the class described, the combination with a rotatable wheel and axle, of a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said forked member farthest removed from said block, a lever of the second order pivoted upon said block, a yoked link pivotally connected to said forked member and to said lever between its ends, means for actuating said lever to bring said friction-shoe into engagement with the periphery of said wheel, and means whereby the rotation of said block may set a brake-shoe; substantially as described.

13. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said forked member, a lever of the second order pivoted to said block, a yoked link pivotally connected to said forked member and to said lever, between its ends, a connecting-rod pivoted to the end of said lever, means for actuating said connecting-rod to draw said friction-shoe into engagement with the periphery of said wheel, means for holding said friction-shoe normally out of engagement with said wheel, and means whereby rotation of said block may set a brake; substantially as described.

14. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said member, means for longitudinally moving said forked member to throw said shoe into engagement with the periphery of said wheel, means for holding said forked member normally in a position wherein said friction-shoe is out of engagement with said wheel and means for limiting the longitudinal movement of said forked member; substantially as described.

15. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a forked member longitudinally movable with respect to said block, a friction-shoe upon the end of said member, means for moving said longitudinal member to bring said shoe into engagement with the periphery of said wheel, means for holding said member normally in a position wherein said shoe is out of engagement with said wheel, a bolt running through the tines of said forked member, and adapted to limit its motion in one direction, and means whereby the rotation of said block may set a brake-shoe; substantially as described.

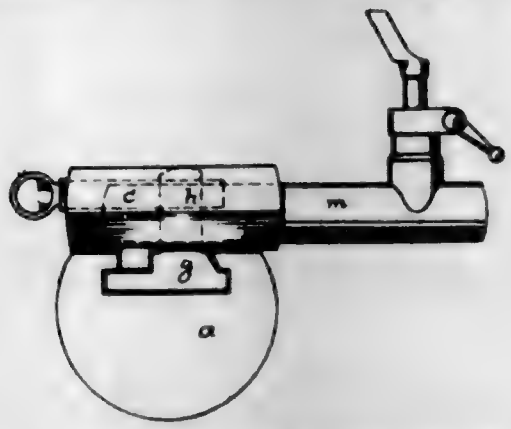
16. In a device of the class described, the combination with a rotatable wheel and axle, of a block running loose upon said axle, a member longitudinally movable with respect to said block, a friction-shoe upon the end of said member farthest removed from said block, means for actuating said member to bring said shoe into engagement with the periphery of said wheel, a suitable brake-setting mechanism, and suitable means of connection between said block and longitudinally-movable member and said brake-setting mechanism, whereby the rotation of said block may actuate said brake-setting mechanism; substantially as described.

17. In a device of the class described, the combination with a rotatable wheel and axle, a block running loose upon said axle, a member longitudinally movable with respect to said block, a brake-shoe upon the end of said member, and means for actuating said member to bring said brake-shoe into engagement with the periphery of said wheel, of a member rigidly connected to said block at right angles to said longitudinally-movable member, a piece pivotally connected to said longitudinally-movable member between said friction-shoe and said block, a third piece connecting the extremity of this piece with the extremity of the member rigidly connected to said block, a chain connected to the junction of these members, and a suitable brake-setting mechanism adapted to be actuated by said chain; substantially as described.

18. In a device of the class described the combination with a truck, of a shaft transversely journaled thereon, wheels upon said shaft, brake-beams upon the front and rear of said truck, connecting-rods running from the peripheries of said wheels to said brake-beams, radial levers connected to said shaft, chains connected to said levers, suitable friction mechanisms upon said truck, connected to said chains, whereby the motion of said friction mechanism may actuate said brake-beams; substantially as described.

19. In a device of the class described, the combination with a car and two axles having wheels connected thereto, of a friction-shoe swung upon each of said axles, a lever upon each end of the car, means of connection between each of said levers and the friction-shoe upon the axle nearer to it, a second lever upon each end of the car, a connecting-rod running from said lever to the opposite end of the car, a crank-shaft journaled upon the opposite end of the car and means of connection between said crank-shaft and the friction-shoe upon the other end of the car whereby the motion of said second lever may operate the friction-shoe upon the axle farthest from it; substantially as described.

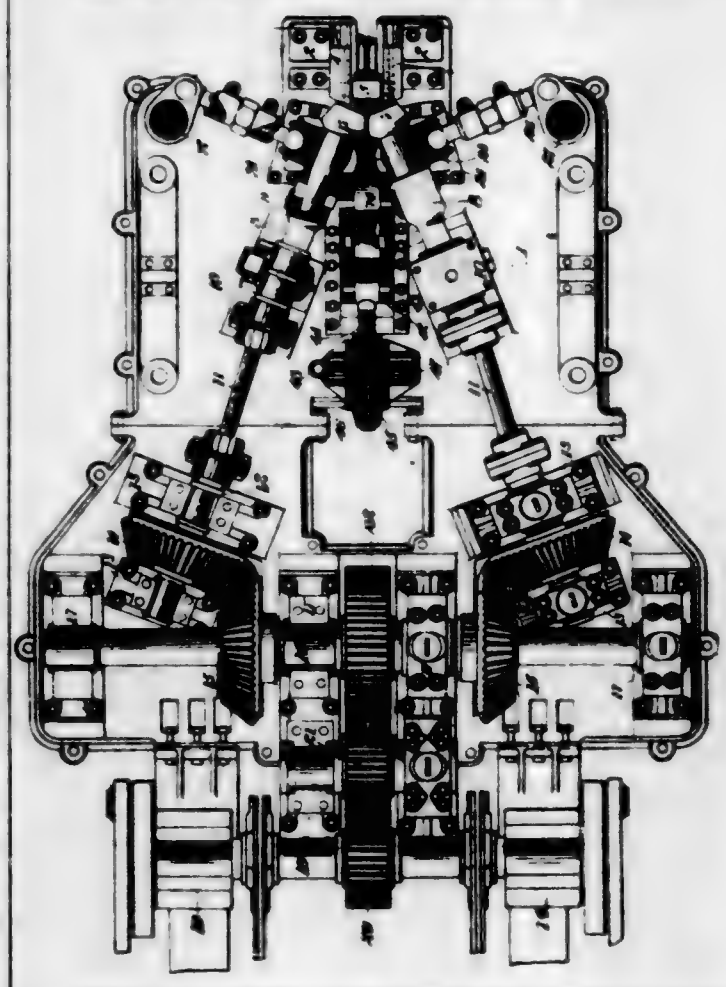
706,678. **LATHE.** Peter Lohse, Bockenheim, Frankfort-on-the-Main, Germany. Filed Nov. 26, 1901. Serial No. 84,120. (No model.)



Claim.—1. The combination with the fixing-plate having a vertical bolt with a transverse hole, of a holder comprising two parts separated by a horizontal kerf and having a vertical hole and a cross-passage, and an eccentric-bolt arranged in the cross-passage and engaging the hole in the vertical bolt, substantially as described.

2. The combination with the fixing-plate having a vertical bolt with a transverse hole, of a holder comprising two parts separated by a horizontal kerf and having a vertical hole and a cross-passage, the adjacent surfaces of the two parts being grooved to receive the rest-slide, and an eccentric-bolt arranged in the cross-passage and engaging the hole in the vertical bolt, substantially as described.

706,674. **MACHINE FOR ROLLING CAR-WHEELS.** Henrik V. Loss, Philadelphia, Pa., assignor to Charles T. Schoen, Philadelphia, Pa. Filed Mar. 7, 1902. Serial No. 97,198. (No model.)



Claim.—1. A machine for rolling car-wheels, comprising a carriage having a horizontal spindle upon which the work is supported in a vertical position, a pair of converging rolls adapted to shape the wheel between its hub and rim, rolls adapted to shape the flanged tread of the wheel, and complemental lateral edge rolls, combined with power appliances for driving the converging rolls positively, independent means for moving positively both of said converging rolls into and out of position and for retaining them in position, independent means for moving the tread-rolls into and out of position, and independent means for moving the edge rolls into and out of position.

2. In a rolling-mill, the combination of lateral shaping-rolls, a main edge-shaping roll having its axis of rotation in the plane of the axis of the work, a complemental edge-shaping roll suspended against the work above the horizontal axial plane of the main shaping-roll and the work, a controlling medium for said complemental edge-shaping roll, and a train of gearing interposed between said complemental edge-shaping roll and the controlling medium.

3. In a machine for rolling car-wheels, a work-supporting carriage having a spindle upon which the work is sustained in a vertical plane, a tread-shaping roll, a carriage in which it is mounted, means to adjust said carriage and its roll relatively to the work and controllable independently of the remainder of the machine, a complemental suspended tread-shaping roll and means for controlling it independently, web-shaping rolls, means to drive said web-shaping rolls positively, and independent means for moving the said web-shaping rolls into and out of position.

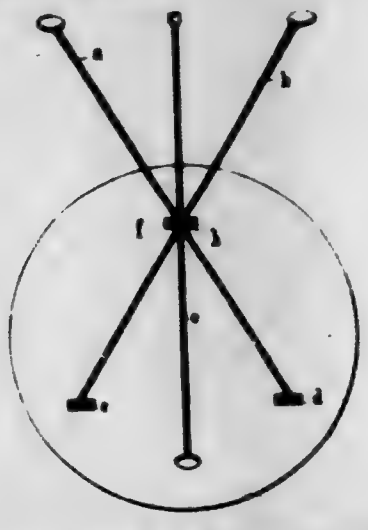
4. In a rolling-mill, a pair of rolls, roll-holders therefor, supports for said holders, bearings for said rolls, rock-shafts, connections between said bearings and said rock-shafts, a screw, a traveling nut on said screw, and connections between said traveling nut and said rock-shafts, combined with means to rotate the screw and thereby rock the shafts to move the rolls into and out of position.

5. In a rolling-mill, a shaping-roll, a carriage in which it is placed, ways for said carriage, a screw applied to said carriage, a nut applied to

said screw, a worm-wheel connected with said nut, a worm-shaft meshing with said worm-wheel, an independent motor, and connections between said worm-shaft and independent motor for actuating the carriage.

6. In a rolling-mill, edge rolls, an eccentric shaft for each of them, a worm-wheel on each of said shafts, a shaft having right and left hand worms meshing with the said worm-wheels, and a train of gearing interposed between a hand-wheel shaft and said worm-shaft for adjusting the said rolls relatively to the work.

706,675. COLLAPSIBLE SUPPORT OR FRAME FOR TABLES, CHAIRS, &c. FRITZ MACK, Nuremberg, Germany. Filed Aug. 21, 1901. Serial No. 72,789. (No model.)



Claim.—1. The combination with a table-top, of legs pivotally secured to the under face thereof, said legs being integral and having their upper ends at an angle to said top, and their lower ends at a substantial right angle to the upper ends, said legs being secured to one another at the corners formed by said upper and lower ends, and a straight leg pivotally secured between said angular legs and detachably secured to the top, substantially as described.

2. In combination with a table-top, a pair of legs pivotally secured to the under face thereof, said legs being secured at an angle to the top of the table, contacting at an intermediate point and then being bent outwardly, a straight leg pivotally mounted between said legs, means passing through all of said legs for securing the legs together, the upper end of said straight leg being detachably secured to the table-top, whereby the said end may be swung on its point of pivot and disengaged from the said top, substantially as described.

706,676. TOP-SPINNING TOY. GEORGE R. HAHN, Columbus, Ohio, assignor of two-thirds to Edwin J. Hiatt and Matthew R. Denver, Wilmington, Ohio. Filed Apr. 30, 1902. Serial No. 104,260. (No model.)

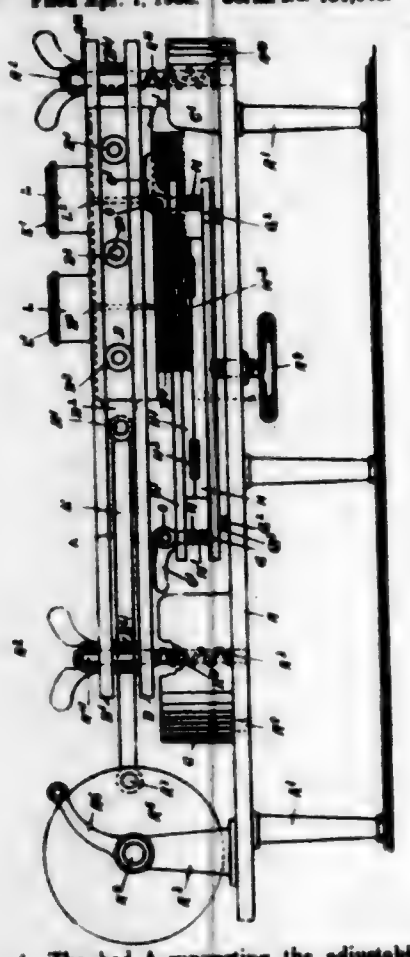
Claim.—1. In a top-spinning toy, the combination of a longitudinally-movable slide, a spring for moving it in one direction, and means for setting the slide and tensioning the spring; with a laterally-movable spring-pressed plate beside the slide, means for regulating the spring-pressure, and opposed frictional surfaces on the plate and slide, substantially as described.

2. In a toy pistol the combination of the stock and barrel, the hammer pivoted thereto having an arm above its pivot projecting rearwardly and downwardly when hammer is cocked, and a notch in hammer adjacent to its pivot, a trigger engaging the notch to hold hammer cocked and a bent spring confined in the handle, one end of said spring engaging the arm of the hammer and operating therewith substantially as and for the purpose described.

3. The herein-described top-spinning toy comprising a hammer, a spring engaging the hammer, a trigger for locking the hammer when "cocked," a slide in the barrel, a link connecting the hammer and slide, a plate in the barrel beside the slide, a spring pressing the plate toward the slide, a regulating-screw therefor, a slot in the barrel adjacent to said frictional surfaces, and a top having a spindle adapted to be inserted through said slot between the said frictional surfaces after the hammer is "cocked" all substantially as and for the purpose described.

4. In a top-spinning toy pistol, the combination of the barrel, a slide therein, a spring-actuated hammer, connections for moving the slide with the hammer, a laterally-movable presser-plate beside the slide, opposed frictional surfaces on the plate and slide between which the top-spindle is held, a spring interposed between the plate and barrel and pressing the plate toward the slide, and means for releasing the spring when desired to actuate the slide, substantially as described.

706,677. KNIFE-CLEANING MACHINE. HENRY MICHAUX, New York, N. Y. Filed Apr. 7, 1902. Serial No. 101,673. (No model.)



Claim.—1. The bed A supporting the adjustable bed G and the screw A^6, the knife-holder H and clamp-bar G, in combination with the reciprocating brush-carrier D having brush D and receptacle L provided with passages L^2 as set forth.

2. The bed A supporting the adjustable bed G, the stanchions N, the bar G and cam-lever O, in combination with the knife-holder H and the reciprocating brush D having receptacles L and passages L^2 as set forth.

3. The bed A stanchion A^7 bars B and B forming a track for the friction-rolls D^2, the springs A^7 and nut A^{12}, in combination with the stanchions N bar G cam-lever O, knife-holder H and reciprocating brush D as set forth.

4. The bed A having the copings C and C the arbor A^4 and disk A^5, operating the rod E and carrier D, in combination with the adjustable bar G cam-lever O knife-holder H brush D and boxes L as set forth.

5. The bed A having screw A^6 screw-stanchions A^7 disk A^5 crank rod E to operate the brush-carrier D, in combination with the bed G stanchions N, bar H, cam-lever O, knife-holder H and reciprocating brush D as set forth.

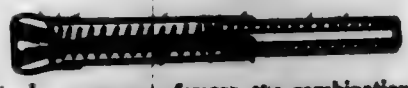
6. The bed A having screw-stanchions A^7 spring A^{11} bars B, blocks B^1 bars B and nuts A^{12}, in combination with the brush-carrier D having rolls D^2 brush D, knife-holder H and bar G held by the cam-lever O as set forth.

706,678. DUPLEX HOOK FOR HITCHING-STRAPS, &c. ELI H. MOORMAN, Winterset, Iowa; Sarah M. Moorman administratrix of said Eli H. Moorman, deceased. Filed Jan. 21, 1901. Serial No. 44,000. (No model.)

Claim.—A duplex hook for hitching-straps, consisting of two mating parts adapted to be adjustably connected with a strap, each part consist-

ing of a body portion that has a hook at its front end, a cross-bar in rear of the hook and a loop curved outwardly at its rear end in combination with a leather strap, as shown and described to operate in the manner set forth for the purposes stated.

706,679. CIGAR-PERFORATOR. SIDNEY MOUNTFORD, Newark, N. J., assignor to the Whitehead & Hoag Company, Newark, N. J., a Corporation of New Jersey. Filed May 21, 1902. Serial No. 108,342. (No model.)



Claim.—1. In a cigar-perforator, the combination of a cutter-section and a holding-section for the cutter having a lengthwise slot, one of the sections having an aperture and the other being provided with an indentation projecting into the aperture for locking the sections together in combination with an extractor having arms united through the slot, one arm in the cutter-section and the other along the outside of said cutter-section and provided with an aperture to receive the cutter-section, and means for holding said parts.

2. In a cigar-perforator, the combination with a cutter-tube and a holding-section therefor, the cutter-tube being split longitudinally and having an aperture near one end and the holding-section having an indentation near one end projecting into the aperture for the purpose described, casing-sections, one being movable endwise and moving the perforator, and an extractor held by the other casing-section and projecting into the cutter-section.

3. In a cigar perforator and cutter, a tubular cutter-section formed of steel having one end provided with a cutting edge and its other end provided with an aperture in its side wall, a tubular holding-section having one end fitting closely upon the perforated end of the cutter-tube, and provided with a depression entering the aperture for the purpose described, in combination with an extractor projecting into the cutter-section, and casing-sections, one engaging and operating the perforator endwise and the other engaging and holding the extractor.

4. In a cigar perforator and cutter, a connecting-tube and a holding-section secured to each other, a sleeve or head mounted on one end of the holding-section, said holding-section having spurs or shoulders crimped or turned outwardly for holding the head in position.

5. In a cigar-perforator, the combination of a tubular cutting-section having one end provided with a cutting edge and its other end provided with an aperture, a tubular holding-section having one end fitting upon the apertured end of the cutter-section and provided with a depression entering said aperture, a head on the opposite end of the holding-section, said holding-section having outturned spurs or shoulders engaging the outer end face of the head for the purpose set forth, an extractor, and telescoping casing-sections one engaging and holding the extractor and the other engaging and operating the perforator-cutter.

6. In a cigar-perforating device, a tubular cutter and perforator, in combination with arms united at one end, one of the arms being inserted in the tubular cutter and the other arm provided with an abutting plate, a head on the perforator and cutter and a spring interposed between said head and the abutting plate.

7. In a cigar cutter and perforating device, the combination with a tubular cutter, of an extractor consisting of a U-shaped bar having one arm inserted in the cutter and means for holding the parts in position.

8. The herein-described extractor for cigar-perforators consisting of a U-shaped bar in combination with a tubular cutter receiving one arm of the bar, and telescoping parts inclosing the former parts and operable endwise to move the cutter lengthwise of the arm therein.

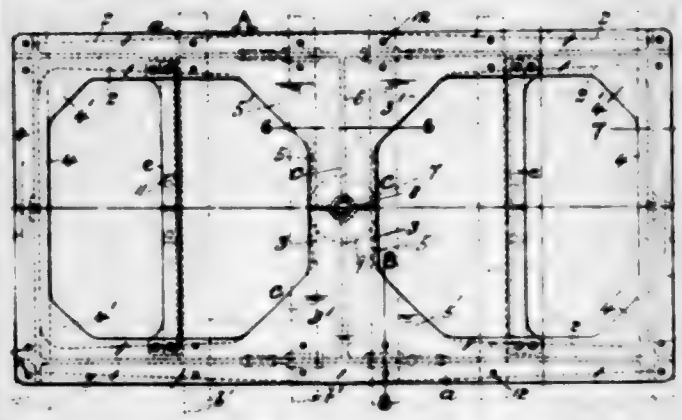
9. The herein-described extractor for cigar-perforators consisting of substantially parallel arms having corresponding ends united, the opposite end of one of the arms being provided with an abutting plate, in combination with a tubular cutter receiving one of the arms, and an inclosing case composed of sections, movable endwise one upon the other, one section engaging the tubular cutter and the other the abutting plate for the purpose set forth.

10. In combination with a slotted cutter and perforator having a tubular cutting-section and an abutting head, an extractor having an arm inserted in the tubular cutter and provided with an abutting head, a spring interposed between said heads and a case inclosing said parts.

11. The combination of telescoping tubes movable endwise one upon the other and a cigar-receiving tip secured to one of the tubes, a hollow cutter and perforator movable with one of the tubes into the tip, an extractor having an arm inserted in the hollow cutter and an abutting plate engaged with the tip and a spring interposed between said abutting plate and one end of one of the tubes for the purpose set forth.

12. In a cigar perforator and cutter, a tube having a removable tip provided with a socket for receiving the cigar end, a second tube movable lengthwise within the former tube, a perforator and cutter engaged by and movable with the second tube into the socket, in combination with a U-shaped extractor having one arm abutting against the inner end of the tip and its other arm inserted in the cutter, and a spring interposed between said abutting end of the extractor and the head of the cutter and perforator.

706,680. CAR BODY-BOLSTER. JOHN V. MCADAM, St. Louis, Mo., assignor to American Steel-Body Double-Bolster Co., St. Louis, Mo., a Corporation of New Jersey. Filed June 9, 1902. Serial No. 110,894. (No model.)



Claim.—1. A car body-bolster, consisting of two opposite side beams, and a cross-beam intermediate to the side beams and united thereto, the said beams having lateral gussets at their junctions to each other, and adapted with the said gussets to bear against the car-sills, substantially as described.

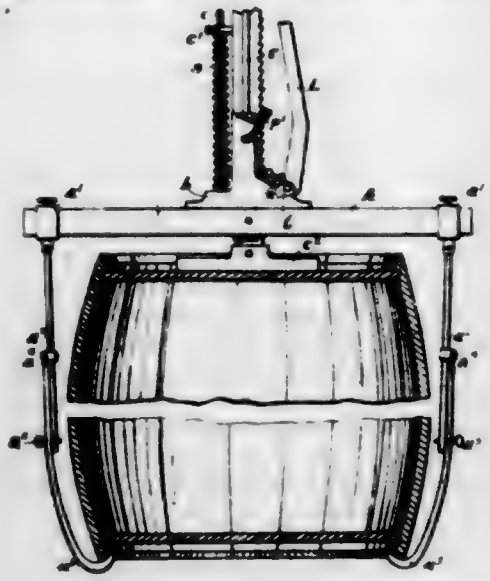
2. A car body-bolster, consisting of two opposite side beams, and a cross-beam intermediate to the side beams and united thereto, the said beams having lateral gussets at their junctions to each other, all the said parts being integral and adapted to bear against the car-sills, substantially as described.

3. A car body-bolster, consisting of two opposite side beams, and a cross-beam intermediate to the side beams and united thereto, the said cross-beam having the body center-bearing, and the said beams having lateral gussets at their junctions to each other, all the said parts being integral and adapted to bear against the car-sills, substantially as described.

4. A car body-bolster, consisting of two opposite side beams, a cross-beam intermediate to the side beams and united thereto at their middle portion, or thereabout, and a cross-beam intermediate to the side beams and united thereto at their end portions, respectively, the said beams having lateral gussets at their junction to each other, and adapted with the said gussets to bear against the car-sills, substantially as described.

5. A car body-bolster, consisting of two opposite side beams, a cross-beam intermediate to the side beams and united thereto at their middle portion, or thereabout, a cross-beam intermediate to the side beams and united thereto at their end portions, respectively, the said beams having lateral gussets at their junctions to each other, and the said cross-beams having respectively the body center-bearings and lugs for the truss-rods, all the said parts being integral, substantially as described.

706,681. PRESS FOR PACKING BARRELS OR OTHER PACKAGES. SYLVESTER MCCOWN, Athalia, Ohio, assignor to Gabe M. Weil, Louis Breckman, and S. S. Weil, copartners as Weil, Breckman & Company, Cincinnati, Ohio. Filed Aug. 7, 1901. Serial No. 71,186. (No model.)



Claim.—1. In an apparatus of the character indicated the combination of the cross-bar, a vertical guide rising from the central longitudinal portion thereof, a rack-bar operating in the guide, an operating-lever fulcrumed to the guide, a pawl to engage said rack-bar, and a spring proximate to and parallel with the guide and rack-bar and seated upon the base of the former, and upholding the rack-bar in its elevated position in relation to the cross-bar.

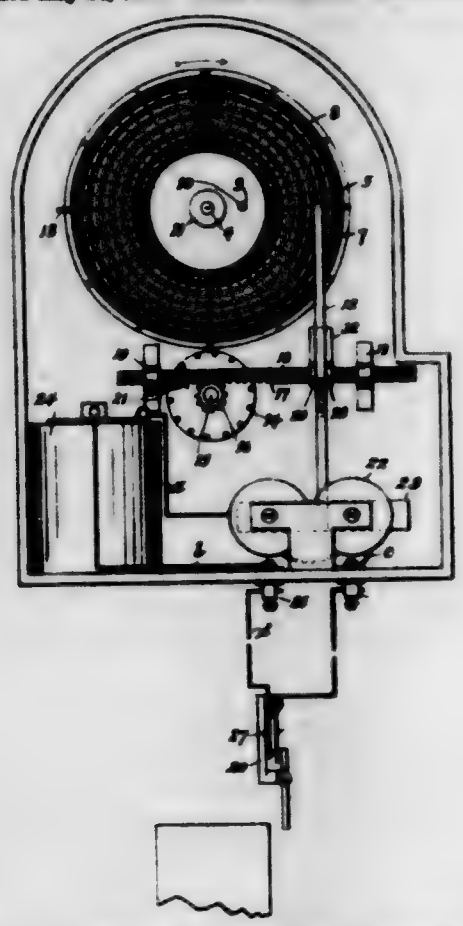
2. In an apparatus of the character indicated in combination with the cross-bar and the rack-bar operated vertically through the same, of pivotally-suspended tie-rods, yokes slidable thereon, hook members pivotally secured to said slidable yokes, and means for holding the hook members in adjusted positions on the tie-rods.

3. In an apparatus of the character indicated, the combination with the cross-bar and rack-bar, operated vertically in relation to the same, of the hooked tie-rods pivotally secured to the ends of the cross-bar and adapted when out of use to fold inward beneath the said cross-bar.

4. In an apparatus of the character indicated, the combination of the cross-bar, the guide-piece, B, provided with the flange *b*, the rack-bar, C, adapted to operate with the guide-piece, and provided with the perforated lug, *c'*, the fixed standard, *c*, and the spring, *s*, coiled upon said standard, between the lug, *c'*, and the flange, *b*.

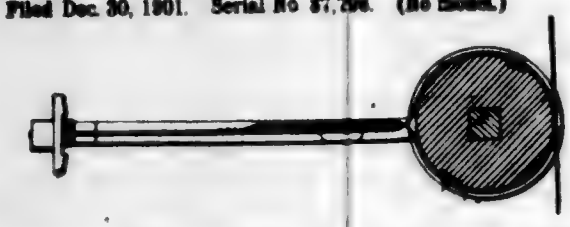
5. In a portable apparatus of the character indicated, the cross-bar in combination with tie-hooks pivoted to the ends thereof to fold inward, said tie-hooks being pivoted midway of their shanks to fold outward substantially as and for the purpose specified.

706,682. RECORDER. EDWARD A. HERBAUER, Iron Mountain, Mich. Filed May 24, 1902. Serial No. 61,660. (No model.)



Claim.—In a recorder, the combination of a dial having a pin projecting from the periphery thereof, and also having a diagram on its face, said diagram divided circularly into time-spaces, and also provided with a series of concentric circular spaces, each circular space indicating a certain period of time as twelve hours, means for rotating the dial so as to cause the same to make a complete revolution once in a stated period of time, a record-making device adapted to act on the diagram, said device being originally set so as to register with the initial concentric circular space of the diagram, a movable rod on which the record-making device is pivotally mounted, but held against longitudinal movement thereon, said rod provided with a series of rack-teeth, a shaft having a toothed wheel mounted fast thereon, the teeth of said wheel being adapted to be successively acted upon by the projecting pin of the dial upon each complete revolution of said dial, a pinion mounted fast on the toothed-wheel shaft, said pinion being in mesh with the rack-teeth of the rod, and adapted to move said rod a limited distance when the toothed wheel is partially rotated, means for holding the rod in adjusted position, and means adapted to act on the record-making device so as to cause said device to leave a visible record on the diagram in one of the circular spaces thereof.

706,683. FIELD-GATE. CLEVELAND P. HILER, Chinook, Mont. Filed Dec. 30, 1901. Serial No. 87,796. (No model.)



Claim.—1. The combination of a swinging gate provided with a latch, a projection or finger extending from the gate, a connecting device extending from the latch and having a loop receiving the finger, a disk or plate connected with the gate, and operating cords or ropes arranged on the disk or plate and connected with the loop, substantially as described.

2. The combination of a swinging gate having a latch and provided with a finger projecting upward from its upper edge, a connecting-rod extending along the top of the gate from the latch and provided with an oblong loop arranged at the rear portion of the gate and receiving the finger, a disk or plate mounted on the gate in rear of the loop, operating cords or ropes arranged on the disk or plate and connected with the loop, and means for limiting the movement of the cords or ropes independently of the disk or plate, substantially as described.

3. The combination of a swinging gate having a latch, a disk or plate mounted on the gate and provided at opposite sides thereof with recesses, operating cords or ropes extending around the disk or plate and capable of movement independently thereof, and provided with stops extending into the said recesses and adapted to engage the end walls thereof, means for connecting the operating cord or ropes with the latch, and means for actuating the cords or ropes, substantially as described.

706,684. SNOW GUARD OR FENDER. FRANCIS A. PETER, Washington Township, Lehigh County, Pa. Filed May 16, 1902. Serial No. 107,658. (No model.)

Claim.—1. In combination, the fastening-bar having one end bent backwardly upon itself to form a brace, and a plate arranged perpendicular to and transversely of the bar, and abutting against the extremity of the brace, said plate having a notch to accommodate the bar and secured thereto, substantially as described.

2. In combination, the guard-plate having an abutment on its front side and a notch in its lower edge; with a fastening-bar lying transversely of the plate, and extending through the notch therein, and having its front end bent backward to form a brace, the extremity of which is fitted against the plate above the abutment, substantially as described.

3. A snow-guard, comprising a fastening-bar having one end bent backwardly upon itself at an angle, and a plate lying transversely of the bar, having an abutment provided with a pintle engaging an aperture in the bar, and a flange above the abutment the extremity of the brace being confined between the flange and top of abutment, substantially as described.

4. A snow-guard comprising a plate having an abutment, provided with a pintle to secure it to the fastening-bar, a fastening-bar extending under and at right angles to the plate, and a brace between the front end of bar and the plate, substantially as described.

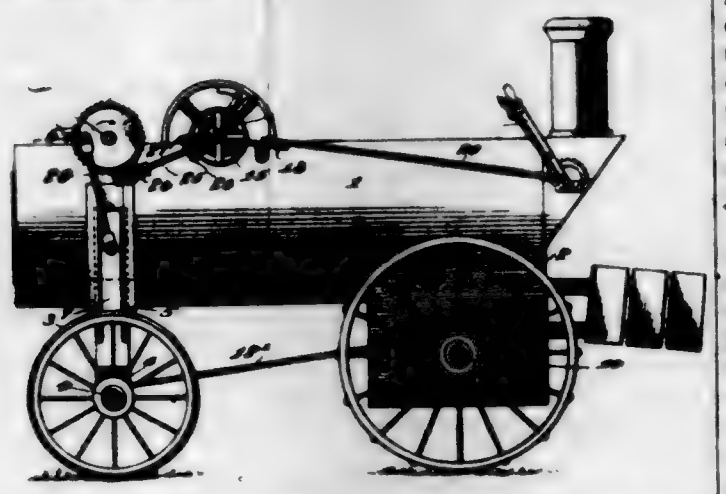
5. A snow-guard comprising a fastening-bar, a plate lying transversely of the bar having an abutment resting on the bar and a flange above the abutment, and a brace between the front of plate and front end of bar, substantially as and for the purpose set forth.

706,685. TRACTION-ENGINE. JOSEPH S. PFENNER, Fountain, Minn. Filed Apr. 28, 1902. Serial No. 106,100. (No model.)

Claim.—1. In a traction-engine, the combination with a boiler and the front axle and wheels journaled thereon; of a supporting-frame having a longitudinal sliding engagement with the axle and a sliding engagement with the boiler, and means for vertically adjusting the boiler with respect to the supporting-frame.

2. In a traction-engine, the combination with the boiler, its traction-wheels and the forward supporting-wheels and their axle; of a frame hav-

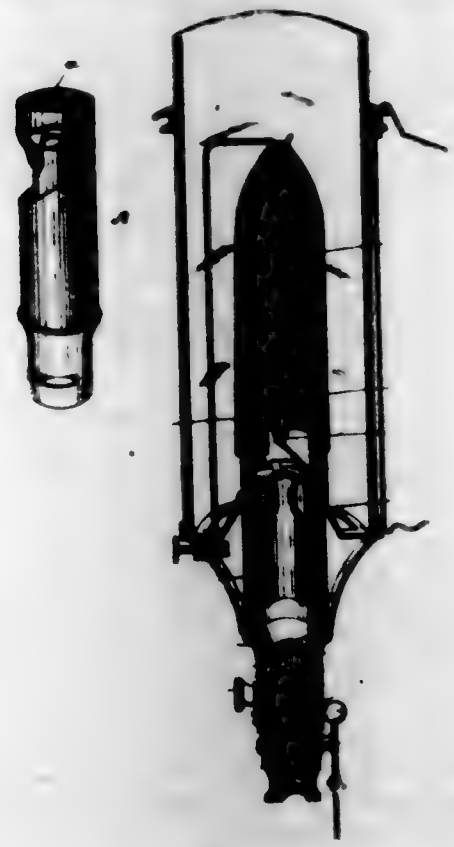
ing a longitudinal sliding connection with said axle, said boiler having a vertically-adjustable connection with said supporting-frame, and means for adjusting said boiler.



3. In a traction-engine, the combination with a boiler and its traction-wheels and its forward supporting-wheels and their axle, a frame connected to said axle and having vertical standards, guides fixed to the sides of the said boiler and engaging said standards, a shaft journaled to said boiler, cranks connected to said shaft, links connecting said cranks to the vertical members of the supporting-frame, a worm-wheel mounted to turn with said shaft, a worm in mesh with said wheel, and means for rotating said worm.

4. In a traction-engine, the combination with a boiler, its traction-wheels and its forward supporting or steering wheels and their axle, a frame connected to the axle and having vertically-disposed members, guideways secured to the sides of the boiler and having a dovetailed sliding connection with said vertical members, a shaft extending across the boiler and provided at one end with a crank and at the other end with a crank-wheel having formed thereon or made integral therewith a worm-wheel, links, one connecting the crank-wheel with one of said vertical members and the other connecting the crank with the other vertical member, a worm in engagement with the worm-wheel, and means for rotating the worm.

706,686. INCANDESCENT GAS-BURNER. EDWARD W. PHELPS, Montreal, Canada, assignor of one-half to Theodore Nadeau, Montreal, Canada. Filed Dec. 9, 1901. Serial No. 85,212. (No model.)



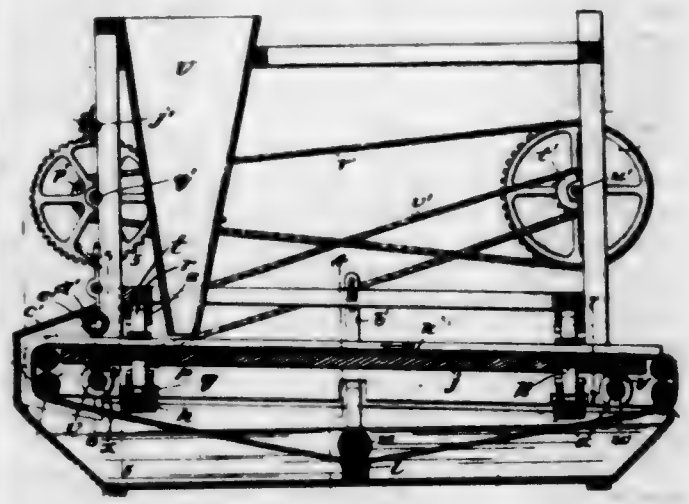
Claim.—1. The combination with the mantle-supporting double-cylinder burner having openings in the outer wall thereof, of a secondary burner substantially cup-shaped in form and extending up within the main burner, a pipe extending down through the cylinder-burner and connecting by a passage-way to the main gas-supply, the said pipe having extending into the upper end thereof, within the cup, a slotted set-screw capable of being turned from the top as specified.

2. The combination with the mantle-supporting double cylinder having openings in the outer wall thereof, of a nosepiece having a central orifice and fitted onto the upper end of the gas-supply pipe and receiving the lower end of the outer wall of the cylinder-burner and having a reduced threaded upper end suitably tapered and flattened at the top and provided with an opening therein, a cylindrical cap internally threaded and provided with a central opening at the top designed to fit over the reduced upper end of the nosepiece and means for circumferentially adjusting such cap and holding it in position when adjusted as specified.

3. The combination with the mantle-supporting double-cylinder burner having openings in the outer wall thereof, and a circumferential slot formed at the lower end thereof, of a nosepiece fitting the central orifice, and fitted onto the upper end of the gas-supply pipe and receiving the lower end of the outer wall of the cylinder and having a reduced threaded upper end suitably tapered and flattened at the top and provided with an opening therein, a cylindrical cap internally threaded and provided with a central opening at the top designed to fit over the reduced upper end of the nosepiece, and an arc-shaped projection formed on the cap and fitting the interior of the lower portion of the cylinder, and a set-screw extending into the arc-shaped projection and through the slot as specified.

4. The combination with the mantle-supporting cylinder-burner having openings in the outer wall thereof, of a nosepiece having a central orifice and fitted onto the upper end of the gas-supply pipe and having the top tapered and an opening extending therethrough, a cap provided with a central opening suitably fitted onto the nosepiece, means for adjusting said cap, a side passage-way extending through the nosepiece to the gas-supply, a tap having the central orifice designed to communicate with the central orifice of the nosepiece, and a side orifice at right angles to the central orifice of the tap and designed to communicate with the side passage-way, a pipe extending upwardly from the side passage-way in the nosepiece and bent at the top so as to have the top centrally disposed and a suitable burner at the top, as and for the purpose specified.

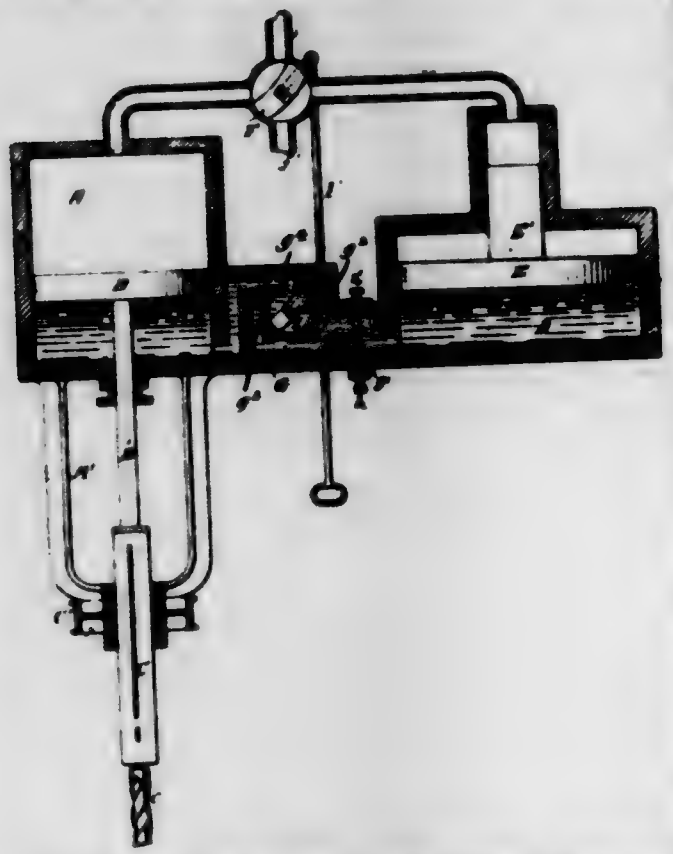
706,687. VANNER. CYRUS C. PRATT, Portland, Oreg., assignor of one-half to Thomas Holland, Portland, Oreg. Original application filed June 18, 1901, Serial No. 65,041. Divided and this application filed Nov. 20, 1901. Serial No. 82,976. (No model.)



Claim.—1. In a machine for the purpose described, the combination of a frame, lower and upper antifriction-rollers arranged in said frame, an oscillatory jigger interposed between said lower and upper antifriction-rollers, and having antifriction-rollers on its under side, transverse shafts having oppositely-disposed cam-wheels arranged between and engaging the antifriction-rollers at the under side of the jigger, and means for rotating said shafts.

2. In a machine for the purpose described, the combination of a water-tank, arranged in a suitable frame, lower and upper antifriction-rollers also arranged in said frame, an oscillatory jigger interposed between said lower and upper rollers, and having antifriction-rollers on its under side, transverse shafts having oppositely-disposed cam-wheels arranged between and engaging the antifriction-rollers at the under side of the jigger, means for rotating the said shafts, a brush disposed in the tank, a roller adjustable toward and from the brush, an endless corrugated belt having its upper stretch disposed above the jigger and its lower stretch passed through the tank and between the brush and roller, means for moving said belt, a pipe having openings, and a covering of wire-gauze for supplying water in a finely-divided state to the upper stretch of the belt, and a hopper disposed above said upper stretch of the belt.

706,688. FLUID-PRESSURE-OPERATED TOOL. JOHN F. W. REYBURN and WILLARD T. SEARS, Harrisburg, Pa. Filed July 17, 1901. Serial No. 68,082. (No model.)



Claim.—1. The combination of a liquid-reservoir, a cylinder containing a piston, a tool operatively connected to said piston, means whereby fluid-pressure may be exerted upon liquid in the reservoir or upon the piston at will, and a structure connecting the reservoir and the cylinder whereby the liquid in the reservoir may be made to act upon the piston, substantially as described.

2. The combination of a liquid-reservoir, a cylinder containing a piston, a tool operatively connected to said piston, means whereby fluid-pressure may be exerted upon liquid in the reservoir or upon the piston at will, and a conduit connecting the reservoir and the cylinder, said conduit being provided with mechanism permitting free flow of liquid in one direction but restricting said flow when the liquid moves in an opposite direction, substantially as described.

3. The combination of a drill or other tool with a feeding device therefor, the same comprising a cylinder having within it a piston, a liquid-reservoir, means for subjecting the liquid in said reservoir to the pressure of an elastic fluid, means for operatively connecting the liquid-reservoir and the piston-cylinder whereby said liquid under the pressure of said fluid may be caused to act upon one side of the piston to move it in one direction, with means for connecting the portion of the cylinder on the other side of the piston with the source of fluid under pressure, whereby said piston may be moved in the opposite direction, the said tool being free to turn independently of the piston, substantially as described.

4. The combination of a drill or other tool, with a feeding device therefor comprising a cylinder with piston therein, fluid-pressure apparatus and communication between said fluid-pressure apparatus and the piston-cylinder, said communication presenting a restricted area to flow in one direction and a greater area to flow in the opposite direction, substantially as described.

5. The combination of a drill or other tool, with a feeding device therefor comprising a cylinder with piston therein, a liquid-reservoir, means for subjecting the liquid in said reservoir to the pressure of an elastic fluid, a communication between said liquid-reservoir at one side of the piston and means for exerting the pressure of the elastic fluid directly upon the other side of the piston, substantially as described.

6. The combination of a drill or other tool with a feeding device therefor comprising a cylinder having in it a piston means for exerting fluid-pressure upon said piston to move the tool, and an automatic valve in the fluid-pressure-supply pipe whereby the area of said pipe is normally restricted when the fluid-pressure is exerted in one direction, but is open to its full extent when pressure is exerted in the opposite direction, substantially as described.

7. The combination of a drill or other tool with a feeding device consisting of a piston and a cylinder therefor, fluid-pressure apparatus, means for operatively connecting said fluid-pressure apparatus and the piston-cylinder, and a valve for use in connection with said means, said valve being constructed to be automatically moved by changes in the direction of flow of the fluid under pressure, being thereby made to occupy two extreme positions, one of which restricts the flow of said fluid to a greater extent than the other, substantially as described.

8. The combination of a drill or other tool with a working cylinder, a piston in said cylinder to which the tool is attached, a reservoir, means for connecting the reservoir and the working cylinder, an automatic valve within said means, means for maintaining the valve at any desired distance off its seat, and means for limiting the upward movement of the valve, an air-pressure pipe communicating with the reservoir, substantially as described.

9. The combination of a working cylinder, a piston therein, a tool connected to the said piston, an oil-reservoir, a passage forming communication between the lower portion of the oil-reservoir and the lower portion of the working cylinder, a valve in said passage, means for adjusting said valve, a controlling-valve, a casing therefor, a pipe leading from said casing to the upper end of the working cylinder, and a pipe leading from the casing to the upper end of the reservoir, an exhaust-pipe and an air-pressure pipe communicating with the valve-casing, substantially as described.

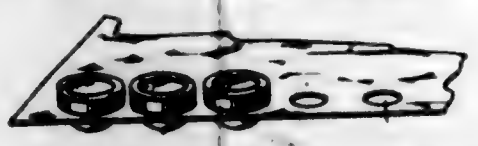
10. The combination of a working cylinder, a piston therein connected to the drill or other tool to be operated, an oil-reservoir, a passage forming communication between the oil-reservoir and the working cylinder, a cylinder mounted above the oil-reservoir, a piston in the oil-reservoir and having a plunger working in the cylinder, a valve-casing, a controlling-valve therein, a pipe leading from the valve-casing to the upper portion of the working cylinder, and a pipe leading from the valve-casing to the upper portion of the plunger-cylinder, an air-pipe and exhaust-pipe communicating with the valve-casing, substantially as described.

11. The combination of a working cylinder, a piston therein connected to the drill or other tool to be operated, an oil-reservoir, a passage forming communication between the oil-reservoir and the working cylinder, a cylinder mounted above the oil-reservoir, a piston in the oil-reservoir, and having a plunger working in the cylinder, a valve-casing, a controlling-valve therein, a pipe leading from the valve-casing to the upper portion of the working cylinder, and a pipe leading from the valve-casing to the upper portion of the plunger-cylinder, an air-pipe and exhaust-pipe communicating with the valve-casing, with a stop-valve in the passage leading from the working cylinder to the reservoir, substantially as described.

12. The combination of the working cylinder, a piston therein, a rod, a tool connected to said rod, a reservoir for liquid, a passage leading from the liquid-reservoir to the working cylinder, a valve in said passage for limiting the flow of liquid through the passage, a stop-valve also in the passage, a controlling-valve casing, a valve therein, a pipe leading from the valve-casing to the liquid-reservoir, the stop-valve and controlling-valve being connected so as to operate in unison, substantially as described.

13. The combination of a drill or other tool with a feeding device therefor, said device including a cylinder and a piston within the same operatively connected to said tool, means for exerting fluid-pressure on one side of the piston, means for controlling the flow of fluid from the portion of the cylinder on the other side of the piston, and a normally open valve constructed to automatically open to a greater or less extent as the direction of flow of fluid through it is changed, substantially as described.

706,689. TOY. FRIEDRICH A. REUTER, Rudolstadt, Germany. Filed Feb. 13, 1902. Serial No. 93,980. (No model.)



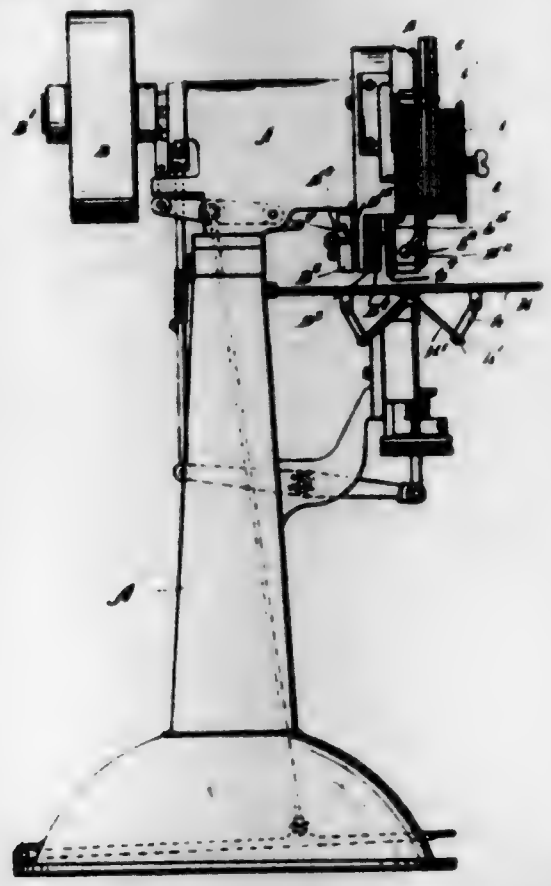
Claim.—1. In a toy for producing various mosaic patterns by means of interchangeable pieces, the combination of recesses and projections on the pieces and depressions in the board to receive the projections of the pieces, the exterior surface of said depressions being adapted to fit the recesses of the pieces at the opposite side substantially as described.

2. In a toy consisting of a board on which a series of colored pieces are arranged to produce a mosaic pattern, the combination of a set of pieces having a depression in the form of a spherical segment on one face and a corresponding expression on the opposite face and a board having a set of correspondingly-shaped depressions and expressions at its opposite sides substantially as described.

706,690. WIRE-STITCHING MACHINE. FREDERICK P. ROSBACK, Chicago, Ill. Filed June 5, 1901. Serial No. 63,235. (No model.)

Claim.—1. In a wire-stitching machine, the wire-feeding device, consisting of the main drive-wheel B, its shaft B', the sprocket-wheel B² se-

cured thereto, its drive-chain B^2 communicating a rotary motion to the sprocket-pinion B^1 that revolves the sleeve-shaft B^3 actuating the pawl-bearing wheel B^9 secured thereto, and provided with pawl B^7 that contacts with ratchet-wheel B^8 for imparting motion to the sleeve-shaft B^3, and the feed-roll B^{11} secured thereto, combined with the geared drive-wheel b^2 that causes the pinion b^1 to actuate the feed-roll B^{11} substantially as shown and described.



2. In a wire-stitching machine, the wire-feeding device consisting of the main drive-wheel B, its shaft B^*, the sprocket-wheel B^2 secured thereto, its drive-chain B^2 communicating a rotary motion to the sprocket-pinion B^1 for rotating the sleeve-shaft B^3 and the pawl-bearing wheel B^9 secured thereto, that is provided with pawl B^7 that contacts with ratchet-wheel B^8 for actuating the sleeve-shaft B^3 having the feed-roll B^{11} secured thereto, and the geared drive-wheel b^2 that imparts motion to the pinion b^1 and its shaft b^3 and the feed-roll B^{11}, combined with the dial-adjusting plate B^{12} secured to the shaft B^{10} and the adjustable ratchet cam-plate B^{14} keyed thereto, having the raised cam on its periphery to contact with the projecting heel o of the pawl and control its connection in various adjustments with the ratchet-wheel B^8 and the cam-plate B^{13}, attached to the frame A for raising the pawl out of action substantially as shown and described.

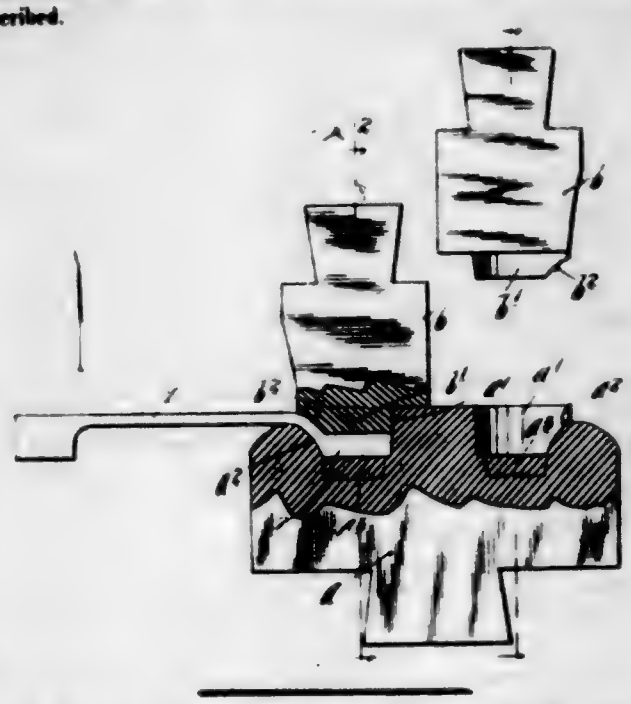
3. In a wire-stitching machine the wire-feeding device in combination with the oscillating adjustable journal-bearing b of the lower feed-roller B^{11}, the tapered projecting flange b' and its screw b^5 whereby the journal-bearing is oscillated to incline its upper surface and press the wire upon one edge and secure proper tension upon the wire substantially as shown and described.

4. In a wire-stitching machine, the staple-forming and staple-driving mechanism combined with the grooved knife c' and the forcing-die E that cuts a section of wire from between the portion which is to form the staple and the remaining portion of the strand, thereby providing square ends substantially as and for the purposes set forth.

5. In a wire-stitching machine the combination of the anvil F having the upwardly-inclined slot f and the vertically-grooved former G, having the holding notch or groove g^3 at its base to receive from the anvil the wire from which the staple is to be formed and hold it in proper position for entering the vertical grooves of the former G substantially as shown and described.

706,691. DIE FOR MAKING GAME-HOOK CLASPS. OLE RUSS, West Duluth, Minn. Filed Oct. 12, 1901. Serial No. 78,662. (No model.)

Claim.—The combination with a die block or section having the rounded bending lug or shoulder a^2 and an adjacent recess a' with countersunk lug-forming rest a^3, of the die-section b having the depending plunger portion b' fitting said recess a' and beveled or cut at b^2 for coöperating with the said rounded shoulder a^2, said die-sections having coöperating stop surfaces or shoulders which properly space apart said surfaces a^3, b^3 and the end of said die b and bottoms of recesses a, a', substantially as described.



706,692. FOLDING CRATE. HARVEY J. SCHROCK, Goshen, Ind. Filed Apr. 11, 1902. Serial No. 102,458. (No model.)

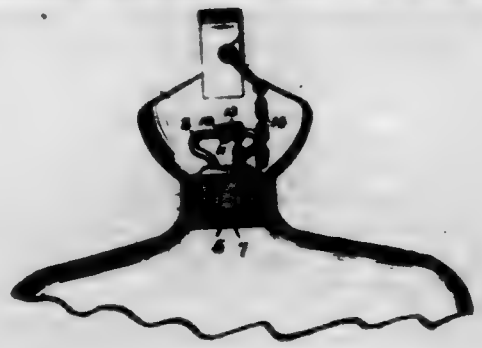
Claim.—1. A folding crate, comprising two end sections and a front and rear section, corner-posts secured to the inner faces of the front and rear section and in line with the end sections, said posts being pivotally connected to the end sections and a bottom hingedly connected to the front or rear section adapted to be folded inward and against the section and also of lesser thickness than the corner-posts.

2. A folding crate, comprising two end sections and a front and a rear section pivotally secured together so that when the crate is folded the ends and front sections are in respectively the same line, corner-posts carried by the front and rear sections providing compartments or spaces upon the inner face thereof when folded and a lid and bottom adapted to fit in said compartments or spaces when the crate is folded.

3. A folding crate, comprising two end sections having its top and bottom rails provided with intermediate depressed recesses and connected together by panels, which fit in said recesses, rods passing through said rails near the ends thereof, a front and a rear section, a corner-post carried at the ends of the front and rear sections upon the inner face thereof adapted to be connected hingedly to said rods, and a bottom hingedly connected to the posts of the rear section adapted to be folded upon the inner side thereof.

4. A folding crate, comprising two ends, a front and a rear section, said end sections comprising a top and bottom rail and panels, said rail projecting beyond each face of the panel to form a rim, and provided with intermediate depressed recesses to receive the ends of the panels, a corner-post carried upon the inner side of the front and rear sections and hingedly connected to the end sections, and a bottom hingedly connected to the posts of the rear section adapted when the crate is extended to rest upon the rim formed by the lower rails and when the crate is folded to rest against the inner face of the section inside the inner edge of the posts.

706,698. BOTTLE-STOPPER. SILAS SHEWBRIE, Belleville, N. J., assignor to Hardman Rubber Company, Belleville, N. J., a Corporation of New Jersey. Filed Nov. 18, 1901. Serial No. 82,612. (No model.)



Claim.—1. In a bottle, a stopper provided with a finger-piece, a means of attachment rotatively connected with said finger-piece so as not to interfere with the rotation of said stopper, a flexible connection secured at its one end to said means of attachment which is connected with the said finger-piece, and a second means of attachment rotatively connected with a portion of said bottle to which the other end of said flexible connection is attached, comprising, an eyelet connected with a portion of said bottle, a pin, and means connected with said eyelet for retaining said pin in its rotative relation to said eyelet, and means on said pin to which the other end of said flexible connection is attached, substantially as and for the purposes set forth.

2. In a bottle, a stopper provided with a finger-piece, a means of attachment rotatively connected with said finger-piece so as not to interfere with the rotation of said stopper, a flexible connection secured at its one end to said means of attachment which is connected with the said finger-piece, a second means of attachment rotatively connected with a portion of said bottle, consisting, essentially, of an eyelet, a ring in said eyelet, a pin rotatively connected with said ring, and means on said pin to which the other end of said flexible connection is attached, substantially as and for the purposes set forth.

3. In a bottle, a stopper provided with a finger-piece, a means of attachment rotatively connected with said finger-piece so as not to interfere with the rotation of said stopper, a flexible connection secured at its one end to said means of attachment which is connected with the said finger-piece, a second means of attachment rotatively connected with a portion of said bottle, consisting, essentially, of an eyelet, a ring in said eyelet, a pin rotatively connected with said ring, said ring being provided with an eye, and a snap-hook connected with said eye to which the other end of said flexible connection is attached, substantially as and for the purposes set forth.

4. In a bottle, a stopper provided with a finger-piece having a perforation, a pin rotatively arranged in said perforation, means connected with said pin for preventing the displacement of said pin, a flexible connection secured at one end to said pin, and a means of attachment rotatively connected with a portion of said bottle to which the other end of said flexible connection is attached, comprising, an eyelet connected with a portion of said bottle, a pin, and means connected with said eyelet for retaining said pin in its rotative relation to said eyelet, and means on said pin to which the other end of said flexible connection is attached, substantially as and for the purposes set forth.

5. In a bottle, a stopper provided with a finger-piece having a perforation, a pin rotatively arranged in said perforation, means connected with said pin for preventing the displacement of said pin, a flexible connection secured at one end to said pin, and a means of attachment rotatively connected with a portion of said bottle, consisting, essentially, of an eyelet, a ring in said eyelet, a pin rotatively connected with said ring, and means on said pin to which the other end of said flexible connection is attached, substantially as and for the purposes set forth.

6. In a bottle, a stopper provided with a finger-piece having a perforation, a pin rotatively arranged in said perforation, means connected with said pin for preventing the displacement of said pin, a flexible connection secured at one end to said pin, and a means of attachment rotatively connected with a portion of said bottle, consisting, essentially, of an eyelet, a ring in said eyelet, a pin rotatively connected with said ring, said ring being provided with an eye, and a snap-hook connected with said eye to which the other end of said flexible connection is attached, substantially as and for the purposes set forth.

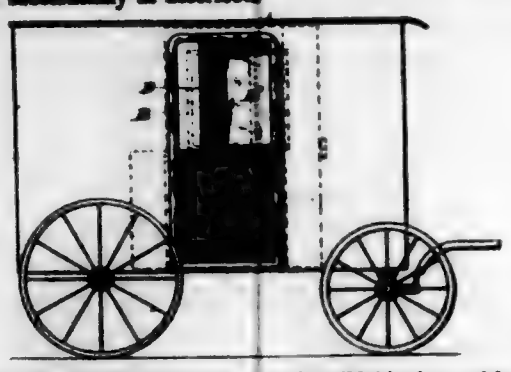
7. In a bottle, a stopper, a means of attachment rotatively connected with said stopper so as not to interfere with the rotation of said stopper, a flexible connection secured at its one end to said means of attachment which is connected with the stopper, and means for detachably connecting the other end of said flexible connection to a portion of the bottle, consisting, essentially, of an eyelet, a ring in said eyelet, a pin rotatively connected with said ring, said ring being provided with an eye, and a snap-hook connected to said eye and also attached to the other end of said flexible connection, substantially as and for the purpose set forth.

706,694. DOOR FOR MAIL-WAGONS. WILLIAM F. SHELLY, Newcastle, Ind. Filed May 16, 1902. Serial No. 107,592. (No model.)

Claim.—1. A door having one of its corners cut out to form a recess, in combination with a doorway with which said recess is adapted to register, substantially as described.

2. A wagon having a doorway, and a door with one of its corners cut out to form a recess, said recess adapted to register with said doorway and form an opening into the interior of the wagon when the door is moved in one direction, and be covered or closed when it is moved in the opposite direction, substantially as described.

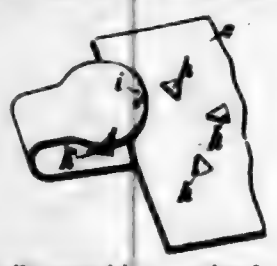
3. A door for a wagon having one of its corners cut out to form a recess, and the upper portion of said door provided with a window in combination with an opening in said wagon with which said recess is adapted to register, substantially as described.



4. A wagon having a doorway, and a slidable door with one of its corners cut out to form a recess adapted to register with said doorway and form an opening in connection therewith when slid in one direction, and when slid in the opposite direction to be covered by the side of the wagon, substantially as described.

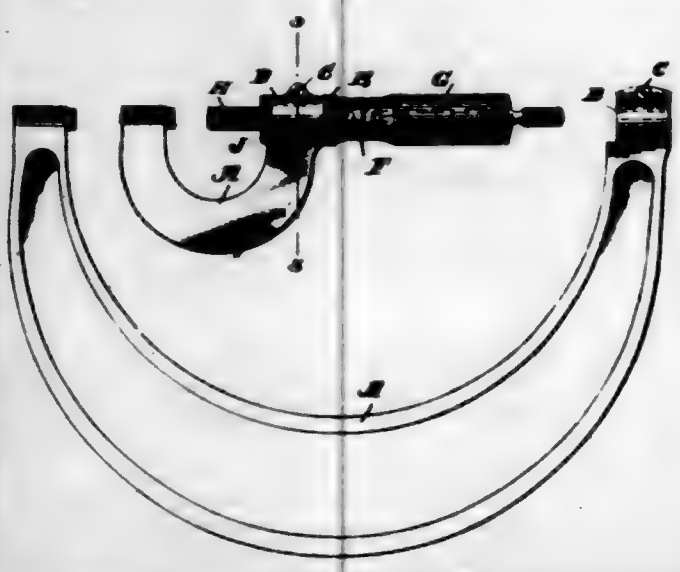
5. A door having one of its corners cut out to form a recess and also having a window, in combination with a doorway with which said window and recess are adapted to register, substantially as described.

706,695. LABEL WITH METAL FASTENING-CLAMP. WILHELM SIEPFERT, Chemnitz, Germany. Filed Sept. 23, 1899. Serial No. 731,198. (No model.)



Claim.—A label-clip comprising a strip of metal having enlarged ends and bent to form a pair of flaps one of greater length than the other, a plurality of claws on the outer edge of the longer flap, a perpendicular tooth located at an intermediate point on the inner face of said longer flap and a tooth on the outer edge of the shorter flap bent inwardly to oppose said intermediate tooth.

706,696. MICROMETER-GAGE. ROBERT J. HERTSON, Athol, Mass., assignor to the L. S. Starrett Company, Athol, Mass., a Corporation of Mass. Filed Apr. 5, 1900. Renewed Jan. 11, 1902. Serial No. 89,256. (No model.)

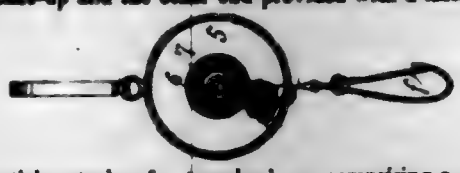


Claim.—In a micrometer-gage, the rotatable spindle and sleeve and the tubular barrel adapted to receive them and formed with a cylindrical end portion D and collar E, in combination with any one of a plurality of frames or bodies, each provided with a receiving-socket and a clamping-screw, adapted to receive and hold said end portion of the barrel, whereby such frames or bodies may be interchangeably attached to and detached from the tool proper, substantially as set forth.

706,697. ARTICLE-ATTACHER. HEATH H. HIRE, Oceanpark, Cal. Filed May 15, 1901. Serial No. 60,306. (No model.)

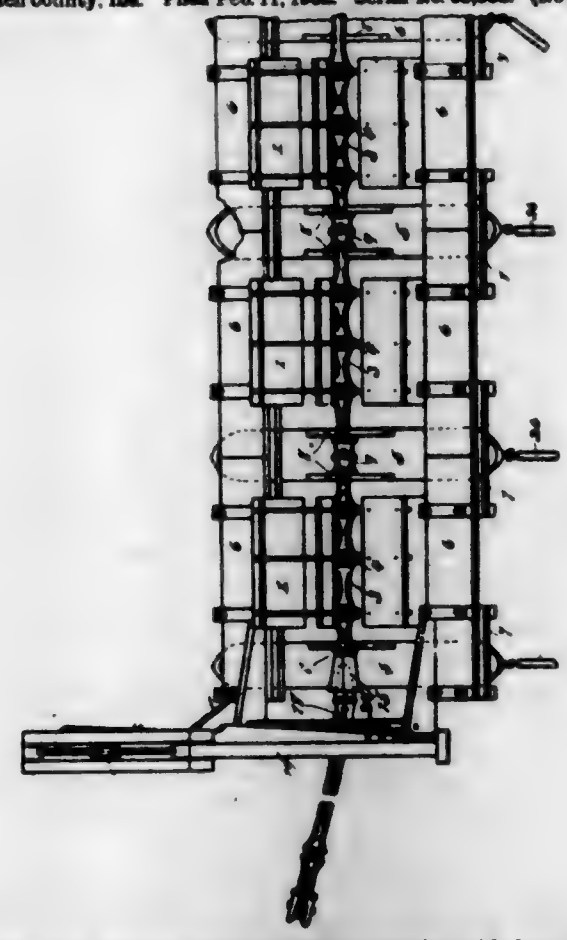
Claim.—1. An article-attacher for travelers' use comprising a cone, the sides of which are extended beyond its periphery to form flanges and

the periphery of which case is provided with means for suspending it in position and is perforated diametrically opposite said means, one wall of the perforation being provided with a sharp edge, a spring secured at one end to the periphery between said flanges and adjacent to the perforation, the free end of the spring being curved and fitting in the perforation with its tip in position to engage said sharp edge, a take-up in the case, and a flexible connector through the perforation between the tip of the spring and the sharp edge, the inner end of the connector being secured to the take-up and the other end provided with a fastener.



2. An article-attacher for travelers' use comprising a case, the periphery of which is perforated and provided with a rigid ring diametrically opposite the perforation, a take-up in the case, a flexible connector secured to the take-up and projecting through the perforation, means for temporarily holding the connector from moving through the perforation, the outer end of the connector and the ring being each provided with a hook, said hooks being each provided with a spring-tongue which stands at an angle to the hook and engages therewith at a distance from its tip the end of the tongue terminating abruptly and being provided with a sharp edge which normally engages with the inner face of the hook.

706,698. CURRENT-MOTOR. LEROY SPRAGUE, Milan Township, Allen County, Ind. Filed Feb. 11, 1902. Serial No. 93,522. (No model.)



Claim.—1. In a current-motor the combination with boats of water wheels and shafts supported thereby, flexible joints connecting said shafts, a land or power shaft, flexible joints therein, a socket-joint connecting said land-shaft with the water-wheel shaft, a vertically-slidable rest supporting said shaft and adapted to be raised or lowered in conformity with the motor, substantially as described.

2. In a current-motor the combination with boats of water wheels and shafts supported thereby, a land-shaft connected to said water-wheel shafts, a vertically-slidable rest adapted to be raised or lowered in conformity to the motor, substantially as described.

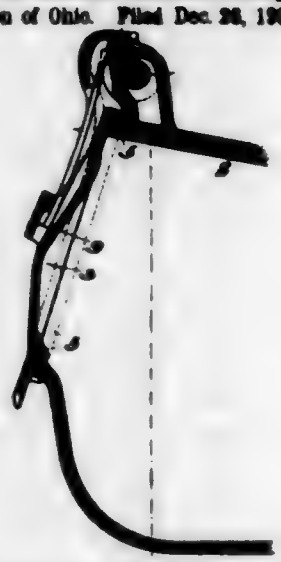
3. In a current-motor, the combination with boats of water wheels and shafts supported thereby, a land-shaft connected to said water-wheel shafts, a sliding joint between the two and means for raising and lowering said land-shaft in conformity to the motor.

706,699. PROCESS OF TREATING TROLLEY-WIRES. ALFRED STEPHENS, Cincinnati, Ohio. Filed Feb. 7, 1902. Serial No. 92,871. (No specimens.)

Claim.—1. The method or process of restoring to normal molecular condition trolley-wires of electric railways deteriorated by use, consisting in treating the wire *in situ* at successive substantially adjacent points in its length by a total or partial interruption of the circuit at each of said points in succession.

2. The method or process of restoring to normal molecular condition trolley-wires of electric railways deteriorated by use, consisting in treating the wire *in situ* at successive substantially adjacent points in its length by a total or partial interruption of the circuit at each of said points in succession, and immediately thereafter cooling said wire to normal temperature by means applied in similar succession to heated portions, substantially as set forth.

708,700. JOURNAL-BOX LID. JOHN W. STEPHENSON, Toledo, Ohio, assignor to the National Malleable Castings Company, Cleveland, Ohio, a Corporation of Ohio. Filed Dec. 26, 1901. Serial No. 87,182. (No model.)



Claim.—1. A journal-box having a lid adapted to fit against the edges of the box, and a leaf-spring fitted to the said lid, the said lid having a recess extending under the spring for the discharge of dirt; substantially as described.

2. A journal-box having a lid adapted to fit against the edges of the box, a leaf-spring, and a socket for holding the spring, said socket being formed on the said lid, being open at its lower end and having a recess extending under the spring for the discharge of dirt, substantially as described.

3. A journal-box having a lid adapted to fit against the edges of the box, a leaf-spring, and a socket for holding the spring, said socket being formed on the said lid, being open at its lower end and having a recess extending under the spring for the discharge of dirt, the spring being substantially of the same width as the socket; substantially as described.

4. A journal-box having a lid adapted to fit against the edges of the box, and a leaf-spring fitted to the said lid, the said lid having a recess extending under the spring for the discharge of dirt, and a hood which covers the spring; substantially as described.

5. A journal-box having a lid adapted to fit against the edges of the box, a leaf-spring fitted to said lid, ribs formed on said lid substantially coextensive in length with the spring, said spring fitting between the ribs and being of substantially the same width as the space between them, said ribs protecting said spring and preventing its sidewise displacement, and a socket at the lower end of said ribs adapted to hold the spring detachably in proper position to engage the box; substantially as described.

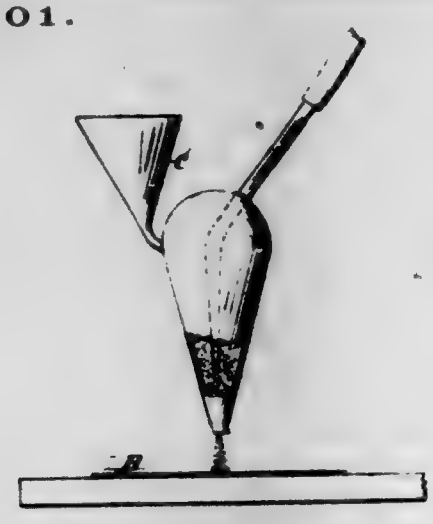
6. A journal-box lid having a leaf-spring, ribs formed upon the lid, said spring being confined between said ribs and protected thereby, and a recess formed between the ribs and extending under said spring for the discharge of dirt; substantially as described.

7. A journal-box lid having a leaf-spring, ribs formed upon the lid, said spring fitting neatly between the ribs, said ribs protecting the spring and preventing its sidewise displacement, and a socket at the lower end of said ribs adapted to hold the spring in proper position to engage the box, said socket being open at its lower end and having a recess beneath the spring for the discharge of dirt; substantially as described.

706,701. METHOD OF IMPACTING ONE METAL UPON ANOTHER. SAMUEL H. THURSTON, Longbranch, N. J. Filed Mar. 28, 1902. Serial No. 99,891. (No specimens.)

Claim.—The method of providing a metal article with a coating of another metal, which consists in forcing particles of the coating metal, by a blast of a gas, against the said article with such force as to cause the particles to become embedded in the surface of the said article and form a permanent coating thereon.

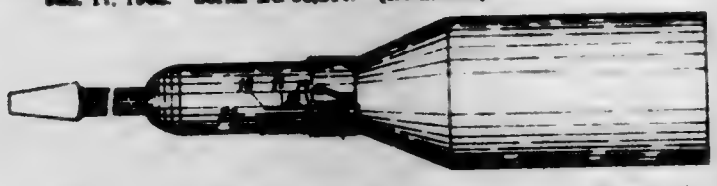
706,701.



706,702. PROCESS OF COATING ONE METAL WITH ANOTHER METAL. SAMUEL H. THURBER, Long Branch, N. J. Filed Dec. 24, 1901. Serial No. 87,079. (No specimens.)

Claim.—The within-described process of coating one metal upon another with an amphorous inherent, adherent, coherent, permanent film or particle of the coating metal, which consists in artificially heating the metal to be coated and then impacting the particles of the coating metal into the pores of the metal being coated, by beating them, substantially and for the purposes hereinbefore specified.

706,708. BAR-CHUCK. TUCKER R. TERRY, Downey, Cal. Filed Jan. 17, 1902. Serial No. 90,217. (No model.)



Claim.—1. A bar-chuck provided with means for varying the size thereof to accommodate different-size nuts or bars and means for retaining the first-mentioned means in operative position after the extension thereof.

2. A bar-chuck provided with a plurality of bushings and means for retaining bushings singly or collectively in an extended and retracted position.

3. A bar-chuck provided with a plurality of bushings and a ring for retaining said bushings singly or collectively in both an extended and retracted position.

4. A bar-chuck provided with a plurality of bushings constructed to fit one within the other and all within the chuck and a device for retaining the bushings in an extended or retracted position.

5. A device of the character described provided with a hollow interior, bushings constructed to fit within the device within each other and a ring for retaining the bushings in both an extended and retracted position.

6. A device of the character described provided with a hollow interior and having slots, bushings or sleeves constructed to fit within said device and within each other and having slots and pins to enter said slots in the device and the bushings and a split ring upon the device constructed to engage said pins, to retain the bushings in an extended and retracted position.

706,704. PLANE. JOSEPH A. TRAUT, New Britain, Conn. Filed May 20, 1901. Serial No. 60,962. (No model.)

Claim.—1. In a plane, the combination with a stock having a sole, of a supplemental sole, a threaded hole in the stock, a differently-threaded hole of different diameter in the sole, and a single thumb-screw having correspondingly-threaded shanks of large and small diameters working in both of said holes.

2. In a plane, the combination with a stock having a sole, of a supplemental sole, a hole in said stock, a hole in said supplemental sole, one of said holes being of larger diameter than the other and one of said holes having a right-hand thread and the other having a left-hand thread, and a screw having shanks of corresponding sizes and threads and working in both of said holes.

3. In a plane, the combination with a stock having a sole, of a supplemental sole, a hole in said stock having a right-hand thread, a hole of smaller diameter in said supplemental sole, and having a left-hand thread, and a screw having shanks of corresponding sizes and threads and working in said holes.

4. In a plane, the combination with a stock having a sole, of a supplemental sole, a hole in said stock having a right-hand thread, a hole of smaller diameter in said supplemental sole and having a left-hand thread of coarser pitch, and a screw having portions of corresponding sizes and threads and working in said holes.

5. In a plane, the combination with a stock having a sole, of a supplemental sole; a threaded hole in the stock; a differently-threaded hole of smaller diameter in the sole; a single thumb-screw having differently-threaded shanks of large and small diameters working in said holes; and means for limiting the movement of said supplemental sole so as to prevent the withdrawal of said screw from said sole.

6. In a plane, the combination with a stock having a sole, of a supplemental sole; a hole in said stock; a hole in said supplemental sole; one of said holes being of larger diameter than the other, and one of said holes having a right-hand thread and the other having a left-hand thread; a screw having portions of corresponding sizes and threads and working in both of said holes, and detachable means for clamping said supplemental sole to the stock; said clamping means including a part which limits the movement of said supplemental sole so as to prevent the withdrawal of said screw therefrom.

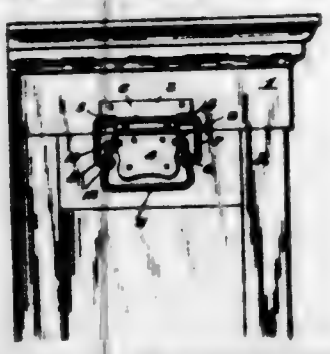
7. In a plane, the combination with a stock having a sole, of a supplemental sole; a hole in said stock having a right-hand thread; a hole of smaller diameter in said supplemental sole having a left-hand thread; a screw having portions of corresponding sizes and threads and working in said holes; a slot in said supplemental sole, and a transverse clamping-screw passing through said slot and engaging said stock; the play of said slotted sole upon the shank of said clamping-screw being insufficient to permit the withdrawal of said adjusting-screw from the supplemental sole.

8. In a plane, the combination of a stock, a supplemental sole, and a screw having near its head a finely-threaded shank portion which is threaded into a hole in said stock, and also having at its tip a coarsely-threaded shank portion of smaller diameter which is threaded into a hole in the supplemental sole.

9. In a plane, the combination with a stock and a supplemental sole adjustable up and down thereon, of an up-and-down thumb-screw having at its upper end a threaded portion of fine pitch which works in a corresponding hole formed in the upper portion of the stock, and also having at its lower end a coarsely-threaded portion of smaller diameter which works in a corresponding hole in the supplemental sole.

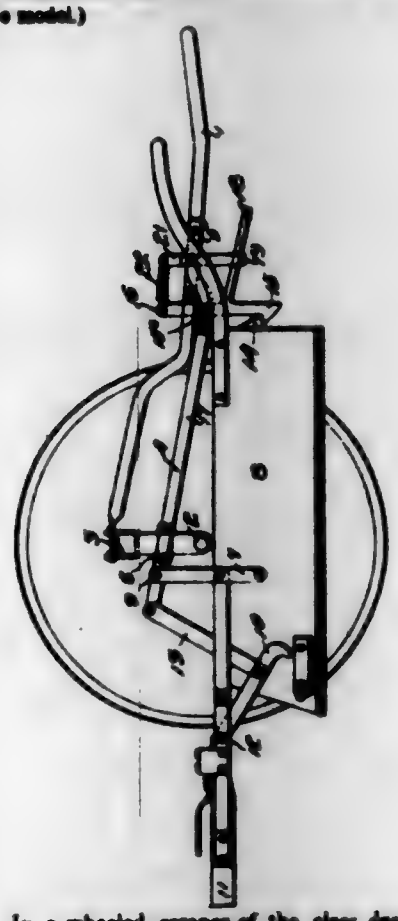
10. In a plane, the combination with a stock and a supplemental sole adjustable up and down thereon, of an up-and-down thumb-screw having at its upper end a right-hand-threaded portion of fine pitch which works in a corresponding hole in the stock, and also having at its lower end a left-hand-threaded portion of smaller diameter and of coarse pitch which works in a corresponding hole in the supplemental sole.

706,705. FURNITURE-CLAMP. WILLIAM L. TUELL, New Albany, Ind. Filed Oct. 7, 1901. Serial No. 77,878. (No model.)



Claim.—The combination with two pieces of furniture, of a clamp consisting of two plates, one secured to one piece of furniture and the other secured to the other piece of furniture, one of said plates being provided with integral hooks or eyes, and the other plate with integral perforated ears projecting at right angles from the plate, a bail pivoted in the hooks or eyes and consisting of a horizontal portion 6, a vertical portion 7, and the inwardly-projecting crank-arms 8, and a second bail consisting of a horizontal portion 11 having inwardly-projecting ends formed with eyes 12 into which the crank-arms 8 project and terminating at their upper ends in inwardly-projecting studs which are pivoted in the perforated ears, substantially as set forth.

706,706. SAFETY-CATCH FOR WHEELED EARTH-SCRAPERS. CHARLES J. WHITING, Lasalle, Ill. Filed June 5, 1902. Serial No. 110,342. (No model.)



Claim.—1. In a wheeled scraper of the class described, a catch pivoted to the lever, adapted to engage the cleat on the rear end of the bowl or box, having an arm 16, extending upwardly from its pivot, and also having a rearwardly-extending lever-arm 18, in combination with a stirrup secured to the lever in rear of the catch, forming a guide and stop for the lever-arm 18, the latter extending therethrough and working therein, said stirrup having an upwardly-extending post 21, and a spring connecting said post to the arm 16 of the catch, substantially as described.

2. In a wheeled scraper of the class described, a pivoted catch carried by the lever and adapted to engage a cleat on the rear end of the bowl, or box, a spring to keep said catch in engagement with said cleat means to prevent lateral movement of said catch, and means to limit the pivotal movement thereof when disengaged from the cleat, substantially as described.

3. In a wheeled scraper of the class described, a pivoted catch carried by the lever and adapted to engage a cleat on the rear end of the bowl or box, said catch having a rearwardly-extending operating-arm and a guide for the latter, carried by the lever, said guide preventing lateral movement of the catch and coacting with the arm to limit the pivotal movement of the catch when disengaged from the cleat, substantially as described

---

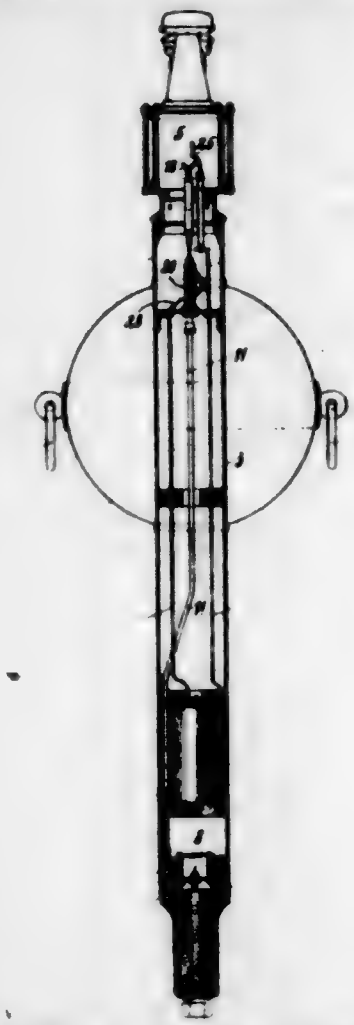
706,707. LIGHT LIFE-BUOY. CARLOS C. A. B. WIBEL, Hamburg, Germany. Filed Nov. 20, 1901. Serial No. 83,017. (No model.)

Claim.—1. A life-buoy composed of a float, a carbid-receptacle having a water-inlet, an expansible bulb communicating with the carbid-receptacle, a cock opened by the bulb and adapted to close an electric circuit, a burner, and a platinum igniting-wire in circuit which serves to break the circuit after igniting the gas, substantially as specified.

2. A life-buoy composed of a float, a vertically-extending tube, a carbid-receptacle, a battery within the lower end of the tube, a circuit and contacts, a burner within the upper end of the tube, an expansible bulb communicating with the carbid-receptacle, a cock opened by the bulb and adapted to close said contacts and circuit, and a platinum igniting-wire in circuit, which is adapted to break the circuit after the ignition of the gas, substantially as specified.

3. A life-buoy composed of a float, a carbid-receptacle, an expansible bulb communicating therewith, a lever operated by the bulb, a cock actuated by the lever, a contact adapted to be engaged by the cock, a circuit closed by the contact, a burner, and a platinum igniting-wire in circuit, which is adapted to break the circuit after the ignition of the gas, substantially as specified.

4. A life-buoy composed of a float, a carbid-receptacle, a burner, a connecting-pipe, a spring-influenced cock in the pipe, a disk on the cock-spindle having a nose and a pair of contacts, a bulb communicating with the gas-receptacle, a lever influenced thereby and adapted to engage the disk, an electric circuit adapted to be closed by the disk contacts, and a platinum igniting-wire in circuit, substantially as specified.



5. In a life-buoy, the combination of a burner and a sulfur-coated platinum igniting-wire, a pair of arms adapted to carry the wire, a sulfur-coated projection on one of said arms, a pair of concentric metallic pipes connected with the arms, an insulating-pipe between the metallic pipes, a battery, two wires connecting the pipes with the battery, and a circuit adapted to glow the platinum wire and ignite the sulfur, substantially as specified.

6. In a life-buoy, the combination of a water-chamber, a tube inserted into the bottom of said chamber, a glass pipe within the said tube, a needle in the glass pipe, and a carbid-receptacle beneath the needle, substantially as specified.

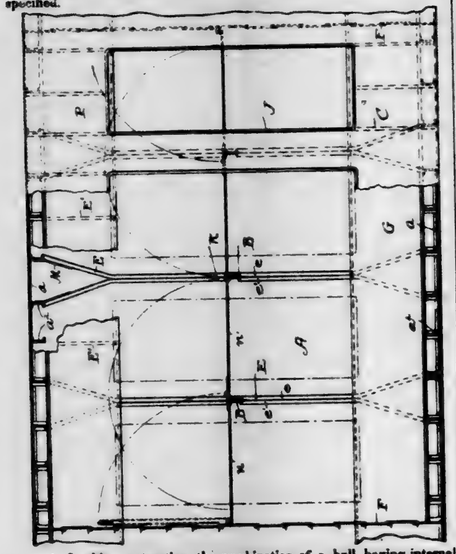
706,708. SHIP CONSTRUCTION. AUGUSTUS B. WOLVIN, Duluth, Minn. Filed Jan. 17, 1902. Serial No. 90,194. (No model.)

Claim.—1. In ship construction the combination of a hull having internal vertical side frame members, vertical stanchions rising from points above the center hatches and midway between the hatches, each consisting of two members secured together from their lower ends up to the points near their upper ends, from which points said members diverge, transverse spar-deck beams secured to the side frame members and to the diverging upper ends of the stanchion members, transverse main-deck beams composed of two members which are connected together and to a stanchion and have diverging outer ends which are connected with the vertical side frame members, whereby the deck-beams are supported by the stanchions and serve to tie the sides of the hull together, substantially as specified.

2. In ship construction the combination of a hull having internal vertical side frame members, stanchions rising from points above the center hatches and midway between the hatches and extended up to the spar-deck, each stanchion consisting of two channel-bars secured together back to back from their lower ends up to a point near the upper deck, from which point they diverge fore and aft, transverse spar-deck beams secured to the side frame members and to the diverging upper ends of the stanchion members, main-deck beams consisting of channel-bars secured together back to back but diverging at their outer ends, said main-deck beams being secured to said stanchions and having their outer diverging ends secured to the vertical frame members, substantially as specified.

3. In ship construction the combination of a hull having internal vertical side frame members, stanchions rising from points above the center hatches and midway between the hatches and each consisting of two channel-bars secured together back to back but diverging at their upper ends, transverse spar-deck beams secured to the frame members, trans-

verse gusset-plates connecting the upper ends of said stanchion members with said deck-beams, longitudinal gusset-plates connecting together the diverging upper ends of the stanchion members, and transverse main-deck beams secured to said stanchions and having at their outer ends diverging arms which are connected with side frame members, substantially as specified.



4. In ship construction, the combination of a hull having internal vertical side frame members, stanchions rising from points above the center keelson and midway between the hatches, each stanchion consisting of two channel-bars riveted together back to back but having diverging upper ends, transverse spar-deck beams secured to the side frame members and to the diverging upper ends of the stanchion members, transverse main-deck beams each consisting of a bar *c* which lies in a transverse groove in the flanges of one of the stanchion members and is riveted to the stanchions and has its ends bent out of line and secured to two of said side frame members, and two bars *c c'* which are batted against the stanchions on opposite sides and extend therefrom toward the sides of the hull and have their ends bent out of line and secured to the side frame members, gusset-plates lying on opposite sides of the stanchion and between the deck-beam members *c c'* and secured to said deck-beam members, and angle-irons fastened to said gusset-plates and to the stanchions, substantially as described.

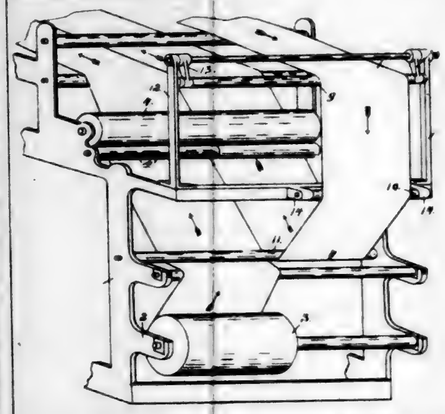
5. In ship construction the combination of a hull having internal vertical side frame members, a plurality of hatches in the spar-deck, bulkheads extending transversely across the hold and secured to the hull, vertical stanchions rising from points above the center keelson and midway between the hatches and having diverging arms at their upper ends, transverse spar-deck beams secured to the side frame members and to the diverging upper ends of said stanchions, transverse main-deck beams which are secured to said stanchions and having diverging ends which are secured to the side frame members, substantially as specified.

6. In ship construction the combination of a hull having internal side frame members, bulkheads extending across the hold at suitable intervals and secured to the hull, and shifting boards, each consisting of two members hinged together on a vertical pivot, and a hinge connection between one member of each shifting board and an adjacent bulkhead, substantially as specified.

7. In ship construction, the combination of a hull and vertical frame members in the hold midway between the sides of the vessel, shifting-board sections hinged to said frame members, and other shifting-board sections respectively hinged to the outer ends of the sections first referred to, whereby the two connected members of the shifting boards are capable of being folded together and then swung around into a position crosswise of the ship, or unfolded and swung into a position lengthwise of the ship, substantially as specified.

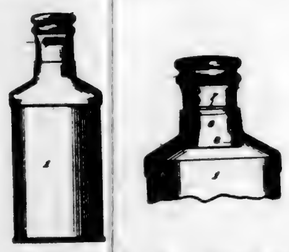
706,709. PRINTING-PRESS. HERBERT B. ALLEN, San Francisco, Cal., assignor to John D. Spreckels, San Francisco, Cal. Filed Feb. 13, 1902. Serial No. 93,514. (No model.)

Claim.—1. The combination in a printing-press of the independent presses A and B, a feed-roll from which a continuous sheet is first delivered through one-half of the portion A, diagonally-disposed guides located between A and B over which the paper is passed and by which it is returned over the top of A, direction-rolls whereby the continuous web or sheet is returned parallel with the first portion and again passed through the press, other direction-rollers by which it is carried from the part A over the top of the part B, a diagonal lead-bar over which it passes and by which it is directed over the top of the part B, direction-rollers by which the sheet is transmitted downwardly and into the press B to pass over printing-rollers within said portion.



2. The combination with a two-part press A and B, of diagonally-disposed lead-bars, means by which they are supported between the parts A and B, said bars serving to return a continuous sheet of paper over the top and again into the part A after it has once passed through said part, direction-rollers and a lead-bar located above the part B whereby the continuous sheet finally delivered from A is caused to pass through the portion B to receive a third impression.

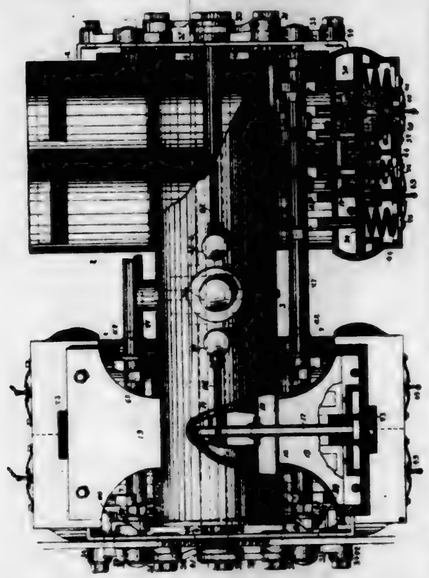
706,710. RECEPTACLE FOR TOOTH-POWDER OR OTHER MATERIAL. JOSEPH C. ALLEN, Plainfield, N. J., assignor to Consolidated Fruit Jar Company, New Brunswick, N. J., a Corporation of New Jersey. Filed June 27, 1901. Serial No. 66,211. (No model.)



Claim.—1. The combination with a receptacle having a top provided with a collar, of a head provided with a continuous neck fitting movably within said collar and having a discharge-aperture therein, and means upon the neck on opposite sides of its discharge-aperture adapted to secure the neck to the collar by a tight joint when the aperture is opened by longitudinal movement of the neck as well as when it is closed, substantially as set forth.

2. The combination with a receptacle having a top provided with a collar, of a head provided with a neck fitting movably within said collar, said neck being provided upon its end within the collar with a continuous, outwardly-flared, slightly-inclined skirt, and upon the outer end with an annular, flaring shoulder, and having a discharge-aperture opening between said skirt and shoulder, said skirt and shoulder being separated by a distance sufficient to permit longitudinal movement of the neck for opening and closing the discharge-aperture, and each being adapted to wedge within the collar and form therewith a tight joint, substantially as set forth.

706,711. MULTIPLE-CYLINDER EXPLOSIVE-ENGINE. GUSTAV S. ADLERS, San Francisco, Cal., assignor to Automobile Company, San Francisco, Cal., a Corporation of California. Filed Dec. 18, 1899. Renewed May 15, 1902. Serial No. 107,462. (No model.)



Claim.—1. In an explosive-engine, four pairs of oppositely-placed cylinders, pistons fitting each pair of cylinders having an intermediate uniting web whereby they are movable in unison, a crank-shaft extending between the adjacent ends of said cylinders, having cranks at each ninety degrees of the circumference of the shaft, connecting-rods uniting each pair of pistons with one of the cranks, valves and mechanism including cam-shafts and cams loose thereon and adapted to engage the shafts by which an explosive mixture is admitted and compressed into each cylinder, means for igniting the explosive mixture successively in the cylinders whereby an impulse is given to the crank-shaft at each quarter of its revolution.

2. In an explosive-engine, four pairs of oppositely-placed cylinders lying in the same plane, an intermediate shaft with cranks at angles of ninety degrees with each other, connections between the pistons and said cranks, inlet and exhaust valves whereby an explosive mixture is admitted to each cylinder successively, and the waste products exhausted therefrom, cam-shafts and cams loose thereon and adapted to engage the shafts to open said valves.

3. In an explosive-engine, a plurality of cylinders disposed in pairs in the same horizontal plane, an intermediate crank-shaft, pistons in each cylinder connected and movable in unison, connections between said pistons and the cranks, spring-pressed admission and exhaust valves, cam-shafts and cams loosely mounted thereon and engaging shoulders on the shafts, mechanism by which said shafts are revolvable whereby the inlet and exhaust valves are opened successively, and mechanism for adjusting the position of the cams and regulating the opening of the valves.

4. In an explosive-engine, a plurality of cylinders, standing in a common plane and disposed in pairs opposite to each other, pistons in said cylinder connected to move in unison, connecting-rods between each pair of pistons and the crank common thereto, spring-closed inlet and exhaust valves, cam-shafts having shoulders and cams loose on the shafts and engaging said shoulders by which said valves are alternately opened, a generator and connection between it and each inlet-valve chamber whereby gas is admitted when the valve is opened, and an air-inlet passage through which air is drawn to mix with the gas by the receding piston when the valve is opened.

5. In an explosive-engine, a plurality of cylinders lying in a common plane in pairs, each pair having the pistons connected with each other and with a crank-shaft common to all so as to move in unison, admission and exhaust valves and cam-shafts and cams loose thereon by which the valves are actuated, and mechanism for moving the shafts and cams to or from the valve-stems, by which said valves are regulated, a generator, means for supplying hydrocarbon liquid thereto, an exterior casing surrounding said generator and connected with the exhaust-passages of the engine, and passages leading from the generator to the inlet-valves.

6. In an explosive-engine, a plurality of cylinders disposed in pairs opposite to each other and in a common plane, a crank-shaft extending between the adjacent ends of the cylinders and connections between the cranks and the pistons whereby each pair of pistons moves in unison within their cylinders, inlet and exhaust valves with passages through which gas and air are admitted to form an explosive, and means for operating the valves including cam-shafts having shoulders and cams loose on the shafts and engaging said shoulders.

7. In a gas-engine and in combination, cylinders lying in the same plane, with pistons connected in pairs, a shaft extending between the adjacent ends of the cylinders having cranks set at angles with each other and connections between each pair of pistons and one of the cranks, admission and exhaust valves, shafts having cams loosely mounted thereon and shoulders whereby the cams are caused to turn with the shafts to open the valves, said cams turning freely upon the shaft after passing the point at which the valves are fully opened whereby the valves are allowed to close instantaneously.

8. In a gas-engine and in combination with cylinders, pistons movable therein, a shaft intermediate of the cylinders, and cranks with which the pistons are connected in pairs, inlet and exhaust valves, shafts with cams thereon whereby the valves are opened, said cams being movable upon the shafts to allow the valves to close after being fully opened, supports in which the cam-shafts are journaled and mechanism by which they and the cams are moved to or from the valve-stems to vary the opening of the valves.

9. In a gas-engine and in combination, cylinders, pistons movable therein, a crank-shaft with which the pistons are connected, admission and exhaust-valves for the cylinders, shafts having cams mounted thereon by the revolution of which the valves are opened, supports in which the cam-shafts are journaled, fulcrumed lever-arms by which said supports are carried, a shaft with eccentrics fixed thereon and connections between the eccentrics and the lever-arms, whereby the turning of the shaft moves the arms and the cam-shafts to vary the position of the cams with relation to the valve-stems, and a mechanism by which the eccentric-shaft is rotated.

10. In a gas-engine and in combination, cylinders having pistons movable therein, a crank-shaft with which the pistons are connected to move in unison, admission and exhaust valves, cams mounted upon shafts and adapted to open and close the valves, fulcrumed lever-arms carrying the journals of the cam-shafts and guides for the movements of said arms, a shaft carrying eccentric-rods connecting with the fulcrums of the levers whereby they are movable, a pinion upon the eccentric-shaft, a slidable rack engaging the pinion whereby the shaft is rotated to vary the positions of the lever-arms and the cam-shafts carried thereby.

11. In a gas-engine and in combination, cylinders having pistons movable therein, a crank-shaft with which the pistons are connected to move in unison, inlet and exhaust valves, cam-shafts and cams mounted thereon adapted to engage the valve-stems and open the valves when the crank-shaft is turned in one direction, other cams mounted upon the shafts and adapted to open the valves so as to reverse the movement of the crank-shaft, journal-boxes for the cam-shafts, beveled or inclined cams carried upon the shafts and a mechanism whereby said cams are moved so that the cam-shafts are caused to slide in the line of their axis and change the positions of the valve-actuating cams to reverse the engine.

12. In a gas-engine and in combination cylinders, pistons movable therein, a crank-shaft with which the pistons are connected, inlet and exhaust valves, shafts having two sets of cams mounted thereon, one set adapted to open the valves to rotate the crank-shaft in one direction, and the other to open the valves to rotate the shaft in the opposite direction, journal-boxes in which the cam-shafts are slidable longitudinally whereby the cams are moved to reverse the movements of the valves and engine, mechanism consisting of a slidable rack-bar, pinions upon the cam-shafts with which said rack engages when moved, and inclined cams mounted upon the cam-shafts so that their faces engage when the shafts are rotated and the cam-shafts are moved longitudinally to change the engagement of the valve-actuating cams.

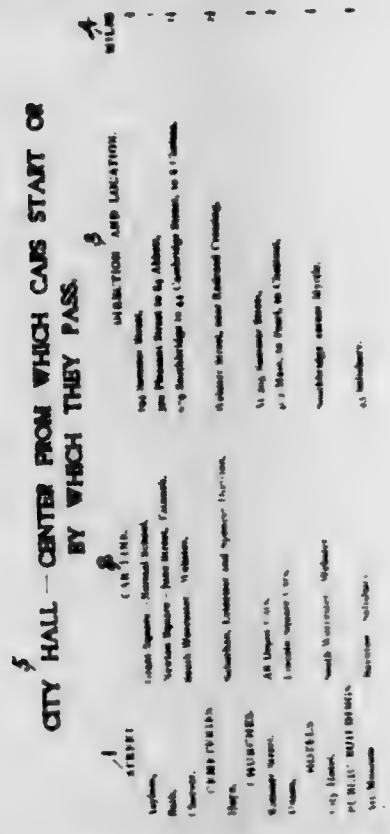
706,712. NON-REFILLABLE RECEPTACLE. HENRY W. AVERY, Cleveland, Ohio. Filed Dec. 27, 1899. Serial No. 741,730. (No model.)

Claim.—1. A receptacle having a central contracted chamber in the neck thereof, and an enlarged annular recess thereabove leaving a substantially flat annular ledge connecting the walls of said chamber and recess, combined with a valve device occupying such chamber and consisting of a buoyant closure surmounted by a weight, and a fluted metal guard in a cup-like form adapted to be inserted concave side downward

and rest on said ledge and be expanded by pressure in the annular recess whereby it is held therein and forms a guard for the valve device below it while allowing the contents of the vessel to pass out, substantially as described.

2. A receptacle having a central well in the neck thereof, and an annular recess thereabove, combined with a buoyant closure interrupting communication of the bottom of said well with the interior of said receptacle, a weight entering said well above the closure, a concave stamped fluted metal guard having a scalloped edge which expands by pressure in said annular recess, whereby it is held therein and forms a guard for the members below while allowing the contents of the vessel to pass out, substantially as described.

706,713. LOCATION-TRACER. HENRY S. BACON, Worcester, Mass. Filed May 2, 1901. Serial No. 58,519. (No model.)



Claim.—1. A location-tracer comprising a plurality of columns arranged under appropriate headings, giving respectively streets or points, car-lines, and connecting thoroughfares, with a key, substantially as set forth.

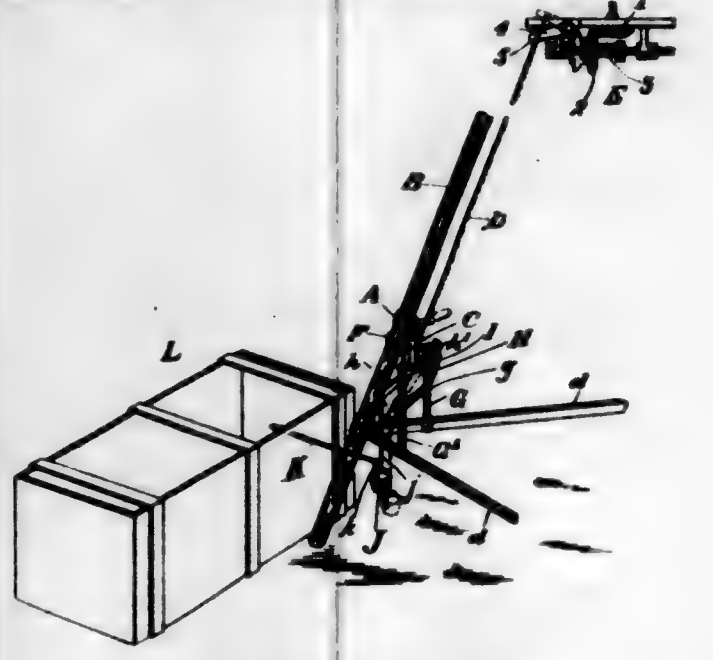
2. A location-tracer comprising a plurality of columns arranged under appropriate headings, giving respectively streets or points, car-lines, connecting thoroughfares, and distances from a given center, with a key, substantially as set forth.

3. In a location-tracer, a key; columns of streets or points, car-lines and connecting thoroughfares respectively arranged consecutively, substantially as set forth.

706,714. WINDMILL-CONTROLLER. WILLIAM J. BAKER, Shelton, N. D. Filed May 19, 1902. Serial No. 107,897. (No model.)

Claim.—1. In an apparatus for automatically releasing spring-actuated gear mechanism of windmills, the combination, with a pivoted lever, a rod extended therefrom and a spring-retained trip-bar, of a bucket suspended from the trip-bar and an overflow-pipe for filling the bucket, and a framework supporting the parts, substantially as shown and described.

2. In an apparatus for automatically releasing spring-actuated gear mechanism of windmills, the combination, with the pivoted lever C and the collar A, for attachment to the leg of a windmill-tower, the rod D extended from said lever, and the spring-retained trip-bar H, and a supporting-frame and means for attaching the same to the lower part of a windmill-tower, of a bucket suspended from said trip-bar and an overflow-pipe for filling the bucket, substantially as shown and described.



706,715. ABDOMINAL SUPPORTING-BANDAGE. MILDRED T. BARRETT, San Francisco, Cal. Filed May 15, 1902. Serial No. 107,266. (No model.)

Claim.—1. An abdominal or like bandage and support consisting of a sheet, elastic in every direction having gores cut, and the edges of the cut portions brought together and united to shape the bandage to the person, and means for securing the bandage.

2. An abdominal or like bandage consisting of a sheet of material elastic in every direction, having gores cut transversely from the edges, the cut edges united, and elastic overlying strips cemented over said seams.

3. The combination in an abdominal or like bandage of a sheet of material elastic in every direction having gores cut transversely and from the ends, the cut edges united to fit the bandage to the person, elastic overlying strips cemented over said seams, and inelastic end pieces attached to the end of the bandage having eyelet-holes and lacing-strings whereby the bandage may be adjustably fitted and retained in place.

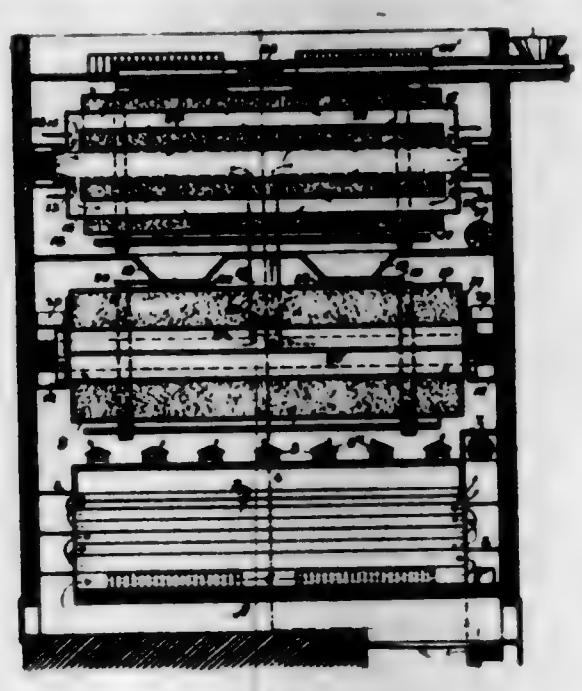
4. The combination in an abdominal or like bandage of a sheet of material elastic in every direction, having gores cut out and the edges united and overlaid with elastic reinforcing-strips, hems formed upon the edge of the bandage, inelastic tapes secured within said hems and forming the bases for the attachment of straps whereby the bandage may be held in place.

5. The combination in an abdominal or like bandage of a sheet of material elastic in every direction and formed to fit the person, supplemental elastic reinforcing-pieces cemented on the bandage to provide for increased pressure at desired points, and means for adjustably securing the bandage in place.

6. The combination in an abdominal or like bandage of a sheet of material elastic in every direction cut to measure to fit the part to which it is to be applied, having elastic reinforcing-strips overlying the seams, supplemental elastic reinforcing-patches cemented on the bandage at desired points, inelastic strips forming continuations of the ends of the bandage with eyelet-holes and lacing-strings, hems formed upon the edge of the bandage with inelastic tapes secured therein and straps connected with said tapes whereby the bandage may be adjustably fitted.

706,716. PNEUMATIC MALTING-KILN. BERNARD BERG, San Francisco, Cal. Filed Dec. 30, 1901. Serial No. 87,746. (No model.)

Claim.—1. The combination in a malting apparatus of a heater, a plurality of chambers, revoluble perforated drums in said chambers, cylinders in said drums, said cylinders adapted to have their ends extend through the heads of said drums, connections between the ends of said cylinders whereby air is delivered from one to the other, air-passages between the heater and the first chamber, heads or spreaders in said chamber by which the air from said passages is distributed, and means for inducing an air-current through said chambers, drums and cylinders.



2. The combination in a malting apparatus of a heater, a plurality of chambers superposed in relation to each other, revoluble perforated drums therein, perforated cylinders in said drums, means for admitting material into said drums, openings in the floor of the uppermost chambers through which the material in the uppermost drum may be delivered into the drum in the chamber beneath, closures for said openings, passages through which air from the heater is admitted to said lower chamber, connections between the ends of said cylinders, and means in said connections by which the air is drawn into the first cylinder through the surrounding material whereby it is attemperated and is thence delivered to the second cylinder and forced outwardly through the material surrounding the heater.

3. In a malting apparatus, the combination of a heating-furnace, a chamber within which said furnace is located, a malting-chamber, one or more mains connecting said chambers, a stationary horizontally-disposed cylinder in the malting-chamber, said cylinder divided longitudinally into compartments, mains in which the ends of said compartments terminate and valves controlling the flow of air through said compartments, and means for forcing air through the apparatus.

4. In a malting apparatus, the combination of a furnace, an air-chamber within which said furnace is located, mains leading from said chamber, a horizontal, perforated cylinder longitudinally divided into a plurality of separate compartments, a revoluble perforated drum inclosing said cylinder, mains in which the ends of the cylinder terminate, valves adjacent to the ends of said cylinder whereby the flow of air through said longitudinal compartments may be regulated, and means for forcing a current of air through the apparatus.

5. In a malting apparatus, the combination of a horizontal, perforated, hollow structure, means for forcing a current of air therethrough, longitudinal partitions therein whereby the air-current is divided, and valves at the ends of the cylinder controlling the compartments thereof and regulating the admission of air thereto, and a drum inclosing said structure and revoluble thereto.

6. In a malting apparatus the combination of a stationary horizontal cylinder, means for forcing a current of air therethrough, longitudinal partitions in said cylinder whereby the air is divided, valves at the ends of the cylinder for controlling the flow of air through certain of the compartments formed by said partitions, and a revoluble drum inclosing said cylinder.

7. In a malting apparatus the combination of a stationary horizontal perforated cylinder, partitions in said cylinder whereby the latter is interiorly divided into a plurality of separated longitudinal compartments, means by which heated air may be forced through said compartments, slide-valves at each end of the cylinder by which the supply of air to any one of said compartments may be controlled, and a drum or germinating-chamber within which said cylinder is contained.

8. In a malting apparatus the combination of a horizontal perforated stationary cylinder, air-conducting mains with which the ends of said cylinder communicate, longitudinal partitions in and extending the length of said cylinder, gates slidable across the ends of the cylinder and regulating the admission of air to the compartments thereof, and a revoluble drum inclosing said cylinder.

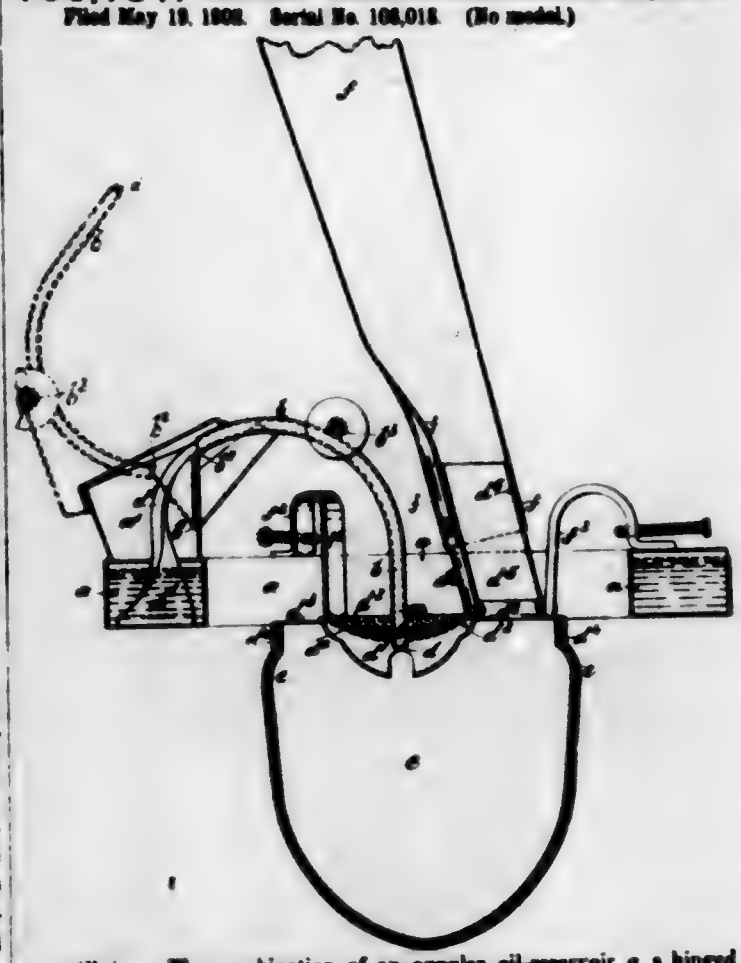
9. In a malting apparatus, the combination of a horizontal perforated cylinder, air-conducting mains with which the ends of said cylinder communicate, partitions within said cylinder whereby the cylinder is longitudinally divided into a plurality of air-conduits communicating with said air-mains, gates or valves slidable across the ends of the cylinder whereby the admission of air to said conduits may be controlled, and a drum inclosing said cylinder.

10. In a malting apparatus, a revoluble perforated drum, a centrally and horizontally disposed, perforated cylinder in said drum, the ends of said cylinder extending beyond the ends of the drum, mains connected therewith, a plurality of perforated cylinders within the drum parallel with the first and having their ends extending beyond the ends of the drum, and short sections connecting the ends of said last-named cylinders with the central cylinder.

11. In a malting apparatus, a perforated drum, a plurality of perforated cylinders in said drum disposed parallel with the axis of the drum, said cylinders having their ends extending through the heads of the drum, means by which a current of air is forced through said cylinders and means in said cylinders exterior to the drum by which the air supplied to said cylinders is regulated.

12. The combination in a malting-kiln of a furnace, a chamber in which said furnace is situated, air inlets and outlets in said chamber, a plurality of drying-chambers, the first of said chambers adapted to receive the air from said heating-chamber, perforated drums in said drying-chambers, a horizontal perforated cylinder in the first of said drums, a longitudinal partition in said cylinder, a plurality of horizontal cylinders in the second drum, air-trunks uniting the ends of the cylinders in both drums, a suction apparatus in said trunks whereby a current of air is induced through the chambers, drums and cylinders, and valves in each of said cylinders whereby the flow of air therethrough may be regulated.

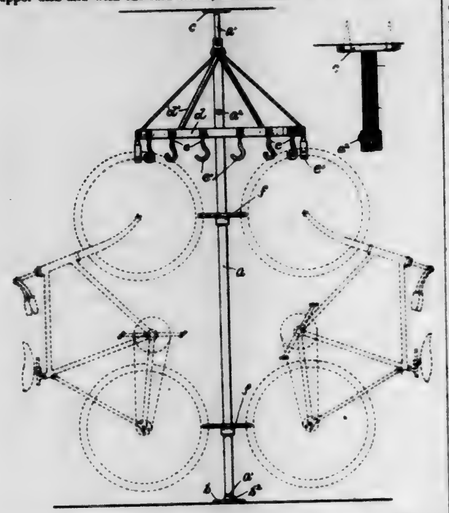
706,717. OIL-LAMP. RUSTOMJEE R. BOTTLEWALLA, Bombay, India. Filed May 19, 1902. Serial No. 108,018. (No model.)



Claim.—The combination of an annular oil-reservoir *a* a hinged wick-holder *b* a plate d^3 carrying a burner or flame chamber *d* and having a socketed aperture and chimney *f* and a detachable globe or shade *e* the whole forming an inverted oil-lamp for throwing the light downward substantially as described and shown.

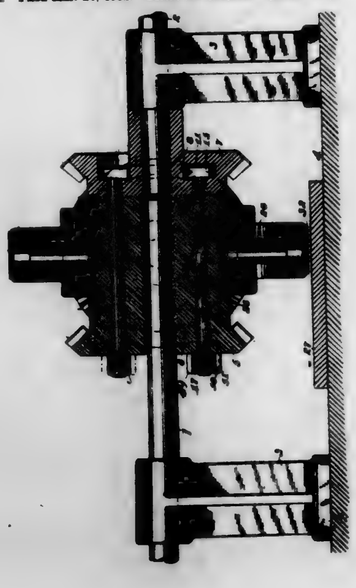
706,718. BICYCLE-STAND. WALTER S. BRADBURY, Willimantic, Conn. Filed Oct. 17, 1901. Serial No. 79,033. (No model.)

Claim.—1. A bicycle-rack consisting of a rotatable vertical spindle, a ring concentric with said spindle, fixed hooks suspended from said ring to receive the rim of the front wheel of a bicycle, a disk on said spindle in proximity to said hooks and having notched periphery, and a second disk fixed to said spindle near its lower end and having notched periphery the notches of which are in vertical alinement with the notches of the upper disk and with the said hooks, as set forth.



2. A bicycle-rack consisting of a rotatable vertical spindle, a rod telescoping in the same, means for holding the same in adjusted position, a lower bearing for said rod having hub with raceway, balls in said raceway and engaging the lower end of the spindle, a ring concentric with the spindle, hooks suspended therefrom, and upper and lower notched disks fast on the spindle below the said ring and having their notches in vertical alinement with each other and with said hooks as set forth.

706,719. **REVERSING MECHANISM.** FREDERICK M. BROUE, Warren, R. I., assignor of one-half to Edmund H. Matteson, Warren, R. I. Filed Mar. 27, 1902. Serial No. 100,219. (No model.)



Claim.—1. In a reversing mechanism, the combination with a driving-shaft of a driving-gear mounted on said shaft, a driven shaft, a gear fixedly mounted on the driven shaft, a circular frame intermediate said gears, gears mounted in said frame and meshing with the driving and driven gears, bolts traversing the driving and driven gears, and means for tightening said bolts.

2. In a reversing mechanism, the combination with a frame of a driving-shaft, a driving-gear mounted on said shaft, a driven shaft, a gear fixedly mounted on the driven shaft, gears mounted in the frame and meshing with the driving and driven gears, bolts provided with threads traversing the driving and driven gears and projecting beyond the face of the driving-gear, nuts provided with lugs engaged with said threads, and means for turning said nuts.

3. In a reversing mechanism, the combination with a frame of a driving-shaft a driving-gear mounted on said shaft, a driven shaft, a gear fixedly mounted on the driven shaft, gears mounted in the frame and meshing with the driving and driven gears, bolts provided with threads traversing the driving and driven gears, and projecting beyond the face of the driving-gear, nuts provided with lugs engaged with said threads, stops upon the driving-gear to limit excessive rotation of the nuts, and means for turning said nuts.

4. In a reversing mechanism, the combination with a driving-shaft of a driving-gear mounted on said shaft, a driven shaft, a channeled gear fixedly mounted on the driven shaft, bolts traversing the driving and driven gears, whose heads are adapted to travel in said channeled driven gear, and means upon the opposite bolt extremities for tightening said bolts.

5. In a reversing mechanism, the combination with a driving-shaft of a driving-gear, mounted on said shaft, a driven shaft, a channeled gear fixedly mounted on the driven shaft, bolts provided with threads traversing the driving and driven gear, and whose heads are adapted to travel in the channel of the driven gear, nuts provided with lugs engaging the threaded bolts, and means contacting with said lugs for turning the nuts.

6. In a reversing mechanism, the combination with a gang of quadrilaterally-arranged gears, of a revolvable frame carrying two of the gears, a metallic band encircling the frame means for permanently holding one end of said band, an eccentric lever-shaft for carrying the other end of the band, and a lever-arm for rotating said shaft.

7. In a reversing mechanism, the combination with a driving-shaft of a driving-gear mounted on said shaft, a driven shaft, a gear fixedly mounted on the driven shaft, bolts provided with threads traversing the driving and driven gears, nuts engaging said threads and protruding from the face of the driving-gear, a frame lying in a plane parallel to that of the driving-gear face pivoted at its base, inwardly-directed projections upon the inner face of said frame adapted to contact with said nuts when the frame is vibrated, and means for vibrating the frame upon its pivot.

8. In a reversing mechanism, the combination with the driving mechanism of an upright slotted frame pivoted at its lower inner corner, projections upon its inner face for contacting with the driving mechanism, a lever-shaft, a lever-arm mounted on said shaft adjacent the outer face of the slotted frame, and a pin mounted on the lever-arm traveling in said slotted frame.

9. In a reversing mechanism, the combination with a driving-shaft of a beveled friction-wheel mounted on said shaft, a driven shaft, a beveled friction-wheel fixedly mounted on the driven shaft, a circular frame intermediate said wheels, beveled friction-wheels mounted in said frame and contacting with the driving and driven wheels, bolts traversing the driving and driven wheels, and means for tightening said bolts.

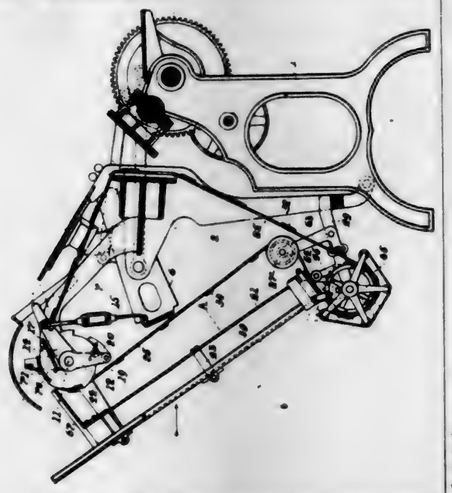
10. In a reversing mechanism, the combination with a driving-shaft of a driving-gear mounted on said shaft, a driven shaft, a channeled gear fixedly mounted on the driven shaft, bolts provided with curved heads and threaded ends engaging the driving-gear and the channeled gear, and nuts engaging the ends of the bolts.

11. In a reversing mechanism, the combination with a driving-shaft of a driving-gear mounted on said shaft, a driven shaft a gear fixedly mounted on the driven shaft, a rotatable frame intermediate said gears, gearing carried in said frame, bolts traversing the driving and driven gears, and means for tightening said bolts.

12. In a reversing mechanism, the combination with a driving-shaft of a driving-gear fixedly mounted thereon, a driven shaft, a gear fixedly mounted thereon, a rotatable frame intermediate said gears, gearing carried in said frame and meshing with the driving and driven gears, and means operated by the driving mechanism for locking the said gears.

706,720. **ADDRESSING ATTACHMENT FOR PRINTING-PRESSES.** JOSEPH P. BRYAN, St. Michaels, Md., assignor to Joseph H. Radcliffe, St. Michaels, Md. Filed Nov. 11, 1901. Serial No. 81,791. (No model.)

Claim.—1. In combination with a printing-press having a bed for a printing-form, a belt with means to move it over or across the said bed a magazine adapted to contain address-printing blocks, and pick-up devices on the said belt, which in the operation of the printing-press, remove the said address-printing blocks separately from the said magazine deliver them to a proper position in the printing-form, substantially as and for the purpose specified.



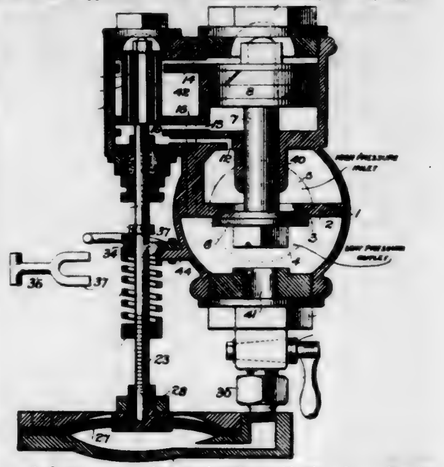
2. In combination with a printing-press having a bed for a printing-form, an endless belt with means to move it intermittently over or across the said bed, a magazine adapted to contain a stack of address-printing blocks, and pick-up devices attached to the said belt, which in the operation of the printing-press remove the said address-printing blocks from the said magazine separately, and carry them to a certain position in the printing-form situated on the bed, substantially as, and for the purpose specified.

3. In combination with a printing-press having a bed for a printing-form, an endless belt with means to move it intermittently over or across the said bed, a magazine adapted to hold stacked address-printing blocks, pick-up devices attached to the said belt, which in the operation of the said printing-press, remove the said address-printing blocks separately from the said magazine and deliver them to a certain position in the printing-form on the said bed, and mechanism to detach the said blocks after they have performed their office, from the pick-up devices and deliver them to the said magazine, substantially as, and for the purpose specified.

706,721. **PRESSURE-REDUCING VALVE.** CHARLES H. BOOKSLEW, Plainfield, N. J. Filed Oct. 30, 1901. Serial No. 80,503. (No model.)

Claim.—1. In a pressure-reducing valve, the combination of a main-valve chest having a high-pressure inlet-chamber and a low-pressure outlet-chamber, a valve between the two chambers, a cylinder on the valve-chest, a piston in said cylinder, which piston is connected to the main valve and is reciprocated only by the action of the high pressure as it is applied to one side or the other thereof, a valve-chamber on the wall of the cylinder, an auxiliary valve in said chamber for controlling the admission of the high pressure to the said valve-operating piston, and a diaphragm-containing chamber together with its diaphragm for moving the valve in one direction, which diaphragm is constantly exposed on one side to the low pressure, together with means for moving the auxiliary valve in the other direction.

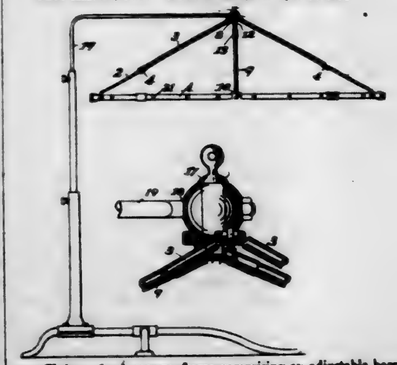
2. In a pressure-reducing valve, the combination of the main-valve chest having a high-pressure inlet-chamber and a low-pressure outlet-chamber, and a valve-seat between the two chambers, a main regulating-valve arranged in connection with said seat, a cylinder contiguous to the valve-chest, a piston in said cylinder whose rod is connected to the main valve, a valve-chamber on the cylinder and an auxiliary valve in said chamber for controlling the admission of high pressure to the cylinder in order that it may act on one side or the other of the piston for the purpose of opening or closing the main valve, said auxiliary valve having passages running through it from one end to the other, a diaphragm-chamber containing a flexible diaphragm which is connected to the stem of the auxiliary valve, a passage between the low-pressure chamber and the diaphragm-chamber which causes low pressure to be constantly applied to one side of the diaphragm, and a spring for moving the auxiliary valve in a direction opposite to that in which it is moved by the diaphragm.



3. In a pressure-reducing valve, the combination of a main-valve chest having a high-pressure inlet-chamber and a low-pressure outlet-chamber, a valve between the two chambers, a cylinder on the valve-chest, a piston in said cylinder which piston is connected to the main valve and is reciprocated by the action of the high pressure as it is applied to one side or the other thereof, an auxiliary valve having a valve-rod, a diaphragm on said valve-rod which is exposed to the low pressure, and means adapted to engage the valve-rod for the purpose of so locating the auxiliary valve as that the main valve will temporarily remain closed and thus the whole reducing-valve mechanism be temporarily converted into a stop-valve.

4. In a pressure-reducing valve, the combination of a main-valve chest having high-pressure and low-pressure chambers, a valve between the chambers, a cylinder on the valve-chest having a piston whose stem is connected to the main valve, said piston being of larger area than the valve and being actuated only by high-pressure fluid, an auxiliary valve controlling ports leading into opposite ends of the cylinder, said auxiliary valve itself having ports running through it from one end to the other, a valve-chamber on the wall of the cylinder for containing said auxiliary valve, an exhaust-port for conveying high-pressure fluid from one side or the other of the piston to the low-pressure chamber, a diaphragm-containing chamber connecting through a passage with the low-pressure chamber, said passage being provided with a cock, a diaphragm in said chamber connected to the auxiliary-valve rod and exposed on one side to low pressure and a spring for moving the auxiliary valve in a direction opposite to that in which it is moved by the diaphragm.

706,722. **CANOPY.** EDWARD G. BURLAND, Watsonville, Cal. Filed Mar. 27, 1902. Serial No. 100,170. (No model.)



Claim.—1. A canopy-frame comprising an adjustable base, adjustable rods pivotally connected thereto, pairs of said rods flexibly connect-

ed to a block and means for connecting said blocks together at a point above the base.

2. A canopy-frame consisting of an adjustable base, adjustable convergent rods pivotally connected therewith, male and female coupling-blocks to which the upper convergent ends of said rods are flexibly connected, and means for securing said blocks together.

3. A canopy-frame consisting of a rectangular adjustable base, rods pivoted adjacent to the angles thereof, said rods adjustable in length, other rods pivotally connected to the base intermediate of its ends, and means by which said rods are detachably united above the base.

4. A canopy-frame consisting of an adjustable rectangular base, rods pivoted adjacent to the angles thereof, the rods at either end of the base connected with a block or member, other rods pivotally connected to the base intermediate of its ends, a block or member to which said rods are connected and means by which all of said members are detachably united.

5. A canopy-frame consisting of a base, convergent rods pivotally connected thereto, male and female coupling-blocks to which said rods are secured and means for holding the blocks together.

6. A canopy-frame consisting of a base, convergent rods pivotally connected thereto, male and female coupling blocks or members with which said rods are flexibly connected and means for locking said members together.

7. A canopy-frame consisting of an adjustable rectangular base, rods pivoted thereto adjacent to the angles thereof, said rods adjustable in length, blocks or members to which said rods are pivotally connected, other rods pivotally connected to said base, a block or member to which said rods are connected, said members adapted to lie adjacent to each other at a point above the base and a locking means by which said members are held together.

8. A canopy-frame consisting of an adjustable rectangular base, rods pivoted at the corners thereof, said rods adjustable in length, a socketed coupling block or member to which these rods at either end of the base are pivotally connected at their upper convergent ends, other rods pivotally connected to said frame, a coupling connection with said other rods, said socketed members adapted to embrace the last-named coupling, and means upon the latter by which said couplings are all united.

9. The combination of an adjustable rectangular base-frame, rods adjustable in length pivoted at the corners of said frame, female coupling members to which the upper ends of said rods are pivotally connected, other rods pivotally connected with the frame, a male coupling having short fork-sections to which said other rods are pivoted, sleeves slidable on said last-named rods which are adapted to embrace said pivotal joints and means for locking said sleeves, means by which said coupling members are locked together, and a standard substantially as described upon which the frame is suspended.

706,728. CONTROL OF DYNAMO-ELECTRIC MACHINERY.

ROBERT R. GARDNER, East Orange, N. J., assignor to the Sprague Electric Company, a Corporation of New Jersey. Filed Jan. 16, 1901. Serial No. 43,720. (No model.)

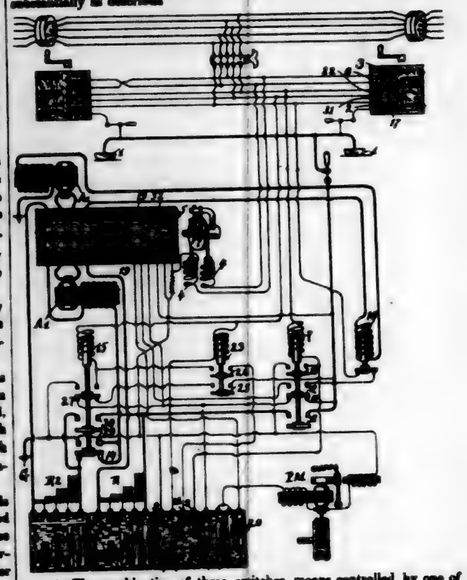
Claim.—1. In a system of control of dynamo-electric machinery the combination of three switches, means controlled by one of the switches for operating another of the switches, and means controlled by these two switches for operating the third switch, and means controlled by either of the other switches for operating the first, substantially as shown.

2. In a system of control of dynamo-electric machinery the combination of a rheostatic switch, a pilot-switch, a motor-grouping switch, means controlled by the rheostatic switch for operating the pilot-switch, and means controlled by the rheostatic switch and the pilot-switch for operating the motor-grouping switch, substantially as described.

3. In a system of control of electric motors, the combination of a rheostatic switch, a pilot-switch, a motor-grouping switch, means controlled by the rheostatic switch for operating the pilot-switch, means controlled by the rheostatic switch and the pilot-switch for operating the motor-grouping switch, and means controlled by the pilot-switch for operating the rheostatic switch substantially as described.

4. In a system of control of a pair of electric motors the combination of a rheostatic switch, a pilot-switch, a series-multiple switch, means controlled by the rheostatic switch for operating the pilot-switch, and means controlled by the rheostatic switch and the pilot-switch for operating the series-multiple switch, to change the motors from series to multiple, substantially as described.

5. In a system of control of a pair of electric motors the combination of a rheostatic switch, a pilot-switch, a series-multiple switch, means controlled by the rheostatic switch for operating the pilot-switch, so that it can be operated only when the rheostatic switch is in position to admit current to the motors, and means controlled by the rheostatic switch and the pilot-switch, for operating the series-multiple switch to change the motors from series to multiple, which means can be operated only when the rheostatic switch is in the open-circuit or a high-resistance position, substantially as described



6. The combination of three switches, means controlled by one of the switches for operating another of the switches, means controlled by the two for operating a third of the switches, means controlled by the second switch for operating the first of the switches, and a master-switch for operating the system, substantially as described.

7. In a system of control of dynamo-electric machinery, the combination of a rheostatic switch, a pilot-switch, a motor-grouping switch, means controlled by the rheostatic switch for operating the pilot-switch, means controlled by the rheostatic switch and the pilot-switch for operating the motor-grouping switch, and a master-switch for operating the system, substantially as described.

8. In a system of control of electric motors, the combination of a rheostatic switch, a pilot-switch, a motor-grouping switch, means controlled by the rheostatic switch for operating the pilot-switch, means controlled by the rheostatic switch and the pilot-switch for operating the motor-grouping switch, and a master-switch for operating the system, substantially as described.

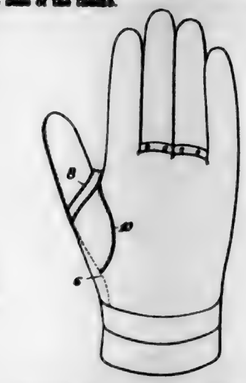
9. In a system of control of a pair of electric motors, the combination of a rheostatic switch, a pilot-switch, a series-multiple switch, means controlled by the rheostatic switch for operating the pilot-switch, means controlled by the rheostatic switch and the pilot-switch for operating the series-multiple switch to change the motors from series to multiple, and a master-switch for operating the system, substantially as described.

10. In a system of control of a pair of electric motors the combination of a rheostatic switch, a pilot-switch, a series-multiple switch, means controlled by the rheostatic switch for operating the pilot-switch, so that it can be operated only when the rheostatic switch is in a position to admit current to the motors, means controlled by the rheostatic switch and the pilot-switch for operating the series-multiple switch to change the motors from series to multiple, which means is operated only when the rheostatic switch is in the open-circuit or a high-resistance position, and a master-switch for operating the system, substantially as described.

706,724. GLOVE.

ROBERT H. CARSON, San Francisco, Cal. Filed Apr. 10, 1902. Serial No. 102,164. (No model.)

Claim.—1. The combination in a glove of a palm portion having the concavo-convex gauge for the thumb cut so as to coincide approximately as the inside of the joint at the base of the thumb, a thumb composed of a piece of leather cut with a notch in the tip separating it into parts, one of which is approximately one-third the size of the other, and has its outer edge extending downwardly so that when stitched together the line of the seam approximately follows the curvature of the thumb-nail from the interior to its base, thence down the outside toward the wrist, and the interior of the base portion being cut in convex curves whereby it unites with the palm portion when fitted thereto on the aforesaid line of the thumb-joint, said thumb portion and palm portion overlapping and double-seamed, and a supplemental reinforcing-strip secured over the said seam at the base of the thumb.

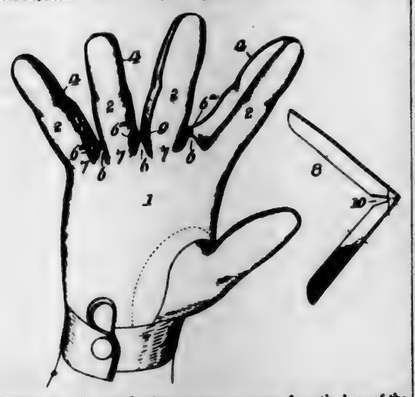


2. The combination in a glove of the palm portion having a thumb-gauge cut in concavo-convex form, and a single thumb-piece cut with a notch in its outer end, dividing it into two parts, one of which is approximately one-third the size of the other and slightly shorter whereby when united a seam is formed following approximately the line of the thumb-nail, the exterior edges of said thumb-piece being extended downwardly and having a notch formed between said downwardly-extending portions with convex sides whereby the outer and narrower portions form the line of the outside seam, and the extension of the wider portion underlaps the palm, reinforcing that portion which covers the base of the thumb.

3. The combination in a glove of the palm portion having a concavo-convex gauge to receive the thumb, a thumb formed of a single piece cut with the narrower and wider sections separated by a notch at the tip, and having the outside lines extending downward and a notch also formed in the opposite end whereby when stitched together and into the thumb-gauge, the narrower portion forms the back of the thumb, the wider portion covers the entire interior of the thumb back to the line of the thumb-nail, the meeting outer edges uniting to form a seam on the outside of the thumb extending downwardly toward the wrist, and the curved lines at the base of the thumb portion forming the seam by which the thumb portion is united to the back and palm on the line of the joint at the base of the thumb, and a supplemental reinforcing-strip secured over said seam along the inside of the thumb.

706,725. GLOVE.

JENNINGS COMER, Milwaukee, Wis. Filed Jan. 22, 1902. Serial No. 93,841. (No model.)



Claim.—1. A glove having tongues cut away from the base of the inside finger parts whereby the inner ends of the said inside finger parts are narrowed and quirks produced which extend in continuous pieces from the palm of the glove and between the fingers thereof and fourchettes attached to the sides of these quirks and to the sides of the inside and outside finger parts.

2. A glove having tongues formed with rounded ends cut away from the inside finger parts whereby the inner ends of the said finger parts are narrowed and quirks produced which extend in continuous pieces from the palm of the glove and between the fingers thereof and fourchettes having recesses at their inner ends in which the rounded ends of the attached or solid end quirks extend, and attached to the sides of the said quirks and to the sides of the inside and outside finger parts.

706,726. CULTIVATOR.

ANDREW J. COMSTOCK, Tyler, Tex., assignor of one-half to Edward L. Booth, Tyler, Tex. Filed Aug. 28, 1901. Serial No. 73,711. (No model.)

Claim.—1. In a cultivator, the combination of a wheeled frame, a shovel-frame loosely connected thereto and capable of being swung vertically thereon, and shovel-frame-supporting means carried by the wheel-frame and capable of being moved out of the path of the shovel-frame to permit of vertical movement of the latter and then capable of movement into engagement with the shovel-frame to support the same in an elevated position.

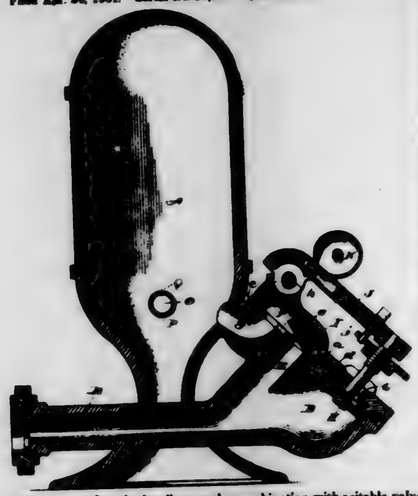
2. In a cultivator, the combination of a wheeled frame, a shovel-frame having a loose connection with the wheeled frame and capable of being swung vertically thereon, and a vertically-swinging shovel-frame support hinged to the wheeled frame, the rear free end of the hinged support lying in the upward path of a portion of the shovel-frame, and being capable of an upward and forward swinging movement to a position out of the path of the shovel-frame to permit of an upward movement of the latter, and then capable of a return movement to its original position to underlie a portion of the shovel-frame and support the same in an elevated position.

3. In a cultivator, the combination with a wheeled frame, of a plurality of shovel-beams loosely connected to the frame, a cross-bar connecting the beams, and a two-part supporting-bar carried by the wheeled frame and having a hinged connection between the parts thereof, the adjacent ends of these parts being beveled and normally bowed to dispose the outer member in an upwardly-inclined position, said movable member being located in the upward path of the bar which connects the shovel-beams.

4. In a cultivator, the combination with shovel-beams, and a cross-bar to connect the same, of a substantially L-shaped bracket having one end applied across the adjacent beam, and its opposite end provided with a laterally-projected ear applied to the cross-bar, a fastening piercing the cross-bar, the beam and the adjacent end portion of the bracket, and another fastening connecting the ear to the cross-bar.

5. The combination with a wheeled frame, of a shovel-beam loosely connected thereto, and a two-part supporting-bar carried by the wheeled frame and having a hinged connection between the parts thereof, the outer part being free and arranged in the path of the shovel-beam for the purpose substantially as described.

706,727. HYDRAULIC RAM. WILLIAM L. DUNING, Salem, Ohio, assignor to the Duning Company, Salem, Ohio, a Corporation of Ohio. Filed Apr. 24, 1901. Serial No. 57,269. (No model.)



Claim.—1. In a hydraulic ram the combination with suitable valve mechanism, an air-chamber and service-pipe; of a horizontally-arranged perforated pressure-regulating and water-discharge tube intersecting the air-chamber and communicating directly with said service-pipe, substantially as described.

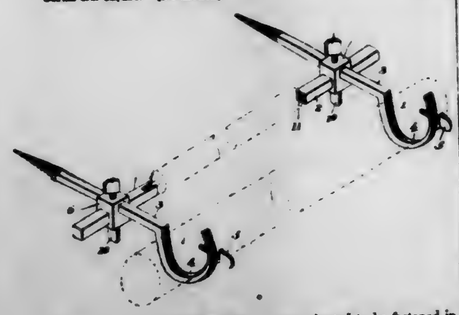
2. In a hydraulic ram the combination with suitable valve mechanism, an air-chamber and service-pipe; of a horizontally-arranged perforated pressure-regulating and water-discharge tube intersecting and supported in opposite walls of said air-chamber and communicating directly with the service-pipe aforesaid, substantially as described.

3. In a hydraulic ram the combination with suitable valve mechanism, an air-chamber and service-pipe; of a horizontally-arranged perforated pressure-regulating and water-discharge tube intersecting opposite walls of said chamber below the normal water-line and communicating directly with the service-pipe aforesaid, substantially as described.

4. In a hydraulic ram the combination with suitable valve mechanism, an air-chamber and service-pipe; of a horizontally-arranged pressure-regulating and water-discharge tube intersecting the air-chamber and perforated by water-inlet ports and superimposed air-inlet ports, substantially as described.

5. In a hydraulic ram the combination with suitable valve mechanism, an air-chamber and service-pipe; of a horizontal pressure-regulating and water-discharge tube intersecting opposite walls of said chamber and communicating directly with the service-pipe, and water and air inlet ports the latter located above the former in the tube aforesaid, substantially as described.

706,728. COMBINED SHADE-ROLLER AND CURTAIN-POLE HOLDER. HERBERT S. DE BOLLAR, Denver, Colo. Filed Nov. 15, 1901. Serial No. 82,420. (No model.)



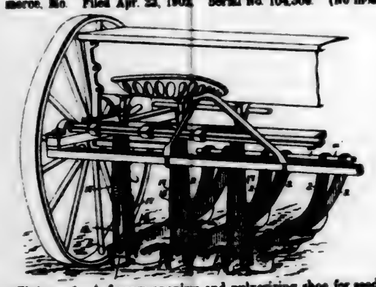
Claim.—1. In combination with a stem adapted to be fastened in place so as to extend horizontally outward from the wall, means for fastening a curtain-pole to its outer end, a frame mounted on the stem and adjustable along the same, and a roller-support mounted in the frame and adjustable in the direction of the axis of the roller.

2. In combination with a pole-holder provided with a stem adapted to be fastened in place so as to extend horizontally from the wall, a block mounted slidingly on said stem, a clamping device carried by the block and arranged to engage the stem, a roller-support mounted in the block and slidable endwise in the direction of the axis of the roller, and a clamping device carried by the block and arranged to engage the support.

3. In combination with a stem adapted to be fastened in place so as to extend horizontally from the wall and formed to support a curtain-pole, a frame mounted on said stem and reversible thereon side for side, and a shade-roller support carried by the frame and reversible thereon end for end.

4. In combination with a stem adapted to be secured in place so as to extend horizontally outward from the wall, said stem being formed on its outer end to support a curtain-pole, a block recessed longitudinally to receive the stem and formed with a transverse opening, means for clamping the block to the stem, a shade-roller support mounted in the said transverse opening in the block, and means for clamping said support to the block.

706,729. PULVERIZING-SHOE. HENRY F. DEYERDING, Commerce, Mo. Filed Apr. 22, 1902. Serial No. 104,309. (No model.)



Claim.—1. A furrow opening and pulverizing shoe for seed-planters, having a worm-like penetrating edge, for the purposes described.

2. A furrow opening and pulverizing shoe, having a cutting-surface, worm-like in a horizontal plane, and laterally-projected wings merging with said cutting-surface.

3. A furrow opening and pulverizing shoe, the body of which is corrugated from the penetrating edge upwardly and rearwardly at an angle to the vertical plane of the shoe.

4. A furrow opening and pulverizing shoe, comprising a corrugated body portion, the corrugations of which extend upwardly and rearwardly from the penetrating edge, and are of a gradually-increasing area in transverse direction from the front to the heel portion.

5. A furrow opening and pulverizing shoe, consisting of a body, having a series of parallel corrugations, inclined rearwardly at an acute angle to the lower or penetrating edge of the body, and merging therewith, for the purposes specified.

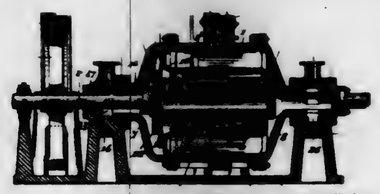
6. In a furrow opening and pulverizing shoe of the character described, the combination with the dropping-tube and a spring-metal shoe-body, having a rearwardly-extended portion, a spring-metal cap-plate for opposing said extension, said extension and cap-plate having seat portions adapted to engage and clamp the dropping-tube, substantially as shown and for the purposes described.

7. As a new article, a spring-metal furrow opening and pulverizing shoe, having attached means for joining it with the supporting-frame of the machine to which it is to be attached, said shoe having a sinuous penetrating edge, and covering-wings extended laterally alternately to each side of the longitudinal plane of the shoe-body, said wings terminating at their lower end with the penetrating edge of the shoe and inclined rearwardly, and being of progressively-increasing widths from the front to the heel end of the shoe, for the purposes described.

706,730. TWO-CYCLE ROTARY MOTOR. PAUL A. DUPONT, Rouen, France. Filed Feb. 17, 1902. Serial No. 94,532. (No model.)

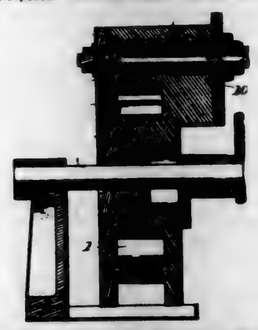
Claim.—1. The combination, in a rotary motor, of a cylinder rotatable in one direction and having axial inlet and exhaust passages at opposite ends communicating through the cylinder, a concentric shaft in the cylinder rotatable in the same direction and projecting through one of said passages, said cylinder and shaft having radial alternate partitions therebetween, forming, alternately, reciprocal abutments and pistons, and valves and valve-gear.

2. The combination, in a rotary motor, of a rotatable cylinder contracted at its ends to hollow journals forming inlet and exhaust passages at opposite ends respectively communicating through the cylinder, an independently-rotatable shaft therein, said cylinder and shaft having alternate pistons therebetween, forming, alternately, abutments for each other, and means to prevent rotation of the cylinder and shaft except in the same direction.



3. The combination, in a rotary engine, of a rotatable cylinder, and a hollow shaft in the cylinder independently rotatable in the same direction and having radial ports, a radial partition projecting from the cylinder to contact with the shaft, a radial partition projecting from the shaft to contact with the cylinder, said partitions forming, alternately, a reciprocal abutment and piston and rocking valves in the hollow of the shaft controlling admission and exhaust through the ports.

706,731. ROTARY ENGINE. JAMES F. EDWARDS, Macon, Mo. Filed June 17, 1901. Serial No. 64,912. (No model.)



Claim.—1. In an engine of the character described, the combination with the cylinder, a revolubly piston mounted therein, a swinging abutment pivoted outside of the cylinder and working in said cylinder and adapted to cooperate with the piston, a valve-chamber and an inlet and an outlet port connecting said chamber and cylinder.

2. In an engine of the character described, the combination with the cylinder, a piston and swinging abutment pivoted outside of and extending into said cylinder, of combined inlet and outlet ports in the path of the swinging abutment, the steam-chamber having two outlet-ports and a sleeve revolubly mounted on said steam-chamber, ports in the sleeve adapted to register with the ports in the steam-chamber, whereby the engine may be reversed.

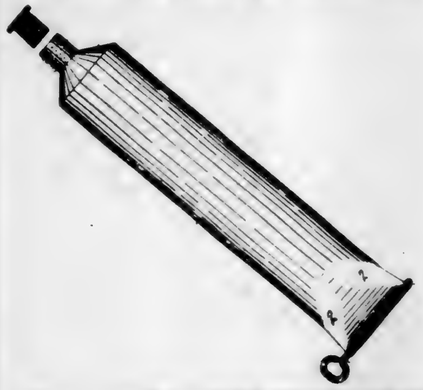
3. In an engine of the character described, the combination with the steam-chamber, an inlet-port and two outlet-ports leading therefrom, a sleeve revolubly mounted on said steam-chamber, ports formed through said sleeve adapted to respectively register with the respective ports in said chamber according to the position of the valve, an exhaust-passage formed in the periphery of the sleeve between said ports, and an exhaust-port connected with said exhaust-passage leading to the outside atmosphere.

4. In an engine of the character described, the combination with the cylinder, a revolubly piston mounted therein, inlet and outlet ports formed in the periphery of the cylinder, of a swinging abutment pivoted outside of, but working in, the cylinder and lips or flanges projecting from said abutment adapted to close said ports at the extreme limit of the upper stroke of the swinging abutment and a main exhaust-port in the cylinder adapted to be opened and closed by the swinging abutment as it moves upward and downward.

5. In an engine of the character described, the combination with the cylinder, a revolubly piston therein, inlet and outlet ports formed in the periphery of the cylinder and a swinging abutment, flanges formed on the inner ends of the same adapted to close said ports, of a steam-chamber, two ports leading therefrom, a sleeve revolubly mounted on the steam-chamber, two ports formed through the sleeve and an exhaust-passage formed in the periphery of the sleeve between said ports and an exhaust-port connected with said exhaust-passage.

6. In an engine of the character described, the combination with the cylinder, a revolubly piston therein, a piston-head integral therewith and having a steam-tight fit with said cylinder, a main exhaust through one side of the cylinder in the path of the piston-head, inlet and outlet ports formed in the periphery of the cylinder, and a swinging abutment adapted to close the main exhaust-port when in its lowermost position, flanges or lips formed on said abutment adapted to close the inlet and outlet ports when the abutment is in its uppermost position, of a steam-chamber, a sleeve revolubly mounted thereon, two ports formed through the sleeve and an exhaust-passage formed in the periphery of the sleeve between said ports and an exhaust-port connected with said exhaust-passage leading to the outside atmosphere.

706,732. APPLICATOR. ALLEN W. ELLINGTON, Los Angeles, Cal. Filed Aug. 7, 1901. Serial No. 71,233. (No model.)



Claim.—1. An applicator provided with an internally-screw-threaded nozzle, to present a smooth exterior to the parts treated, an externally-screw-threaded plug therefor, said nozzle having lateral orifices, an attachment having a longitudinal slot to receive the extremity of the applicator and constructed to be rotated to wind said extremity thereupon to expel the contents of the applicator through said nozzle and orifices.

2. An applicator provided with an internally-screw-threaded nozzle having a smooth exterior to present a smooth surface to the parts into which the nozzle is introduced, said nozzle having lateral discharge-orifices and a plug having an enlarged head or cap and an exteriorly-screw-threaded shank constructed to enter and engage said interiorly-screw-threaded nozzle and close said orifices, whereby the applicator can be submerged in a sterilizing agent to cleanse the same without injury to the contents.

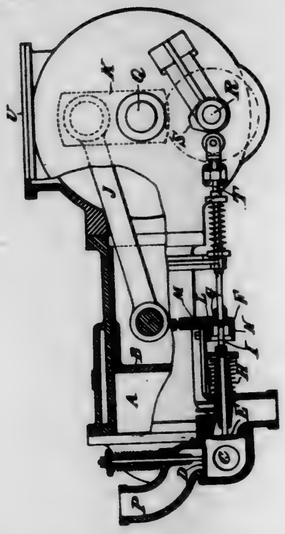
706,733. FOUR-CYCLE EXPLOSIVE-VAPOR ENGINE. GUSTAF ERICSON, Södertelje, Sweden, assignor to Vagnfabriks Aktiebolaget I Södertelje, Södertelje, Sweden. Filed Oct. 9, 1901. Serial No. 78,088. (No model.)

Claim.—1. A four-cycle internal-combustion engine having a suction admission-valve for the explosive mixture, a valve communicating with the explosion-chamber and closing outward, automatic means for opening said valve at regular intervals, a spring for closing said valve, and dash-pot device for retarding the closing of the last-named valve after the beginning of the suction-stroke, substantially as set forth.

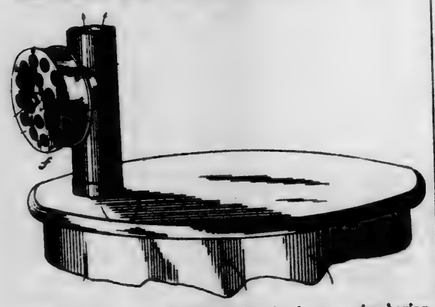
2. A four-cycle internal-combustion engine having as an automatic means for controlling the smoking in of the explosive mixture, an exhaust-valve communicating with the explosion-chamber, means operated by the engine for opening said valve at regular intervals, a spring for closing said valve, and means for retarding the closing of said valve by its spring, said means comprising a fixed cylinder having an inlet for air and a valve-controlled outlet for the same, and a piston in said cylinder and fixed on the stem of the last-named valve, substantially as set forth.

3. A four-cycle internal-combustion engine having a suction admission-valve for the explosive mixture, an exhaust-valve, automatic means for opening said exhaust-valve at all times to the same extent, a spring which closes said valve, and means for retarding the exhaust-valve, said means comprising a fixed cylinder or pot G, having a lateral air-inlet N and a valve-controlled outlet O, a screw-valve M controlling said outlet,

and a piston F, in said cylinder or pot and connected with the stem of the exhaust-valve.



706,784. ATTACHMENT FOR STOVEPIPES. WILLIAM H. BUCHHOLZ and LORIS B. WITHERELL, Knoxville, Ill. Filed Mar. 16, 1901. Serial No. 51,394. (No model.)



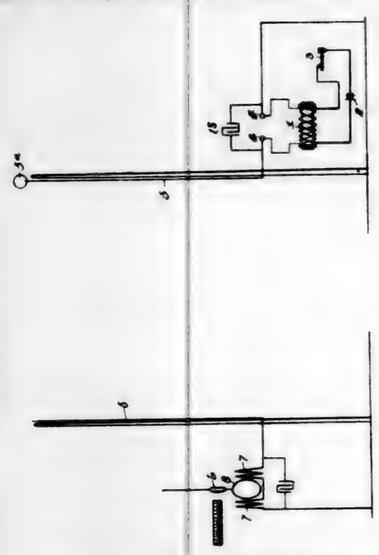
Claim.—In a damper, the combination of a damper-casing having substantially parallel end plates, one of which is provided with apertures or perforations and with an offset bearing on its inner face, a pipe open at both ends extending from the other end plate and in communication with said casing a rod slidably mounted in said bearing and end plate and a damper at the end of said rod and at substantially right angles thereto adapted to close the end of said pipe.

706,785. WIRELESS TELEGRAPHY. REGINALD A. FESSENDEN, Allegheny, Pa. Filed Dec. 15, 1900. Serial No. 740,698. (No model.)

Claim.—1. As an improvement in the art of transmitting signals electrically by electromagnetic waves the method herein described, which consists in the generation of electromagnetic waves at one station and transforming the energy of the currents generated by such waves at the receiving-station into the energy of motion, that is without the necessary interposition of a secondary or auxiliary generator for the production of such motion, substantially as set forth.

2. As an improvement in the art of transmitting signals between stations by electromagnetic waves, the method herein described which consists in causing the radiation of electromagnetic waves from a grounded conductor, generating voltages by such waves in a conductor at the receiving-station and transforming the energy of each of said voltages into the energy of motion, substantially as set forth.

3. As an improvement in the art of transmitting signals electrically between stations by electromagnetic waves, the method herein described which consists in producing an electromagnetic field in a receiving mechanism consisting of relatively fixed and movable members arranged in operative relation to each other by the generation of electromagnetic waves at the sending-station, thereby causing a movement of one of the parts of the receiving mechanism, substantially as set forth.



4. As an improvement in the art of transmitting signals electrically between stations by electromagnetic waves, the method herein described which consists in the generation of a current or currents in a portion of a receiving mechanism consisting of relatively fixed and movable members by the generation of electromagnetic waves at the sending-station and then producing a current or currents in the other portion of the receiving mechanism by the current or currents generated by the electromagnetic waves, whereby one part of the receiving mechanism is caused to move relative to the other part, substantially as set forth.

5. As an improvement in the art of transmitting electrical energy by electromagnetic waves the method herein described, which consists in maintaining a secondary circuit in an energized condition and controlling the energy of said circuit by current effects produced by electromagnetic waves flowing through a current-operated wave-responsive device forming a portion of the secondary circuit.

6. As an improvement in the art of transmitting electrical energy by electromagnetic waves the method herein described, which consists in prolonging the oscillations of an energy-radiating conductor by energy from a source external to the radiating-conductor and tuned to the period of the radiating-conductor, substantially as set forth.

7. As an improvement in the art of transmitting electrical energy by electromagnetic waves the method herein described, which consists in the generation of electromagnetic waves at one station and transforming the energy of the currents generated by such waves at the receiving-station into the energy of motion, varying the motion thus produced by varying the amount of energy delivered at the receiving-station without the necessary interposition of a secondary or auxiliary generator for the purpose of such motion, substantially as set forth.

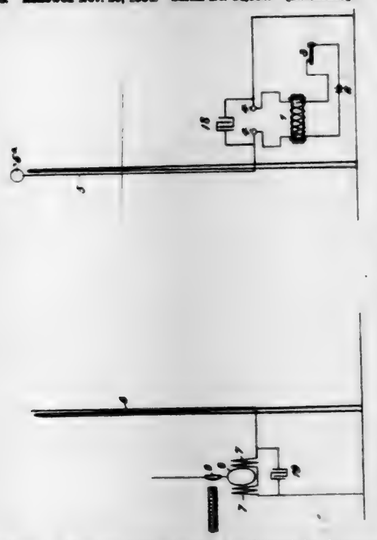
8. As an improvement in the art of signaling by electromagnetic waves the method herein described, which consists in generating electromagnetic waves in a grounded conductor at the sending-station, receiving such waves at the receiving-station and transforming the energy of electromagnetic waves so received into the energy of motion by means of a receiving instrument having a low resistance, substantially as set forth.

9. As an improvement in the art of transmitting electrical energy, the method herein described, which consists in varying the conductivity of a secondary circuit at the receiving-station by motion produced by currents generated by electromagnetic waves, substantially as set forth.

10. As an improvement in the art of transmitting electrical energy, the method herein described, which consists in the generation of electromagnetic waves at one station, transforming the energy of the currents generated by such waves at the receiving-station into energy of motion, varying the currents in two or more local circuits by such energy of motion and transforming the energy of such currents into the energy of motion, substantially as set forth.

11. As an improvement in the art of transmitting electrical energy, the method hereby described, which consists in generating electromagnetic waves at one station, transforming the energy of currents generated by such waves into the energy of motion, varying the currents in two or more local or secondary circuits by such energy of motion, transforming the energy of the varied currents into the energy of motion and causing the energies of motion so produced to operate in the same direction, substantially as set forth.

706,786. APPARATUS FOR WIRELESS TELEGRAPHY. REGINALD A. FESSENDEN, Allegheny, Pa. Original application filed Dec. 15, 1900, Serial No. 740,698. Divided and this application filed May 17, 1900. Renewed Nov. 20, 1901. Serial No. 84,097. (No model.)



Claim.—1. In a plant for the transmission of signals by electromagnetic waves, the combination of means located at the sending-station for the generation of electromagnetic waves, a receiving-conductor at the other station, means for directly transmitting the energy of the currents produced in the receiving-conductor by the electromagnetic waves into energy of motion and means for observing or recording such motion, substantially as set forth.

2. In a plant for the transmission of signals by electromagnetic waves, the combination of means located at the sending-station for the generation of electromagnetic waves, a receiving-conductor at the other station, a field coil or coils adapted to be energized by the currents produced in the receiving-conductor and a ring forming a closed circuit movably supported with its plane normally at an angle less than a right angle to the field, the ring having relatively low resistance and high self-induction so that a current induced therein will impart a twisting movement to the ring and means for recording or observing the movements of the ring, substantially as set forth.

3. As a means for transforming the energy of electromagnetic waves into the energy of motion, the combination of a receiving-conductor in which currents may be produced by electromagnetic waves, a field coil or coils adapted to be energized by the current produced in the receiving-conductor, a condenser connected in shunt with said field, and a ring forming a closed circuit movably supported in such relation to the field that a current will be induced therein, substantially as set forth.

4. In a plant for the electrical transmission of signals without the use of wires, the combination of means for the generation of electromagnetic waves, said means including a capacity of relatively large radiating-surface, and means for directly translating the energy of the currents produced in a receiving-conductor by electromagnetic waves into the energy of motion, substantially as set forth.

5. As a means for transforming the energy of electromagnetic waves into the energy of motion, the combination of a receiving-conductor in which currents may be produced by electromagnetic waves, a field formed by a single turn of wire adapted to be energized by the currents produced in the receiving-conductor, and a ring forming a closed circuit movably supported in operative relation to the coil, the ring having relatively low resistance and high self-induction, substantially as set forth.

6. In a system of transmission of energy by means of electromagnetic waves, a receiving system including in combination a receiving-conductor and a wave-responsive device, the portion of the receiving system containing said wave-responsive device constituting a closed circuit tuned to the frequency of the transmitter, substantially as set forth.

7. In a system of transmission of energy by electromagnetic waves, a receiving system including in combination a receiving-conductor, a wave-responsive device, which is also an inductance and a condenser in shunt thereto, said inductance and capacity being adjusted to make the portion of the receiving system in which they are placed resonant to the frequency of the transmitter, substantially as set forth.

8. In a system of transmission of energy by electromagnetic waves, a receiving system including in combination a receiving-conductor and a wave-responsive device, the portion of the system containing said wave-responsive device having two conducting-paths in shunt relation, one having inductance and the other having capacity, said inductance and capacity being adjusted to each other and to the frequency of the transmitter to cause one hundred and eighty degrees difference in phase of the currents in the two conducting-paths, substantially as set forth.

9. In a receiving system for transmission of energy by electromagnetic waves, a closed circuit tuned to the frequency of the transmitted impulses and a current-operated wave-responsive device, substantially as set forth.

10. In a system of transmission of energy by electromagnetic waves, a transmitter system including a tuned circuit, said system being adjusted to radiate trains of electromagnetic waves in which a single frequency is predominant, in combination with a receiver system including a closed circuit tuned to said predominant frequency, substantially as set forth.

11. In a system of transmission of energy by electromagnetic waves, a transmitter system including a closed tuned circuit, said system being adapted to radiate trains of electromagnetic waves in which a single frequency is predominant, and a receiver system including a closed circuit tuned to said predominant frequency, substantially as set forth.

12. In a system of transmission of energy by electromagnetic waves, the combination of a generator, a grounded sending-conductor, a receiving-conductor, means for translating the energy of currents produced at the receiving-station by electromagnetic waves radiated from the sending-conductor into the energy of motion and means for observing or recording such motion, substantially as set forth.

13. In a system of transmission of signals by electromagnetic waves, the combination of means for generating and radiating electromagnetic waves at the sending-station, a receiving-circuit at the receiving-station tuned to the sending-circuit, and a low-resistance means for producing signals by currents produced by electromagnetic waves radiated from the sending-conductor, substantially as set forth.

14. In a system of transmission of signals by electromagnetic waves, the combination of means for generating and radiating electromagnetic waves at a sending-station, a receiving-circuit at the receiving-station tuned to the sending-circuit, and a current-actuated wave-responsive device included in said receiving-circuit, substantially as set forth.

15. In a receiver system for signaling by electromagnetic waves, a low-resistance receiving mechanism in series with a transformer, the primary of the transformer being in the circuit of the receiving-conductor, substantially as set forth.

16. A system of signaling by electromagnetic waves, having in combination a receiving-conductor and a differentially-wound indicating mechanism controlled by currents produced in the receiving-conductor by electromagnetic waves, substantially as set forth.

17. A system of signaling by electromagnetic waves, having in combination a receiving-conductor and a differentially-wound indicating mechanism dependent for its operation on currents produced by electromagnetic waves, substantially as set forth.

18. A system for signaling by electromagnetic waves, having in combination therewith a differentially-wound mechanism dependent for its operation on currents produced by electromagnetic waves, substantially as set forth.

19. In a system of signaling by electromagnetic waves the combination of a receiving-conductor, a secondary circuit and a current-actuated wave-responsive device controlling the secondary circuit, substantially as set forth.

20. In a system of signaling by electromagnetic waves the combination of a receiving-conductor, a secondary circuit and a self-restoring current-actuated wave-responsive device controlling the secondary circuit, substantially as set forth.

21. A system for signaling by electromagnetic waves having in combination therewith a current-actuated wave-responsive operative device in a closed circuit, tuned to the frequency of the electromagnetic waves to which it is desired to respond, substantially as set forth.

22. In a plant for the transmission of electrical energy without the use of wires, the combination of means located at the sending-station for the generation of electromagnetic waves, a receiving-conductor at the other station, and means having a low resistance for directly translating the energy of the currents produced in the receiving-conductor by the electromagnetic waves into the energy of motion, substantially as set forth.

23. In a plant for the transmission of electrical energy without the use of wires, the combination of means located at the sending-station for the generation of electromagnetic waves, and a low-resistance receiving mechanism at the other station operative by the currents generated by the electromagnetic waves, substantially as set forth.

24. In a plant for the transmission of electrical energy without the use of wires, the combination of means located at the sending-station for the generation of electromagnetic waves, including a grounded sending-conductor, a receiving-conductor and a low-resistance receiving mechanism in circuit with the receiving-conductor, substantially as set forth.

25. In a plant for the transmission of electrical energy without the use of wires, the combination at the receiving-station of two local or secondary circuits, a receiving mechanism having a movable member, a wave-operated means adapted to increase the resistance in one local circuit and to decrease the resistance in the other local circuit, the currents thus modified tending to produce motion of the movable member in the same direction, substantially as set forth.

26. In a system of signaling by electromagnetic waves, the combination at the sending-station of a generator, a sending-conductor, a spark-gap, and a condenser connected across the spark-gap so that the condenser and its connecting-wires form a local and parallel circuit in resonance to the sending-conductor, substantially as set forth.

27. In a system of signaling by electromagnetic waves, the combination at the sending-station of a generator, a grounded conductor, a spark-gap, and a condenser connected across the spark-gap so that the condenser and its connecting-wires form a local and parallel circuit in resonance to the sending-conductor.

28. In a receiving system for transmission of energy by electromagnetic waves, a closed circuit of low resistance tuned to the frequency of the transmitted impulses and a current-actuated wave-responsive device, substantially as set forth.

29. In a system of signaling by electromagnetic waves, the combination at the receiving-station of a closed tuned circuit and a current-operated wave-responsive device adapted to give indications proportioned to the total activity of the receiving-circuit, substantially as set forth.

30. In a system of wireless transmission of energy by electromotive waves, an apparatus for utilizing the energy of said waves, said apparatus including in combination a conductor constructed and arranged to cause the energy of each wave to develop electric-current flow, means for rendering said current-flow persistent and for coördinating the currents developed by successive waves to cause them to act cumulatively upon each other to produce an increased or reinforced resultant current-flow, and means operated by said resultant current-flow to produce a sensible effect or indication, substantially as set forth.

31. A system of signaling by electromotive waves, having at the receiving-station a current-operated constantly-receptive wave-responsive device.

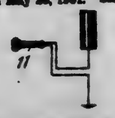
32. A system of signaling by electromotive waves, having at the receiving-station a current-operated, self-restoring, constantly-receptive wave-responsive device.

33. A system of signaling by electromotive waves, having at the receiving-station a current-operated, constantly-receptive, wave-responsive device, in combination with a closed tuned circuit.

34. A system of signaling by electromotive waves, having in combination a current-operated, constantly-receptive wave-responsive device at the receiving-station and a source of persistent radiation at the sending-station.

35. A system of signaling by electromotive waves, having in combination a closed tuned circuit, a current-operated, constantly-receptive, wave-responsive device at the receiving-station and a source of persistent radiation at the sending-station.

706,787. WIRELESS TELEGRAPHY. REGINALD A. FESSENDEN, Allegheny, Pa. Filed May 30, 1901. Serial No. 62,201. (No model.)



Claim.—1. A sending-conductor for electromagnetic waves, having a large capacity distributed with substantial uniformity over its radiating portion, substantially as set forth.

2. A sending-conductor for electromagnetic waves, having its capacity so adjusted that the waves radiated therefrom have a low frequency, substantially as set forth.

3. A sending-conductor for electromagnetic waves, having its capacity and inductance so adjusted that the waves radiated therefrom have a low frequency, substantially as set forth.

4. In a system for transmission of energy by electromagnetic waves, the combination of a source of alternating voltage and a conductor in series therewith forming a sending-conductor said sending-conductor being adapted to radiate electromagnetic waves and having its radiating portion of a length which is a large fraction of the quarter-wave length produced by the alternating source of the radiating portion in the medium surrounding the radiating portion, substantially as set forth.

5. In a system for transmission of energy by electromagnetic waves, the combination of a source of alternating voltage and a conductor in series therewith forming a sending-conductor said sending-conductor being adapted to radiate electromagnetic waves having its radiating portion of a length which is a large fraction of the length of the sending-conductor, substantially as set forth.

6. In a system for transmission of energy by electromagnetic waves, the combination of a source of alternating voltage generating groups of impulses of low frequency and a conductor in series therewith forming a sending-conductor said sending-conductor being adapted and proportioned to radiate electromagnetic waves, and being tuned to the source of alternating voltage, substantially as set forth.

7. In a system for the transmission of energy by electromagnetic waves, the combination of an alternating-current dynamo and a conductor in series therewith forming a sending-conductor said sending-conductor being tuned to the dynamo and adapted to radiate electromagnetic waves and tuned to the dynamo, substantially as set forth.

8. In a system for the transmission of energy by electromagnetic waves, the combination of a sending-conductor so proportioned as to radiate waves of low frequency and an alternating-current dynamo having its terminals connected respectively to the sending-conductor and to ground, the dynamo being so adjusted that its periodicity is the same or approximately the same as the natural period of the sending-conductor, substantially as set forth.

9. A sending-conductor for electromagnetic waves, formed by an alternating-current dynamo and a conductor in series therewith, one pole of the dynamo being grounded, the sending-conductor thus formed being so proportioned as to radiate waves of low frequency, substantially as set forth.

10. A sending-conductor for electromagnetic waves so proportioned as to radiate waves of low frequency in combination with a source of alternating voltage having its terminals connected respectively to the radiating portion of the sending-conductor and to ground, the voltage-generator being so adjusted that its periodicity is the same or approximately the same as the natural period of the system when so connected, substantially as set forth.

11. A sending-conductor for electromagnetic waves, formed by a source for continuously generating alternating voltage and a conductor in series therewith, one pole of the source of alternating voltage being grounded, the sending-conductor thus formed being so proportioned as to radiate waves of low frequency, substantially as set forth.

12. A system for signaling by electromagnetic waves having in combination a conductor adapted to radiate waves of low frequency, and a receiver dependent for its action upon a constant or independently-varying magnetic field and adapted to respond to currents produced by said waves, substantially as set forth.

13. A sending-conductor for electromagnetic waves of a length much less than a quarter of the length of an ether-wave, having a frequency equal to the natural period of said sending-conductor, and having a radiating portion which is a large fraction of its total length.

14. A sending-conductor for electromagnetic waves having a natural period of vibration much lower than the period of an ether-wave four times its length, whereby its radiating portion may be a relatively large fraction of the total length of said sending-conductor.

15. A sending-conductor for electromagnetic waves tuned to a desired low frequency by large capacity and small inductance.

16. A sending-conductor for electromagnetic waves having small inductance and tuned to a desired low frequency by a suitably-proportioned large capacity.

17. A sending-conductor for electromagnetic waves having low resistance, small self-induction and great capacity, substantially as and for the purpose set forth.

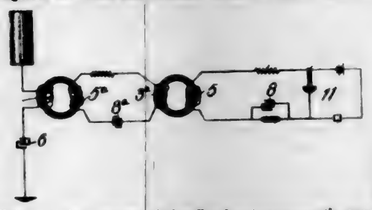
18. A sending-conductor for electromagnetic waves having low resistance, small self-induction and great capacity so correlated as to support persistent oscillation of a frequency much less than that of an ether-wave of a length four times that of said sending-conductor.

19. A system for transmission of energy by electromagnetic waves in combination with a radiating-conductor and a source of alternating electrical energy or potential, said radiating-conductor and source being coördinated and relatively adjusted to radiate a substantially continuous stream of electromagnetic waves.

20. A system of transmission of energy by electromagnetic waves including in combination a radiating-conductor and a source of alternating electrical energy or potential, said radiating-conductor and source being coördinated and relatively adjusted to generate and radiate a substantially continuous stream of electromagnetic waves.

21. A system for transmission of energy by electromagnetic waves, including in combination a radiating-conductor and a source of alternating electrical energy or potential, said radiating-conductor and source being coördinated and relatively adjusted to radiate a substantially continuous stream of electromagnetic waves of substantially uniform strength.

706,788. WIRELESS TELEGRAPHY. REGINALD A. FESSENDEN, Allegheny, Pa. Filed May 30, 1901. Serial No. 62,202. (No model.)



Claim.—1. In a system of signaling by electromagnetic waves, a receiving-conductor having a transforming device in series in the circuit, in combination with a circuit including a translating device and having a local source of voltage and controlled by the transforming device and a source of voltage so arranged that its voltage will oppose the voltage from the local source operating the translating device, substantially as set forth.

2. In a system of signaling by electromagnetic waves, a receiving-conductor having a transforming device in series in the circuit, in combination with a circuit including a translating device and having a local source of voltage and controlled by the transforming device and an electrolytic cell so arranged that its voltage will oppose the voltage from the local source operating the translating device, substantially as set forth.

3. In a system of signaling by electromagnetic waves, a sending-conductor adapted to maintain and to radiate persistent oscillations, in combination with a receiving-conductor and one or more secondary circuits controlled by the receiving-conductor, a wave-responsive device included in a secondary circuit of the series, the several circuits being each tuned to correspond to the period of the sending-conductor, substantially as set forth.

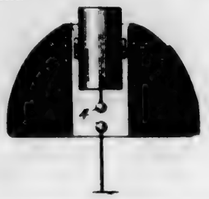
4. In a system of signaling by electromagnetic waves, a sending-conductor adapted to radiate electromagnetic waves having its electrical constants so proportioned that only a relatively small fraction of the energy of the charged conductor is radiated during a single oscillation, in combination with a prime conductor including the receiving-conductor, one or more secondary circuits controlled by the prime conductor and a wave-responsive device included in the last circuit of the series, the several circuits being each tuned to correspond to the period of the sending-conductor, substantially as set forth.

5. In a system of signaling by electromagnetic waves, a sending-conductor adapted to maintain and to radiate persistent oscillations, in combination with a receiving-conductor and one or more secondary circuits controlled by the receiving-conductor, the ratio of inductance to capacity being larger in a secondary circuit than in the sending-conductor, a wave-responsive device included in a secondary circuit of a series, the several circuits being each tuned to correspond to the period of the sending-conductor, substantially as set forth.

6. In a system of signaling by electromagnetic waves, a sending-conductor adapted to maintain and to radiate persistent oscillations in combination with receiving-conductor and one or more secondary circuits controlled by the receiving-conductor, the inductance of the secondary circuit being greater than that of the primary circuit, a wave-responsive device included in the secondary circuit of the series, the several circuits being each tuned to correspond to the period of the sending-conductor, substantially as set forth.

706,789. CONDUCTOR FOR WIRELESS TELEGRAPHY. REGINALD A. FESSENDEN, Allegheny, Pa. Filed May 30, 1901. Serial No. 62,203. (No model.)

Claim.—1. A conductor for radiating electromagnetic waves, in combination with a medium having an electrical constant on which the wave length depends of a value greater than that of air arranged in suitable relation to the conductor.



2. A conductor for radiating electromagnetic waves having in combination therewith, a medium having an electrical constant on which the wave length depends of a value greater than that of air, arranged around the conductor, substantially as set forth.

3. A conductor for radiating electromagnetic waves in combination with a medium consisting of lamina of insulated magnetic material arranged in suitable operative relation to the conductor, substantially as set forth.

4. A conductor for radiating electromagnetic waves in combination with a medium consisting of lamina or wire of magnetic material and a material of higher specific inductive capacity than that of air, filling the spaces between the lamina of conducting material, substantially as set forth.

5. A conductor for radiating electromagnetic waves in combination with a medium having an electrical constant on which the wave length depends of a value greater than that of air and means for causing an incremental effectiveness in a given direction, substantially as set forth.

6. A conductor for radiating electromagnetic waves in combination with a medium having an electrical constant on which the wave length depends of a value greater than that of air and a reflector whereby the waves generated by the conductor may be concentrated and projected in a given direction, substantially as set forth.

7. A conductor for radiating electromagnetic waves in combination with means whereby a different periodicity is imparted to the wave generated from different portions of the conductor, and a medium having an electrical constant on which the wave length depends of a value greater than that of air arranged in suitable relation to the conductor, substantially as set forth.

8. A conductor for radiating electromagnetic waves in combination with a piece of conducting material arranged on the conductor, and a medium having an electrical constant on which the wave length depends of a value greater than that of air arranged in suitable relation to the conductor, substantially as set forth.

9. A conductor for wireless telegraphy in combination with a movable piece of conducting material arranged on the conductor, substantially as set forth.

10. A conductor for radiating electromagnetic waves, surrounded by a medium in which the wave length of electromagnetic radiation is less than the wave length of the same radiation in air, substantially as set forth.

11. A conductor for radiating electromagnetic waves, in combination with a movable piece of conducting material so arranged and proportioned that the system will simultaneously radiate waves of different periodicities of approximately the same energy, substantially as set forth.

12. A conductor for radiating electromagnetic waves, having a substantially uniform capacity over a large portion of its length and a piece of conducting material connected to such portion, whereby waves of different periodicities but of approximately the same energy may be radiated, substantially as set forth.

13. The combination of a vertically-arranged conductor for wireless telegraphy and a medium substantially as described arranged in operative relation to the conductor, substantially as set forth.

14. The combination of a conductor for radiating electromagnetic waves connected to ground and a medium having an electrical constant on which the wave length depends of a value greater than that of air arranged in operative relation to the conductor, substantially as set forth.

15. A grounded conductor for radiating electromagnetic waves in combination with a medium having an electrical constant on which the wave length depends, of a value greater than that of air, arranged in suitable relation to the conductor.

16. A grounded conductor for wireless telegraphy, having in combination therewith a medium having an electrical constant on which the wave length depends, of a value greater than that of air, arranged around the conductor, substantially as set forth.

17. A grounded conductor for wireless telegraphy, having in combination therewith a medium consisting of lamina of insulated magnetic

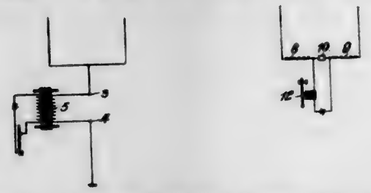
material arranged in suitable operative relation to the conductor, substantially as set forth.

18. A grounded conductor for wireless telegraphy, in combination with means whereby a different periodicity is imparted to the waves generated from different portions of the conductor, and a medium having electrical constant on which the wave length depends, of a value greater than that of air, arranged in suitable relation to the conductor, substantially as set forth.

19. A grounded conductor for wireless telegraphy, in combination with a movable piece of conducting material arranged on the conductor, substantially as set forth.

20. A combination of a vertically-arranged grounded conductor for radiating electromagnetic waves, and a medium substantially as described arranged in operative relation to the conductor, substantially as set forth.

706,740. WIRELESS SIGNALING. REGINALD A. FESSENDEN, Manteo, N. C. Filed Sept. 23, 1901. Serial No. 76,536. (No model.)



Claim.—1. In a system of signaling by electromagnetic waves, the combination of a source of waves of different periodicities and two or more receivers responsive respectively to the differing waves or impulses and a wave-responsive device operative when the waves or impulses attain a certain predetermined phase relation, substantially as set forth.

2. In a system of signaling by electromagnetic waves, the combination of two or more sources producing waves of different periodicities, two or more receiving-conductors responsive respectively to the differing waves or impulses and a wave-responsive device operative when the waves of impulses attain a certain predetermined difference in phase, substantially as set forth.

3. In a system of signaling by electromagnetic waves, the combination of two or more sources producing waves or impulses of different periodicities and two or more receiving-conductors responsive respectively to the differing waves or impulses and a wave-responsive device operative by such waves or impulses when they attain a certain predetermined difference in phase, substantially as set forth.

4. In a system of signaling by electromagnetic waves, the combination of a generator, two or more sending-conductors adapted to produce waves or impulses differing in periodicity, two or more receiving-conductors tuned to the sending-conductors, and wave-responsive device operative by the oscillations in the receiving-conductors when the oscillations attain a certain predetermined difference in phase, substantially as set forth.

5. In a system of signaling by electromagnetic waves, the combination of two or more sources of persistent waves or impulses of different periodicities, two or more receiving-conductors responsive respectively to waves or impulses produced by the generators, and a wave-responsive device operative by the oscillations in the receivers only when said oscillations attain a predetermined difference in phase, substantially as set forth.

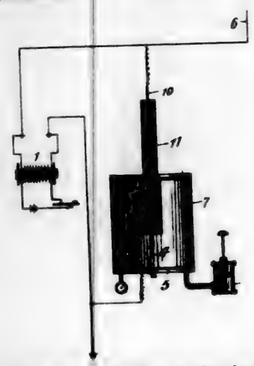
6. In a system of signaling by electromagnetic waves, the combination of means at the sending-station for generating two or more sets of waves of different periodicities and a wave-responsive device at the receiving-station operative by the conjoint action of such sets of waves, substantially as set forth.

7. In a system of signaling by electromagnetic waves, the combination of a source of waves of different periodicities, two or more receiving-circuits responsive respectively to the different waves or impulses, and a current-operated, wave-responsive device operative when the waves or impulses attain a certain predetermined phase relation, substantially as described.

8. In a system of signaling by electromagnetic waves, the combination of two or more sources producing waves of different periodicities, two or more receiving-conductors responsive respectively to the different waves or impulses, and a current-operated, wave-responsive device operative when the waves or impulses attain a certain predetermined difference in phase, substantially as set forth.

9. In a system of signaling by electromagnetic waves, the combination of means at the sending-station for generating two or more sets of waves of different periodicities, and a current-operated, wave-responsive device at the receiving-station operative by the conjoint action of such sets of waves, substantially as set forth.

706,741. APPARATUS FOR WIRELESS TELEGRAPHY. REGINALD A. FESSENDEN, Manteo, N. C. Filed Nov. 5, 1901. Serial No. 81,215. (No model.)



Claim.—1. An apparatus for the generation of radiation, having in combination sparking terminals directly connected respectively to the radiating portion of the sending-conductor and to ground, and the gap or space between the terminals being occupied by an insulating medium under pressure greater than atmospheric pressure, substantially as set forth.

2. An apparatus for the generation of radiation, having in combination sparking terminals directly connected respectively to the radiating portion of the sending-conductor and to ground, and the gap or space between the terminals being occupied by a gaseous insulating material under pressure greater than atmospheric pressure, substantially as set forth.

3. An apparatus for the generation of radiation, having in combination sparking terminals, one of said terminals having a large superficial area relative to the other and the gap or space between the terminals being occupied by an insulating medium under pressure greater than atmospheric pressure, substantially as set forth.

4. An apparatus for the generation of radiation, having in combination sparking terminals, the space between the terminals being occupied by an insulating medium under pressure, the gap between said terminals forming, when the spark passes, practically all the resistance between the radiating portion of the sending-conductor and the ground, substantially as set forth.

5. An apparatus for the generation of radiation, having in combination a conductor for radiating electromagnetic waves, and sparking terminals, all gaps between sparking terminals being occupied by insulating material under pressure greater than atmospheric pressure, substantially as set forth.

6. An apparatus for the generation of radiation, having in combination sparking terminals, one of said terminals having a large superficial area relative to the other, the surface of the larger terminal being arranged at or approximately at right angles to a line passing through points on said terminals most closely adjacent to each other, and the gap or space between the terminals being occupied by an insulating medium under pressure greater than atmospheric pressure, substantially as set forth.

7. In an apparatus for the generation of radiation, the combination of a chamber having at least one of its walls formed of conducting material, and connected to ground and a rod projecting into the chamber but not in electric connection with the metallic wall, the conducting-wall and rod being connected to the radiating portion of the sending-conductor, said chamber containing an insulating medium under pressure, substantially as set forth.

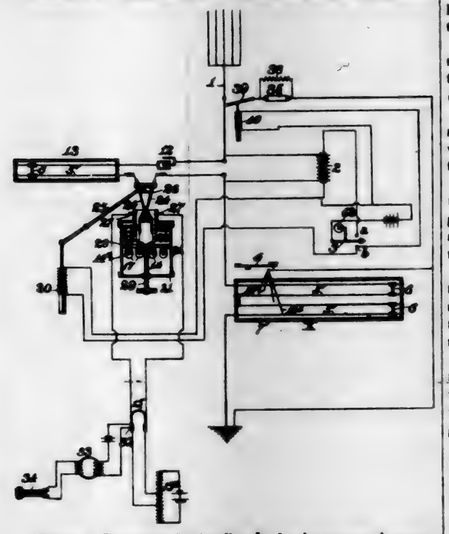
8. An apparatus for the generation of radiation having in combination sparking terminals directly connected to the circuit in which the oscillations occur, and the gap or space between the terminals being occupied by an insulating medium under pressure greater than atmospheric pressure, substantially as set forth.

9. An apparatus for the generation of radiation having in combination a conductor for radiating electromagnetic waves and sparking terminals, all gaps between sparking terminals being occupied by insulating material under pressure greater than sixty (60) pounds above atmospheric pressure, substantially as set forth.

10. An apparatus for the generation of radiation having in combination a conductor for radiating electromagnetic waves and sparking terminals, all gaps between sparking terminals being occupied by insulating material under pressure greater than eighty (80) pounds above atmospheric pressure, substantially as set forth.

11. An apparatus for the generation of radiation having in combination a conductor for radiating electromagnetic waves and sparking terminals, all gaps between sparking terminals being occupied by insulating material under pressure above a certain critical high pressure.

706,742. WIRELESS SIGNALING. REGINALD A. FESSENDEN, Manteo, N. C. Filed June 6, 1902. Serial No. 110,469. (No model.)



Claim.—1. In a system for signaling, &c., by electromagnetic waves, the combination of a conductor adapted to radiate and receive electromagnetic waves, mechanism for causing the radiation of electromagnetic waves from said conductor, means for modifying one or more of the characteristics of said waves, a receiving mechanism controlled by currents produced in said conductor by electromagnetic waves, and means for bringing said conductor into operative relation with either the generating or the receiving mechanism, substantially as set forth.

2. In a system for signaling, &c., by electromagnetic waves, the combination of a conductor adapted to radiate and receive electromagnetic waves, mechanism for causing the radiation of electromagnetic waves from said conductor, a receiving mechanism controlled by currents produced in said conductor by electromagnetic waves, and means for bringing said conductor into operative relation with either the generating or the receiving mechanism, substantially as set forth.

3. In a system for signaling, &c., by electromagnetic waves, the combination of a conductor adapted to radiate and receive electromagnetic waves, mechanism for causing the radiation of electromagnetic waves from said conductor, a receiving mechanism controlled by currents produced in said conductor by electromagnetic waves, and electrically-operated means for bringing said conductor into operative relation with either the generating or the receiving mechanism, substantially as set forth.

4. In a system for signaling, &c., by electromagnetic waves, the combination of a conductor adapted to radiate and receive electromagnetic waves, mechanism for causing the radiation of electromagnetic waves from said conductor, means for modifying step by step one or more of the characteristics of said waves, a receiving mechanism controlled by currents produced in said conductor by electromagnetic waves, and means for bringing said conductor into operative relation with either the generating or the receiving mechanism, substantially as set forth.

5. In a system for signaling, &c., by electromagnetic waves, the combination of a conductor adapted to radiate electromagnetic waves, means for causing the radiation of electromagnetic waves from said conductor and means for modifying one or more of the characteristics of said waves, substantially as set forth.

6. In a system for signaling, &c., by electromagnetic waves, the combination of a conductor adapted to radiate electromagnetic waves, means for causing the radiation of electromagnetic waves from said conductor and means for modifying step by step one or more of the characteristics of said waves, substantially as set forth.

7. In a system of signaling by electromagnetic waves, a tuning device having one or more conductors arranged for tuning and constructed so as to have small inductance as compared with that of a coil containing an equal length of the conductor for the purpose of preventing the inductance from prolonging the oscillations of the sending-circuit and hence cutting down the radiation per oscillation, substantially as set forth.

8. In a system of signaling by electromagnetic waves, a tuning device having one or more conductors arranged for tuning and so adjusted as to have the same ratio of inductance to capacity per unit of length that the radiating conductor has, as distinguished from tuning devices having conductors so formed as to have maximum inductance, substantially as set forth.

9. In a system of signaling by electromagnetic waves, the combination of a conductor and a spark-gap with means for changing the function of the conductor, *i. e.*, from sending to receiving without bridging or disconnecting the spark-gap, substantially as set forth.

10. In a system of signaling by electromagnetic waves, the combination of a radiating conductor, a spark-gap, a capacity and a source of voltage with a high resistance, whereby an intermittent discharge across the spark-gap may be produced, substantially as set forth.

11. In a system of signaling by electromagnetic waves, the combination of a radiating conductor, a spark-gap, one terminal of the spark-gap being connected to ground, a capacity and a source of voltage with a high resistance, whereby an intermittent discharge across the spark-gap may be produced, substantially as set forth.

12. In a system of signaling by electromagnetic waves, the combination of a radiating conductor and a spark-gap, one terminal of the spark-gap being connected to ground, with means for changing the function of the conductor, *i. e.*, from sending to receiving without bridging the spark-gap, substantially as set forth.

13. In a system of signaling by electromagnetic waves, the combination of a radiating conductor, a spark-gap, a capacity and a source of voltage with a high resistance, and means for varying said resistance, whereby any desired number of discharges per second across the spark-gap may be produced, substantially as set forth.

14. In a system of signaling by electromagnetic waves, the combination of a wave-responsive device, an indicating mechanism and means for operating the indicating mechanism when the wave-responsive device becomes inoperative while in operative connection, substantially as set forth.

15. In a system of signaling by electromagnetic waves, the combination of a receiver, an indicating mechanism, and means for operating the indicating mechanism when the receiver is ruptured, substantially as set forth.

16. In a system of signaling by electromagnetic waves, the combination of a receiving-circuit, a series of receivers, and means shifting any desired one of said receivers into and out of operative relation to the receiving-conductor, substantially as set forth.

17. A system for signaling by electromagnetic waves, the combination of a receiver, rods movable into and out of contact with the terminals of the receiver, contacts adapted to be brought into contact by the rods when shifted out of contact with the receiver-terminals, substantially as set forth.

18. A system for signaling by electromagnetic waves, in combination therewith, a tuning device consisting of one or more connected pairs of conductors and one or more contact-pieces connecting the legs of each pair movable along the same, substantially as set forth.

19. A system of signaling by electromagnetic waves, having in combination one or more connected pairs of connected conductors in series in the sending-circuit and contact-fingers adapted to bear against the conductors in succession, thereby cutting different portions of the sending-conductor, substantially as set forth.

20. A system of signaling by electromagnetic waves, having in combination a sending-conductor and a key provided with fingers arranged to be brought into contact with the sending-conductor at different points, substantially as set forth.

21. A system of signaling by electromagnetic waves, having in combination a sending-conductor and a key provided with fingers adapted to be brought into contact in succession with the sending-conductor at different points, substantially as set forth.

22. A system of signaling by electromagnetic waves, having in combination therewith mechanism for the production of the proper signal of a station at that station, as means for indicating the busy or free state of that station, substantially as set forth.

23. A system of signaling by electromagnetic waves, having in combination therewith automatic mechanism for the production of the proper signal of a station at that station, as means for indicating the busy or free state of that station, substantially as set forth.

24. A system of signaling by electromagnetic waves, having in combination a sending-conductor and a normally closed shunt, said parts being so arranged that the sending-conductor will have the natural period proper to that station, substantially as set forth.

25. A system of signaling by electromagnetic waves, having in combination a sending-conductor, a sending-key forming part of a shunt for

said conductor and provided with a finger normally in contact with the conductor so that said conductor will normally have the natural period proper to that station, substantially as set forth.

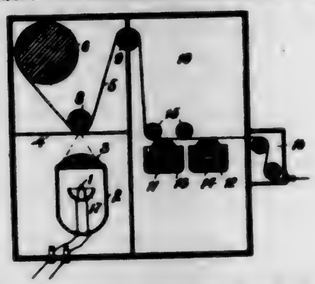
26. A system of signaling by electromagnetic waves having in combination therewith means for indicating to a third station during sending or receiving that such sending or receiving station is busy, substantially as set forth.

27. In a system of signaling by electromagnetic waves, the combination of radiating-conductor and a gap, one terminal of the gap being connected to ground, with means for changing the function of the conductor, i. e., from sending to receiving, without bridging the gap, substantially as set forth.

28. In a system of signaling by electromagnetic waves, a sending-conductor, a receiving-conductor, a transformer connected in operative relation to the receiving-conductor, in combination with a current-actuated wave-responsive device (in the secondary circuit of the transformer,) the secondary circuit, receiving-conductor and sending-conductor all being tuned to the same periodicity.

29. A system for signaling by electromagnetic waves having in combination therewith an aerial conductor, a tuning device for said system including a pair of conductors constructed and arranged to inductance and capacity in substantially the same ratio as the aerial conductor, and means for varying the operative length of the pair of conductors, substantially as set forth.

706,743. WIRELESS SIGNALING. REGINALD A. FESSENDEN, Manteo, N. C. Filed June 25, 1902. Serial No. 113,244. (No model.)



Claim.—1. As an improvement in the art of signaling by electromagnetic waves, the method herein described, which consists in producing interpretable characters or symbols on a strip or film by chemical action produced by currents generated by electromagnetic waves, substantially as set forth.

2. As an improvement in the art of signaling by electromagnetic waves, the method herein described, which consists in affecting a sensitive strip or film by currents generated by electromagnetic waves, substantially as set forth.

3. As an improvement in the art of signaling by electromagnetic waves, the method herein described, which consists in producing interpretable characters or symbols on a strip or film by chemical action induced by electric currents generated by electromagnetic waves, substantially as set forth.

706,744. CURRENT-ACTUATED WAVE-RESPONSIVE DEVICE. REGINALD A. FESSENDEN, Manteo, N. C. Original application filed June 6, 1902, Serial No. 110,669. Divided and this application filed July 1, 1902. Serial No. 113,968. (No model.)

Claim.—1. A receiver for currents produced by electromagnetic waves consisting of a conductor having small heat capacity, substantially as set forth.

2. A receiver for currents produced by electromagnetic waves consisting of a conductor having small radiating-surface, substantially as set forth.

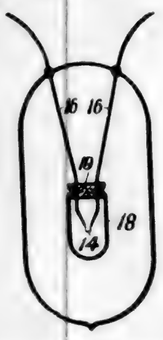
3. A receiver for currents produced by electromagnetic waves consisting of a conductor having low resistance and small heat capacity, substantially as set forth.

4. A receiver for currents produced by electromagnetic waves consisting of a conductor having a curved portion of small heat capacity, substantially as set forth.

5. A receiver for currents produced by electromagnetic waves consisting of a conductor constructed to lose its heat more rapidly by conduction than by radiation, substantially as set forth.

6. A receiver for currents produced by electromagnetic waves consisting of a conductor rapidly responsive as regards temperature to variations in electrocurrents, substantially as set forth.

7. A receiver for currents produced by electromagnetic waves consisting of a conductor formed of two or more materials and having small heat capacity, substantially as set forth.



8. A receiver for currents produced by electromagnetic waves, consisting of a short conductor having small heat capacity, substantially as set forth.

9. A receiver for currents produced by electromagnetic waves, consisting of a composite conductor, substantially as set forth.

10. A current-actuated wave-responsive device formed by a conducting filament, substantially as set forth.

11. A current-actuated wave-responsive device formed by a metallic filament, substantially as set forth.

12. A current-actuated wave-responsive device formed by a platinum filament, substantially as set forth.

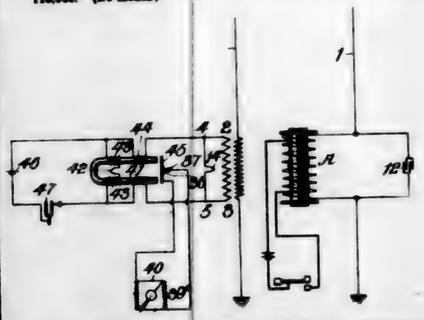
13. A current-actuated wave-responsive device formed of conducting material and coated with another conducting material, substantially as set forth.

14. A current-actuated wave-responsive device formed of a conducting filament having relatively large ends or terminals of high heat conductivity, substantially as set forth.

15. A current-actuated wave-responsive device formed by a platinum filament having a silver coating, substantially as set forth.

16. A current-actuated wave-responsive device consisting of a conductor having a small heat capacity arranged in a vacuum, substantially as set forth.

706,745. SIGNALING BY ELECTROMAGNETIC WAVES. REGINALD A. FESSENDEN, Manteo, N. C. Filed July 1, 1902. Serial No. 113,969. (No model.)



Claim.—1. In a system of signaling by electromagnetic waves, the combination at the receiving-station of a current-operated wave-responsive device and a closed circuit, said closed circuit having a ratio of inductance to capacity larger than the ratio of inductance to capacity in the receiving-conductor, substantially as set forth.

2. In a system of signaling by electromagnetic waves, the combination at the receiving-station of a current-operated wave-responsive device, a closed circuit, said closed circuit having a ratio of inductance to capacity larger than the ratio of inductance to capacity in the receiving-conductor, and a source of persistent radiation at the sending-station, substantially as set forth.

3. In a system of signaling by electromagnetic waves, the combination of a current-operated wave-responsive device in series with a closed

circuit, said closed circuit having a ratio of inductance to capacity greater than the ratio of inductance to capacity of the receiving-conductor, substantially as set forth.

4. In a system of signaling by electromagnetic waves, the combination of a current-operated wave-responsive device in series with a closed circuit, said closed circuit having a ratio of inductance to capacity greater than the ratio of inductance to capacity of the receiving-conductor, and a source of persistent radiation at the sending-station, substantially as set forth.

5. In a system of signaling by electromagnetic waves, the combination of a current-operated wave-responsive device in series with a closed tuned circuit, said circuit having a ratio of inductance to capacity greater than the ratio of inductance to capacity of the receiving-conductor, and a source of persistent radiation at the sending-station, substantially as set forth.

6. In a system of signaling by electromagnetic waves, the combination at the receiving-station of a current-operated wave-responsive device and a closed tuned circuit, said closed tuned circuit having a ratio of inductance to capacity larger than the ratio of inductance to capacity in the receiving-conductor, substantially as set forth.

7. In a system of signaling by electromagnetic waves, the combination at the receiving-station of a current-operated wave-responsive device, a closed tuned circuit, said closed tuned circuit having a ratio of inductance to capacity larger than the ratio of inductance to capacity in the receiving-conductor, and a source of persistent radiation at the sending-station, substantially as set forth.

8. In a system of signaling by electromagnetic waves, the combination of a current-operated wave-responsive device in series with a closed tuned circuit, said closed circuit having a ratio of inductance to capacity greater than the ratio of inductance to capacity of the receiving-conductor, substantially as set forth.

9. In a system of signaling by electromagnetic waves, the combination at the receiving-station, of a current-operated wave-responsive device, and a closed secondary circuit, substantially as set forth.

10. In a system of signaling by electromagnetic waves, the combination of a current-operated wave-responsive device and a closed tuned secondary circuit, substantially as set forth.

11. In a system of signaling by electromagnetic waves, the combination at the receiving-station, of a current-operated wave-responsive device, a closed secondary circuit and a source of persistent radiation at the sending-station, substantially as set forth.

12. In a system of signaling by electromagnetic waves, the combination at the receiving-station, of a current-operated wave-responsive device, a closed tuned secondary circuit and a source of persistent radiation at the sending-station, substantially as set forth.

13. In a system of signaling by electromagnetic waves, the combination at the receiving-station, of a current-operated wave-responsive device and a step-down closed tuned secondary circuit, substantially as set forth.

14. In a system of signaling by electromagnetic waves, the combination at the receiving-station, of a closed tuned secondary circuit, a current-operated wave-responsive device in series with said circuit and a source of persistent radiation at the sending-station, substantially as set forth.

15. In a system of signaling by electromagnetic waves, the combination of a step-down closed tuned secondary circuit and a current-operated wave-responsive device in series with said circuit, substantially as set forth.

16. In a system of signaling by electromagnetic waves, a current-operated wave-responsive device, in combination with a microphonic circuit controlled thereby, and an indicating mechanism controlled by the microphonic circuit and adapted to be inoperative for steady or slowly-varying currents and responsive to rapid variations of currents, substantially as set forth.

17. In a system of signaling by electromagnetic waves, the combination of a receiving-circuit and a receiver having small heat capacity and adapted to be energized by currents produced by electromagnetic waves in the receiving-circuit, substantially as set forth.

18. In a system of signaling by electromagnetic waves, the combination of a receiver rapidly responsive as regards temperature to variations in currents produced by electromagnetic waves and an indicating mechanism controlled by changes in temperature due to variations in currents in said receiver, substantially as set forth.

19. In a system of signaling by electromagnetic waves, the combination of a receiving-conductor, a receiver rapidly responsive as regards temperature to variations in electric currents and adapted to be energized by currents produced by electromagnetic waves in the receiving-conductor, a circuit controlled by said receiver and an indicating mechanism controlled by said circuit, substantially as set forth.

20. In a system of signaling by electromagnetic waves, the combination of a grounded sending-conductor, a receiving-conductor, a receiver rapidly responsive as regards temperature to variations in electric currents and adapted to be energized by currents produced by electromagnetic waves in the receiving-conductor, a circuit controlled by said receiver and an indicating mechanism controlled by said circuit, substantially as set forth.

21. A system of signaling by electromagnetic waves, having in combination a receiver responsive as regards temperature to variations in currents produced by electromagnetic waves, and a differentially-wound indicating mechanism controlled by currents produced in the receiving-conductor by electromagnetic waves, substantially as set forth.

22. In a system of signaling by electromagnetic waves, the combination of a receiving-conductor, a receiver responsive as regards temperature to variations in currents produced in said conductor by electromagnetic waves, a circuit controlled by said receiver and a differentially-wound mechanism controlled by said circuit, substantially as set forth.

23. In a system for signaling, &c., by electromagnetic waves, the combination of a receiver responsive as regards temperature to variations in currents produced by electromagnetic waves and a differentially-wound indicating mechanism dependent for its operation on currents produced by electromagnetic waves in the receiving-conductor, substantially as set forth.

24. A system for signaling, &c., by electromagnetic waves, having in combination a receiver rapidly responsive as regards temperature to variations in currents produced by electromagnetic waves, and a differentially-wound mechanism controlled by said receiver, substantially as set forth.

25. In a system for wireless transmission of energy by electromagnetic waves, an apparatus for utilizing the energy of said waves, said apparatus including in combination a conductor adapted to receive the energy of said waves and to conserve the same in the form of electric-current flow, means for transforming said current energy into energy of a different order or class, said means being adapted to conserve and accumulate such transformed energy, and a sensitive receiver cumulatively responsive to said transformed energy, substantially as set forth.

26. In a system for wireless transmission of energy by electromagnetic waves, an apparatus for utilizing the energy of said waves, said apparatus including in combination a conductor adapted to receive the energy of said waves and to conserve the same in the form of electric-current flow, means for transforming said current energy into energy of heat, said means being adapted to conserve and accumulate such transformed energy, and a sensitive receiver cumulatively responsive to said transformed energy, substantially as set forth.

27. A system of signaling by electromagnetic waves, having in combination at the receiving-station a closed tuned secondary circuit and a constantly-receptive current-operated, wave-responsive device, substantially as set forth.

28. A system of signaling by electromagnetic waves, having in combination at the receiving-station a closed tuned secondary circuit and a constantly-receptive, self-restoring, current-operated, wave-responsive device, substantially as set forth.

29. A system of signaling by electromagnetic waves, having at the receiving-station a closed tuned secondary circuit and a constantly-receptive, current-operated, wave-responsive device, in combination with a source of persistent radiation at the sending-station, substantially as set forth.

30. A system of signaling by electromagnetic waves, having in combination at the receiving-station, a closed tuned secondary circuit and a constantly-receptive rapidly-responsive, wave-responsive device, and a source of persistent radiation at the sending-station, substantially as set forth.

706,746. SIGNALING BY ELECTROMAGNETIC WAVES. REGINALD A. FESSENDEN, Manteo, N. C. Filed July 1, 1902. Serial No. 113,970. (No model.)

Claim.—1. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves and an artificial ground connected to the lower end of the sending-conductor and to ground and extending outwardly from the sending-conductor, substantially as set forth.

2. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves and an artificial ground connected to the lower end of the sending-conductor and to ground and extending outwardly from the sending-conductor a distance equal to a quarter wave length in air of the electromagnetic-wave length used, substantially as set forth.

3. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves and an artificial ground consisting of a series of wires or strips connected to the lower end of the sending-conductor and to ground and radiating from the lower end of the conductor and connected at suitable intervals by transverse wires or strips, substantially as set forth.

4. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves and an artificial ground connected to the lower end of the sending-conductor and to ground and extending outwardly from the sending-conductor a distance equal to a quarter wave length in air of the electromagnetic-wave length used and in the direction in which it is desired to send the waves, substantially as set forth.

5. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves and an artificial ground connected to the lower end of the sending-conductor and connected at its outer end to ground, substantially as set forth.

6. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves supported by a metallic conductor of low resistance to currents of the frequencies used, substantially as set forth.

7. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves supported by a metallic conductor, a shield for said conductor having low resistance to currents of the frequencies used, substantially as set forth.

8. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves supported by a metallic conductor having a natural period of oscillation different from that of the frequencies of the electromagnetic waves used, substantially as set forth.

9. A conductor for radiating electromagnetic waves, consisting of a conductor immersed in a liquid medium having an electric constant on which the wave length depends of a value greater than that of air, substantially as set forth.

10. A conductor for radiating electromagnetic waves, consisting of a conductor immersed in water, substantially as set forth.

11. A conductor for radiating electromagnetic waves, consisting of a metal vessel containing a medium of the character described, a conductor immersed in said medium and a generator, substantially as set forth.

12. A conductor for radiating electromagnetic waves, consisting of a metal vessel containing a medium of the character described, a tubular conductor immersed in the medium, sparking terminals arranged in the chamber, substantially as set forth.

13. In a system for the transmission of energy by electromagnetic waves, a sending-conductor for radiating such waves, an artificial ground connected to the lower end of the sending-conductor and to ground and extending outwardly from the sending-conductor, and a second grounded conducting-strip leading around the station from that facing a source of electrical disturbances to the opposite side, substantially as set forth.

14. In a system for transmission of energy by electromagnetic waves, a support for a conductor encircled by one or more turns or coils of magnetic material, substantially as set forth.

15. In a system for transmission of energy by electromagnetic waves, a support for a conductor encircled by one or more turns or coils by iron wire, substantially as set forth.

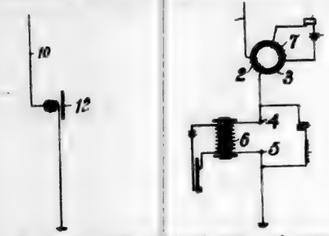
16. In a system for transmission of energy by electromagnetic waves, a conductor in combination with a support therefor, said support having a coating of non-magnetic material, substantially as set forth.

17. In a system for transmission of energy by electromagnetic waves, a conductor in combination with a support therefor, said support having a coating of non-magnetic material and encircled by one or more turns of magnetic material, substantially as set forth.

706,747. APPARATUS FOR SIGNALING BY ELECTROMAGNETIC WAVES. REGINALD A. FESSENDEN, Manton, N. C. Original application filed Sept. 26, 1901, Serial No. 76,257. Divided and this application filed July 22, 1902. Serial No. 116,468. (No model.)

Claim.—1. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses, means for modifying or changing the character of such waves or impulses without interruption of their continuity, and an indicating means or mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

2. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses, means for continuously modifying or changing the character of such waves or impulses without interruption of their continuity, and an indicating mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.



3. In a system of signaling by electromagnetic waves, the combination of means for generating the electromagnetic waves or impulses, means for modifying or varying the character of a portion of such waves or impulses without interruption of their continuity, and an indicating mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

4. In a system of signaling by electromagnetic waves, the combination of means for the generation of electromagnetic waves or impulses of uniform character, means for continuously modifying or varying the character of a portion of such waves or impulses without interruption of their continuity and an indicating mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

5. In a system for transmitting sounds by electromagnetic waves, the combination of means for the generation of electromagnetic waves or impulses, means operative by sound waves or impulses for modifying or varying the character of the electromagnetic waves or impulses without interruption of their continuity, and mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

6. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses normally of a predetermined character, means for changing the electrical constants of the sending-conductor so as to change the degree of resonance between the generator and the sending-conductor and thereby modify or change the character of such waves or impulses without interrupting their continuity, and mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

7. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses, means for modifying or changing the intensity of said waves or impulses without interrupting their continuity and a receiving-conductor tuned to correspond with the sending-conductor, whereby the receiving-conductor will be affected by the electromagnetic waves or impulses during only a portion of the time, substantially as set forth.

8. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses, and means for changing the resistance in the sending-conductor, thereby modifying or changing the intensity of the electromagnetic waves or impulses without interrupting their continuity substantially as set forth.

9. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses normally of a predetermined character, means for modifying or changing the character of such waves or impulses without interruption of their continuity, and mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

10. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses normally of a predetermined character, means for continuously modifying or changing the character of such waves or impulses without interruption of their continuity and indicating mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

11. In a system for the transmission of sounds by electromagnetic waves, the combination of means for the generation of electromagnetic waves or impulses normally of uniform character and means operative by sound waves or impulses for modifying or changing the character of the electromagnetic waves or impulses without interruption of their continuity, substantially as set forth.

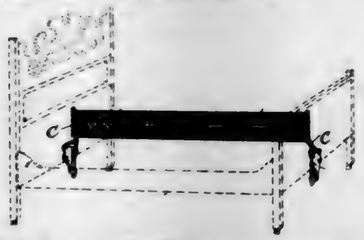
12. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses of uniform character, means for modifying the character of said waves or impulses without interruption of their continuity and indicating mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

13. In a system of signaling by electromagnetic waves or impulses, the combination of means for the practically continuous generation of electromagnetic waves or impulses of constant periodicity, means for modifying or changing the intensity of such waves without interruption of their continuity and an indicating mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

14. In a system for transmission of speech by electromagnetic waves the combination at the sending-station of means for the practically continuous generation of electromagnetic waves a telephone-transmitter for modifying the character of the waves or impulses, and a telephone-receiver at the receiving-station responsive to currents generated by the electromagnetic waves, substantially as set forth.

15. In a system of signaling by electromagnetic waves, the combination of means for the practically continuous generation of electromagnetic waves or impulses of constant periodicity, means for changing the resistance of the sending-conductor, thereby modifying or changing the intensity of such waves or impulses without interruption of their continuity, and an indicating mechanism at the receiving-station operative by the electromagnetic waves or impulses, substantially as set forth.

706,748. BED-GUARD. JOHN C. FINK, Shelby, Ohio. Filed Oct. 23, 1900. Serial No. 34,072. (No model.)



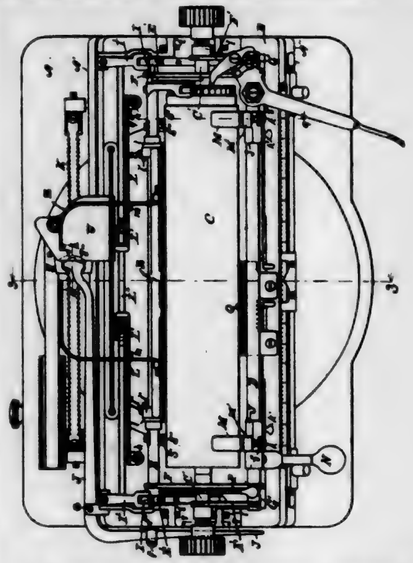
Claim.—1. In combination with a bedstead, brackets adapted to be secured thereto, said brackets each having a vertical opening through its lower end and a vertical recess thereabove aligning with said opening, said opening and recess forming a guide, uprights carried by said guides, means for adjusting the heights of said uprights, and a flexible partition stretched between said uprights, substantially as described.

2. The combination with a bedstead, of brackets, means for securing said brackets to the frame of said bedstead, a vertical guide formed in the feet of each of said brackets, projections on said brackets thereabove to form another guide in the form of an open-ended slot, offset uprights carried in said guides, and a vertical flexible partition stretched between said uprights, substantially as described.

3. A bedstead having a head or foot with a substantially horizontal cross bar or member, combined with a bracket secured to the head or foot lower than the cross-bar but outside of the vertical plane through it, and an upright having an offset and continuing substantially parallel with said head or foot above and below said offset, said upright being carried by said bracket beneath the offset, an upright at the other end of the bed, and a flexible partition stretched between said uprights, substantially as described.

706,749. TYPE-WRITING MACHINE. WILLIAM R. FOX and GLENN J. BARRETT, Grand Rapids, Mich. Filed Nov. 4, 1899. Serial No. 735,774. (No model.)

Claim.—1. In a type-writing machine, the combination of the main frame A with suitable ways A′, A″ thereon; a non-shiftable carriage traveling on said ways; a platen-cylinder O; a suitable frame therefor having end pieces F, front bar D and back bar E; a rock-shaft H with upwardly-projecting fin H′ thereon, supported on the frame A; spring connections to hold the same yieldingly in position; a shift-key connection for actuating the same; a rock-shaft G supported on the said carriage with an arm G″ containing a notch to engage the fin H′ of the rock-shaft H on said main frame; upwardly-projecting arms G′ on the rock-shaft G having inwardly-projecting shoulders at the top to receive the front ends of the end pieces F of the platen-frame; antifriction-rollers E′ to the rear of the platen-frame, adapted to rest on suitable ways a with notches a′ on said carriage; links F′ connecting pivots a on the arms G′ of the rock-shaft with the spindle of the platen; a lever E for raising the platen-frame and its platen for the inspection of the writing, all constructed substantially as described for the purpose specified.



2. In a type-writing machine, the combination of the main frame A with suitable ways A′, A″ thereon; a non-shiftable carriage traveling on said ways; a platen-cylinder O; a suitable frame therefor having end pieces F, front bar D and back bar E; a rock-shaft H with upwardly-projecting fin H′ thereon, supported on the frame A; spring connections to hold the same yieldingly in position; a shift-key connection for actuating the same; a rock-shaft G supported on the said carriage with an arm G″ containing a notch to engage the fin H′ of the rock-shaft H on said main frame; upwardly-projecting arms G′ on the rock-shaft G having inwardly-projecting shoulders at the top to receive the front ends of the end pieces F of the platen-frame; antifriction-rollers E′ to the rear of the platen-frame, adapted to rest on suitable ways a with notches a′ on said carriage; links F′ connecting pivots a on the arms G′ of the rock-shaft with the spindle of the platen; all constructed for the purpose specified.

3. In a type-writing machine, the combination of the main frame A with suitable ways A′ A″ thereon; a non-shiftable carriage traveling on said ways; a platen-cylinder C; a suitable frame therefor having end pieces F, front bar D and back bar E; a rock-shaft H with upwardly-projecting fin H′ thereon, supported on the frame A; spring connections to hold the same yieldingly in position; a shift-key connection for actuating the same; a rock-shaft G supported on the said carriage with an arm G″ containing a notch to engage the fin H′ of the rock-shaft H on said main frame; upwardly-projecting arms G′ on the rock-shaft G having shoulders to receive the front ends of the end pieces F of the platen-frame; antifriction-rollers E′ to the rear of the platen-frame, adapted to rest on suitable ways a with notches a′ on said carriage; links F′ connecting pivots a on the arms G′ of the rock-shaft with the platen and platen-frame, all constructed for the purpose specified.

4. In a type-writing machine, the combination of the main frame with suitable ways thereon; a non-shiftable carriage traveling on said ways; a platen-cylinder; a suitable frame; a rock-shaft with upwardly-projecting fin thereon supported on the frame; a shift-key connection for actuating the same; a rock-shaft supported on the said carriage with an arm containing a notch to engage the fin of the rock-shaft on said main frame; antifriction-rollers E′ to the rear of the platen-frame, adapted to rest on suitable ways with notches, on said carriage; links from the last aforesaid rock-shaft to the platen and platen-frame, all constructed for the purpose specified.

5. In a type-writing machine the combination of a non-shiftable carriage; a platen-frame consisting of end pieces F and side pieces or rods D, E, adapted to rest upon ways on the said carriage; antifriction-rollers E′ to the rear of the said platen-frame; a rock-shaft G supported on the carriage; means of actuating the rock-shaft supported on the main frame; arms G′ extending upwardly from said rock-shaft with suitable shoulders for the front of the ends F of the platen-frame to rest upon; links F′ connecting pivots a on the arms G′ and the spindle of the platen

together, for the purpose of shifting the platen and frame back and forth, all consting for the purpose specified.

6. In a type-writing machine, the combination of a main frame; a non-shiftable carriage thereon; a platen supported in a suitable frame adapted to rest on said carriage in suitable ways; a rock-shaft on said carriage; suitable connections from the main frame to actuate said rock-shaft; and link connections from said rock-shaft to the platen and its frame to shift the platen back and forth and permit its being swung up from the carriage for convenient inspection of the writing, as specified.

7. In a type-writing machine, the combination of a main frame; a non-shiftable carriage thereon; a platen supported in a suitable frame adapted to rest on said carriage; a rock-shaft on said carriage; means of actuating said rock-shaft; link connection from the said rock-shaft to the platen and its frame, to shift the platen back and forth and permit its being swung up from the carriage for the convenient inspection of the writing, as specified.

8. In a type-writing machine, the combination of the main frame; a non-shiftable carriage thereon; a platen in a suitable frame adapted to rest on suitable ways on said carriage; antifriction-rollers on said platen-frame; means of shifting said platen back and forth on said carriage; and rollers I yieldingly supported above said antifriction-rollers and adapted to press against the same to force the platen-frame back and forth to the limits of its movements when the same is shifted, for the purpose specified.

9. In a type-writing machine, the combination of the main frame; a non-shiftable carriage thereon; a platen in a suitable frame adapted to rest on suitable ways on said carriage; antifriction-rollers on said platen-frame; means of shifting said platen back and forth on said carriage; springs I'; and rollers I at the ends thereof, supported above said antifriction-rollers and adapted to press against the same to force the platen-frame back and forth to the limit of its movements when the same is shifted for the purpose specified.

10. In a type-writing machine, the combination of a platen-roll; a suitable frame therefor; a feed-roll; arms *l* from the platen-frame carrying said feed-roll and containing suitable longitudinal slots; curved springs *l'* secured to the platen-frame and adapted to press the said roll against the platen; means of adjusting the pressure on said spring; and a lever P pivotally supported on the platen-frame with a portion P' thereof extending through the slots in said arms *l* and connected by suitable pivots to the frame, consting for the purpose specified.

11. In a type-writing machine, the combination of a platen-roll; a suitable frame therefor; a feed-roll; arms from the platen-frame carrying said feed-roll and containing suitable longitudinal slots; curved springs secured to the platen-frame and adapted to press upon antifriction-rolls at the end of said rolls; adjusting-screws *l''* for adjusting the pressure on said springs; and a lever P pivotally supported on the platen-frame with a portion P' thereof extending through the slots in said arms and connected at its opposite end to the back bar of said frame, consting for the purpose specified.

12. In a type-writing machine, the combination of a platen-roll; a suitable frame for supporting the same; a feed-roll supported by suitable pivoted arms and adapted to rest against said platen-roll; a lever pivoted to said frame extending transversely to said platen-roll at its outer end and bent parallel to said roll at its opposite end and inserted through suitable perforations in the said pivoted arms which support the said feed-roll the same being swung bodily to control the said feed-roll for the purpose specified.

13. In a type-writing machine the combination of a platen-roll; a suitable frame for supporting the same; a feed-roll supported by suitable pivoted arms and adapted to rest against said platen-roll; a lever pivoted to said frame extending transversely to said platen-roll at its outer end and bent parallel to said roll at its opposite end and engaging said pivoted arms which support the said feed-roll; arms on said levers with balls on their ends engaging apertures in the rear bar of the said frame to control the said feed-roll for the purpose specified.

14. In a type-writing machine, the combination of a platen-roll; a suitable frame therefor; a paper-guide consisting of the curved spring-band M adapted to embrace the roll; and a spring M' one end of which is attached to the frame and the opposite end pivoted at O to the center of the spring-band M said pivot being parallel to the platen-roll as specified.

15. In a type-writing machine the combination of a platen-roll; a paper-guide consisting of a spring conformed to said roll, a yielding support for said spring pivoted to the middle portion thereof said pivot being parallel to the platen-roll, for the purpose specified.

16. In a type-writing machine, the combination of the platen-roll; the spring-band paper-guide M; spring-loop M' pivotally connected to said band M at one end by a pivot parallel to the platen-roll, and secured to the platen-frame at the opposite end and the screw-threaded bolt *t* extending through said loop; and a thumb-nut *t'* on said bolt for adjusting the tension on said spring for the purpose specified.

17. In a type-writing machine the combination of a platen-roll; a paper-guide conformed thereto; a curved-spring support pivoted to the middle portion thereof by a pivot parallel to the platen-roll; and means of adjusting said spring to vary its tension.

18. In a type-writing machine, the combination of a platen-roll; a paper-guide conformed thereto; a curved-spring support centrally connected thereto; and means of adjusting said spring to vary its tension.

19. In a type-writing machine, the combination of a platen; a paper-guide on said platen; a rod D to one side of said platen having a key-seat D'; a spring D'' within the said key-seat curved to contact at its ends therewith; a sleeve *j* on said rod; a screw *k* to secure the said paper-guide sleeve and spring together; and a knob *k'* for adjusting the same, consting as specified.

20. In a type-writing machine, the combination of a platen; a paper-guide on said platen; a rod D to one side of said platen having a key-seat D'; a spring D'' within the said key-seat; a sleeve *j* on said rod; a screw *k* to secure the said paper-guide sleeve and spring together, consting as specified.

21. In a type-writing machine, the combination of a platen; a paper-guide therefor; a rod to one side of said platen having a longitudinal groove therein; means of securing said paper-guide to said rod by embracing the same; a spring secured to said paper-guide and resting in said groove to retain the same by friction so it can be adjusted along said rod for the purpose specified.

22. In a type-writing machine, the combination of the platen; a paper-guide therefor; a rod to one side of said platen, having a longitudinal groove therein; means of securing said paper-guide to said rod by embracing the same; a spring carried by said paper-guide and resting in said groove to retain the guide by friction so it can be adjusted along said rod, for the purpose specified.

23. In a type-writing machine, the combination of the main frame of the machine; a carriage therefor; a platen on said carriage; a combined ribbon-guide and paper-guide consisting of plates T suitably slotted at T' for the ribbon with the edges toward the front side of the machine curved upwardly at T''' to serve as a guide for the paper; and a guide Q secured to the carriage and extending down and in front of the band-ribbon guide and paper-guide as specified.

24. In a type-writing machine, the combination of the main frame of the machine; a carriage therefor; a platen on said carriage; a combined ribbon-guide and paper-guide consisting of plates T suitably slotted at T' for the ribbon with the edges toward the front side of the machine curved upwardly at T''' to serve as a guide for the paper; as specified.

25. In a type-writing machine, the combination of the main frame; a carriage; a platen on said carriage; a ribbon-guide supported by the frame having a curved portion to serve as a paper-guide; a guide carried by said carriage in proximity thereto, for the purpose specified.

26. In a type-writing machine, the combination of the main frame; a carriage; a platen on said carriage; a ribbon-guide supported by the frame having a curved portion to serve as a paper-guide for the purpose specified.

27. In a type-writing machine, the combination of the main frame of the machine; a carriage resting on suitable tracks or ways thereon; levers L pivoted to the main frame; antifriction-rollers L' on the upper ends of said levers to rest upon the carriage; and springs to put tension on said levers to hold the carriage into close engagement with the tracks or ways, as specified.

28. In a type-writing machine, the combination of the main frame; a carriage resting on suitable tracks or ways thereon; antifriction-rollers resting on said carriage; and spring connections to put pressure on said rolls to hold the carriage close to its track for the purpose specified.

29. In a type-writing machine, the combination of the main frame; a carriage traveling in suitable ways thereon; a double-toothed oscillating rack pivoted to oscillate on said main frame; escapement-dogs carried by said carriage to engage said rack; a lever J pivoted to said carriage and extending between the dogs of said rack having a guide for said lever between said dogs; a guide *f* for the opposite end of said lever with suitable spring to hold it normally out of engagement with the pawls whereby the lever will throw either pawl out of engagement with said rack and permit the adjustment of the carriage, as specified.

30. In a type-writing machine, the combination of the main frame; a carriage thereon; a toothed rack on said main frame; escapement-dogs to engage the same carried by said carriage; an angle-lever extending from one front corner of said carriage to the flank and thence to the escapement-pawls; suitable guides for said lever; and a spring holding it normally out of engagement with the pawls, for the purpose specified.

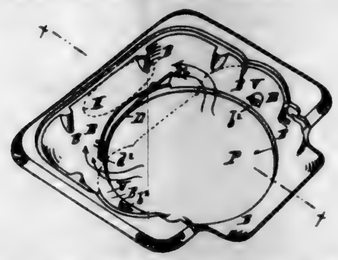
31. In a type-writing machine, the combination of the platen; a frame for carrying the same; a platen-scale S to rest against the same supported by spring-arms S' secured to the platen-frame; fingers S'' struck up from said arms to serve as additional guides; and a paper-roll between the said arms with means of releasing the same, as specified.

32. In a type-writing machine, the combination of the platen; a paper-roll adapted to rest against said platen; a platen-scale to rest against the said platen, and curved outwardly to embrace and protect said paper-roll; spring-arms beyond the ends of the paper-roll for retaining the platen-scale in position; and means for controlling the said paper-roll and platen-scale independent of each other.

33. In a type-writing machine, the combination of the platen; a paper-roll adapted to rest against said platen; means for releasing the same independent of the platen-scale; and a platen-scale to rest against the said platen curved outwardly to embrace and protect the paper-roll and retain the paper when the roll is released.

706,750. COOKING-STOVE. ROBERT GALBRAITH, Troy, N. Y., assignor to the Great Western Stove Company, Leavenworth, Kans.

Filed Aug. 5, 1901. Serial No. 70,960. (No model.)



Claim.—1. The combination with the fire-cylinder of a stove having a combustion-chamber that is partly directly over, and in part horizontally extended beyond the upper edge of the fire-cylinder, to encircle the same thereat; and is provided with an exit-flue in the rear of the boiler-hole top inclosing said combustion-chamber; of a deflecting-plate that is upwardly projected from the top edge of the fire-cylinder at the rear thereof to connect with the boiler-hole top in front of said exit-flue; a passage at each end of said deflecting-plate whereby the heat and gases evolved from the fire in the fire-cylinder are caused to pass through said lateral extension of the combustion-chamber to reach the exit-flue, substantially as, and for the purposes set forth.

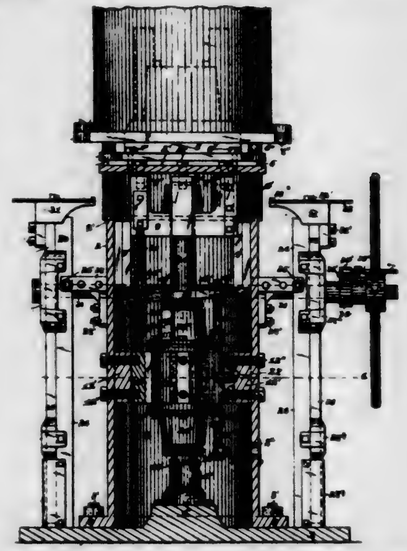
2. The combination with the fire-cylinder P, of the combustion-chamber C, arranged above the latter, and having the laterally-arranged combustion-chamber extension E, provided with the exit-flue F, at its rear; the deflecting-plate D, upwardly projected from the rear edge of said fire-cylinder at its top to connect with the under side of the boiler-hole top of the combustion-chamber; and the passage *d*, at each end of said deflecting-plate whereby the heat and gases evolved from the fire-cylinder will be forced to pass through the lateral extension of the combustion-chamber to reach the exit-flue, substantially as, and for the purposes set forth.

706,751. MOLDING-MACHINE. CHARLES EHRMAN, Allegheny, Pa. Filed Apr. 8, 1901. Serial No. 54,972. (No model.)

Claim.—1. In a molding-machine, the combination of a jarring-block, a casing, a post within said casing having a pattern-plate thereon carrying a pattern, a stripping-plate supported by the pattern-plate and carrying a flask, and a power-motor contained within said casing and directly connected to said post for imparting a vertical reciprocatory movement to the post and the pattern-plate, pattern, stripping-plate and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern; substantially as described.

2. In a molding-machine, the combination of a jarring-block, a casing having guides on its inner surface, a cover fitting over and around the top of said casing, a cross-head in said casing connected to said cover and adapted to slide on said guides, a post in said casing connected to said cross-head, a pattern-plate carrying a pattern connected to said cover, a stripping-plate carrying a flask supported by said pattern-plate, and a power-motor connected to said post for imparting a vertical reciprocatory movement to said post and the pattern-plate, pattern, stripping-plate, and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern; substantially as described.

3. In a molding-machine, the combination of a jarring-block, a casing, a post within said casing having a pattern-plate thereon carrying a pattern, a stripping-plate supported by the pattern-plate and carrying a flask, and a power-cylinder contained within said casing having its piston directly connected to said post for imparting a vertical reciprocatory movement to the post and the pattern-plate, pattern, stripping-plate, and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern; substantially as described.



4. In a molding-machine, the combination of a jarring-block, a casing having guides on its inner surface, a cover fitting over and around the top of said casing, a cross-head in said casing connected to said cover and adapted to slide on said guides, a post in said casing connected to said cross-head, a pattern-plate carrying a pattern connected to said cover, a stripping-plate carrying a flask supported by said pattern-plate and a power-cylinder having its piston connected to said post for imparting a vertical reciprocatory movement to said post and the pattern-plate, pattern, stripping-plate and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern; substantially as described.

5. In a molding-machine, the combination of a jarring-block, a post having a pattern-plate carrying a pattern, a power-cylinder having its piston directly connected to said post, valve mechanism for said cylinder, and mechanism whereby said valve mechanism is automatically operated to admit fluid to the cylinder to impart to the piston a vertical reciprocatory movement, which movement is transmitted to the post whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand around the pattern; substantially as described.

6. In a molding-machine, the combination of a jarring-block, a post having a pattern-plate carrying a pattern, a power-cylinder having its piston directly connected to said post, valve mechanism for said cylinder, and mechanism whereby said valve mechanism is operated to admit fluid to the cylinder to impart to the piston a vertical reciprocatory movement, which movement is transmitted to the post whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand around the pattern; substantially as described.

7. In a molding-machine, the combination of a jarring-block, a casing having guides on its inner surface, a cover fitting over and around said casing, a cross-head within said casing connected to said cover and adapted to slide on said guides, a post within said casing connected to said cross-head, a pattern-plate carrying a pattern connected to said cover, a stripping-plate carrying a flask supported by said pattern-plate around the pattern, a power-cylinder having its piston connected to said post, valve mechanism for said cylinder, and mechanism whereby said valve mechanism is automatically operated to admit fluid to the cylinder to impart to the piston a vertical reciprocatory movement, whereby said post is caused to strike against the jarring-block for the purpose of compacting the sand in the flask around the pattern; substantially as described.

8. In a molding-machine, the combination of a jarring-block, a casing having guides on its inner surface, a cover fitting over and around said casing, a cross-head within said casing connected to said cover and

adapted to slide on said guides, a post within said casing connected to said cross-head, a pattern-plate carrying a pattern connected to said cover, a stripping-plate carrying a flask supported by said pattern-plate around the pattern, a power-cylinder having its piston connected to said post, valve mechanism for said cylinder, a bar connected to said cross-head, and a lever pivoted on the cylinder and connected to said rod and to said valve mechanism whereby said valve mechanism is automatically operated to admit fluid to the cylinder to impart to the piston a vertical reciprocatory movement whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand around the pattern; substantially as described.

9. In a molding-machine, the combination of a jarring-block, a casing, a post within said casing having a pattern-plate thereon carrying a pattern, a stripping-plate supported by the pattern-plate and carrying a flask, a power-motor contained within said casing and directly connected to said post for imparting a vertical reciprocatory movement to the post and to the pattern-plate, pattern, stripping-plate and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern; and mechanism for engaging with said stripping-plate to raise the same and the flask from around the pattern; substantially as described.

10. In a molding-machine, the combination of a jarring-block, a casing, a post within said casing having a pattern-plate thereon carrying a pattern, a stripping-plate supported by the pattern-plate and carrying a flask, a power-motor contained within said casing and directly connected to said post for imparting a vertical reciprocatory movement to the post and the pattern-plate, pattern, stripping-plate and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern, vertically-movable lifting-bars adapted to engage with said stripping-plate to raise the same and the flask from around the pattern, and mechanism for operating said lifting-bars; substantially as described.

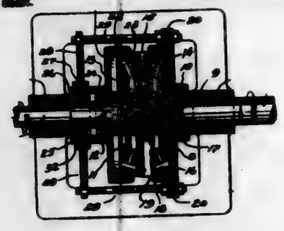
11. In a molding-machine, the combination of a jarring-block, a casing, a post within said casing having a pattern-plate thereon carrying a pattern, a stripping-plate supported by the pattern-plate and carrying a flask, a power-motor contained within said casing and directly connected to said post for imparting a vertical reciprocatory movement to the post and to the pattern-plate, pattern, stripping-plate and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern, vertically-movable lifting-bars adapted to engage with said stripping-plate to raise the same and the flask from around the pattern, gear-racks on said lifting-bars, and gear-wheels meshing with said gear-racks for lifting and lowering said lifting-bars; substantially as described.

12. In a molding-machine, the combination of a jarring-block, a casing, a post within said casing having a pattern-plate thereon carrying a pattern, a stripping-plate supported by the pattern-plate and carrying a flask, a power-motor connected to said post for imparting a vertical reciprocatory movement to the post and to the pattern-plate, pattern, stripping-plate and flask carried thereby and partaking of the movements thereof, whereby said post is caused to strike against said jarring-block for the purpose of compacting the sand in the flask around the pattern, vertically-movable lifting-bars adapted to engage with said stripping-plate to raise the same and the flask from around the pattern, gear-racks on said lifting-bars, gear-wheels meshing with said gear-racks for operating said lifting-bars, a ratchet-wheel on said shaft, and a pawl engaging with said ratchet-wheel for holding said lifting-bars in their elevated position; substantially as described.

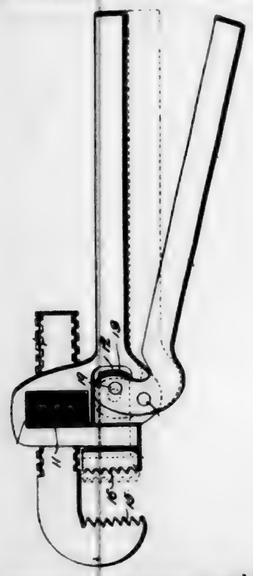
13. In a molding-machine, the combination of a jarring-block, a casing, a post within said casing having a pattern-plate thereon carrying a pattern, a stripping-plate supported on the pattern-plate around the pattern and carrying a flask, mechanism connected to said post for imparting a vertical reciprocatory movement to said post, pattern-plate, pattern, stripping-plate and flask, whereby said post is caused to strike against said jarring-block, vertically-moving lifting-bars for engaging said stripping-plate to raise the same and flask, gear-racks on said lifting-bars, gear-wheels meshing with said gear-racks for operating said lifting-bars, a ratchet-wheel, a spring-operated pawl for engaging with said ratchet-wheel to hold said lifting-bars in their raised position, and a pivoted lever adapted to come in contact with said pawl for holding the same in engagement with said ratchet-wheel; substantially as described.

706,752. REVERSING-GEAR. THOMAS HOLLIDAY, Chicago, Ill. Filed July 11, 1901. Serial No. 67,041. (No model.)

Claim.—In a reversing-gear, the combination of a frame; a driving-shaft journaled in said frame; a driven shaft journaled in said frame in line with said driving-shaft; a gear rigidly secured to said driving-shaft; a second gear rigidly secured to said driven shaft; a wheel loosely journaled on one of said shafts and between said gears, the outer face of its rim being substantially the frusta of two cones placed base to base; a gear journaled within said wheel and in mesh with the gears on said shafts; a flange having an inner conical face concentric with the shafts, adapted to fit the adjacent part of the face of said wheel, said flange having thereon a lug engaging said frame whereby said flange is secured against rotation but slidable longitudinally of said shafts; a second flange having an inner conical face concentric with the shafts, adapted to fit the adjacent part of the face of said wheel, said secured to the other shaft so as to be longitudinally slidable thereon and revolvable therewith; suitable connection between said flanges for maintaining a constant distance between same; and means for controlling the position of said flanges longitudinally of said shaft.



706,753. PIPE-WRENCH. WILLIAM HOLKER, Parkersburg, W. Va. Filed Mar. 5, 1902. Serial No. 97,331. (No model.)

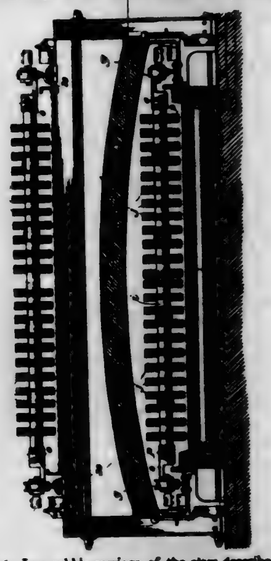


Claim.—In a wrench, a stock having an enlarged end provided with a longitudinal and a transverse aperture intersecting each other, a longitudinally-slidable jaw and an operating-nut for the same mounted in said apertures, a longitudinally-slidable nether jaw mounted in a longitudinal recess at the front end of and in alinement with the stock, and an operating-lever pivotally connected with the latter and having pivotal connection with the nether jaw through an opening formed transversely in the stock, substantially as set forth.

706,754. WAGON-POLE CAP. PATRICK HOLMSTROM, Hancock, Minn., assignor of one-half to William Ramsey Craig, St. Paul, Minn. Filed May 1, 1902. Serial No. 105,502. (No model.)

Claim.—The combination with a wagon-pole, of a sleeve on the end thereof carrying a fin on its under side extending downwardly at an angle to the sleeve and terminating in an eye-shaped hook having an L-shaped seat on its inner upper edge, a pair of spaced lugs formed integral with the end of the sleeve between the top and bottom thereof, a tongue pivotally secured between said lugs and having its free end engaging in said seat on the hook, the inward movement of the tongue being limited by the outer end of the sleeve, and a spring secured to the tongue engaging over the head thereof and having its free end engaging between said lugs and the end of the sleeve, substantially as described.

706,755. RABBLE-CARRIAGE. DANIEL C. JACKLING, Republic, Wash. Filed Aug. 2, 1901. Serial No. 70,643. (No model.)



Claim.—1. In a rabble-carriage of the class described, the combination of a body portion provided with a pair of bars extending longitudinally thereof, a pair of wheel-washers secured in position between the ends of the pair of bars to form a ball-raceway, an annular wheel-rim surrounding said washers and completing the raceway, and a plurality of antifriction-balls interposed between the washer and wheel-rim, substantially as described.

2. In a rabble-carriage of the class described, the combination of a body portion provided with a pair of longitudinal bars, a pair of trolley-wheels mounted between the ends of the longitudinal bars, a laterally-projecting tubular portion made in two parts, means for clamping said parts together, and a rabble-bar secured in said clamping tubular portion, substantially as described.

3. In a rabble-carriage of the class described, the combination of a body portion provided with a pair of longitudinal bars, a pair of trolley-wheels—one mounted between each end of the longitudinal bars, a laterally-projecting tubular portion made in two parts extending inwardly from each carriage, means for clamping said parts together, a tubular rabble-bar mounted in the clamping portions of the carriage, and rabble-blades secured to said tubular bar extending upwardly and downwardly therefrom and at an angle to their line of motion, substantially as described.

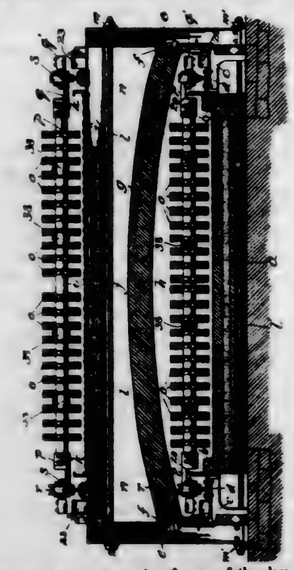
4. In a rabble-carriage of the class described, the combination of a body portion provided with a pair of longitudinal bars, trolley-wheels composed of fixed washers and movable wheel-rims and antifriction-balls interposed between the same and secured between each end of the parallel bars, a laterally-projecting tubular portion on each body portion made in two clamping parts—one movable and one fixed, bolt-and-nut mechanism for securing said parts together, a tubular rabble-bar, rabble-blades on said tubular rabble-bar extending upwardly and downwardly therefrom and provided with a cylindrical hub portion, and dowel mechanism for securing the rabble-carriage and rabble-blades to the tubular bar so as to prevent their having independent motions, substantially as described.

5. In a rabble-carriage of the class described, the combination of a body portion provided with trolley-wheels, an outwardly and laterally extending arm provided with a recess, a sprocket-chain, and clip mechanism removably secured in said recess for attaching and detaching the sprocket-chain thereto and therefrom, substantially as described.

6. In a rabble-carriage of the class described, the combination of a body portion provided with trolley-wheels, laterally-extending arms forming a part thereof and extending outwardly therefrom provided with a shouldered recess in one surface thereof, a sprocket-chain, a pair of T-shaped clips removably secured in said recess, a block interposed between the ends of each clip, and bolt-and-nut mechanism for securing the clips and laterally-projecting arm of the rabble-carriage together, substantially as described.

7. In a rabble-carriage of the class described, the combination of a body portion provided with a pair of flanged trolley-wheels, a bar detachably secured thereto and provided with a plurality of rabble-blades, a second carriage provided with a pair of trolley-wheels having smooth peripheral cylindrical surfaces to permit expansion and contraction of the tubular bar, a laterally-projecting tubular portion on each of said body portions made in two clamping parts—one movable and one fixed—on which the rabble-bars are detachably secured, and bolt-and-nut mechanism for securing said parts together substantially as described.

706,756. ORE-ROASTING FURNACE. DANIEL C. JACKLING, Republic, Wash. Filed Aug. 2, 1901. Serial No. 70,644. (No model.)



Claim.—1. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, tracks arranged parallel therewith, and means for supporting said tracks independent of the ore-roasting hearth, substantially as described.

2. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above the ore-roasting hearth, tracks arranged parallel with and outside of both said hearths, and means for supporting the track mechanism and cooling-hearth independently of the roasting-hearth, substantially as described.

3. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above said ore-roasting hearth, an arched wall forming the roof of the ore-roasting chamber, a pair of tracks arranged parallel with and outside of each of said hearths, and a plurality of brackets and side posts supporting said track, cooling-hearth and arched roof independent of the ore-roasting hearth, substantially as described.

4. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above the ore-roasting-hearth, a pair of tracks arranged outside of and

parallel with both hearths, rabble mechanism movably mounted on such tracks, a plurality of side posts supporting the cooling-hearth independent of the ore-roasting hearth and formed of channel-irons arranged back to back with their web portions transverse of the furnace, and a plurality of side brackets secured to each side posts to support the tracks outside of the ore-roasting hearth and independent thereof, substantially as described.

5. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above the ore-roasting hearth, a pair of tracks arranged outside of and parallel with both of such hearths, a pair of rabble-tracks oppositely mounted upon such tracks and connected together by a rabble-supporting bar, rabble mechanism on such supporting-bar, link belts connecting together the rabble-tracks on each side of both such hearths in a continuous manner, driving-shaft mechanism provided with sprocket-wheels for operating such link belts, and flanged pulleys to receive the rabble-tracks as they leave one track and convey them opposite to and in alinement with the other set of tracks, substantially as described.

6. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above the ore-roasting hearth, a pair of tracks arranged outside of and parallel with both of such hearths, a pair of rabble-tracks oppositely mounted upon such tracks and connected together by a rabble-supporting-bar, rabble mechanism on such supporting-bar, link belts connecting together the rabble-tracks on each side of both such hearths in a continuous manner, driving-shaft mechanism provided with sprocket-wheels for operating such link belts, flanged pulleys to receive the rabble-tracks as they leave one track and convey them opposite to and in alinement with the other set of tracks, a hinged door at the discharge end of the ore-roasting hearth, and bumper mechanism on the rabble-bars to contact such hinged door and hold it open as the rabble mechanism is passed out of the same, substantially as described.

7. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above the same, a hinged door arranged at each end of the ore-roasting hearth, a hopper provided with a hinged chute or apron arranged at the receiving end of the cooling-hearth to discharge the roasted material thereon, a pair of tracks arranged outside of and parallel with both of such hearths, a plurality of rabble-tracks oppositely mounted on each of such pairs of tracks, a pair of link belts connecting each rabble-tracks together in a continuous manner, rabble-supporting bars connecting each pair of tracks together, rabble mechanism on each bars for agitating and moving the material along both of such hearths, means for transferring the rabble mechanism from one pair of tracks to the other, bumper mechanism on such rabble-supporting bars to contact with the hinged doors and apron to raise the same and hold them in raised position until the rabble mechanism passes thereunder, and an endless flexible conveyor to receive the material from the ore-roasting chamber and convey it into the hopper at the end of the cooling-hearth, substantially as described.

8. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above the same, a hinged door arranged at each end of the ore-roasting hearth, a hopper provided with a hinged chute or apron arranged at the receiving end of the cooling-hearth, a pair of tracks arranged outside of and parallel with both of such hearths, a plurality of rabble-tracks oppositely mounted on each of such pairs of tracks, a pair of link belts connecting such rabble-tracks together in a continuous manner, rabble-supporting bars connecting each pair of tracks together, rabble mechanism on such bars for agitating and moving the material along both of such hearths, means for transferring the rabble mechanism from one pair of tracks to the other, bumper mechanism on such rabble-supporting bars to contact with the hinged doors and apron to raise the same and hold them in raised position until the rabble mechanism passes thereunder, an endless flexible conveyor to receive the material from the ore-roasting chamber and convey it into the hopper from which it is discharged onto the cooling-hearth, a boot arranged adjacent to the receiving end of the ore-roasting hearth to be contacted by the rabble mechanism and move the material therein into and upon the ore-roasting hearth, a trough arranged at the discharge end of the cooling-hearth, and a screw conveyor in such trough to discharge the cooled product therefrom, substantially as described.

9. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel with and above the same, a hinged door arranged at each end of the ore-roasting hearth, a hopper provided with a hinged chute or apron arranged at the receiving end of the cooling-hearth, a pair of tracks arranged outside of and parallel with both of such hearths, a plurality of rabble-tracks oppositely mounted on each of such pairs of tracks, a pair of link belts connecting such rabble-tracks together in a continuous manner, rabble-supporting bars connecting each pair of tracks together, rabble mechanism on such bars for agitating and moving the material along both of such hearths, means for transferring the rabble mechanism from one pair of tracks to the other, bumper mechanism on such rabble-supporting bars to contact with the hinged doors and apron to raise the same and hold them in raised position until the rabble mechanism passes thereunder, an endless flexible conveyor to receive the material from the ore-roasting chamber and convey it into the hopper from which it is discharged onto the cooling-hearth, a boot arranged adjacent to the receiving end of the ore-roasting hearth to be contacted by the rabble mechanism and move the material therein into and upon the ore-roasting hearth, a trough arranged at the discharge end of the cooling-hearth, a screw conveyor in such trough to discharge the cooled product therefrom, and means for driving the operative mechanisms, substantially as described.

10. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a pair of tracks arranged parallel with and outside of the same, rabble-tracks provided with rabble mechanism mounted upon such tracks for agitating and moving material along the ore-roasting hearth, link-belt mechanism connected with such rabble-tracks to operate them in a continuous manner, shafts provided with sheave and sprocket wheels for operating such link belts, a main driver connected with one of such shafts, slide mechanism upon which at least one of said shafts is mounted, and means for operating such slides and moving the shaft, should the link belt break, to disconnect the operative mechanism and stop the machine, substantially as described.

11. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a pair of tracks arranged outside of and parallel with the ore-roasting hearth, rabble-tracks provided with rabble mechanism mounted on such tracks for agitating and moving the material along such hearth, link belts connecting such tracks for operating them in a continuous manner, driven shafts provided with sheave and sprocket wheels for operating the link belts, a main driver geared with at least one of the said shafts, slide-block mechanism in which one of the said shafts has its bearing, and a weighted chain connected with such sliding block to keep the link belt under tension and operate such sliding block, should either one or both the link belts become broken, to contact the driving mechanism and disengage it from the sprocket-driving mechanism, substantially as described.

12. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a pair of tracks arranged parallel with and outside of such hearth, a cooling-hearth arranged parallel with and above the ore-roasting hearth, a pair of tracks arranged parallel with and outside of the cooling-hearth, a plurality of rabble-tracks provided with rabble mechanism for agitating the moving material along both of such tracks, a pair of link belts connecting the rabble-tracks together in a continuous manner, a plurality of shafts provided with sheave and sprocket wheels for holding and driving the pair of link belts, a pair of slide-blocks supporting one of such shafts, a counter-shaft connected with one of the said shafts to transmit power and motion thereto, means for driving such counter-shaft, shipper mechanism for throwing the driving means into and out of engagement with the driving-shaft, and a weighted chain or similar element connected with the slide-blocks to hold the link belts under tension and, should either or both of such belts break, contact the shipper mechanism and disengage the driving means from the counter-shaft, substantially as described.

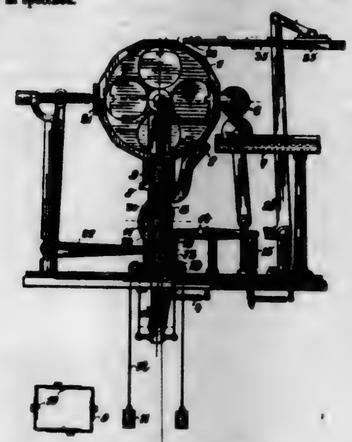
13. In an ore-roasting furnace of the class described, the combination of an ore-roasting hearth, a cooling-hearth arranged parallel therewith, a pair of tracks arranged outside of and parallel with such hearths, rabble-tracks provided with rabble mechanism mounted upon such tracks and provided with outwardly-extending arms q', endless chains connected to such rabble-tracks at or near the outer edge thereof, a pair of sheave-pulleys provided with and mounted on rotatable shafts at each end of the furnace having annular flanges inclined inwardly at the outer edges thereof arranged to be contacted by the outwardly-extending arms q' of the rabble-tracks thereby centering the rabble-tracks as they are passed from one hearth to the other, and means for driving the operative mechanisms, substantially as described.

706,757. MACHINE FOR COATING LABELS WITH ADHESIVE. FRED R. JAGENBERG and RICHARD HÖPFLER, Düsseldorf, Germany. Filed Feb. 11, 1902. Serial No. 93,512. (No model.)

Claim.—1. In a machine for coating labels with an adhesive, the combination of an intermittently-rotated drum, with gluing-rolls in contact therewith, means for feeding labels to the drum, and a gripper for taking the labels off the drum, substantially as specified.

2. In a machine for coating labels with an adhesive, the combination of an intermittently-rotated drum, with gluing-rolls in contact therewith, a notched disk and belt for locking the drum, a label-magazine, means for moving said magazine toward and away from the drum, and a gripper for taking the labels off the drum, substantially as specified.

3. In a machine for coating labels with an adhesive, the combination of an intermittently-rotated drum, with gluing-rolls in contact therewith, means for feeding labels to the drum, a sliding gripper for taking the labels off the drum, and means for guiding the sliding gripper, substantially as specified.



706,758. GOLF-BALL. ELMER KIMBALL, Boston, Mass. Filed June 14, 1902. Serial No. 111,703. (No model.)

Claim.—1. In a playing-ball, the combination of a center piece; a multitude of windings thereon of extremely thin and highly-tensioned approximately pure acid-cured sheet-rubber, said windings forming a solid body, and a cover formed of plastic material; said cover holding said rubber under compression, and said center piece consisting of undistended segments of molded elastic material drawn together at their edges by said windings.

2. In a playing-ball, the combination of a center piece, a multitude of windings thereon of extremely thin and highly-tensioned acid-cured sheet-rubber, said windings forming a solid body of spherical form and adhering to one another; and a shell of gutta-percha holding said body under compression; said center piece consisting of a hard sphere and a molded rubber elastic shell thereon.

3. A playing-ball comprising a small hard center piece; a small sphere of solid molded soft rubber thereon; a substantially solid materially larger spherical body upon said soft-rubber sphere and consisting of windings of extremely thin and highly-tensioned acid-cured sheet-rubber; and a shell or cover of plastic material.

4. In a playing-ball, the combination of a center piece; adherent windings thereon of thin and highly-tensioned acid-cured sheet-rubber, and a cover of gutta-percha upon said rubber; said windings forming such a proportion of the ball as to enable it to float in water, and said center piece comprising a celluloid sphere and a shell of solid soft rubber thereon.

5. A playing-ball comprising a hard sphere 1 of between twenty-five and thirty-five per cent. of the diameter of the ball; a sphere upon said sphere 1 and consisting of soft rubber, the diameter of said soft-rubber sphere being between thirty-five and forty-five per cent. of the diameter of the ball; a substantially solid sphere 4 upon said soft-rubber sphere and consisting of a multitude of extremely thin and highly-tensioned approximately pure acid-cured sheet-rubber, the diameter of said sphere 4 being between seventy and ninety per cent. of the ball; and a gutta-percha shell or cover.

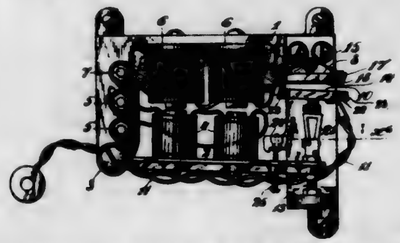
6. In a playing-ball, the combination of a sphere of celluloid, a sphere of solid molded rubber tensioned thereon; a multitude of windings of extremely thin and highly-tensioned approximately pure acid-cured sheet-rubber upon said sphere, and a shell of plastic material.

7. In a playing-ball, a center piece compounded of celluloid and solid soft rubber, a solid body thereon consisting of windings in miscellaneous directions of highly-tensioned acid-cured sheet-rubber, each of said windings being not more than four one-thousandths of an inch in thickness; and a cover of wear-resisting material upon said body.

8. In a playing-ball, the combination of a solid body of spherical form and provided with a center piece, and consisting of miscellaneous coherent windings of highly-tensioned approximately pure acid-cured sheet-rubber, each of said windings being not more than four one-thousandths of an inch in thickness, and a shell of gutta-percha holding said windings under compression; said center piece consisting of a hard sphere and undistended segments of solid soft rubber drawn together at their edges by said windings.

9. A playing-ball comprising a hard sphere 1 whose diameter is thirty per cent. of the diameter of the ball; a soft-rubber sphere upon said hard sphere, the diameter of said soft-rubber sphere being forty per cent. of the entire ball; a substantially solid sphere 4 upon said soft-rubber sphere and consisting of a multitude of windings of extremely thin and highly-tensioned approximately pure acid-cured sheet-rubber, the diameter of said sphere 4 being eighty-five per cent. of that of the entire ball and each of said windings being not more than four one-thousandths of an inch in thickness; and a gutta-percha shell holding said sphere 4 under compression; substantially as set forth.

706,759. ELECTRICAL SWITCH OR CUT-OFF. PATRICK KENNEDY, Brooklyn, N. Y. Filed Dec. 4, 1901. Serial No. 84,632. (No model.)



Claim.—1. An electrical circuit-closing device having a sheet of metallic gauze over the face of one of its terminals.

2. An electric circuit-closing device having a flat-faced metal contact-terminal, and having a spring 16, carrying at its respective ends carbon contact-blocks 18, which are advanced, normally, slightly beyond the face of the metal terminal, in combination with another contact-terminal, coöperating with the first and having a metal face and two carbon blocks, substantially as set forth.

3. An electric circuit-closing device having a substantially fixed or non-moving contact-terminal, a lever-arm, and a contact-terminal carried by said arm, said terminal being carried by a stem having its axis perpendicular to the face of the contact and composed of spring-like supporting-plates grouped substantially as set forth.

4. In an electrical circuit-closing device, the combination with the substantially fixed contact-terminal, having a flat face covered with wire-gauze, and provided with a yielding carbon contact which is normally advanced beyond the face of the metal terminal, of the movable contact-terminal of metal provided with a carbon contact adapted to contact with the yielding carbon of the non-moving terminal when the circuit is closed, substantially as and for the purpose set forth.

5. The combination with the lever-arm, of the moving terminal, and the laterally-yielding support for the latter on said lever-arm, said support comprising the two spring-like supporting-plates 19, and the two spring-plates 21, all arranged and constructed substantially as set forth.

6. An electrical circuit-closing device having a flat-faced metal terminal, the face of which is covered with wire-gauze, and having a spring 16, carrying at its ends carbon contact-blocks 18, which are advanced, normally, slightly beyond the face of the metal terminal, in combination with another contact-terminal having a metal face and two carbon contact-blocks, substantially as set forth.

7. An electric circuit-closing device having two coöperating terminals of metal with relatively extended contact-surfaces, one of said terminals having metallic gauze over its face and the other having its face cross-grooved, substantially as set forth.

8. In an electrical switch, the combination with a terminal contact-piece and the part which carries it, of an intermediate support for said

contact-piece, comprising the two spring-plates 21, secured to the carrying part and contact-piece at their respective ends, and the two spring-plates 19, secured to only one of said parts, substantially as set forth.

706,760. HYDRAULIC FIREPROOF CEMENT. WILLIAM B. KNOX, Newark, N. J. Filed July 10, 1901. Serial No. 68,422. (No specimens.)

Claim.—An improved hydraulic cement comprising the following ingredients necessary to produce one hundred pounds of cement, viz. silica, twenty-four pounds, alumina six and one-half pounds, magnesia, five pounds, lime, sixty pounds, muriatic acid, three pounds, iron oxid, one and one-half pounds.

706,761. GAS-BURNER. JOHN G. KOEHLE, Columbus, Ohio. Filed Jan. 2, 1902. Serial No. 88,112. (No model.)

Claim.—1. A burner consisting of an elongated hollow body the interior upper portion of which tapers upwardly, on curved lines, to form a reduced longitudinal ridge which is provided with a row or series of burner-openings; whereby as the combustible mixture within the burner ascends in the chamber thereof it will be compressed and caused to issue from said burner-openings with more force than would otherwise occur; said burner-body having at its lower part one or more depending frusto-conical mixing-chambers into which the gas is conducted, said mixing-chambers being each provided, near its base, with side openings for the admission of air; and the said burner-body having, above the inlet of each mixing-chamber, a baffle-plate, *f*, to equalize the pressure of the combustible gaseous mixture within the chamber of the said burner.

2. A burner consisting of an elongated hollow body to form a main receiving-chamber for the combustible material, the interior upper part of said body tapering upwardly on curved lines, to form an auxiliary distributing-chamber having the form of a reduced longitudinal ridge surmounting the main chamber, said ridge being provided with a row or series of burner-openings at its apex; whereby as the combustible mixture within the burner ascends into the said distributing-chamber it will be compressed and caused to issue from said burner-openings at the apex of the ridge with more force than would otherwise occur; the body of said burner being provided at its opposite ends with exterior supports to be engaged by holders.

3. A burner, consisting of a longitudinal hollow body the interior upper portion of which tapers upwardly on curved lines, to form a reduced longitudinal ridge which is provided with a row or series of burner-openings; whereby as the combustible mixture within the burner ascends in the chamber thereof it will be compressed and caused to issue from said burner-openings with more force than would otherwise occur; the body of said burner being provided at its opposite ends with circular exterior supports so that the burner may be pivotally mounted in suitable holders.

4. The combination in a burner, of an elongated body containing a main receiving-chamber for the combustible mixture, an upper central longitudinal ridge surmounting said body and containing a distributing-chamber, said ridge having burner-openings formed in its apex and having at its ends journals or pivotal supports, and holders in which said burner-body is mounted so that it may be turned to give said burner any desired inclination or chest.

5. A burner consisting of a cast-metal elongated body *a* having an integral depending and upwardly-tapering mixing-chamber *b* provided at or near its base with transverse air-openings *c* and with a gas-opening *d*, said burner being provided with an interior horizontal spreader above the opening with which the said mixing-chamber communicates with the interior of the burner, and the said burner being upwardly tapered transversely at its top portion, both interiorly and exteriorly, to form a reduced part or ridge which is provided with burner-openings.

706,762. WINDOW-SCREEN. MAX KOLF, St. Louis, Mo., assignor to Emil J. Blumz and John A. Bednarzick, St. Louis, Mo. Filed Apr. 15, 1902. Serial No. 102,936. (No model.)

Claim.—In a window-screen, the combination with the parting-strips 7; of the extension-pieces 8; the brackets 9 and 10 attached to the lower corners of the window-sash and extending outwardly and laterally to points in front of the extension parting-strips 8; the roller 11 mounted in the brackets; the clock-spring 12 connecting the roller to one of the brackets; the fly-screen 13 attached to the roller and adapted to be wound thereon; the stiffening-bars 14 and 15 attached to the lower edge of the fly-screen, one on each side thereof; brackets 17 attached to the window-casing; and hooks 18 extending outwardly from the brackets through the screen, and rigidly engaging the bars 14 and 15; substantially as specified.

706,763. BOX-JOINT. REINHOLD A. LAMBE, St. Louis, Mo. Filed Mar. 6, 1902. Serial No. 96,888. (No model.)

Claim.—1. In a box, the combination of side pieces having alternated mortises and tenons at their ends slanting downwardly, end pieces having alternated mortises and tenons at their sides interlocking with those on the side pieces and slanting upwardly, and grooves in said end pieces in which keys or wedges are inserted.

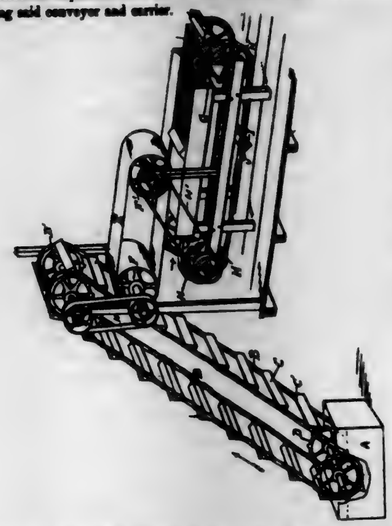
2. In a box, the combination of side and end pieces having interlocking beveled mortises and tenons those on the end pieces being slanted oppositely to those on the sides, transverse grooves in said end pieces, and wedge-shaped keys located in said grooves when the box is assembled.

3. In a box, the combination of side and end pieces having mortises and tenons, tenons on the bottom which fit into grooves in said end pieces, said grooves being wider than the tenons fitting therein to, and keys fitting into the extra width of said grooves.

4. In a box, the combination of side pieces having downwardly-inclined mortises and tenons, and pieces having transversely upwardly inclined mortises and tenons interlocking therewith, a bottom having a tenon at each end the extremity of which is thicker than its piece of union with said bottom piece, a groove in each of said end pieces in the lower part thereof, said groove being deeper at its bottom than at its opening, wedge-shaped keys extending through said grooves, resting on said tenons at each end of the bottom piece, said keys being inserted in place through holes in the tenons of the end pieces registering with mortises in the side pieces after the box is assembled.

706,764. FISH-FLAKING MACHINE. EDWARD H. LAWRENCE, Lubec, Me. Filed Dec. 12, 1901. Serial No. 86,783. (No model.)

Claim.—1. In a fish-flaking machine, a tank adapted to contain fish suspended in liquid, an endless conveyor provided with a series of buckets adapted to take the fish from said tank, an endless carrier adapted to carry fish-drying flakes removably mounted thereon, means for preventing accidental displacement of the flakes on the carriage, and means for rotating said conveyor and carrier.

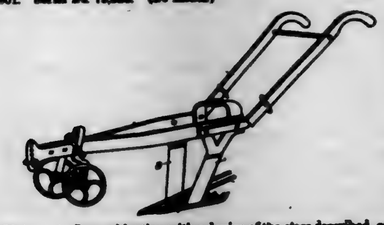


2. In a fish-flaking machine, a tank adapted to contain fish suspended in liquid, an endless conveyor provided with a series of buckets adapted to take the fish from said tank, an endless traveling apron adapted to receive the fish delivered by the buckets and spread them evenly, a carrier adapted to carry fish-drying flakes removably mounted thereon and to have an onward motion in a position to receive on said flakes the fish delivered by said apron and means for operating said conveyor, apron and carrier.

3. In a fish-flaking machine, a tank adapted to contain fish suspended in liquid, an endless conveyor provided with a series of buckets adapted to take the fish from said tank, a carrier-table, an endless carrier adapted to traverse said table, removable flakes supported on said carrier and positioned to receive the fish delivered by the buckets, means for preventing the fish from falling upon the flake-frame, and means for operating said conveyor and carrier.

4. In a fish-flaking machine, a tank adapted to contain fish suspended in liquid, an endless conveyor provided with a series of buckets adapted to take the fish from said tank, a carrier-table having inclined side guards, an endless carrier adapted to traverse said table and having inverted-V-shaped transversely-positioned guards spaced apart the length of a flake, removable flakes supported on said carrier, the frame of the flake being hidden by said guards and means for operating said conveyor and carrier.

706,765. SUGAR-BEET PLOW. JOHN T. LEUTHEUSER and JOHN G. SCHMIDT, Frankenlust township, Bay county, Mich. Filed Oct. 22, 1901. Serial No. 79,093. (No model.)



Claim.—1. In combination with a device of the class described, comprising a frame carrying a pair of supports having shoes on their lower ends extending in advance and in the rear of the supports; inclined lifting-bars secured at their forward ends to the forward part of said shoes and having their rear portions supported from the shoes by adjustable means connecting said bars and shoes whereby the inclination of the bars may be adjusted.

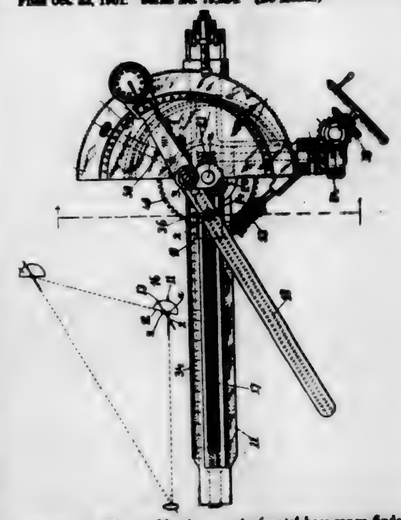
2. In combination with a device of the class described, comprising a pair of supports having shoes mounted on their lower ends; a pair of inclined lifting-bars having their front ends removably secured to said shoes, together with means for raising or lowering the rear ends of said bars.

3. In combination with a device of the class described, comprising a pair of standards having shoes mounted on their lower ends; inclined lifting-bars having their front ends removably secured to said shoes, together with a curved link for raising or lowering the rear end of each bar, and means for clamping said link to the shoe, substantially as described.

4. A digging device for plows of the class described, comprising a pair of digging-shoes, a pair of inclined lifting-bars each having near its front end a downwardly-projecting finger to engage a socket in the shoe; together with a curved link for raising or lowering the rear end of each bar, and a bolt for clamping said link to the shoe.

5. A digging device for plows of the class described, comprising a pair of digging-shoes, a pair of inclined lifting-bars each having near its front end a downwardly-projecting curved finger to engage a curved socket in the shoe; together with a curved link for raising or lowering the rear end of each bar, and a bolt for clamping said link to the shoe, substantially as described.

706,766. RANGE-FINDER. ISAAC N. LEWIS, Washington, D. C. Filed Oct. 22, 1901. Serial No. 79,094. (No model.)



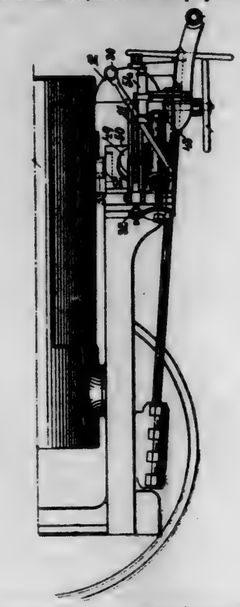
Claim.—1. The combination, in a horizontal-base range-finder, of a base-piece having an arm or bar adapted to be traversed correspondingly with the changing azimuth position of a target, a sector having a base-line corresponding to the line of orientation, and intermediate mechanism operating on the sector to maintain the relation of its base-line to the line of orientation during the traverse of the base-piece, substantially as described.

2. In a horizontal-base range-finder, the combination of a sector having an azimuth-scale, a bar adapted to be swung according to the changing position of the target in azimuth and mounted or supported together with the sector so that when the bar is swung the base-line of the sector will tend to be moved with it, an angle-measuring arm pivoted on said sector and connected with the former bar by a pivotal and sliding connection, and mechanism for maintaining the position of the base-line of said sector and bar during the swinging of the support in azimuth substantially as described.

3. In a horizontal-base range-finder, the combination of a sector having an azimuth-scale, two angle-measuring bars pivotally connected to the base-line of said sector, means operating on the sector to maintain the relation of its base-line to the line of orientation during the traverse of the instrument, and an adjustable coupling in the operating mechanism adapted to permit readjustment in accordance with changes in location of the termini of the base-line with which the instrument is used, as and for the purpose described.

706,767. AUTOMATIC RANGE-FINDING SIGHT FOR CANNON. ISAAC N. LEWIS, Washington, D. C. Filed Oct. 22, 1901. Serial No. 79,095. (No model.)

Claim.—1. The combination with a gun, of a horizontal-base range-finder having an adjustable member or members adapted to be set to angles corresponding to the angles at the gun and distant observing-stations respectively, and training mechanism for the gun connected with said adjustable member or members, as and for the purpose described.



2. The combination with a gun and the elevating mechanism therefor, of a horizontal-base range-finder having its adjustable member or members connected with the elevating mechanism, so that in the act of bringing the adjustable member or members to position corresponding to the observed angle at the distant station the gun will be automatically sighted upon the target.

3. The combination with elevating mechanism for a gun, of a horizontal-base range-finder having two coördinately-operating arms or devices, one adapted to be set according to the traverse of the gun in azimuth, and the other to be set or adjusted according to the transmitted horizontal angle sent from another observing-station, and operating devices connected with said arms or devices at the point of intersection and with the elevating mechanism, as and for the purpose described.

4. The combination of a gun, with an elevating mechanism having a transmitting cam or curve plotted or calibrated according to the variable elevation required for different ranges, and a horizontal-base range-finder, whose coördinately-operating parts are connected with the elevating mechanism of the gun.

5. An automatic sighting apparatus for guns comprising an azimuth indicator or sector whose base-line corresponds to a base-line connecting the gun and observing-station, and mechanism for elevating the gun connected with the azimuth-indicator, and having a transmission-gear plotted according to the elevation required for different ranges.

6. The combination with a gun, of a horizontal-base range-finder mounted on the gun-carriage, an angle-measuring arm or bar for the range-finder, and means to automatically change the angular rotation of said arm to the base-line of the range-finder in the act of traversing the gun.

7. The combination with a gun, of a range-finder mounted to swing in azimuth therewith and comprising a sector, an indicator-arm adapted to be adjusted over a scale of angles on said sector, and means for maintaining the relation of the sector base-line to the line of orientation during the swinging of the gun in azimuth.

8. The combination with a gun, of a horizontal-base range-finder having its base-line portion pivotally mounted with relation to the gun-carriage, means for traversing the gun, and intermediate mechanism for turning the base-line portion of the range-finder so as to maintain the position of said line with relation to the line of orientation.

9. The combination substantially as described with a gun, of a horizontal-base range-finder having two coördinately-operating arms or devices, one adapted to be set as desired according to the azimuth of the target at the gun-station, and the other to be set or adjusted according to the transmitted horizontal angle sent from another observing-station, and mechanism connecting the shiftable point of intersection of said arms with the elevating devices for the gun.

10. The combination with a gun, of an elevating mechanism provided at some point in its transmission-gear with a transmission-cam calibrated or plotted with reference to the variable elevation required for different ranges.

11. The combination with a gun and its elevating mechanism, of interchangeable transmission-cams plotted or calibrated with reference to varying muzzle velocities of projectiles to be discharged by the gun.

12. The combination with a gun, of a horizontal-base range-finder having parts adapted to represent in miniature the elements of a triangle whose base is the line between the gun-station and an observing-station, and whose sides are respectively lines joining the gun and the distant observing-station with the target, and means for automatically shifting the base-line portion of the instrument when the gun is turned in traverse.

13. The combination with a gun, of a horizontal-base range-finder having parts adapted to represent in miniature the elements of a triangle whose base is the line between the gun-station and an observing-station, and whose sides are respectively lines joining the gun and the distant observing-station with the target, and means for automatically setting the parts to angular position corresponding to the angle between the base-line and the line joining the gun and target when the gun is traversed to direct it upon the target.

14. The combination with a gun, of a horizontal-base range-finder having two adjustable angle-measuring arms or members adjustable with reference to a common base-line representing the base between a distant observing-station and the gun, means for automatically adjusting one of said arms with reference to the base-line in traversing the gun, and means for automatically adjusting the other arm in the act of changing the elevation of the gun.

15. The combination with a gun, of a horizontal-base range-finder mounted on the gun-carriage and comprising two adjustable angle-measuring arms or members adapted to be adjusted with reference to a common base-line representing the base between the gun and a distant observing-station, means for automatically adjusting one of said members in the operation of traversing the gun, and means for adjusting the other member according to the azimuth angle transmitted from the distant station.

706,768. SOFT-TREAD HORSESHOE. BURTON P. MARSLEY, Brooklyn, N. Y. Filed Jan. 23, 1902. Serial No. 90,973. (No model.)

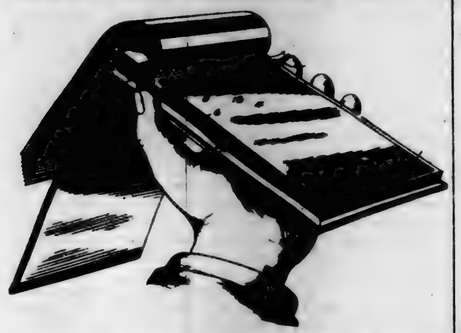
Claim.—In combination, a horseshoe comprising a continuous vertical rim and an inner horizontal flange and having heel extensions forming continuations of the said rim, and a pad spaced from the rim and having the forward corner portions of the heel part cut away to receive the aforementioned heel extensions of the horseshoe, substantially as set forth.

706,769. MANIFOLDING SALES OR ORDER BOOK. BELA G. MERRILL, Oakpark, Ill. Filed Oct. 19, 1901. Serial No. 79,241. (No model.)

Claim.—1. In a device of the character described, the combination with a support, of a carbon-carrier frame consisting of a single piece of wire bent to form a pair of angularly-related arms, and a clamping member formed in a single piece of metal bent around one of said arms to form a hinged connection therewith, said clamping member being disposed longitudinally over the other arm to clamp a carbon-sheet thereon, and a clip for retaining the clamping member in its closed position.

2. In a device of the character described, the combination with a support, of a carbon-carrier frame consisting of a single piece of wire bent to form a pair of angularly-related arms, and a clamping member consisting of a single piece of metal bent to form a sleeve encircling one arm of the frame to effect a hinged connection therewith, said clamping member being disposed over the other arm to clamp a carbon-sheet thereon, and having spring-clips engaging said last-named arm to hold the clamp closed.

3. In a device of the character described, the combination with a support, of a carbon-carrier frame consisting of a single piece of wire bent to form a pair of angularly-related arms, and a clamping member consisting of a single piece of metal bent to form a longitudinal concavity for the reception of one arm, and also to form a pair of spring-clips engaging said arm to retain the clamping member in its closed position, and a sleeve integral with the clamping member and encircling an arm to form a hinged connection therewith, the end of the clamping member opposite the sleeve being bent outward to form an opening for the reception of a pencil-point or the like for the purpose of opening the clamp.



4. In a device of the character described, the combination with a support for a series of leaves, of a carbon-carrier comprehending a transverse arm extended across a leaf, a hinged clamping member disposed over said arm and having a longitudinal concavity for the reception thereof, spring-clips carried by the clamp and engaging the arm to hold the clamp closed, and a clamping lip or flange extending longitudinally along one side of the clamping member in a plane below the upper surface of the arm to clamp the carbon-sheet flat against its support at a point adjacent to the clamp.

5. In a device of the character described, the combination with a carbon-carrier comprising a rounded arm having a beveled end, of a clamping member having a longitudinal concavity for the reception of the arm and having its end bent outward and opposed to the oppositely-inclined or beveled end of the arm to provide an opening for the reception of a pencil-point or the like.

6. In a device of the character described, the combination with a support, of a carbon-carrier frame consisting of a single piece of wire bent to form a pair of angularly-related arms, and a transversely U-shaped clamping member having an integral portion thereof engaging one of said arms to form a hinged connection therewith, said clamping member being disposed longitudinally over and embracing the other of said arms to clamp a carbon-sheet thereon.

7. In a device of the character described, the combination with a support for a series of leaves, of a carbon-carrier comprehending an arm extending across the support to sustain one end of a carbon-sheet, and a clamping member engaging said arm to retain the carbon-sheet and having means disposed to clamp the carbon-sheet flat against a subjacent leaf.

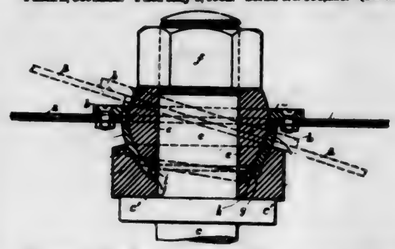
8. In a device of the character described, the combination with a support, of a carbon-carrier frame consisting of a single piece of wire bent to form a pair of angularly-related arms, and a clamping member consisting of a single piece of metal bent to form a longitudinal concavity for the reception of one arm, and also to form a pair of spring-clips engaging said arm to retain the clamping member in its closed position, and a sleeve integral with the clamping member and encircling an arm to form a hinged connection therewith.

9. In a device of the character described, the combination with a support for a series of leaves, of a carbon-carrier comprehending a transverse arm extended across a leaf, a hinged clamping member disposed over said arm and having a longitudinal concavity for the reception thereof, and a clamping lip or flange extending longitudinally along one side of the clamping member in a plane below the upper surface of the arm to clamp the carbon-sheet against its support at a point adjacent to the clamp.

10. In a device of the character described, the combination with a support, of a carbon-carrier frame consisting of a single piece of wire bent to form a pair of angularly-related arms, and a transversely U-shaped clamping member having an integral part thereof surrounding one of said arms to form a hinged connection therewith, said clamping member being disposed longitudinally over and embracing another of said arms to clamp a carbon-sheet thereon, the extremity of said last-named arm being inclined and the adjacent extremity of the clamping member being bent outward to define an opening for the reception of a pencil-point or the like.

11. In a device of the character described, the combination with a support, and a series of leaves, of a carbon-carrier comprehending a transverse arm, a clamping member disposed over said arm to retain one end of a carbon-sheet, and a clamping lip or flange extending longitudinally along one side of the clamping member in a plane below the upper surface of the arm to clamp the carbon-sheet against its support at a point adjacent to the clamp.

706,770. CIRCULAR SAWING MACHINE. WILLIAM MILLER, Falkirk, Scotland. Filed May 6, 1902. Serial No. 106,280. (No model.)



Claim.—1. In a circular sawing machine, means for setting the saw-disk at any desired inclination to, and retaining it upon its rotating spindle, said means consisting of a cup-shaped boss on the saw-disk, a socket-block adapted to receive said cup-shaped boss, a convex-shaped washer surrounding the rotating spindle and a nut threaded upon said spindle for clamping together the saw-disk boss, socket-block, and rotating spindle, substantially as described.

2. In a circular sawing machine means for setting the saw-disk at any desired inclination to, and retaining it upon its rotating spindle, said means consisting of a cup-shaped boss formed on or fitted to the saw-disk and having a pin projecting from its surface, a concave socket-block adapted to receive said cup-shaped boss, a groove in said socket-block eccentric to the spindle orifice and adapted to receive the pin upon the cup-shaped boss of the saw-disk, a convex washer surrounding the spindle and adapted to enter the cup-shaped boss, and a nut threaded upon the outer end of the saw-disk spindle for clamping together the saw-disk boss, socket-block, and rotating spindle, substantially as described.

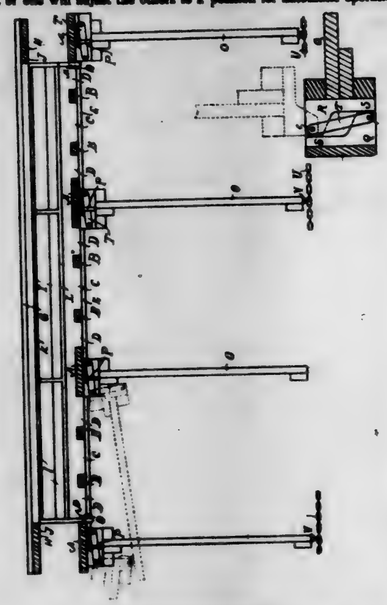
706,771. JAR-CLOSURE. WILLIAM R. MCCARNEY, Eureka Springs, Ark. Filed June 27, 1901. Serial No. 66,366. (No model.)

Claim.—The combination of a jar, having an external annular flange upon the neck thereof, the under edge of the flange being inclined upwardly and outwardly and the outer edge of the flange being inclined upwardly and inwardly, the two inclined faces intersecting at an acute angle, with a cover applied to the outer end of the neck and having its marginal edge inclined upwardly and inwardly to correspond with the inclined outer edge of the neck-flange, and also provided with oppositely-inclined cam-surfaces upon the top of the cover, and clamps to connect the cover to the jar, each clamp comprising a rigid body portion lying against the corresponding inclined outer edges of the neck-flange and the cover, and provided at opposite ends with rigid laterally-projected shoulders which are undercut at acute angles corresponding to and for engagement respectively with the under inclined edge of the neck-flange and one of the cam-surfaces of the cover, each clamp being separate from and slidably movable in a circular direction about the peripheries of the cover and neck-flange.

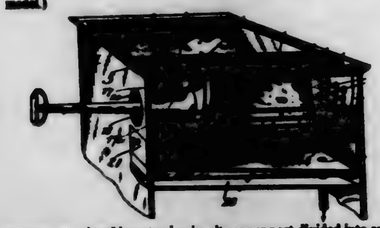
706,772. FOLDING STALL FOR CATTLE. ROBERT A. MCLEBY, JOHN W. WILSON, and AMOS S. WOOSTER, Palmyra, Wis. Filed Apr. 9, 1902. Serial No. 102,102. (No model.)

Claim.—In a stable, the combination of a series of swinging partitions hinged to suitable supports at their inner ends along the manger-line, with their outer ends unsupported and free to move in either direction, each independently of the others; a pivotal hinge for each of said

partitions; a second hinge for each partition, acting eccentrically to tilt the partition, when swung from its normal position at right angles to the manger-line, whereby the partition will be automatically restored to normal position by gravity, except when swung to an extreme or folded position with both hinge-joints in substantially the plane of the partition, said partitions being formed to overlap when folded whereby the movement of one will adjust the others to a position for automatic operation.



706,773. ICE-CRUSHER FOR REFRIGERATORS. FRANK H. NIEMAN, Lynn, Mass. Filed Nov. 14, 1901. Serial No. 82,180. (No model.)



Claim.—1. A refrigerator having its upper part divided into an ice-storage compartment and an ice-crushing compartment, the latter comprising a chamber having inclined sides and bottom with spaced openings therein, and a plunger-pick slidable on the sides and bottom of said chamber to crush the ice between said pick and the end of said chamber.

2. A refrigerator having its upper part divided into an ice-storage compartment and an ice-crushing compartment, the latter comprising a chamber having inclined sides and bottom with spaced longitudinal openings therein and provided at one end with a plurality of penetrating points projecting inwardly, and a plunger-pick embodying a head slidable on the sides and bottom of said chamber and provided with like opposed points.

3. A refrigerator having its upper part divided into an ice-storage compartment and an ice-crushing compartment, the latter comprising a chamber having inclined sides and bottom with spaced longitudinal openings and one end of which is provided with inwardly-projecting penetrating points, a plunger-pick embodying a head slidable on the sides and bottom of said chamber and provided with similar opposed points, and removable means positioned beneath said chamber to receive the crushed ice and provided with an outlet to drain the same.

4. A refrigerator having its upper part divided into an ice-storage compartment and an ice-crushing compartment, the latter comprising a chamber having inclined sides and bottom with spaced openings therein and provided at one end with a plurality of penetrating points of different lengths projecting inwardly, and a plunger-pick embodying a head slidable on the sides and bottom of said chamber and provided with like opposed points.

5. An improved device of the class described, comprising a chamber within the refrigerator U-shaped in cross-section and provided at one end with inwardly-projecting penetrating points and with sides and a bottom composed of spaced bars, a plunger-pick embodying a U-shaped head slidable on said bars and provided with penetrating points adapted to coact with the points in the end of such chamber, and a sliding rod extending through an opening in the wall of said refrigerator and secured at one end to said head.

6. An improved device of the class described, comprising a closed compartment within the refrigerator, a chamber U-shaped in vertical cross-section in the upper part of said compartment one end of said chamber consisting of a plate provided with inwardly-projecting points of different lengths and the bottom and sides of said chamber consisting of spaced bars, guide-rails along the top of the sides of said chamber and extending inwardly, a plunger-pick embodying a head fitting in said chamber beneath said guide-rails and sliding on said bars which head is provided with projecting points of different lengths, a sliding rod secured at one end to said head and projecting through an opening in the wall of said refrigerator, and means beneath said chamber to receive the crushed ice and provided with a drain-outlet.

7. The combination with a refrigerator comprising a casing, a chamber therein provided with openings in its sides and bottom, and a plunger-pick slidable in said chamber, of a drawer beneath said chamber to receive the crushed ice and provided with a bottom inclined from front to rear and with a drain-outlet at the rear.

8. The combination with a refrigerator comprising a casing, a chamber therein provided with openings in its sides and bottom, a plunger-pick slidable in said chamber, and a drawer beneath said chamber to receive the crushed ice and provided with a drain-outlet, of a drain-compartment extending across said casing beneath said drawer, when the latter is in normal position.

706,774. PROCESS OF PRODUCING PHOTOGRAPHS IN RELIEF. WILHELM GUNT, Berlin, Germany. Filed June 1, 1901. Serial No. 62,800. (No specimens.)

Claim.—1. The process of producing a picture in rilievo by photography, which consists in throwing a strong light upon the object to be reproduced, placing the object opposite a photographic camera, and causing a shade to gradually reach over the object in the axis of the photographic apparatus while but a single exposure is made, substantially as specified.

2. The process for producing a picture in rilievo by photography, which consists in first throwing a strong light upon the object to be reproduced, exposing the object to a sensitive plate, then covering the object gradually by a shade while but a single exposure is made, the position of the shade relatively to the sensitive plate and to the object being changed gradually during exposure, and finally covering a layer of sensitized gelatin with the picture produced upon the said sensitive plate and then developing said sensitized layer to form a solid rilievo-picture, substantially as specified.

706,775. FORMING STATUARY OR OTHER ORNAMENTAL STRUCTURES. FELIX PEANO, Oakland, Cal. Filed Mar. 7, 1902. Serial No. 97,502. (No model.)

Claim.—1. A process of forming statuary or other ornamental structures consisting in shaping a natural cellular body and then applying thereto an exterior plastic coating which enters the cells of the cores and forms a bond or union for locking the coating to said core.

2. A process of forming statuary and other ornamental structures consisting in imparting an outline to a natural cellular body and then finishing with an outer coating applied in a plastic state so that it will enter the cells of the body and form a bond or union therewith.

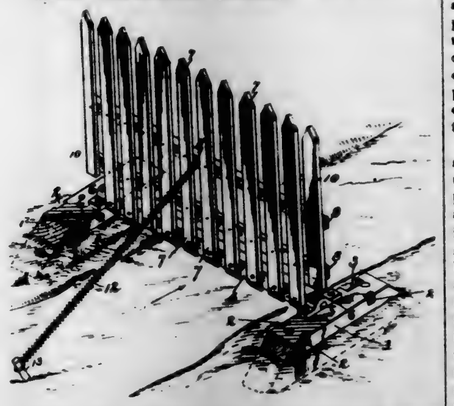
3. A process of producing statuary and other ornamental structures consisting in building up a sectional cellular body and uniting the sections by plastic material which enters the cells and forms a bond or union therewith, thus shaping the exterior of the body, and, finally, finishing with an outer coating of plastic material which also enters the cells and forms a bond to retain the outer coating in place

4. A process of producing statuary and other ornamental structures consisting of forming a cellular, viscous core, boring channels or holes therethrough, inserting perforated pipes in said holes, injecting cement or the like into said pipes whereby they become embedded in the cement and closely united with the surrounding core, sculpturing said core and applying thereto an external surface coating.

5. A process of producing statuary and like ornamental structures consisting in shaping a cellular body into the desired form or design and ornamenting the exterior by applying in a plastic state a metallic coating which enters the cells and forms a bond therewith.

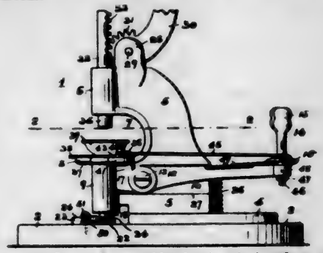
6. As a new article of manufacture, the combination of a porous, mineral body and a metallic outer coating entering the pores of the body and forming a permanent bond therewith.

706,776. FLOOD-GATE. JOHN D. PERRY, Farmgould, Ark., assignor to Samuel K. S. Russell, Bard, Ark. Filed June 8, 1901. Renewed Apr. 25, 1902. Serial No. 104,672. (No model.)



Claim.—The combination of the mudsills 1, provided with recesses 2, and 3; a hinged beam secured to said mudsills by bearings 6; slats secured to the front face of said hinged beam in an upright position; a cross-beam secured to said slats just above said hinged beam, and extending beyond each end of said hinged beam; an upper cross-beam secured to said slats, above last-mentioned beam, and extending beyond the ends of said hinged beam; two shorter slats, one at each end, secured to the ends and front faces of said last-mentioned cross-beams; an eye secured in the front face of the upper cross-beam, flush with the front faces of the first-mentioned slats; a spiral spring, having one end secured to said eye, and its other to a stob in the stream in such position that when the gate is horizontal, the upper part of said spring, and the extreme upper part of said eye will not extend above the said slats; extensions, one secured to the lower face and near each end of the hinged beam; extensions secured to the inner face of each of the mudsills in position to arrest the first-mentioned extension, and hold the gate as against the spring in an upright position, substantially as shown and described and for the purposes set forth.

706,777. PELLET OR TABLET MAKING APPARATUS. EMERICH PETRANYI, Elizabeth, N. J. Filed Feb. 15, 1902. Serial No. 94,368. (No model.)



Claim.—1. In a pellet or tablet forming device, the combination with a base and a standard, of a table connected with said standard having a plunger-receiving opening, a guide directly beneath said table having its guiding portion communicating with said opening in the table, a presser-rod movably arranged in said guide, a plunger provided with means for forcing its lower end down into the said opening in the table, and means for causing a sliding movement of said presser-rod, an arm pivotally arranged on said table, a finger-piece connected with said arm, a funnel-shaped compound-containing receptacle on said arm provided with an open bottom for delivering a predetermined quantity of the compound into the opening in said table, and a slide-arm pivotally arranged on said table adapted to be slid laterally across the opening in said table for removing the finished pellet or tablet, substantially as and for the purpose set forth.

2. In a pellet or tablet forming device, the combination, with a base and a standard, of a table connected with said standard having a plunger-receiving opening, a guide directly beneath said table having its guiding portion communicating with said opening in the table, a presser-rod movably arranged in said guide, a plunger provided with means for forcing its lower end down into said opening in the table, and means for causing a sliding movement of said presser-rod, consisting, essentially, of a pivoted lever on said standard, having a finger-piece at or near its one end and said lever having its opposite end in lifting engagement with said presser-rod, an arm pivotally arranged on said table, a finger-piece connected with said arm, a funnel-shaped compound-containing receptacle on said arm provided with an open bottom for delivering a predetermined quantity of the compound into the opening in said table, and a slide-arm pivotally arranged on said table adapted to be slid laterally across the opening in said table for removing the finished pellet or tablet, substantially as and for the purposes set forth.

3. In a pellet or tablet forming device, the combination, with a base and a standard, of a table connected with said standard having a plunger-receiving opening, a guide directly beneath said table having its guiding portion communicating with said opening in the table, a presser-rod movably arranged in said guide, a plunger provided with means for forcing its lower end down into the said opening in the table, means for causing a sliding movement of said presser-rod, and an adjusting means on said base on which the lower end of said presser-rod rests, capable of raising and lowering the relative positions of said presser-rod with respect to the upper surface of said table, an arm pivotally arranged on said table, a finger-piece connected with said arm, a funnel-shaped compound-containing receptacle on said arm provided with an open bottom for delivering a predetermined quantity of the compound into the opening in said table, and a slide-arm pivotally arranged on said table adapted to be slid laterally across the opening in said table for removing the finished pellet or tablet, substantially as and for the purposes set forth.

4. In a pellet or tablet forming device, the combination, with a base and a standard, of a table connected with said standard having a plunger-receiving opening, a guide directly beneath said table having its guiding portion communicating with said opening in the table, a presser-rod movably arranged in said guide, a plunger provided with means for forcing its lower end down into the said opening in the table, means for causing a sliding movement of said presser-rod, and an adjusting means on said base on which the lower end of said presser-rod rests, capable of raising and lowering the relative positions of said presser-rod with respect to the upper surface of said table, consisting, of a rotatably-arranged cam-disk provided with a cam-shaped face, and means connected with said disk for holding said disk in its variously-adjusted positions, an arm pivotally arranged on said table, a finger-piece connected with said arm, a funnel-shaped compound-containing receptacle on said arm provided with an open bottom for delivering a predetermined quantity of the compound into the opening in said table, and a slide-arm pivotally arranged on said table adapted to be slid laterally across the opening in said table for re-

moving the finished pellet or tablet, substantially as and for the purposes set forth.

5. In a pellet or tablet forming device, the combination, with a base and a standard, of a table connected with said standard having a plunger-receiving opening, a presser-rod and a plunger both connected with the said standard, and a compound-containing receptacle slidably arranged upon said table, said receptacle being provided with an opening in its bottom for depositing a certain quantity of the compound through the opening in the table and directly upon the end of the presser-rod, means connected with said plunger for forcing its lower end down into the said opening in the table, and means for causing a sliding motion of said presser-rod, consisting, essentially, of a lever pivoted to said standard, having a finger-piece at or near its one end and said lever having its opposite end in lifting engagement with said presser-rod, substantially as and for the purposes set forth.

6. In a pellet or tablet forming device, the combination, with a base and a standard, of a table connected with said standard having a plunger-receiving opening, a guide directly beneath said table having its guide portion communicating with the opening in the table, a presser-rod movably arranged in said guide, a plunger provided with means for forcing its lower end down into the said opening in the table, a slide-arm on said table for removing the finished pellet or tablet, and means for causing a sliding movement vertically of said presser-rod and a sliding movement laterally on said table of said slide-arm, consisting, essentially, of a lever pivoted to said standard, said lever having its one end in lifting engagement with said presser-rod, a post rotatively arranged at or near the opposite end of said lever, and a connecting-link between said post and said slide-arm, substantially as and for the purposes set forth.

7. In a pellet or tablet forming device, the combination, with a base and a standard, of a table connected with said standard having a plunger-receiving opening, a guide directly beneath said table having its guide portion communicating with the opening in the table, a presser-rod movably arranged in said guide, a plunger provided with means for forcing its lower end down into the said opening in the table, a slide-arm on said table for removing the finished pellet or tablet, and means for causing a sliding movement vertically of said presser-rod and a sliding movement laterally on said table of said slide-arm, consisting, essentially, of a lever pivoted to said standard, said lever having its one end in lifting engagement with said presser-rod, a post rotatively arranged at or near the opposite end of said lever, and a connecting-link between said post and said slide-arm, and a set of springs 26 and 49 connected with said lever for returning said lever and the parts operated by said lever to their normally inoperative positions, substantially as and for the purposes set forth.

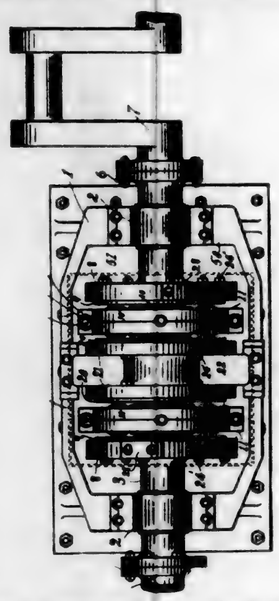
8. In a pellet or tablet forming device, the combination, with a table having an opening, and means for pressing a compound into a pellet or tablet, of an arm pivotally arranged on said table, a finger-piece connected with said arm, a funnel-shaped compound-containing receptacle on said arm provided with an open bottom for delivering a predetermined quantity of the compound into the opening in said table, and a slide-arm pivotally arranged on said table adapted to be slid laterally across the opening in said table for removing the finished pellet or tablet, substantially as and for the purposes set forth.

9. The herein-described pellet or tablet making device, consisting, essentially, of a base, a standard, and a table connected with said standard having a plunger-receiving opening, a tubular guide 6 connected with said standard, a plunger movably arranged in said guide 6, a second guide 9 directly beneath said table having its guide portion in communication with the opening in said table, a presser-rod movably arranged in said guide 9, a pivotally-arranged lever on said standard having one end in lifting engagement with said presser-rod for bringing the upper end of said presser-rod flush with the upper surface of said table, an arm 37 pivotally arranged on said table, a finger-piece connected with said arm 37, a funnel-shaped compound-containing receptacle on said arm 37 provided with an open bottom for delivering a predetermined quantity of the compound into the opening in said table, and a slide-arm 43 pivotally arranged on said table adapted to be slid laterally across the opening in said table for removing the finished pellet or tablet, substantially as and for the purposes set forth.

706,778. MEDICATED TAMPON. EDWARD M. PUTT, Rutland, Vt. Filed Dec. 3, 1901. Serial No. 84,830. (No model.)

Claim.—A medicated tampon, consisting of a body of fibrous material, fragile restraining-cords to compress the body arranged at intervals thereon, and a strand threaded under the cords lengthwise of the body to cut the cords and permit the body to expand.

706,779. THRUST-BEARING. JOHAN POETTY, San Francisco, Cal. Filed Apr. 12, 1901. Serial No. 55,574. (No model.)



Claim.—1. In a device of the character described, the combination of a shaft, a thrust-collar thereon, a fixed abutment, bearing-plates removably secured to said collar and abutment on opposing faces thereof, each plate being divided into sections along radial lines extending from the center at such an angle with each other as to pass beneath the hereinafter-mentioned rollers diametrically, a roller-carrier mounted loosely on the shaft between said collar and abutment, and divided diametrically into sections, and a circular series of an even number of rollers carried by said carrier, said rollers being interposed between the bearing-plates or the collar and abutment, substantially as described.

2. In a device of the character described, the combination of a shaft, a thrust-collar thereon, a fixed abutment, bearing-plates removably secured to said collar and abutment on opposing faces thereof, each plate being divided into sections along radial lines extending from the center at such an angle with each other as to pass beneath the hereinafter-mentioned rollers diametrically, a roller-carrier mounted loosely on the shaft between said collar and abutment, and divided diametrically into sections, and a circular series of rollers carried by said carrier, said rollers being interposed between the bearing-plates on the collar and abutment, substantially as described.

3. In a device of the character described, the combination of a shaft, a thrust-collar thereon, a fixed abutment, bearing-plates removably secured to said collar and abutment on opposing faces thereof, said plates being divided into sections, clamps at the periphery of said plates, means for moving said clamps inwardly to clamp said plate-sections tightly together, a roller-carrier mounted loosely on said shaft between said collar and abutment, and a circular series of rollers carried by said carrier, said rollers being interposed between the bearing-plates on the collar and abutment, substantially as described.

4. In a device of the character described, the combination of a shaft, a thrust-collar thereon, a fixed abutment, a roller-carrier mounted loosely on the shaft between said collar and abutment, and a circular series of rollers carried by said carrier, each roller being fixedly secured on axles extending radially from the center of the carrier, the outer ends of said axles being stepped in the carrier and preventing their radial movement, and the carrier being divided into sections on a plane at right angles to the shaft, each section having inner and outer series of half-bearings to receive the ends of said roller-axles, substantially as described.

5. In a device of the character described, the combination of a shaft, a thrust-collar thereon, a fixed abutment, a roller-carrier mounted loosely on the shaft between said collar and abutment, a circular series of rollers carried by said carrier, said rollers being interposed between the collar and abutment, and a frame comprising end walls supporting said shaft, and side walls supporting the upper section of the abutment, said side walls and end walls being closed to form an oil-tank for lubricating the moving parts, substantially as described.

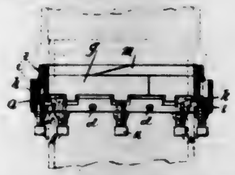
6. In a device of the character described, the combination of a shaft, a thrust-collar thereon, a fixed abutment, a roller-carrier mounted loosely on the shaft between said collar and abutment, and divided diametrically into sections, a circular series of rollers carried by said carrier and interposed between the collar and abutment, and bolts connecting the two sections of the carrier at the ends of said diameter, said roller-carrier being of circular form but its circular periphery being cut down or notched on each side of the ends of the dividing diameter whereby the projecting ends of the bolts may lie in said notches and below or within the circumference of the said peripheral circle of the carrier, thereby avoiding projections beyond said circumference, substantially as described.

7. In a device of the character described, the combination of a shaft a thrust-collar thereon, a fixed abutment, a roller-carrier mounted loosely on the shaft between said collar and abutment and divided diametrically into sections, a circular series of rollers carried by said carrier and interposed between the collar and abutment, and double-ended bolts, each having a central head contained in recesses or sockets in the opposing faces of the carrier-sections, the threaded ends of each bolt being passed through said sections, and nuts on said threaded ends, substantially as described.

8. In a device of the character described, the combination of a shaft, a thrust-collar thereon, a fixed abutment, a roller-carrier mounted loosely on the shaft between said collar and abutment, and divided diametrically into sections, a circular series of rollers carried by said carrier and interposed between the collar and abutment, said roller-carrier being of circular form, but its circular periphery being cut down or notched on each side of the ends of the dividing diameter, and double-ended bolts connecting the two sections of the carrier at the ends of said diameter, each bolt being threaded at each end, and said threaded end projecting into one of said notched portions, and nuts on the ends of the bolts in said notched portions, substantially as described.

9. In a thrust-bearing, in combination with a circular series of rollers, a carrier therefor divided diametrically into sections and also divided on a plane at right angles to the axis, double-ended bolts at the ends of the aforesaid diameter, extending in said plane on each side of said diameter, and nuts on the threaded ends of said bolts, said nuts having on their inner faces conical sockets, and the carrier-sections having conical ring-sections adapted to fit into said sockets and to be clamped by said nuts, substantially as described.

706,780. CLAMP FOR PIPES. HENRY P. G. REED, Chicago, Ill., assignor to George W. Phillips, Camden, N. J. Filed June 28, 1900. Serial No. 722,125. (No model.)



Claim.—1. In a pipe-clamp, the combination with an annulus adapted to be fixedly supported upon a pipe, of an annular packing-strip surrounded by said annulus and movable longitudinally of the annulus and adapted for fixed engagement with an opposed face of a pipe-joint, and a plurality of independently-acting adjusting devices *k* acting longitudinally of the pipe for effecting a fixed engagement between the packing-strip and an opposed face of a pipe-joint, substantially as described.

2. In a pipe-clamp, the combination with an annulus adapted to be fixedly supported upon a pipe, of an annular packing-strip surrounded by said annulus and movable longitudinally of the annulus and adapted for fixed engagement with an opposed face of a pipe-joint, and a plurality of independently-acting adjusting-screws *k k* carried by said annulus, acting longitudinally of the pipe for effecting a fixed engagement between the packing-strip and an opposed face of a pipe-joint, substantially as described.

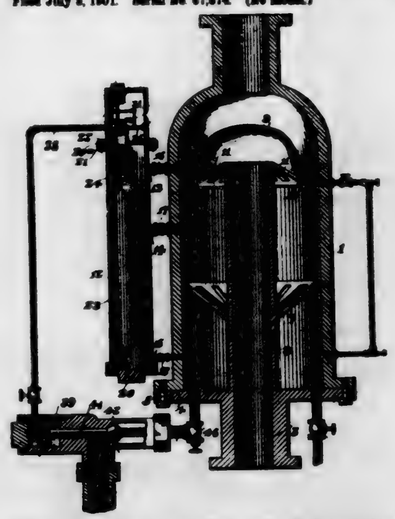
3. The combination with an annulus formed in sections, of means for securing said annulus about a pipe, a second annulus formed in sections and inclosed by the first aforesaid annulus and having a packing-face, and longitudinally-acting screws *k k* carried by the first aforesaid annulus adapted for engagement with the latter annulus to force the same longitudinally of the pipe and thereby effect fixed engagement between the packing-face and the pipe-joint, substantially as described.

4. The combination with an annulus formed in sections, of means for securing said annulus about a pipe, a second annulus formed in sections and inclosed by the first aforesaid annulus and having a packing-face, outwardly-projecting lugs *h* provided upon the second aforesaid annulus, and longitudinally-acting screws *k k* carried by the first aforesaid annulus, adapted for engagement with said lugs to force the annulus carrying the same longitudinally of the pipe and thereby effect fixed engagement between the packing-face and the pipe-joint, substantially as described.

5. The combination with an annulus formed in sections, of means for securing said annulus about a pipe, a second annulus formed in sections and inclosed by the first aforesaid annulus and having a packing-face, outwardly-projecting lugs *h* provided upon the second aforesaid annulus and projecting within recesses provided in the first aforesaid annulus, and longitudinally-acting screws *k k* carried by the first aforesaid annulus adapted for engagement with said lugs to force the annulus carrying the same longitudinally of the pipe and thereby effect fixed engagement between the packing-face and the pipe-joint, substantially as described.

6. The combination with an annulus formed in sections, of a plurality of radially-acting screws *d* for fixing said annulus about a pipe, a second annulus formed in sections and inclosed by the first aforesaid annulus and having a packing-face, and longitudinally-acting screws *k k* carried by the first aforesaid annulus adapted for engagement with the latter annulus to force the same longitudinally of the pipe and thereby effect fixed engagement between the packing-face and the pipe-joint, substantially as described.

706,781. STEAM-TRAP. WILLIAM H. REYNOLDS, Houston, Tex. Filed July 9, 1901. Serial No. 67,674. (No model.)



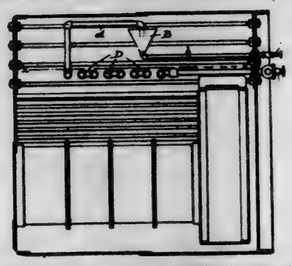
Claim.—1. In a device of the character described, the combination with a trap, a float-cylinder, valve-controlled water-relieving means for the trap and a float within the cylinder, of a hollow head located at the upper end of the float-cylinder, a valve-casing located within said head at one side thereof, a balanced valve controlling the communication between the float-cylinder and the valve-casing, connecting devices operatively connecting the float and the balanced valve, and a conduit extending from the valve-casing to the water-relieving means to convey steam to said water-relieving means when the balanced valve is opened by the actuation of the float.

2. In a device of the character described, the combination with a trap, an exteriorly-arranged float-cylinder, valve-controlled water-relieving means for the trap and a float within the cylinder, of a hollow head located at the upper end of the float-cylinder, a valve-casing located within said head at one side thereof, a pivoted arm mounted in the head opposite the casing, a balanced valve controlling the communication between the float-cylinder and the valve-casing, connecting devices effecting an operative connection between the pivoted arm, the float and the balanced valve, and a conduit extending from the valve-casing to the water-relieving means to convey steam to said water-relieving means when the balanced valve is opened by the action of the float.

3. In a device of the character described, the combination with a trap, an exteriorly-arranged float-cylinder, a float within said cylinder, water-relieving means for the trap, a conduit extending from the float-cylinder to the water-relieving means, and a valve controlling said con-

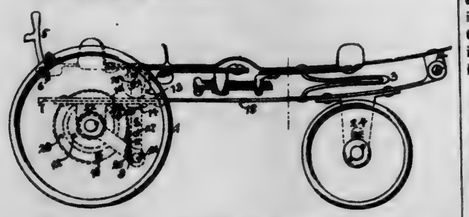
duit and connected to the float for actuation thereby, of a valve-controlled pipe establishing communication between the upper portion of the trap and the float-cylinder at a point above the float to permit the escape of steam to the cylinder, a second valve-controlled pipe extending between the trap and cylinder at a point adjacent to the first-named pipe to permit the escape of water from the trap to the float-cylinder, and a third valve-controlled escape-pipe establishing communication between the trap and cylinder adjacent to the lower extremities thereof, said last-named pipe serving to permit the escape of water from the float-cylinder in any desired ratio to the escape of water from the trap, for the purpose of effecting the depression of the float and the closing of the balanced valve either before or after the trap has been entirely emptied, or at the moment of complete discharge, as desired.

706,782. FEED-WATER HEATER AND PURIFIER. HARRY J. REYNOLDS, Cleveland, Ohio, assignor of one-half to Ernest T. Saunders, Cleveland, Ohio. Filed Feb. 28, 1901. Serial No. 48,419. (No model.)



Claim.—In a feed-water heater and purifier for steam-boilers, the combination of a feed-pipe leading into the boiler, a horizontal heating-coil connected therewith and located in the boiler in a plane parallel with but just below the normal water-line of the boiler and a pipe leading up from the inner end of the coil and having its discharge end curved over and downwardly, with an open-topped funnel-shaped receiving vessel located in the boiler below said discharge-outlet of the heating-coil but above the normal water-line of the boiler and a discharge-pipe connected with the lower end of said receiving vessel and extending out through the shell of the boiler, together with suitable valves in the feed and discharge pipes, outside of the boiler, to control them, substantially as specified.

706,783. AUTOMATIC CYCLE OR BICYCLE SKATE. ELIAS E. RIES, New York, N. Y. Filed May 8, 1897. Renewed Dec. 28, 1901. Serial No. 87,627. (No model.)



Claim.—1. In a motor-skate the combination of a base-plate or frame carrying the driving and pilot wheels, a bodily-depressible foot-plate having suitable pivotal or hinged connections with said base-plate, and driving mechanism operatively connected with said foot-plate and acting upon said driving wheel or wheels.

2. In a skate, the combination of a base-plate, with a depressible foot-plate pivotally connected to the said base-plate at the toe portion of the said foot-plate, and a guide or guides between the foot-plate and base-plate at or near the heel portion of said foot-plate.

3. In a motor-skate, the combination of a base-plate supporting front and rear wheels with a depressible foot-plate supported and guided by the base-plate, at two or more separate points in its length, and driving mechanism operated by the foot-plate.

4. In a skate, the combination of a base-plate, and a bodily-depressible foot-plate pivoted thereto, with driving mechanism operated by the said foot-plate.

5. In a skate, the combination of a base-plate with a depressible foot-plate connected to the said base-plate at the toe portion of said foot-plate, and driving mechanism operated by the said foot-plate.

6. In a skate, the combination of a base-plate, and a bodily-depressible foot-plate pivoted thereto, with driving mechanism operated by the depression of said foot-plate, and means for normally raising the said foot-plate.

7. In a skate, the combination of a base-plate supporting at its rear end one or more driving-wheels and at its forward end one or more pilot-wheels, and a bodily-depressible foot-plate mounted upon the base-plate, with driving mechanism connecting the rear portion of the foot-plate with the driving wheel or wheels.

8. In a skate, the combination of a base-plate supporting at its rear end one or more driving-wheels and at its forward end one or more pilot-wheels, and a bodily-depressible foot-plate mounted upon the base-plate, with driving mechanism connecting the rear portion of the foot-plate with the driving wheel or wheels, and adapted to impart thereto a positive forward motion while always permitting the continual forward rotation of said driving wheel or wheels.

9. In a skate, the combination of a base-plate supporting pilot and driving wheels, and a bodily-depressible foot-plate pivoted to said base-plate, with driving mechanism and means to engage the said driving mechanism with the driving-wheel on the depression of said foot-plate and to disengage the same during the upward motion of the foot-plate.

10. In a skate, the combination of a base-plate, with a bodily-depressible foot-plate pivoted thereto, and yielding buffers or stops between the foot-plate and the base-plate, to form a cushion-stop for the foot-plate at the end of each downward movement or throw.

11. In a skate, the combination of a base-plate, and a foot-plate pivoted to the base-plate at the toe portion of the foot-plate, with a driving-wheel carried by the base-plate and driving mechanism connected to the rear end of the foot-plate.

12. In a skate, the combination of a base-plate supporting pilot and driving wheels, and a bodily-depressible foot-plate pivoted to the base-plate, with driving mechanism operated by said foot-plate, and means for locking the driving-wheel against backward rotation.

13. In a skate, the combination of a base-plate and a foot-plate pivoted thereto and means for normally separating the foot-plate from the base-plate, with driving mechanism and a driving-wheel, and a clutch adapted to engage the driving mechanism with the driving-wheel during the depression of the foot-plate and to disengage the same during the upward motion of the foot-plate.

14. In a skate, the combination of a base-plate, a foot-plate pivoted thereto, and means for normally separating the foot-plate from the base-plate, with driving mechanism and a driving-wheel, and a clutch adapted to engage the driving mechanism with the driving-wheel during the depression of the foot-plate and to disengage the same during the upward motion of the foot-plate, and an inclosing drum for said clutch.

15. In a cycle-skate, the combination with the base-plate, foot-plate and driving-axle, of a driving-gear mounted upon said axle, a reciprocating rod or rods connected respectively with the foot-plate and driving-gear, and a clutch or friction mechanism designed and adapted to be operated to engage with the driving-gear so as to positively rotate the driving-axle when the connecting rod or rods are moved in one direction and to permit of the continued rotation of the driving-axle while the connecting rod or rods are moving in the opposite direction, substantially as set forth.

16. In a cycle-skate, the combination of the base-plate or frame, the driving-axle and a driving-gear or friction-pulley mounted rigidly thereon, an inclosing drum mounted loosely upon said axle, a bodily-depressible foot-plate connected to the drum for rocking the same upon said axle, and suitable pawl or friction-clutch devices within said drum designed and adapted to engage with the driving-gear or friction-pulley, substantially as and for the purposes set forth.

17. In a cycle-skate, the combination with the base-plate, foot-plate and driving-axle, of a connecting rod or rods secured at one end to and arranged to be moved or reciprocated by the foot-plate, one or more links or levers pivotally mounted upon the base-plate or driving-axle and adapted to be operatively engaged by the other end of said connecting rod or rods, and mechanism, substantially as described, connected with and designed and adapted to be operated by the said links or levers so as to convert the intermittent movements of the same into a progressive rotary motion of the driving-axle.

18. As a new article of manufacture, an automatic or self-acting cycle or bicycle skate comprising a base-plate or support having bearings in which the wheels or the axles forming part of, or secured to the same are free to move, a bodily-movable foot plate or support having clamps or fastenings for securing the same to the foot or shoe, said foot-plate being pivotally secured to said base-plate, means for normally lifting or separating the foot-plate from the base-plate when the foot to which the skate is secured is lifted or when its pressure upon the foot-plate is removed, and a motion-converting mechanism designed and adapted to be set into operation by the downward movement of the foot plate or support when the foot is depressed and the weight of the body is brought to bear upon it, to convert the downward movement of the foot-plate into a direct forward motion of the skate, substantially as set forth.

19. As a new article of manufacture, an automatic or self-acting cycle or velocipede skate having an adjustable foot-support pivoted at its forward end and capable of a limited reciprocating motion in a substantially vertical direction, one or more driving-wheels between the yielding foot-support and the ground or other surface of travel, and a suitable driving gear or mechanism interposed between the foot-support and the driving wheel or wheels and designed and adapted to convert the limited vertical motion of the foot-support at each thrust or stroke into an amplified forward or horizontal motion of the said skate, substantially as and for the purpose set forth.

20. In a cycle-skate, the combination with the skate-frame, of a pilot wheel or wheels of comparatively small diameter mounted in suitable bearings under and located entirely beneath the ball or toe portion of the skate-frame, a driving wheel or wheels of larger diameter than the said pilot wheel or wheels, also mounted in suitable bearings behind or at the sides of the heel portion of the skate-frame and partially projecting above the latter, a vertically-movable foot-plate and mechanism connecting the same with the driving wheel or wheels as and for the purpose described.

21. In a cycle-skate, the combination with a frame or base-plate and a foot-plate movable with respect thereto, of one or more driving-wheels mounted in suitable bearings on said frame or base-plate, a friction-clutch mechanism for said driving wheel or wheels also mounted upon said frame or base-plate and designed and adapted to rotate the said wheel or wheels in a forward direction and to lock the same against backward movement, and pivoted rods or links connecting the movable foot-plate with the clutch mechanism and arranged to transmit the movement of the foot-plate to the same, substantially as set forth.

22. In a cycle-skate, the combination with the frame or base-plate containing the driving wheel or wheels and clutch mechanism, and a foot-plate movable with respect thereto, of one or more pairs of driving-levers having one end journaled upon the driving-axle, one or more pivoted rods or links connecting the free ends of said levers with the movable foot-plate, and one or more flexible bands, straps or chains having one end secured to the clutch mechanism and the other end fastened to the driving-levers, substantially as set forth.

23. In a cycle-skate, the combination of a base-plate or frame, a foot-plate vertically movable independently of said frame, a clutch mechanism consisting of a friction-disk keyed to the driving-axle, a hollow projecting drum surrounding or inclosing said disk and capable of a rocking motion about the same, and friction devices carried by said drum in contact with the periphery or sides of said disk in such a manner as to grasp or bind the latter and compel it to revolve when the drum is rotated in one direction, and to loosen their hold upon the disk when the drum is rotated in the opposite direction, substantially as set forth.

706,784. CHEMICAL APPARATUS. RALPH C. ROBINSON, Boston, Mass., assignor to John Irving, Newton, Mass. Filed Dec. 6, 1901. Serial No. 84,938. (No model.)

Claim.—1. A testing-blade having a substantially plane face, and a passage-way extending longitudinally of the blade substantially from its upper to its lower end.

2. A testing-blade having a nook at its upper end provided with an inlet, an outlet near the lower end of the blade, a passage-way extending longitudinally of the blade and connecting the inlet and outlet, and means for supporting the blade upon the edges of the vessel in which the blade is used.

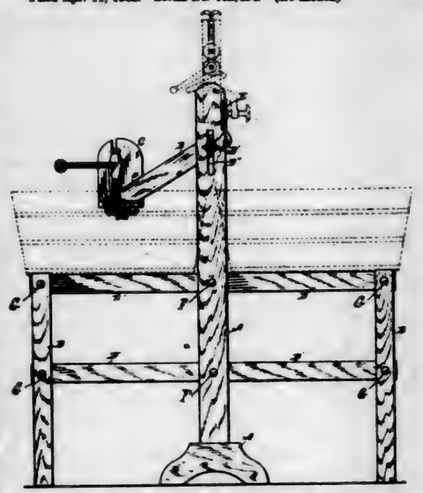
3. A testing-blade having an inlet and an outlet, the body of the blade showing a dark color at one of its faces.

4. A testing-blade having an inlet and an outlet, and provided with scale-marks.

5. A testing-blade having a substantially plane face, means for supporting the blade upon the edges of the vessel in which it is used, said blade being provided with scale-marks.

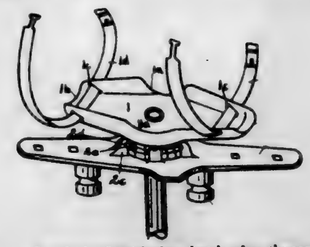
6. A vessel having supporting notches or pockets, combined with a testing-blade having legs to engage said notches or pockets and support the blade and prevent rotation or movement thereof within said vessel.

706,785. WASHBENCH. LEROY A. ROBBINS, Constantine, Mich. Filed Apr. 11, 1902. Serial No. 102,404. (No model.)



Claim.—In a washbench, the combination of the standards A having slots D'; rounds F securing said standards together; legs B; rounds G securing said legs together in pairs; longitudinal bars B' arranged in pairs, pivoted on said rounds F and G respectively, whereby said legs are permitted to fold upwardly; arms D secured to a suitable washing-machine; bolts through said arms inserted through said slots; and suitable thumb-nuts on said bolts, whereby the position of said washing-machine may be adjusted, substantially as described.

706,786. DEVICE FOR STRINGING ELECTRIC WIRES. JOHN W. SHARAR, Bay City, Mich. Filed Jan. 14, 1902. Serial No. 89,726. (No model.)



Claim.—1. In a device for stringing electric wires, the combination of a base adapted to be attached to the framework of a building, and a detachable insulator-carrying cap secured to said base by means whereby said cap can be secured at various angles relatively to the base, for the purposes set forth.

2. The combination of a base having a circumferentially-grooved polygonal boss secured thereto; an insulator-carrying cap having oppositely-placed lugs with grooves to register with the groove of the polygonal boss, and pins fitting said grooves for locking the lugs to the boss, substantially as described.

3. In a device for stringing electric wires the combination of a base; a polygonal boss secured to said base; radial slots in the faces of said boss; a circumferential groove intersecting said radial slots; together with a cap carrying oppositely-placed lugs; inwardly-projecting tongues integral with said lugs and adapted to engage the radial slots of the boss; a transverse slit in each tongue; and a pin adapted to interlock said lugs and boss.

4. In combination with a base and an angularly-adjustable cap; a detachable cutout-carrying bracket; comprising a flat frame having radial slots, and openings intermediate said slots; together with an upwardly-

extending projection on said bracket adapted to engage a hole in said cap, substantially as described.

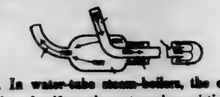
5. In a device for stringing electric wires the combination with a base and an angularly-adjustable cap removably secured thereto; of a detachable insulator-carrying bracket removably secured to said cap, the plane of said bracket being offset from the plane of the cap, for the purposes set forth.

6. In a device of the kind described, a base having upwardly-extended sides provided with slits near their ends; of metal straps passing through the slits, each of said straps having one end T-shaped and having at the other end a straight slit and a T-shaped slit whereby the ends of said straps can be locked together, for the purposes set forth.

7. In a device for stringing electric wires, the combination of a base adapted to be secured to the frame of a building; an angularly-adjustable insulator-carrying cap removably secured to said base; a threaded opening through said cap; and extension-bars having threaded ends to engage said openings, whereby a plurality of caps may be supported from a single base.

8. The combination of a base having upwardly-extending sides provided with curved recesses and having slits near their ends; metal straps passing through the slits, each strap being T-shaped at one end and having at the other end a straight slit and a T-shaped slit; a circumferentially-grooved polygonal boss secured to the face of said base; an insulator-carrying cap having oppositely-placed lugs with grooves to register with the groove of the polygonal boss; a pin fitting said grooves for locking the lug to the boss; a central threaded opening in the cap; extension-bars having threaded ends to engage said threaded openings; a switch-supporting bracket having a projection; an opening in the cap to receive said projection; radial slots in said bracket; and an L-shaped offset-bracket having an upwardly-extending projection to fit the opening in the cap, all arranged substantially as described and for the purposes set forth.

706,787. **WATER-TUBE BOILER.** HERMEGO VICENTE, Cartagena, Spain. Filed Feb. 13, 1902. Serial No. 93,650. (No model.)



Claim.—1. In water-tube steam-boilers, the combination with a drum and a number of uniform elements each consisting of a downwardly-extending lower tube closed at its base, a chamber with which the upper end of the lower tube communicates, and a removable cover to the said chamber; of a removable slide for each chamber adapted to be slid into same, and guides in the chambers to receive the slides, water-supply tubes extending from the lower part of the drum equal in number to the elements employed, and steam-tubes extending from the upper part of the drum also equal in number to the elements employed, all the tubes from the drum entering the wall of the chamber of the first element, the slide of the first chamber being formed with steam and water conducting passages coinciding with continuation-tubes to the next element-chamber, and also carrying the downwardly-extending water-feed tube of its own chamber, the removable slide of the second chamber carrying the water-supply tube therefor and communicating passages for the next chamber and so on, a furnace, and means for supporting the elements in position so that the furnace-gases pass between the lower tubes of the elements, substantially as set forth.

2. In water-tube steam-boilers, the combination with a furnace, a main drum, a number of uniform elements each consisting of a downwardly-extending lower tube closed at its base, a chamber with which the upper end of the lower tube communicates and a removable cover to the chamber, with means for supporting series of the elements in position so that the furnace-gases pass between the lower tubes of the elements; of a single steam-conducting tube passing from the drum and extending to the chamber of the first element of a series, and so on from chamber to chamber of the elements to collect the steam from all the chambers, and a number of water-feed tubes equal to the number of chambers, the water-tubes extending from the drum and entering the first chamber of a series, a removable slide in each chamber, and passages in the slide connecting all the tubes but one with corresponding tubes passing from the first chamber to the second, and a tube carried by the slide extending into the lower tube of the element and corresponding with the remaining water-tube from the drum, and by which the first element is supplied with water, the second being supplied in like manner and so on, substantially as set forth.

3. In water-tube steam-boilers, the combination with a furnace, a main drum, a number of uniform elements each consisting of a downwardly-extending lower tube closed at its base, a chamber with which the upper end of the lower tube communicates, and a removable covering to the chamber, with means for supporting series of the elements in position so that the furnace-gases pass between the lower tubes of the elements; of a steam-conducting tube passing from the drum and extending to the chamber of the first element of a series and so on from chamber to chamber of the elements to collect the steam from all the chambers, and a common water-feed tube extending from the lower part of the drum and extending to the first chamber of a series and so on from chamber to chamber of the elements; a removable slide in each chamber, a passage in the slide connecting the water-feed tube upon one side of the chamber with the continuation of the water-feed tube upon the other side of the chamber leading to the next, and a branch from the slide-passage extending into the lower tube of the element to supply water thereto, substantially as set forth.

706,788. **METALLIC RAILWAY-TIE.** JOHN F. WEHRROD, Allegheny, Pa. Filed Feb. 11, 1902. Serial No. 93,573. (No model.)

Claim.—1. A rail-tie, composed of similar metallic channels, bowed longitudinally, set on edge, and united back to back.

2. A rail-tie, composed of two pressed-steel channels, bowed longitudinally, arranged on edge, and united back to back.

3. A rail-tie, composed of similar channels, bowed longitudinally, set on edge, united back to back, and having their outer ends flaring, and stays interposed between the flanges at the points of support of the rails.

4. A rail-tie, composed of longitudinally-bowed channels united back to back, and provided with rail-seats in their upper flanges, and stays interposed between the flanges beneath the rail-seats.

5. A metallic rail-tie, combined with rail-fastenings, each of which has a flat portion adapted to be bolted to the tie, a vertical portion projecting beyond the tie to abut against the base of the rail, and a substantially horizontal portion on said vertical portion to overlap the base of the rail, one of which fastenings is adjustable.

6. A metallic rail-tie, combined with rail-fastenings, each of which has a flat portion adapted to be bolted to the tie, a vertical portion projecting beyond the tie to abut against the base of the rail, and a substantially horizontal portion on said vertical portion to overlap the base of the rail, means to adjust the fastenings, and a cross-bolt engaging the vertical portions of the fastenings beneath the rail-base.

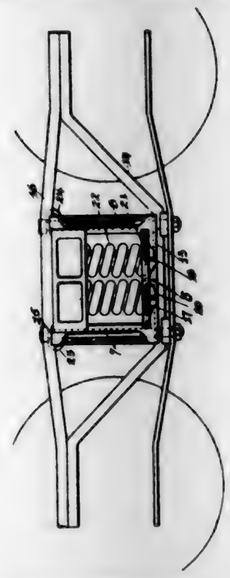
706,789. **TRUCK-END CASTING.** CHARLES T. WHITLAKE, Granite City, Ill., assignor to Commonwealth Steel Company, St. Louis, Mo., a Corporation of New Jersey. Filed Mar. 25, 1902. Serial No. 99,976. (No model.)

Claim.—1. The improved truck-column casting, consisting of an integral spring-seat base 6; truck-columns extending upwardly from the ends of the base; brake-hangers extending inwardly from said columns; all cast integrally; a spring-seat resting upon said base; lugs extending downwardly from the spring-seat upon each side of the base; and lugs extending outwardly from the ends of said spring-seat upon each side of each of said columns; substantially as specified.

2. A truck-end or truck-column casting comprising a spring-seat base 6; truck-columns extending upwardly from the base, there being column-bolt openings lengthwise of said columns; brake-hangers extending inwardly from said columns; lugs extending from the upper ends of said columns on each side of the upper arch-bar; all cast integrally; and a spring-seat resting upon said base; lugs extending downwardly from the spring-seat upon each side of the base and lugs extending outwardly from the ends of said spring-seat upon each side of each of said columns; substantially as specified.

3. The improved truck-column casting, consisting of an integral spring-seat base 6; truck-columns extending upwardly from the ends of the base; brake-hangers extending inwardly from the upper ends of said columns; lugs extending upwardly from the upper ends of said columns on each side of the upper arch-bar; all cast integrally; a spring-seat resting upon said base; lugs extending downwardly from the spring-seat upon each side of the base; and lugs extending outwardly from the ends of said spring-seat upon each side of each of said columns; substantially as specified.

4. A truck-end or truck-column casting comprising a spring-seat base 6; truck-columns extending upwardly from the base, there being column-bolt openings lengthwise of said columns; brake-hangers extending inwardly from the upper ends of said columns; lugs extending downwardly from the spring-seat base on each side of the lower arch-bar; lugs extending upwardly from the upper ends of said columns on each side of the upper arch-bar; all cast integrally; and a spring-seat resting upon said base; lugs extending downwardly from the spring-seat upon each side of the base and lugs extending outwardly from the ends of said spring-seat upon each side of each of said columns, substantially as specified.



706,790. **CLEANING-PASTE AND PROCESS OF MAKING SAME.** AUGUST WOLFERS, Hannoverwald, Germany. Filed Mar. 20, 1902. Serial No. 98,804. (No specimens.)

Claim.—1. A cleaning-paste, consisting of soap, milk and eggs intimately mixed.

2. The process of producing a cleaning-paste, which consists in cooking soap and milk until it reaches the consistency of a paste, and then adding eggs to the mixture, and stirring the whole until cold.

706,791. **SEAT FOR WATER-CLOSETS.** WILLIAM C. ANDERSON, Detroit, Mich. Filed Feb. 15, 1901. Serial No. 47,411. (No model.)

Claim.—1. A closet-seat of fibrous material laid in layers arranged regularly around the center with included sections of strengthening-wire and having holding-nails driven at intervals through the layers of the structure, substantially as described.

2. A closet-seat of fibrous material wound in a coil with included sections of strengthening-wire, substantially as described.

3. A closet-seat of fibrous material laid in layers arranged regularly around the center with included sections of strengthening-wire, said wire having a continuous bent or wavy form, substantially as described.

4. A closet-seat of fibrous material laid in layers arranged regularly around the center with included sections of strengthening-wire, said wire having a continuous bent or wavy form, said seat having holding-nails driven at intervals through the layers of the structure, substantially as described.

706,792. **ATTACHMENT FOR BEER-PUMPS.** EDWARD A. AUSMS, Chicago, Ill. Filed Aug. 28, 1901. Serial No. 73,980. (No model.)

Claim.—1. The combination with a beer keg or barrel, of a gas-charging cylinder, a supply-pipe directly connecting said cylinder with the keg or barrel, a storage-tank, a pump between the keg or barrel and the tank, a pipe leading directly from said storage-tank to the supply-pipe between the charging-cylinder and the keg or barrel, a reducing or regulating valve in said pipe leading from the storage-tank, and means to prevent the gas from flowing in the reverse direction from the supply-pipe into the storage-tank, substantially as described.

2. The combination with a beer keg or barrel, of a bung therefor and a tapping-pipe passing through the bung and capable of longitudinal adjustment therein, a charging-cylinder, a supply-pipe directly connecting the said cylinder with the bung and therethrough to the keg or barrel, a storage-cylinder and a pipe connecting it with the supply-pipe, a regulating-valve in the pipe from the storage-tank, a check-valve in the last-named pipe, a pump connected with the storage-tank, and a tube leading from the pump to the keg or barrel, said tapping-pipe being adapted to be connected with the pipe leading to the draft-faucet when its lower end is extended beneath the surface of the beer in the keg or barrel, and to be disconnected from said pipe and connected with the said pump-tube when its lower end is drawn up above the surface of the beer, substantially as described.

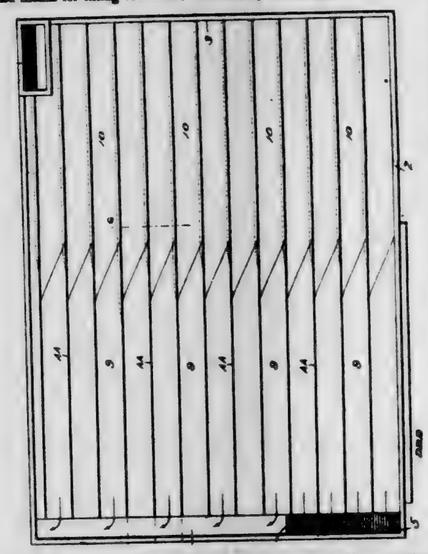
3. The combination with a beer keg or barrel, of a bung therefor adapted to be connected with a gas-charging cylinder, a tapping-pipe passing through said bung and capable of longitudinal adjustment therein, said pipe being arranged when its lower end is beneath the surface of the beer and the gas-pressure is turned on to be connected with the draft-faucet for drawing beer in the usual manner, a controlling means to close the passage through said pipe, a gas-saving mechanism adapted to be connected with said pipe when the latter is drawn above the beer to draw the gas out of the keg or barrel, and a normally closed branch connection formed on said tapping-pipe outside the barrel or keg through which a suitable siphon-tube may be inserted when the pipe is again inserted into the beer for siphoning purposes, whereby the same pipe is utilized for drawing beer and for siphoning, the gas is saved and the beer is prevented from foaming during the siphoning process, substantially as described.

706,793. **ORE-CONCENTRATOR.** HOWARD S. BAILEY and WILLIAM E. WILD, Denver, Colo. Original application filed Feb. 14, 1901, Serial No. 47,315. Divided and this application filed Feb. 20, 1902. Serial No. 94,975. (No model.)

Claim.—1. In an ore-concentrator, a reciprocating table containing a plurality of ore-pulp-receiving recesses of equal lengths, width and depth, a plurality of ridges or dams extending across said ore-pulp-receiving recesses, also of equal lengths, a plurality of concentrate-washing and classifying portions below said dams, also of equal lengths, the said recesses and the said dams being arranged in a line at right angles to the length of the table, and means for feeding ore-pulp into and across said recesses, substantially as described.

2. In an ore-concentrator, a reciprocating table containing a plurality of ore-pulp-receiving reservoirs of equal lengths in the head-end portion of the table and of predetermined breadths and depths, a plurality

of ridges or dams of equal lengths extending across said ore-pulp-receiving reservoirs, a plurality of concentrates washing and classifying portions below said ridges or dams, also of equal lengths, the said reservoirs and dams being arranged in a line at right angles to the length of the table, and means for conveying the concentrates from each of said reservoirs to each concentrates washing and classifying portion below said ridges and dams, means for feeding ore-pulp into and over said reservoirs, and means for tilting said table, substantially as described.



3. In an ore concentrator and separator, a reciprocating concentrating-table provided with a plurality of concentrating-surfaces of equal lengths from one end of the table to the other, in step form, each step comprising inclined surfaces intersecting at points intermediate of the ends of the steps, the said points of intersection forming dams arranged in a line at right angles to the length of the table, substantially as described.

4. In a reciprocating ore concentrator and separator, a table having a concentrating-surface comprising a plurality of concentrating-surfaces of equal lengths, in stepped form, each stepped surface comprising warped inclined surfaces intersecting each other at a point intermediate of the length of the step and each step being provided with a pocket in its vertical wall, substantially as described.

5. In an ore-concentrator, a reciprocating table comprising a plurality of separating portions of equal lengths in stepped relation, each separating-step comprising inclined warped surfaces intersecting each other at a point intermediate of the length of the step, the portion of the surface near the discharge end being inclined, and the series of intersections being arranged in a line at right angles to the length of the table, substantially as described.

6. In an ore-concentrator, a reciprocating table composed of a succession of separating portions of equal lengths in stepped relation, each portion comprising surfaces of different pitches intersecting each other in a line in such a manner as to form a dam intermediate the ends of the separating portions, the series of dams being arranged at right angles to the length of the table, substantially as described.

7. In an ore-concentrator, a reciprocating concentrating-table comprising a plurality of separating portions in stepped relation, each portion comprising surfaces intersecting each other on a line to form a dam on said separating portions, a pocket extending into each wall between two separating portions and extending along the lower edge of each portion, the series of dams being arranged at right angles to the length of the table, substantially as described.

8. In an ore-concentrator, a reciprocating, concentrating-table comprising a group of independent separating portions of equal lengths, each portion comprising two curved inclined sections intersecting each other on a line oblique to the length of the table, the feed-section being inclined to form an uphill surface for the pulp or ore to travel over, a vertically-disposed wall between the highest edge of each portion and the lowest edge of the succeeding portion, each wall being provided with a pocket tapering toward the discharge-section and merging into the substantially horizontal surface with which the discharge-section is provided near the discharge end, the lines of intersection being arranged at right angles to the length of the table, substantially as described.

9. In an ore-concentrator, a reciprocating, concentrating-table comprising a plurality of independent, concentrating portions of equal lengths, each consisting of an independent concentrating-surface, the discharging-sections being inclined slightly at the discharge ends, the concentrating-sections being substantially straight at the feed end, and of equal lengths, and each section being upwardly curved to form ridges or dams intermediate of the length of the table, the said ridges or dams being of equal lengths, the concentrating portions being transversely inclined and being arranged in step relation, a wall between each portion and tapering pockets of each corner formed by said separating portions and walls, said pockets entering the face of each wall, the series of ridges or dams above mentioned extending across the table at right angles to its length and being adapted to retain a bed of ore or pulp in each concentrating-section and to guide the mineral of said ore into said pockets, substantially as described.

10. In a reciprocating, ore-concentrating table over which ore-pulp flows, a plurality of reservoirs, of equal lengths, in the head end portion of said table adapted to receive said ore-pulp, a plurality of ridges or dams of equal lengths arranged at the discharge-end portion of said table and arranged to intersect said reservoir portions, and a plurality of pockets or channels of equal lengths, one of said pockets in each of said reservoirs, arranged to receive the concentrates from said ore-pulp of said reservoirs and arranged and adapted to convey said concentrates from said reservoirs past said ridges, the series of reservoirs and dams being arranged at right angles to the length of the table, substantially as described.

11. In an ore-concentrator, a reciprocating concentrating-table embodying on its concentrating-surface a plurality of ore-pulp-receiving recesses extending from the head end of said table toward its discharge end, a plurality of ridges at some distance from the discharge end of said table arranged to intersect said ore-pulp-holding recesses in a diagonal line in such a manner as to form dams across them and arranged to make of said recesses ore-pulp-holding reservoirs, and a pocket or channel in said recesses or reservoirs extending past said dam and arranged to bleed into portions of said table beyond the dams formed by said ridges, the said ridges and reservoirs being all of equal lengths and arranged in a series at right angles to the length of the table, substantially as described.

12. In an ore-concentrator, a reciprocating table containing a plurality of ore-pulp-receiving recesses of uniform depth for a portion of their length from the head end of the table and of decreasing depth the rest of their length, the bottoms sloping upwardly to form diagonal ridges with the upwardly-sloping surfaces of discharge-sections which extend from said ridges to the discharge end of the table, and means for feeding pulp transversely over said series of recesses, the said reservoirs being of equal lengths and arranged at right angles to the length of said table, the said ridges being of equal lengths and arranged in a series at right angles to the length of the table, and the said discharge-sections also being of equal lengths, substantially as described.

13. In an ore-concentrator, a reciprocating table containing a plurality of recesses of equal lengths extending longitudinally of said table and of uniform depths for a predetermined portion of their lengths, and gradually decreasing in depth by an upward slope on diagonal lines of their bottoms the rest of their length, the said diagonal lines being arranged in a series at right angles to the length of the table, the intersection of said upwardly-sloping bottoms with the upwardly-sloping bottoms of discharging-sections extending from said recesses to the discharge end of said table forming diagonal ridges or dams extending across said recesses and a pocket in each channel arranged to convey the concentrates to the ridges that form said dams, substantially as described.

14. In an ore-concentrator, a reciprocating table having in its concentrating-surface a plurality of ore-pulp-receiving reservoirs of equal lengths extending longitudinally from the head of said table, a plurality of discharging-sections extending from the discharge end of the table to said reservoirs, also of equal lengths, the surface of said discharging-sections sloping upwardly to form diagonal intersecting dams across the ends of said reservoirs, a pocket in the side of each of said reservoirs extending at least to the said dams and the said dams being arranged in a series at right angles to the length of the table, substantially as described.

15. In an ore-concentrator, a reciprocating table comprising a plurality of inclined intersecting surfaces forming reservoir-sections of equal lengths at the head of the table, and discharge-sections extending from the discharge end of the table to the reservoir-sections, the surfaces of the discharge-sections being placed at a higher horizontal plane than those of the respective reservoir-sections, the surfaces of the reservoirs and discharge-sections being curved to different pitches to form dams at their intersections across the ends of the reservoirs, the said dams being arranged in a series at right angles across the table, and a passage in the side of each reservoir extending by the dam to the discharging-section, each reservoir and its dam being independent in its concentrating action of those reservoirs and dams above and below it and each reservoir and its dam being of a predetermined length, substantially as described.

16. In an ore-concentrator, the combination of a reciprocating table composed of a plurality of longitudinal concentrating-sections of equal length, each section comprising an ore-pulp-receiving portion and a concentrates washing and discharging portion, the respective portions intersecting each other to form a ridge or dam across the section at a point intermediate of its length, and a channel or pocket connecting the respective portions past said ridge or dam, substantially as described.

17. In an ore-concentrator, the combination of a reciprocating table composed of a plurality of concentrating-sections of equal lengths, each section being composed of two portions, the portion at the head end of the table being so inclined as to form a deep recess, and the other portion being inclined at a less depth to form a slight step; the intersection of the two inclined portions forming a diagonal ridge or dam, the said dams being arranged in a line at right angles to the length of the table, a tapering pocket extending along the side of the head portions of each section merging into the surface of the portion beyond the ridge, substantially as described.

18. In an ore concentrator and separator, a reciprocating, concentrating-table provided with a plurality of inclined concentrating-surfaces of equal lengths in step form, each comprising a reservoir-section and an ore washing and classifying section, said inclined surfaces intersecting at points intermediate of the ends of the steps, a ridge or dam portion at the point of intersection of said inclined surfaces of predetermined form, and a concentrates-passage connecting the reservoir-sections of said concentrating-surfaces with the ore washing and classifying section, substantially as described.

19. In an ore concentrator and separator a reciprocating, concentrating-table provided with a plurality of concentrating-surfaces of equal lengths in step form, each stepped concentrating-surface comprising an inclined reservoir-section and an inclined ore washing and classifying section, the said sections being arranged to intersect one another at points intermediate of the ends of the stepped concentrating-surfaces, a raised ridge or dam at the point of intersection, a concentrates-passage past the dam arranged to connect the lowest portions of the inclined surfaces with one another, a pocket in the lowest side of the inclined surface at and adjacent to the head end of the table bleeding into said concentrates-passage and having said dams arranged and adapted to guide the concentrates from the reservoir-section away from the dam below and in a substantially different direction from that in which the ore-pulp flows, and having said dams arranged across the table in any suitable direction substantially as described.

20. In an ore concentrator and separator a reciprocating, concentrating-table provided with a plurality of concentrating-surfaces of equal lengths in step form, each step comprising concentrating-surfaces of different inclination, a dam intermediate of the opposite ends of said concentrating-surfaces arranged to guide the concentrates away from the dam of the concentrating-surface below it, and a channel at the side of the dam nearest the feed side of the table arranged to connect said concentrating-surfaces on each side of the said dam, substantially as described.

21. In an ore concentrator and separator, a reciprocating, concentrating-table comprising a plurality of concentrating-surfaces of equal lengths, each concentrating-surface having an upward step or wall at one side and a downward step or wall at its opposite side, each concentrating-surface comprising an independent concentrating-surface consisting of two coöperating sections, a head-end section comprising an ore-pulp-holding reservoir, which extends from the head end of the table a predetermined distance toward the discharge end of the table, an inclined concentrates washing and classifying portion positioned above the bottom of said reservoir portion and extending from the discharge end of said table to said reservoir portion, a dam arranged to intersect and extend across said reservoir portion, and an upwardly-sloping inclined portion in said reservoir extending upward from its bottom adjacent to said dam to its top edge, a concentrates-passage from said reservoir past said dam, means for reciprocating said table, substantially as described.

22. In an ore-concentrator a reciprocating table comprising a plurality of riffles, a plurality of dams arranged across said riffles in such a manner as to close them at predetermined points and form of them ore-pulp-holding reservoirs, said dams being positioned at a predetermined distance from the head end of said table and commencing at the tailings-discharge side of said riffles and extending in a diagonal line toward the feed side of said riffles a predetermined distance, and a plurality of ore-washing portions below said dams, the said dams being arranged in a line at right angles to the length of the table, substantially as described.

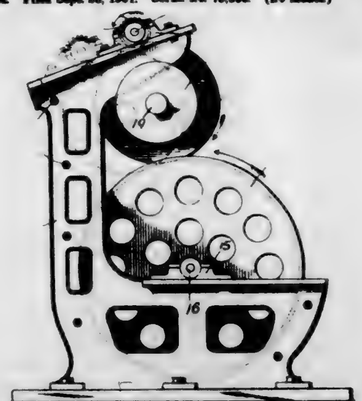
23. In an ore concentrator and separator a reciprocating table comprising a plurality of stepped inclined concentrating-surfaces, each concentrating-surface being composed of two end-to-end sections of different inclined pitches arranged to intersect each other intermediate of their ends diagonally and having the diagonal line of intersection commencing at the head end and tailings-discharge side of each concentrating-surface, and extending toward the feed side of each inclined concentrating-surface, and having said diagonal lines of intersection arranged in a line at right angles to said table, substantially as described.

24. In an ore concentrator and separator a reciprocating table composed of a succession of separating-surfaces of equal length in stepped relation extending across the table from end to end, each concentrating-surface comprising end-to-end sections, one of which is a head-end reservoir-section, and the other an ore washing and classifying and discharge section, the said sections being of different pitches and arranged to intersect each other diagonally to form a dam across the head-end section, a passage by the feed side of each dam from one section to the other and having said intersecting dams arranged to commence at the head end and tailings-discharge side of said separating-surfaces, and extend diagonally toward their feed side and discharge end and having said dams arranged in a right-angle path across the table from the feed side to the discharge side of the table, substantially as described.

25. In an ore concentrator and separator, a reciprocating table composed of a plurality of concentrating-surfaces of equal lengths extending across the table from one end to the other, each surface being composed of sections of different pitches and arranged in end-to-end order and to form diagonally-arranged ridges or dams across one another, a pocket in one wall of one section of each end-to-end concentrating-surface, each dam being arranged from the head end and tailings-discharge side diagonally toward the feed side of each concentrating-surface and arranged one below the other in a line at right angles across the table, substantially as described.

26. In an ore-concentrator, a reciprocating table, containing a plurality of ore-pulp-receiving reservoirs of equal length, a plurality of dams extending across the ends of said reservoirs, a plurality of inclined ore washing and classifying portions of equal length extending from said dams to the discharge end of said table, a plurality of pockets arranged to convey concentrates from said reservoirs below said dams onto said ore washing and classifying portions, the said dams being each arranged diagonally from the head end and tailings side toward the feed side and discharge end of said table the position of each dam being such that the concentrates from each ore-pulp-receiving reservoir will be guided by its own individual dam away from the dam or dams below it to the feed side of its concentrating-surface and onto the feed side of its riffled ore washing and classifying portion below the dam and the tailings from each dam will flow clear ahead of all the dams below the second or third dam below it, substantially as described.

706,794. **MULTIPLYING-GEARING.** ELIE BESSET, Worcester, Mass. Filed Sept. 20, 1901. Serial No. 75,808. (No model.)



Claim.—1. In a power-transmitting gearing, the combination of a driving-shaft having a gear thereon, a shaft to be driven having a gear thereon, and a floating intermediate power-transmitting gear supported without internal bearings so as to normally tend to wedge itself by gravity between the driving and driven gears.

2. In a power-transmitting device, the combination of a driving-shaft having a toothed gear thereon, a shaft to be driven having a toothed gear thereon, and a heavy floating intermediate power-transmitting gear arranged without internal bearings in position to wedge itself by gravity between the toothed gears.

3. In a power-transmitting device, the combination of a shaft to be

driven having a gear thereon, a driving-shaft journaled above and at one side of the center line of the driven shaft, and having a gear thereon, and a solid intermediate power-transmitting gear arranged without internal bearings, and supported on the driven shaft so as to tend to wedge itself by gravity between the driving and driven gears.

4. In a power-transmitting gearing, the combination of a driven shaft having a flanged wheel or wheels secured thereon, a driving-shaft, and a floating power-transmitting wheel supported on the flanged wheels of the driven shaft at one side of the center line thereof, and tending to wedge itself by gravity into engagement with gears on the driving-shaft and driven shaft.

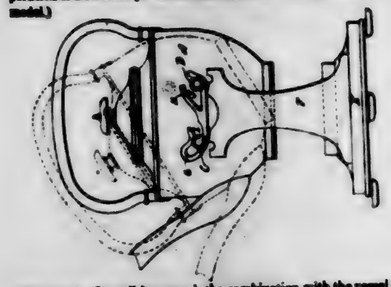
5. In a power-transmitting gearing, the combination of a driving-shaft, a shaft to be driven, wheels secured on the driving-shaft, flanged wheels secured on the driven shaft, and a floating intermediate power-transmitting wheel supported without internal bearings upon the driven shaft, so as to tend to wedge itself by gravity into engagement with said shaft and held in place by the flanges on the wheels of the driven shaft.

6. In a power-transmitting gearing, the combination of a shaft to be driven having wheels thereon, a driving-shaft having a wheel thereon journaled above and at one side of the center of the driven shaft, a floating intermediate power-transmitting wheel supported without internal bearings to rest on the driven shaft, so as to tend to wedge itself by gravity into engagement with the wheels on the driving-shaft and driven shaft respectively, a tooth-gear on the driving-shaft, a tooth-gear on the driven shaft, and a tooth-gear turning with the intermediate wheel and meshing with the two previously-named gears to maintain a constant speed ratio between the driving-shaft and the driven shaft.

7. In a power-transmitting gearing, the combination of a driven shaft, flanged wheels secured on the driven shaft, a driving-shaft journaled above and at one side of the driven shaft, a wheel secured upon the driving-shaft, a floating intermediate power-transmitting wheel resting upon the wheels of the driven shaft and held from lateral displacement by the flanges thereof, in position tending to wedge itself by gravity into engagement with the wheels on the driving-shaft and driven shaft respectively, and toothed gears on the driving-shaft, driven shaft, and intermediate power-transmitting wheel for maintaining a substantially constant speed ratio between the driving-shaft and driven shaft.

8. In a power-transmitting and multiplying gearing, the combination of a framework, a driving-shaft and a shaft to be driven journaled in the framework and carrying wheels, a heavy intermediate power-transmitting wheel arranged to wedge itself by gravity into engagement with the wheels on the driving-shaft and shaft to be driven, said wheels being arranged inside said framework, and supplemental weights secured on the shaft of the intermediate power-transmitting wheel outside the framework.

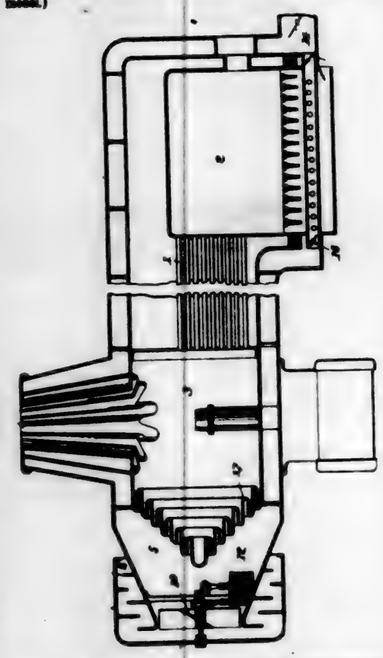
706,795. TILTING VESSEL. ALBERT J. BOTTERSON, Meriden, Conn., assignor to the International Silver Co., Meriden, Conn., a Corporation of New Jersey. Filed Mar. 24, 1902. Serial No. 99,773. (No model.)



Claim.—1. In a tilting vessel, the combination with the vessel thereof, having two trunnions on each side arranged in a substantially horizontal plane, of a stand having uprights upon which said trunnions may rest, fingers at the upper ends of said uprights, the ends of which extend into the path of said trunnions, one of said fingers having a hooked end whereby, when the vessel is raised, the trunnions will engage with said fingers and hold the vessel in engagement with the stand, substantially as described.

2. In a tilting vessel, the combination with the vessel thereof, having two trunnions on each side arranged in a substantially horizontal plane, of a stand having uprights upon which said trunnions rest, resiliently-extending fingers on said uprights, one of said fingers having a hooked end, said fingers being so arranged that the vessel is free to rock upon the uprights, but held against vertical movement by said fingers whereby, when the vessel is tilted, it will be interlocked with the stand, substantially as described.

706,796. HEATING APPARATUS. FRANK BURGER and HENRY M. WILLIAMS, Fort Wayne, Ind.; said Burger assignor of one-half of his right to said Williams. Filed Jan. 15, 1900. Serial No. 1,483. (No model.)



Claim.—1. The combination of a boiler, its smoke box and stack, said smoke-box having a vertical front wall concentrically corrugated and said stack being corrugated longitudinally, a shell surrounding the boiler stack and smoke-box to leave a space between them and projecting beyond the front wall of the smoke-box, means supported in the front end of the shell to force air from the exterior directly against the front wall of the smoke-box and through the spaces between the shell and the smoke-stack and boiler, and a conduit leading from said space at the rear end of the boiler, substantially as set forth.

2. The combination of a boiler and its smoke-box, a shell surrounding the same to leave a space between the two the said shell being formed with an open end, a flanged cap surrounding said end and separated therefrom to form an inlet-passage, the flange of the cap extending rearwardly, means for directing air through the space between the shell and boiler, and an outlet-passage leading from said space, substantially as described.

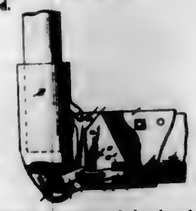
3. The combination with the boiler and its smoke-box, a shell surrounding the same to leave a space between them, the said shell being formed with an open end, a cap surrounding said end and separated therefrom to form an inlet-passage, baffle-plates within said passage, a blower likewise arranged in the passage, and an outlet-passage leading from the space between the shell and boiler, substantially as described.

4. The combination of a locomotive, its saddle and boiler resting thereon, the said boiler having a smoke-box, the wall of which is formed with a series of parallel corrugations, segmental filling-pieces within the recesses of the corrugations, bolts passing through said filling-pieces and the saddle, a shell surrounding the boiler and separated therefrom to leave a space between the two, and inlet and outlet passages leading to and from the said space respectively, substantially as described.

706,797. LOAD-RETAINING MEANS FOR VEHICLES. WILLIAM H. CASE, Carlton, Minn. Filed Mar. 26, 1902. Serial No. 100,096. (No model.)

Claim.—1. In a load-retaining apparatus, the combination with a suitable load-bearing structure, of a bracket extending therefrom, a stake-carrying socket pivotally supported in said bracket, a lever for locking said socket in a vertical position, means carried by said socket engaging said lever for effecting the locking operation, and means extending beyond said socket for operating and controlling said lever, substantially as described.

2. In a load-retaining apparatus, the combination with a suitable load-bearing structure, of a bracket extending therefrom, a tubular socket pivotally mounted on said bracket, a lever-engaging finger formed on said socket, a stake carried by the socket, a lever pivotally supported in the said bracket and adapted to engage said finger, and means pivotally supported by said bracket for controlling the movement of said lever, substantially as described.



3. In a load-retaining apparatus of the class described, the combination with a suitable load-bearing structure, of a bracket extending therefrom, a stake-carrying socket pivotally supported in said bracket, a lever pivoted at its upper end and provided with a locking-finger, means carried by said socket engaging said finger for locking the socket in position, and means for swinging said lever on its pivot for releasing said engaging means, substantially as described.

4. In a load-retaining apparatus of the class described, the combination with a suitable load-bearing structure, of a bracket extending therefrom, a stake-carrying socket pivotally supported in said bracket, a pivotally-mounted lever, means carried thereby for locking said socket against movement, and means engaging the pivot of said socket and also engaging the free end of said lever for controlling the movement of the lever, substantially as described.

5. In a load-retaining apparatus the combination with a suitable load-bearing structure of a bracket extending therefrom; a stake-socket pivotally secured on said bracket and provided with lever-engaging means; a lever pivotally secured to said bracket and adapted to engage said means and provided with latch-engaging means; a latch pivotally secured at one end to said bracket and adapted to engage the latch-engaging means of said lever, substantially as described.

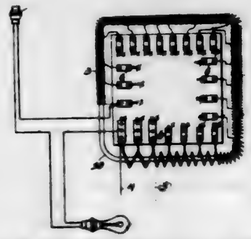
6. In a load-retaining apparatus the combination with a suitable vehicle of a bracket secured thereon and extending therefrom; a stake-socket pivotally secured to said bracket and provided with lever-engaging means; a lever pivotally secured to said bracket and adapted to engage said means and provided with latch-engaging means; a latch pivotally secured to said bracket and adapted to engage the latch-engaging means of said lever; means extending beyond said bracket for operating said latch, substantially as described.

7. In a load-retaining apparatus the combination with a suitable vehicle of a bracket secured thereto and extending therefrom; a stake-socket pivotally secured to said bracket, and provided with lever-engaging means; a lever pivotally secured to said bracket and adapted in operative position to engage said means, and provided with latch-engaging means; a latch pivotally secured near one end to said bracket and adapted intermediate of its ends to engage the latch-engaging means of said lever; means for operating said latch, comprising an integral locking-bolt formed with an angular extension adapted, in operative position, to overreach said latch, a wedge portion adapted, in operation to lift said latch and a vertical stop, substantially as described.

8. In a load-retaining apparatus, the combination with a suitable vehicle of a bracket extending therefrom and formed with forwardly-projecting parallel arms; a stake-socket forked at its lower end and pivotally secured between said arms and provided near its upper end with lever-engaging means; a lever centrically pivoted near its upper end between the walls of said bracket and adapted at said upper end in operative position to interlock with the lever-engaging means of said socket, and provided near its lower end with a latch-engaging pin; a latch pivoted at one end between the arms of said bracket and having a slot formed therein intermediate of its ends extending longitudinally thereof and having a vertical extension of said slot at the end thereof nearest the pivoted end of said latch, and adapted to engage said latch-engaging pin; latch-operating means, comprising a bolt formed with an angular portion adapted in operative position to overreach the free end of said latch, a wedge portion adapted in operation to raise said latch, a vertically-extending lug adapted to prevent the entire withdrawal of said bolt from beneath said latch and a draw-rod secured to said bolt for moving the same; means for securing said draw-rod against movement substantially as described.

706,798. ELECTRIC TESTING APPARATUS. PHINEAS R. CHAPMAN, St. Louis, Mo. Filed Dec. 4, 1901. Serial No. 84,681. (No model.)

Claim.—1. In a testing-coil, an incandescent lamp, a circuit for operating the lamp, a transformer in the lamp-circuit, and means of taking current from any desired portion of the transformer, substantially as specified.



2. In a testing-coil, an incandescent lamp, a circuit for operating the lamp, a transformer in the lamp-circuit, said transformer being subdivided and graduated so that any desired amount of the transformer may be short-circuited or loaded, substantially as specified.

3. In a testing-coil, an incandescent lamp, an adjustable stand supporting the lamp, a circuit for operating the lamp, a transformer in the circuit sufficient to reduce the brilliancy of the lamp to a desired extent, and means of short-circuiting or loading a desired amount of the transformer, substantially as specified.

4. In a testing-coil, an incandescent lamp, a circuit for operating the lamp, a transformer in the circuit to reduce the brilliancy of the light, so that when a part of the transformer is short-circuited the light will increase in brilliancy proportionately to the value of the short circuit, substantially as specified.

5. In a testing-coil, or transformer, an incandescent lamp, a circuit for operating the lamp, a transformer in the lamp-circuit to materially reduce the brilliancy of or extinguish the light, means of subdividing and graduating the transformer, and leads adapted to be attached to the transformer at any desired point so that said leads may be used in testing, the effect of the leads being to carry current to the work, and as means for short-circuiting a predetermined amount of the transformer to increase the brilliancy of the light, substantially as specified.

6. In a testing-coil, an incandescent lamp, a circuit for operating the lamp, a transformer in said circuit, said transformer being subdivided and graduated, binding-posts connected to said subdivisions, and leads adapted to be connected to said binding-posts, substantially as specified.

7. In a testing-coil, an incandescent lamp, a transformer, a circuit for operating the lamp, and a rotary transformer or other device for transforming direct current to alternating current suitable for supplying alternating current to the testing-coil, substantially as specified.

8. In a testing-coil, a transformer, a circuit for operating same substantially as above described, and an ammeter or other current-indicating device having sufficient impedance inherent or auxiliary, substantially as specified.

706,799. GARMENT-CLASP. BYRON S. CLARK, Brookline, Mass., assignor to the Clark Manufacturing Company, Boston, Mass., a Corporation of New Jersey. Filed Jan. 2, 1902. Serial No. 87,995. (No model.)

Claim.—1. A clasp comprising a plate having a transverse opening at one end to receive the end of the webbing, a transverse tubular bearing at the other end of the plate, a swinging loop mounted in said bearing, to receive the free end of the webbing, the latter being firmly held and pinched between the loop and the adjacent end of the plate, means to engage and stop further movement of the loop when the webbing is pinched thereby, a movable jaw mounted on the plate independently of the said bearing, and means to operate and control the jaw.

2. A clasp comprising a plate having a transverse webbing-receiving slot at one end, a loop pivotally connected with the plate at its other end, and adapted to be swung beyond the under face of the plate when in operative position, to thereby firmly pinch and hold the webbing passed through the loop, between the latter and the adjacent end of the plate, means to stop the movement of the loop when in position to pinch the webbing, a movable jaw mounted on the plate, and means to operate and control said jaw.

3. In a garment-clasp, a plate having at one end a transverse slot, and at its other end reduced in width to present lateral shoulders, and provided with a transverse tubular bearing between the shoulders, and a loop fulcrumed in said bearing, and adapted to be swung past dead-

center close to the adjacent end of said plate, to pinch and firmly hold a piece of webbing when passed beneath the plate and through said loop, the sides of the loop at each time engaging the shoulders and being held thereby from further movement.

4. In a garment-clasp, a plate folded upon itself at one end, and bent to form a tubular, transverse bearing adjacent the folded end, and having a lateral shoulder at each end of said bearing, a movable jaw mounted on the plate independently of the bearing, a webbing-holding loop pivotally mounted in the bearing, and adapted to be swung past dead-center beyond the under face of the plate, and closely adjacent the folded end thereof, to pinch and hold a piece of webbing passed through the loop, said loop when pinching the webbing engaging and being held by the shoulders from movement beyond dead-center.

5. In a garment-clasp, a plate having a supporting-strap of webbing attached at one end thereto, and passed longitudinally along the under face of the plate, swinging means mounted on the opposite end of the plate to clamp or pinch the webbing at such point, and prevent transmission of longitudinal strain to the webbing under the plate, a fixed bearing on the plate for said means, a clamping-jaw mounted on the plate independently of said bearing to cooperate with the said plate, and a device to stop the movement of the clamping means when the webbing is clamped thereby.

706,800. **MEAT-CHOPPER.** LAUTAUS S. COBB, Holden, and CHAS M. JORDAN, Somerville, Mass., assignors to William G. Bell Company, Boston, Mass., a Corporation of Massachusetts. Filed May 1, 1902. Serial No. 105,625. (No model.)

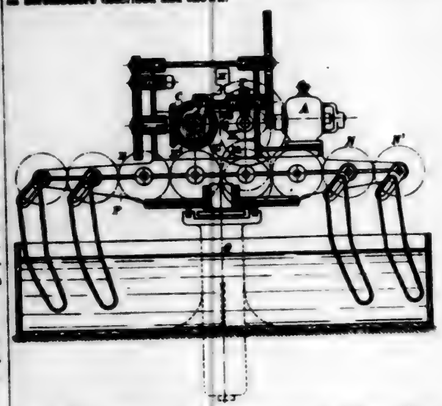
Claim.—1. A meat-chopper comprising a frame having a receiving-hopper and a lateral outlet, a cutter-shaft journaled in said frame and located in said outlet, said shaft and outlet having cooperating cutting members, one end of the cutter-shaft projecting through a bearing formed at one end of the casing, a gear detachably secured to the projecting end of the cutter-shaft, the cutter-shaft being removable from said gear and through the bearing and outlet, a driving-shaft journaled in a bearing on the supporting-frame and provided with a gear, and an intermediate gear meshing with the gears on the driving and cutter shafts and located below the said detachable gear, whereby the intermediate gear is adapted to prevent downward displacement of the detachable gear when the cutter-shaft is removed therefrom, means being also provided for preventing lateral displacement of said gear after removal of the cutter-shaft.

2. A meat-chopper comprising a frame having a receiving-hopper and a lateral outlet, a cutter-shaft journaled in said frame and located in said outlet, said shaft and outlet having cooperating cutting members, one end of the cutter-shaft projecting through a bearing formed at one end of the casing, a gear detachably secured to the projecting end of the cutter-shaft, the cutter-shaft being removable from said gear and through the bearing and outlet, a driving-shaft journaled in a bearing on the supporting-frame and provided with a gear, an intermediate gear meshing with the gears on the driving and cutter shafts and located below the said detachable gear, whereby the intermediate gear is adapted to prevent downward displacement of the detachable gear when the cutter-shaft is removed therefrom, and a hood affixed to the supporting-frame and inclosing said gears, said hood cooperating with the intermediate gear in preventing lateral displacement of the detachable gear and having an opening which permits access to the device which secures the detachable gear to the cutter-shaft.

706,801. **APPARATUS FOR DYEING, &c.** CÉSAR CORREA, Lyons, France. Filed Feb. 16, 1901. Serial No. 47,563. (No model.)

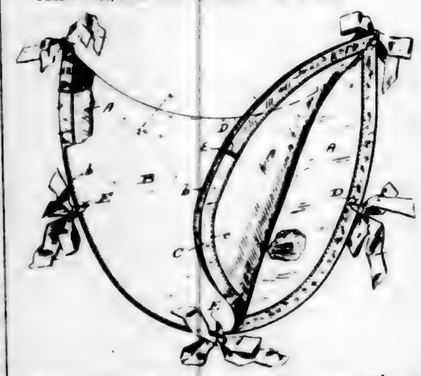
Claim.—1. In a machine for dyeing or for washing yarn or like materials in skeins, the combination with the ordinary means employed for elevating and lowering the skein-carriers as well as for producing the displacement of the skeins upon the carriers, of eccentric gears and interposed gears meshing therewith and keyed directly to the spindles of the skein-carriers for imparting to the said skein-carriers during their eccentric displacement in both directions of movement varying successive speeds, substantially as hereinbefore described and for the purpose specified.

2. In a machine for the treatment of yarn or like materials in skeins, the skein-carriers of a shape constituting an undulated skein-carrier, combined with means for imparting thereto during their eccentric movements in both directions of movement varying successive speeds, substantially as hereinbefore described and shown.



3. In a machine serving for the purpose described, the combination with the ordinary arrangements hitherto provided in connection with skein-carriers, of an operating-gear of eccentric toothed wheels and gears on the spindles of said skein-carriers meshing with said eccentric wheels for imparting to their skeins varying successive speeds during every revolution, the said skein-carriers having undulatory portions, the whole substantially as described and for the purpose specified.

706,802. **DRESS-SHIELD.** EMMA M. COWLES, Milwaukee, Wis. Filed Feb. 16, 1901. Serial No. 47,644. (No model.)

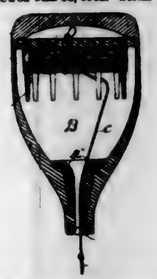


Claim.—1. A dress-shield comprising a fabric cover and a removable rubber lining of equal area, and both provided with hems or bindings having coinciding eyelets, in combination with fastening devices for temporarily securing the cover and lining together.

2. A dress-shield, comprising a fabric cover having holes or eyelets in its edge, in combination with a folded sheet of rubber, provided with a binding formed with holes or eyelets therein at intervals corresponding to those in said cover and registering therewith, and a series of tapes or ribbons for holding the cover and rubber together, and for attaching same to a dress and its sleeves.

3. A dress-shield comprising a folded fabric cover, made double, of two pairs of similarly-shaped pieces, having concave upper edges, with the upper meeting edges of the outer pieces turned in and stitched together, and the upper meeting edges of the inner pieces likewise turned in and stitched together, independently of the stitching of the outer pieces, and with the other edges of said pieces stitched together and formed with eyelets therethrough, in combination with a removable folded rubber lining provided with a binding, said lining and its binding being equal in area to said cover, and the binding of the lining being formed with eyelets coinciding with the cover-eyelets; and a series of tapes or ribbons, each passed through one coinciding pair of said eyelets for temporarily holding the cover and lining together, and for removably attaching the same to a dress and its sleeves.

706,803. **BUOY.** WILLIAM S. CROUCH, Jr., Tacoma, Wash. Filed Apr. 30, 1901. Renewed Jan. 30, 1902. Serial No. 91,905. (No model.)



Claim.—1. A buoy for sending a line to or from a distressed vessel, comprising in its construction a body portion of substantially oval shape, said buoy being hollow and having its lower end weighted, a device for holding a line loosely in position, suspended within the hollow buoy and having fixed depending projections for loosely engaging a line, the said line being adapted to pass therefrom through an aperture in the lower end of the buoy, substantially as described.

2. A floating buoy for sending a line to or from a vessel, comprising a divided body portion, the main part of which is hollow and weighted at its lower end, a line-holding device suspended in the upper part of the buoy and having fixed projections depending into the lower part thereof, a line loosely disposed on said fixed projections so that it may be easily drawn therefrom and passed out through the hole in the bottom of the buoy, the buoy being so constructed that the line-holding device may be removed and the line replaced, substantially as described.

3. A floating buoy for sending a line to or from a distressed vessel, comprising in its construction a suitable body portion of substantially oval shape, said buoy being hollow and having a reduced, weighted lower end, a device for holding and paying out a line arranged within the buoy, said device comprising a plurality of pins or pegs upon which the line is wound, the line being adapted to be passed through an aperture in the lower weighted end of the buoy, and means for affording access to the interior of the buoy for the insertion or removal of the line, substantially as described.

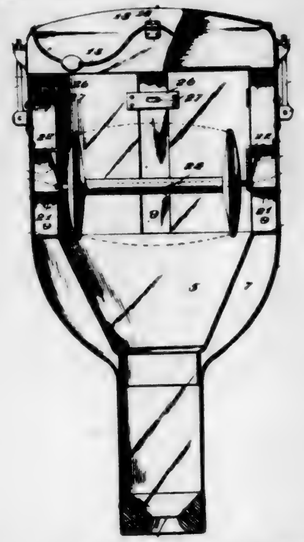
4. A floating buoy for sending a line to or from a distressed vessel, comprising in its construction a suitable body portion of substantially oval shape, said buoy being hollow and having a reduced, weighted lower end, and a movable cover, a device for holding and paying out a line arranged within the cover, and adapted to be removed therefrom for the insertion of another line-holding device, the line being adapted to be passed through an aperture in the lower end of the buoy, means for temporarily locking the line-holding device within the cover, and means for locking the cover in position on the lower section of the buoy, substantially as described.

5. A buoy comprising a hollow casing having a suitable cover fitting upon its upper end and being provided with an outlet or aperture at its lower end, a weight disposed at the lower end of the buoy to hold the aperture normally at the bottom of the buoy, a plate or board secured within the removable top of the buoy and provided with a series of depending, tapering pins upon which a suitable line may be wound, the arrangement being such that when the buoy is released the line will easily pay out through the aperture in the bottom of the buoy, substantially as described.

6. A buoy comprising a hollow casing larger at the top than at the bottom, a weight for maintaining the small lower end in the lowest position when the buoy is floating, a removable cover closing the upper end of the buoy, a removable plate or board secured to the inner surface of the cover, a series of latches carried by the plate or board and engaging detents on the cover so that the said board can be easily removed or replaced, a series of depending pins projecting from the under surface of the said plate or board upon which a line is loosely wound, the structure being such that the line can be easily drawn out of the buoy through the bottom aperture thereof, and the plate can be removed from the cover for rewinding the line upon the pins at any time, substantially as described.

7. A buoy for sending a line to or from a distressed vessel, or for indicating the location of an anchor, comprising in its construction a suitable hollow body portion, and provided with an aperture or outlet at its lower end, and also with a suitable cover which fits upon the upper end of the buoy, a weight disposed at the lower end of the buoy for holding the latter in an upright position, a device for holding and paying out a line arranged within the buoy, said device comprising a plate or board provided with a series of depending tapering pins upon which the line is adapted to be wound, means for temporarily locking the device within the buoy, the arrangement being such that when the buoy is released the line will readily pay out through the aperture in the bottom of the buoy, substantially as described.

706,804. **BUOY.** WILLIAM S. CROUCH, Jr., Tacoma, Wash. Filed Jan. 30, 1902. Serial No. 91,897. (No model.)



Claim.—1. A buoy for sending a line to or from a distressed vessel, or for indicating the location of an anchor, comprising in its construction a suitable hollow body portion, and provided with an aperture or outlet at its lower end, and also with a suitable cover which fits upon the upper end of the buoy, said cover being formed with an air-compartment, a weight disposed at the lower end of the buoy for holding the latter in an upright position, and a device for holding and paying out a line arranged within the buoy, substantially as described.

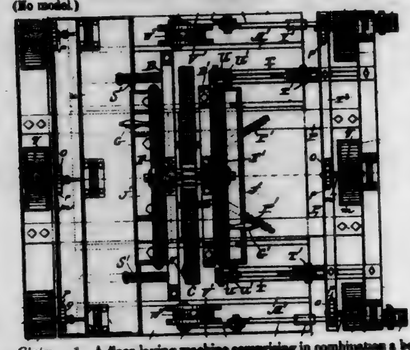
2. A buoy for sending a line to or from a distressed vessel, or for indicating the location of an anchor, comprising in its construction a suitable hollow body portion, and provided with an aperture or outlet at its lower end, and also with a suitable hollow cover which fits upon the upper end of the buoy, means disposed at the lower end of the buoy for retaining the latter in an upright position, a device for holding and paying out a line arranged within the buoy, said device comprising a plurality of pins or pegs upon which the line is wound, the line being designed to be passed through the aperture in the lower end of the buoy, substantially as described.

3. A buoy for sending a line to or from a distressed vessel, or for indicating the location of an anchor, comprising in its construction a suitable hollow body portion which is weighted at its lower end and provided with an aperture at said lower end which communicates with the interior of the buoy, a device within said buoy for holding and paying out a line, means for temporarily locking the line-holding device within the buoy, a cover for said buoy, means for locking the cover in position on the body of the buoy against the entrance of water, independent air-compartments arranged within the buoy, and also an air-compartment in the cover, substantially as described.

4. A buoy for sending a line to or from a distressed vessel, or for indicating the location of an anchor, comprising a hollow body portion, the buoy being weighted at its lower end and provided with an aperture at said lower end which communicates with the interior of the buoy, a device arranged within the buoy for holding and paying out a line, independent air-compartments within the buoy with spaces between said compartments for the reception of means for holding the line-holding device, and a cover for said buoy, means for locking the cover in position on the buoy against the entrance of water, and a rope carrying corks or floats secured around the buoy, substantially as described.

5. A buoy comprising a hollow body portion having its lower end weighted and apertured, a device arranged within said body portion for holding and paying out a line, and independent air-compartments within said body portion arranged with spaces therebetween for the reception of means for retaining the line-holding device, substantially as described.

706,805. FLOOR LAYING AND NAILING MACHINE. JOSEPH C. DAIGNAULT, Worcester, Mass., assignor of one-half to Wilfred A. Beaudette, Worcester, Mass. Filed Nov. 20, 1899. Serial No. 737,589. (No model.)



Claim.—1. A floor-laying machine comprising in combination a bed having supporting-standards carrying horizontal shafts; a series of vertically-arranged, intermeshing gears, mounted on said shafts and having means for turning them; sprocket-wheels, mounted on one of the shafts of said gearing; horizontal rollers fitted to turn in suitable bearings in the bed, and each having a gear mounted thereon; endless chains engaging said sprocket-wheels and the last-named gears; an eccentric mounted on one of the gear-shafts; a frame fitted over and operated by said eccentric; a nail-driver pivoted to a suitable support connected with the eccentric-frame; horizontal bars, fitted to slide longitudinally in the bed; means for imparting longitudinal movements thereto from one of the gears and for drawing them back when the pressure is removed; combined nail receptacle and feed devices mounted on said slide-bars and operated by connection with the eccentric-frame to intermittently feed the nails into position for the drivers to act thereon, and said drivers also mounted on supports connected with the eccentric-frame, substantially as and for the purpose set forth.

2. In a floor-laying machine, the combination of the bed and vertical stands mounted thereon, with a series of vertically-arranged, intermeshing gears mounted on horizontal shafts, in turn mounted in said stands, one of said gears being provided with a cam projection; means for turning said gears; a pair of rollers, one at each side of the machine fitted to turn in suitable bearings and adapted to travel upon the floor; means for connecting said rollers with one of the gear-shafts to impart the driving power thereof to said rollers; horizontal bars fitted to slide in the bed, and adapted to be moved longitudinally by engagement with the aforesaid cam projection on the gear; means for imparting opposite longitudinal movements thereto, and horizontal friction-rolls mounted on the outer ends of said bars and adapted when moved forward to bear against the edge of the board being laid, substantially as and for the purpose set forth.

3. In a floor-laying machine, the combination of the bed and vertical stands mounted thereon, with a series of vertically-arranged intermeshing gears mounted on horizontal shafts, in turn mounted in said stands, one of said gears being provided with a cam projection; means for turning said gears; a pair of rollers, one at each side of the machine, fitted to turn in suitable bearings and adapted to travel upon the floor; means for connecting said rollers with one of the gear-shafts to impart the driving power thereof to said rollers; horizontal bars fitted to slide in the bed and adapted to be moved longitudinally by engagement with the aforesaid cam projection on the gear; means for imparting opposite longitudinal movements thereto; horizontal friction-rolls mounted on the outer ends of said bars and adapted when moved as aforesaid, to bear against the edge of the board being laid; combined nail receptacles and feed devices mounted on said longitudinally-operating bars, each device consisting of an outer case having a hopper at its upper end for the nails and a chute for guiding the nails to the edge of the floor-board, a transversely-arranged, longitudinally-grooved cylinder fitted to turn in said case, and a ratchet-wheel attached to the shaft of said grooved cylinder, and adapted to be turned by a reciprocating pawl on the machine, substantially as and for the purpose set forth.

4. In a floor-laying machine, the combination of the bed and vertical stands mounted thereon with a series of vertically-arranged intermeshing gears mounted on horizontal shafts, in turn mounted in said stands; means for turning said gears; an eccentric mounted on one of the gear-shafts; the frame in which said eccentric is fitted to turn, having means for supporting a vertically-arranged pawl; said pawl, adapted to engage with the ratchet-wheel of the feed device, and said ratchet-wheel, substantially as and for the purpose set forth.

5. In a floor-laying machine, the combination of the bed and vertical stands mounted thereon, with a series of vertically-arranged, intermeshing gears mounted on horizontal shafts, in turn mounted in said stands; means for turning said gears; an eccentric mounted on one of the gear-shafts; the frame in which said eccentric is fitted to turn, having means for supporting a vertically-arranged pawl; said pawl adapted to engage with the ratchet-wheel of the feed device, said ratchet-wheel; the shaft upon which it is mounted; the longitudinally-grooved cylinder of the feed device also mounted on said shaft; the feed-device case, having a hopper at its upper end to receive the nails and a suitable chute for guiding said nails to the edges of the floor-boards, and means for supporting said feed device, substantially as and for the purpose set forth.

6. In a floor-laying machine, the combination of the bed and vertical stands mounted thereon, with a series of vertically-arranged intermeshing gears mounted on horizontal shafts, in turn mounted in said stands; means for turning said gears; an eccentric mounted on one of the gear-shafts; the frame in which said eccentric is fitted to turn, the nail-drivers mounted on a support on said frame and the feed device, substantially as and for the purpose set forth.

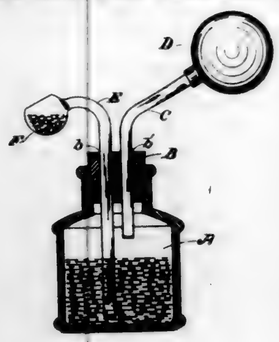
7. In a floor-laying machine, the combination of the vertically-reciprocating pawl for operating the ratchet-wheel of the feed device, with said ratchet-wheel; the shaft upon which it is mounted; the longitudinally-grooved cylinder, also mounted on said shaft for carrying around the nails to the chute of the device; the case of the device having a hopper at its upper end to receive the nails and a chute for guiding said nails to the edges of the floor-boards, and means for supporting said feed device, substantially as and for the purpose set forth.

8. In a floor-laying machine, the combination of the bed and vertical stands mounted thereon, with a series of vertically-arranged intermeshing gears mounted on horizontal shafts, in turn mounted in said stands; means for turning said gears; an eccentric mounted on one of the gear-shafts; the frame in which said eccentric is fitted to turn; a link, pivoted to each end of said frame; two levers, each pivoted to said links and to a fixed bearing, and the nail-drivers mounted on the outer ends of said levers, substantially as and for the purpose set forth.

9. In a floor-laying machine, the combination of the bed and a vertical fixed bearing mounted thereon, with an eccentric pivoted on a transverse bolt in said bearing and having means for turning it; said bolt; a carriage arranged in the bed under said eccentric; wheels mounted thereon and normally out of contact with the floor, and means for connecting said carriage with the eccentric, and for elevating and depressing the carriage, substantially as and for the purpose set forth.

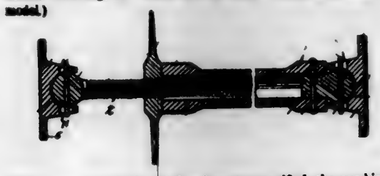
10. In a floor-laying machine, the combination of the bed and a vertical, fixed bearing, mounted thereon, with an eccentric pivoted on a transverse bolt in said bearing and having means for turning it; said bolt; a crank-arm attached to said bolt; a connecting rod or lever pivoted to said crank-arm and fitted to slide in a fixed bearing, and a shoe pivoted to the outer end of said rod or lever and provided with spurs adapted to engage with the floor, substantially as and for the purpose set forth.

706,806. BOTTLE ATTACHMENT. LOUIS S. DE FOREST, New Haven, Conn. Filed Apr. 18, 1902. Serial No. 103,615. (No model.)



Claim.—In a bottle the combination with a stopper B, of perforations *b* and *b'* in said stopper; a tube C adapted to fit through said perforation *b'* in said stopper and having secured at its outer end a collapsible bulb D, and a tube E adapted to pass through the perforation *b* of said stopper and have formed integral with its outer end a well or bucket F, substantially as described.

706,807. DITCHING-JACK. CHARLES E. DIXON and JOHN E. DIXON, Pittsburg, Pa. Filed Jan. 13, 1902. Serial No. 89,544. (No model.)



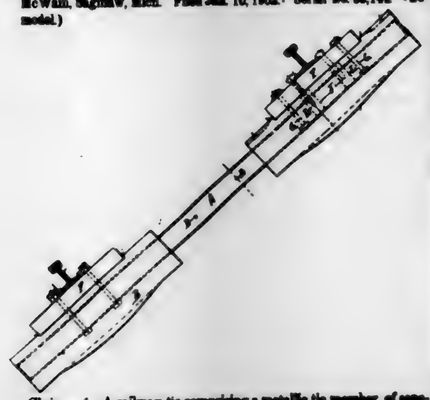
Claim.—1. In a device of the character specified, the combination with shoes having lateral impact lugs and sockets provided with transversely-alined slots, of two adjustable parts or sections having their outer ends provided with balls to engage the sockets, and pins rigidly associated with the balls and projecting through the slots.

2. In a device of the character specified, the combination of the shoes having lateral impact lugs and sockets and transversely-alined slots, a sleeve and a screw carrying balls engaging the sockets, pins rigidly associated with the balls and projecting through the slots, and a nut engaging the screw.

3. In a device of the character specified, the combination with the shoes having sockets, of a screw carrying a ball associated with one socket, a sleeve having its ends circumferentially enlarged for the purpose of reinforcement and carrying a ball engaging the other socket, and a nut carried by the screw.

4. As a new article of manufacture, a shoe for ditching-jacks provided with impact-lugs extending beyond the base of the shoe and with a socket provided with alined slots.

706,808. RAILWAY-TIE. JOHN DOYLE, Grand Rapids, and GEORGE H. KIMBALL, Detroit, Mich., assignors of one-third to W. J. McWain, Saginaw, Mich. Filed Jan. 10, 1902. Serial No. 88,144. (No model.)



Claim.—1. A railway-tie comprising a metallic tie member, of separated cement sleepers formed on the ends of the tie member, a combining rail-block on each sleeper, the sleepers extending substantially equal distances on opposite sides of the rail-bearing.

2. A railway-tie comprising a rigid metallic tie member, of two separated cement sleepers formed on the ends of the tie member, rail-blocks on the sleepers to support the rails, the sleepers extending a substantially equal distance on each side of the rail-bearing, and the rail-blocks being of such length and thickness as to distribute the load throughout the sleepers.

3. A railway-tie comprising a cement body having openings at the points where the spikes are to be driven, plugs therein, fibrous blocks thereon and bolts for securing the blocks on the body over the plugs.

4. A railway-tie comprising a cement body, wooden spike-plugs therein, and wooden blocks secured on the body, having apertures in line with the plugs.

5. A railway-tie, comprising a body formed of two separated cement sleepers, wooden rail-blocks secured to the sleepers, and flanged bars connecting the sleepers and extending therein beyond the blocks.

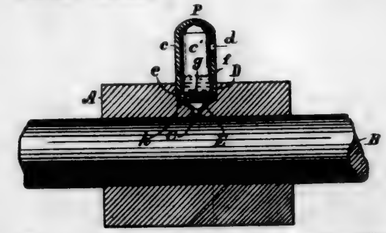
6. A railway-tie comprising two flanged bars spaced apart and tied, cement sleepers molded about the end portions thereof, and a cement filling between the intermediate faces thereof.

7. A railway-tie comprising two flanged bars spaced apart and tied, cement sleepers molded about the end portions thereof, having a transverse gain at each end on top, and rail-blocks secured in the gains.

8. A railway-tie comprising metallic bars spaced apart, cement sleepers molded about the end portions thereof, and an integral bowed trans-shaped bottom thereon.

9. The combination in a railway-tie, of longitudinal metallic tie members, separated cement sleepers molded about the ends thereof, wooden rail-blocks on the sleepers and vertical bolts for clamping the blocks to the sleepers.

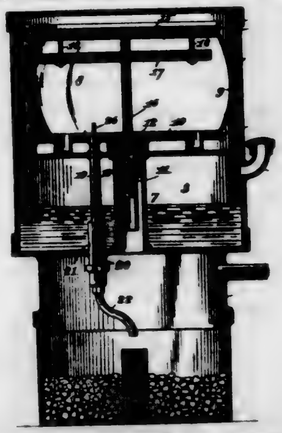
706,809. OIL-HOLE PROTECTOR. FRED L. EBERHARDT and HENRY F. EBER, Newark, N. J., assignors to Gould & Eberhardt, Newark, N. J., a Corporation of New Jersey. Filed June 19, 1901. Serial No. 65,157. (No model.)



Claim.—1. The oil-hole protector herein shown and described, and consisting of a cup provided with a feed-hole, the internal cavity of the cup having at the bottom the recess *e* with shoulder *f* upon its upper side to set a felt disk at a given point, and the annular lip A at the bottom or margin of the recess, adapted to hold a felt disk in the recess when the disk is crowded through the lip into contact with the shoulder.

2. The oil-hole protector herein shown and described and made in one piece, and consisting of an inverted cup with feed-hole in the side, the internal cavity *c'* of the cup being enlarged at the bottom to form the recess *e* having shoulder *f* to set a felt disk at a given point, and the cup having the annular lip A at the margin of the recess adapted to hold a felt disk in the recess, when the disk is crowded through the lip into contact with the shoulder.

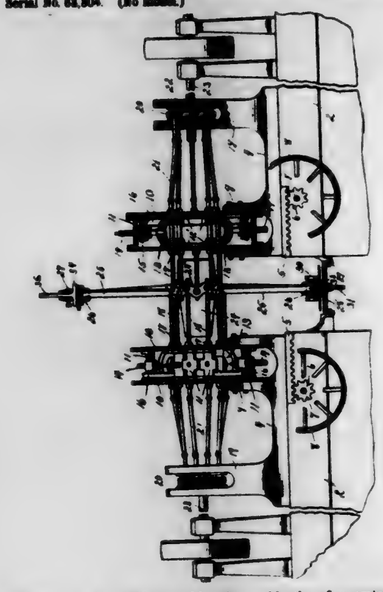
706,810. ACETYLENE-GAS GENERATOR. ALFRED C. REMPEL, St. Louis, Mo. Filed Feb. 18, 1901. Serial No. 47,711. (No model.)



Claim.—In an acetylene-gas generator, the combination of a casing containing a generating-chamber, a collapsible bag having communication with said generating-chamber, a weight loosely suspended from the top of said bag, a water-reservoir, a valve-housing mounted in said cas-

servoir between the generating-chamber and collapsible bag and having communication with said reservoir and said generating-chamber, a tube extending from said housing to said collapsible bag, a valve in said housing, a spring arranged to press said valve to its seat and a stem carried by said valve extending through said tube into said collapsible bag above the bottom thereof and adapted to receive the impact of said weight when the bag collapses for the purpose of unseating said valve, substantially as described.

706,811. MACHINE FOR DRILLING RIVET-HOLES IN WHEEL-HUBS. GEORGE H. EVERSON, Pittsburg, Pa. Filed July 13, 1901. Serial No. 68,804. (No model.)



Claim.—1. In a drilling-machine, the combination of separated parallel side members formed on adjacent faces with corresponding radial guideways and radial slots, heads slidable in the guideways, drill-actuating shafts extending through said radial slots and journaled in said heads, shaft-actuating means, and means for radially adjusting said heads, substantially as shown and described.

2. In a drilling-machine, the combination of drilling mechanism, an upright work-holding frame, wheel-supporting cradle 30, screw 31 and guides 32 depending from the cradle into the lower portion of the frame, means for vertically adjusting said screw, and an adjustable wheel-clamping device in the upper portion of the frame, substantially as shown and described.

706,812. HANDLE FOR SAD-IRONS. WILLIAM B. PENN, Wilkesbarre, Pa., assignor to A. J. Rost Manufacturing Company, Kingston, Pa. Filed Sept. 28, 1901. Serial No. 76,901. (No model.)

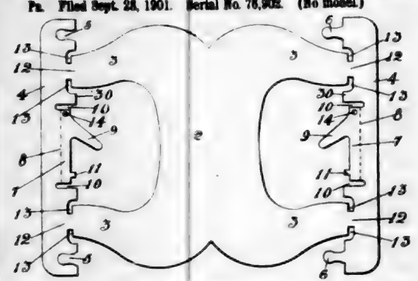
Claim.—1. A handle for sad-irons composed of a blank of sheet metal comprising a central body portion and oppositely-directed end portions 4, said blank being adapted to be formed into a handle, the central body portion and the legs of which are tubular in cross-section, and the legs of which are split from the body upwardly, substantially as shown and described.

2. A handle for sad-irons formed from a blank of sheet metal comprising a central body portion 3 and oppositely-directed leg portions 4 at each end thereof, said parts being adapted to be folded so as to form a tubular handle and tubular leg portions, the handle portion and leg portions being gradually curved at the outer and inner sides thereof and the leg portions being split from the bottom upwardly so as to form spring side portions, substantially as shown and described.

3. The combination with a handle-plate for sad-irons provided with holes to receive the legs of a handle, of a tubular handle provided with tubular legs composed of separate spring side portions and the ends of which are adapted to be inserted into said holes and means for securing said legs in said holes, substantially as shown and described.

4. A handle-plate for sad-irons provided with openings 12 having inwardly-directed lugs or projections 13, at their opposite sides, and a hollow detachable handle, the legs of which are split from the bottom upwardly and adapted to be inserted into said openings 12, said legs being also provided at their lower ends with openings 5 adapted to receive the lugs or projections 13, substantially as shown and described.

706,813. HANDLE FOR SAD-IRONS. WILLIAM B. PENN, Wilkesbarre, Pa., assignor to A. J. Rost Manufacturing Company, Kingston, Pa. Filed Sept. 28, 1901. Serial No. 76,902. (No model.)



Claim.—1. A handle and attaching-plate for sad-irons, said parts being stamped from a single sheet of metal and pressed or folded into form, said handle being tubular in cross-section and provided with legs interiorly connected with said plate, which are also tubular in form, said attaching-plate being also adapted to be connected with the iron and being provided with a stationary hook on its under side, and a spring hook-plate provided with side hooks, and means for connecting said hook-plate with said attaching-plate substantially as shown and described.

2. A handle and attaching-plate for sad-irons comprising a blank composed of a body portion 2 having laterally-directed leg extensions or members 3 connected by parallel attaching-plate members 4, said blank being adapted to be folded or pressed into shape, substantially as shown and described.

3. A handle and attaching-plate for sad-irons formed from a blank comprising a body portion 2 laterally-directed end members 3 and plate members 4 provided centrally with prongs or hooks 9 and recesses 10 also with holes 14 and pins or projections 11, substantially as shown and described.

4. A handle and attaching-plate for sad-irons formed from a blank comprising a body portion 2, laterally-directed end members 3, and plate members 4 provided centrally with prongs or hooks 9 and recesses 10, also with holes 14 and pins or projections 11, said plate members being also provided, one with recesses 5, and the other with corresponding lugs or projections 6, substantially as shown and described.

5. The combination with a handle-plate for sad-irons of a spring hook-plate 24 slotted longitudinally and provided at one end with hooks 26 having slots 27 and at the opposite end with pins or projections 25, substantially as shown and described.

706,814. SCYTHE-SNATH-FASTENING DEVICE. PETER FOLEEN, Oakley, Mich. Filed Dec. 27, 1900. Serial No. 41,223. (No model.)

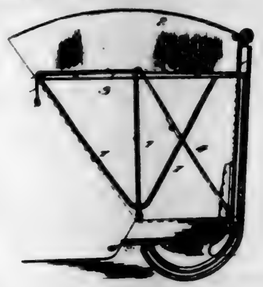
Claim.—1. In a scythe-snath-fastening device, the combination, with a scythe-snath, of a clip comprising two semicircular parts one of which is formed with a flattened surface, a shoulder adjacent one end of said flattened surface, and means for securing said parts together and to the snath.

2. In a scythe-snath-fastening device, the combination with a scythe-snath, of a clip comprising two semicircular parts hinged together, one of which is formed with a laterally-projecting slotted plate, and the other with a tangentially-projecting threaded stem to enter said slotted plate the last-named part having a flattened portion on its interior surface and a shoulder adjacent said flattened portion.

706,815. HOSE-BRIDGE. GEORGE H. FRASHER, JOHN W. WAGNER, and HARRY G. IRWIN, Dennison, Ohio. Filed Mar. 3, 1902. Serial No. 96,496. (No model.)

Claim.—A hose-bridge consisting of an arc-shaped body portion having an opening therein to receive the hose, outwardly-projecting horizontally-arranged rectangular flanges formed integral with the lower portion of the body and extending the entire length thereof, a downwardly-projecting rib formed integral with the lower face of the body portion and having beveled ends extending beyond the ends of the flanges, said rib being secured to one side of the longitudinal center of said body to engage the head of the rail, prongs formed integral with the lower faces of the said flanges adapted for engagement in the road-bed, some of said prongs extending adjacent said rib and engaging the side of the rail-head opposite to that engaged by the rib, and a tread on the body, substantially as described.

706,816. VEHICLE-TOP. LEONARD GILLASPY, Sturgeon, Mo., assignor of one-half to David A. Mayer, Sturgeon, Mo. Filed June 5, 1902. Serial No. 110,332. (No model.)



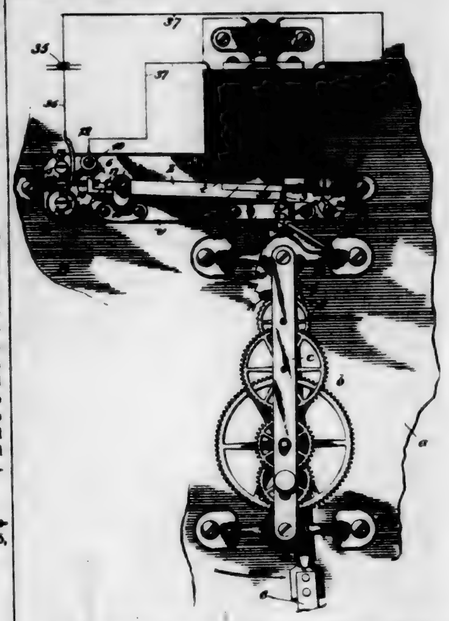
Claim.—In a folding vehicle-top, spring-rollers applied to said top at the rear of its sides and movable therewith, the lower ends of said rollers being movable in curved lines, a guide for the lower ends of the rollers, and side curtains adapted to wind upon the said rollers, substantially as set forth.

706,817. ELECTRIC CLOCK. HARLOWE GILLETTE, Highland Park, Ill. Filed June 24, 1899. Serial No. 721,698. (No model.)

Claim.—1. In a clock, the combination with the time-measuring vibrator, of a gravity impelling device therefor comprising a pivotal swinging armature-lever, an armature upon and weighting said lever, an electromagnet, a movable circuit making and breaking contact actuated by fall of the armature-lever to close the circuit and by rise of the armature-lever to break the circuit, and a prop for the armature-lever displaced by movement of the said vibrator, substantially as described.

2. In a clock, the combination with the time-measuring vibrator, of gravity impelling-lever mechanism therefor, comprising a permanent magnet, a lever-raising armature of too great resistance to be attracted by the permanent magnet alone, an electromagnet-winding for the permanent magnet, and a circuit making and breaking contact actuated under the movement of the vibrator to reinforce the magnet intermittingly to attract the armature, substantially as and for the purpose set forth.

3. In a clock, the combination with the time-measuring vibrator, of gravity impelling-lever mechanism therefor comprising a permanent magnet, a vibrator-impelling lever, an armature, upon and weighting said lever, of too great resistance to be attracted by the permanent magnet alone, an electromagnet-winding for the permanent magnet, and a circuit making and breaking contact actuated under the movement of the vibrator to reinforce the magnet intermittingly to attract the armature and raise the said lever, substantially as and for the purpose set forth.



4. In a clock, the combination with the time-measuring vibrator of a pivotal vertically-swinging gravity impelling-lever therefor, a lever-raising armature, an electromagnet having a projecting core extending beyond the path of the end of the armature, means for adjusting the core with relation to the path of the armature, and means for making and breaking the electric current through the magnet, comprising a pivotal contact-piece actuated by movement of the said lever, substantially as described.

5. In a clock, the combination with the time-measuring vibrator, of a pivotal gravity impelling-lever therefor, a lever-raising armature upon and weighting said lever, an electromagnet and means for making and breaking the electric current through the magnet, comprising a relatively stationary contact and a vibratory spring-operated contact-piece actuated to snap to and from the said stationary contact by change in angle of the said lever, substantially as described.

6. In a clock, the combination with the time-measuring vibrator, of a pivotal gravity impelling-lever therefor, a lever-raising armature upon and weighting said lever, an electromagnet and means for making and breaking the electric current through the magnet, comprising a relatively stationary contact and a vibratory spring-operated contact-piece pivotally engaging the end of the said lever to snap to and from the said stationary contact by change in angle of the said lever, substantially as described.

7. In a clock, the combination with the pendulum, of a pivotal gravity impelling-lever therefor, a lever-raising armature, an electromagnet and means for making and breaking the electric current through the magnet, comprising a stop and a stationary electric contact-point close to said stop, a vibratory contact-piece provided with sharpened bearing ends resting end to end against said lever, and extending between said contact-point and stop, and a spring connected with said contact-piece and with a stationary support and operating to snap the contact-piece alternately to the contact-point and stop under changes in angle between the contact-piece and said impelling-lever, substantially as described.

8. In a clock, the combination with the pendulum, of a pivotal gravity impelling-lever therefor, a lever-raising armature, an electromagnet and means for making and breaking the electric current through the magnet, comprising a stop and a stationary electric contact-point close to said stop, a vibratory contact-piece provided with sharpened bearing ends resting end to end against said lever, and extending between said contact-point and stop, a spring connected with said contact-piece and with a stationary support and operating to snap the contact-piece alternately to the contact-

point and stop under changes in angle between the contact-piece and lever, and tensioning means for said spring, substantially as described.

9. In a clock, the combination with the pendulum, of a pivotal gravity impelling-lever therefor, a lever-raising armature, an electromagnet and means for making and breaking the electric current through the magnet, comprising a stop and a stationary electric contact-point close to said stop, a vibratory contact-piece provided with sharpened bearing ends resting end to end against said lever, and extending between said contact-point and stop, and a spring connected with said contact-piece and with a stationary adjustable spring-tensioning support and operating to snap the contact-piece alternately to the contact-point and stop under changes in angle between the contact-piece and lever, substantially as described.

10. In a clock, the combination with the pendulum, and gravity impelling device therefor comprising a pivotal swinging armature-lever, electromagnet and means for making and breaking the electric current through the magnet, of a movable prop for the armature-lever operating normally to engage the same, and a gravitating releaser for the prop actuated by movement of the pendulum, substantially as described.

11. In a clock, the combination with the pendulum, and gravity impelling device therefor comprising a pivotal swinging armature-lever, electromagnet and means for making and breaking the electric current through the magnet, of a movable prop, a spring connected with the prop and operating normally to move the same into sustaining engagement with the armature-lever, and a gravitating releaser for the prop actuated by movement of the pendulum, substantially as described.

12. In a clock, the combination with the electromagnet and pendulum of a vibratory gravity impelling-lever for the pendulum, a lever-raising armature, means for making and breaking the electric circuit through the magnet actuated by movement of the said lever, to close the circuit in the fall of the lever to its lowest limit and open the circuit in the rise of the lever, a movable prop engaging the lever when raised, and a bearing swinging with the pendulum and movable against the lever to effect release thereof from the prop, and subject to the weight of the lever in the descent thereof, substantially as described.

13 In a clock, the combination with the electromagnet, the electric circuit, pendulum, gravity impelling-lever *z* for the pendulum and lever-raising armature, of circuit making and breaking mechanism comprising a vibratory contact-piece 13 having pivotal end-to-end engagement with the lever *z* and provided with a contact-surface portion 15, a stop above and a contact below said contact-piece and a snapping-spring 16 for the contact-piece, all arranged to operate substantially as and for the purpose set forth.

14. In a clock, the combination of a lever-raising armature having a shoulder 3, a vibrating arm A carrying bearing-pieces 33 and 34, a movable prop 19, and a prop-releasing lever 28, all constructed to operate as and for the purpose set forth.

15. In a clock, the combination of a lever-raising armature having a shoulder 3, a vibrating arm A carrying adjustable screw-bearing pieces 33 and 34, a movable prop, and a prop-releasing lever 28, all constructed to operate as and for the purpose set forth.

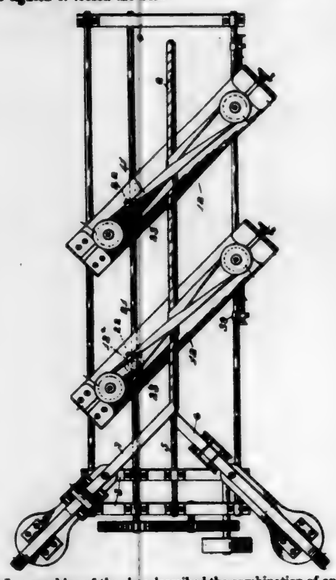
16. In a clock, the combination of a lever-raising armature having a shoulder 3, a vibrating arm A carrying bearing-pieces 33 and 34, a movable prop 19, prop-spring 23, tensioning means for the prop-spring, and a prop-releasing lever 28, all constructed to operate as and for the purpose set forth.

17. In a clock, the combination of a lever-raising armature having a shoulder 3, a vibratory arm A carrying bearing-pieces 33 and 34, bearing-pins *k* and 27, prop 19, prop-spring 23, and gravity prop-releasing lever 28 having the prop-engaging finger 30 and guide-finger 31, all arranged to operate substantially as and for the purpose set forth.

706,818. MACHINE FOR MAKING SPIRAL TUBING. GERHARDT H. GRIEB, Camden, N. J., assignor to Sidney Mason. Filed Nov. 20, 1900. Renewed Jan. 28, 1902. Serial No. 90,542. (No model.)

Claim.—1. A machine for making spiral tubing comprising parallel ways and a power-shaft, strip-guides and their accessories, an arm pivoted near its end to one of said ways and having sliding contact at its other end with the other of said ways, belt-pulleys carried by said arm, a belt and a mandrel, a traveler intermediate of the points of pivotal support and sliding contact of the arm and carrying intermeshing bevel gear-wheels of which one is splined to the power-shaft, a train of gear-wheels driven by the other bevel gear-wheel and operatively connected with the pulleys, and movable studs for intermediate wheels of the last-mentioned train.

2. A machine for making spiral tubing comprising parallel ways and a power-shaft, strip-guides and their accessories, an arm pivoted near its end to one of said ways and having sliding contact at its other end with the other of said ways, belt-pulleys carried by said arm, a belt and a mandrel, a traveler intermediate of the points of pivotal support and sliding contact of the arm and carrying intermeshing bevel gear-wheels of which one is splined to the power-shaft, a train of gear-wheels driven by the other bevel gear-wheel and operatively connected with the pulleys, movable studs for the intermediate wheels, and means for shifting one of said pulleys to tighten or loosen the belt.



3. In a machine of the class described the combination of an arm pivoted at or near one of its ends and provided with belt-pulleys, a power-shaft, a traveler located intermediate of the ends of the arm and carrying a pair of intermeshing bevel-wheels of which one is splined to the power-shaft, a toothed wheel carried by the traveler and connected with the other bevel gear-wheel, a train of gear-wheels for driving said pulleys, intermediate wheels between the toothed wheel and the train of gear-wheels, and movable studs for the intermediate wheels, substantially as described.

4. In a machine of the class described, the combination of an arm pivoted at one of its ends, a way having sliding engagement with the other end of the arm, and a screw fastened to the way and the last-mentioned end of the arm for both shifting and holding the latter, substantially as described.

5. The combination in a machine of the class described of a movable arm, a way, a guide having sliding engagement with the way and with the arm, means for clamping and unclamping the guide, a clamp adapted to the way, and a screw interposed between the clamp and arm, substantially as described.

706,819. PRESSED-METAL BELT-SHIFTER ARM. HOWARD T. HALLOWELL, Philadelphia, Pa. Original application filed Aug. 11, 1900, Serial No. 26,560. Divided and this application filed Nov. 12, 1900. Serial No. 36,168. (No model.)

Claim.—1. As an improved article of manufacture, an arm for supporting a belt-shifter, made in sections of sheet metal secured together, a clamping device for holding said sections in position, and a guide-piece carried by said arm and adapted to support said belt-shifter.

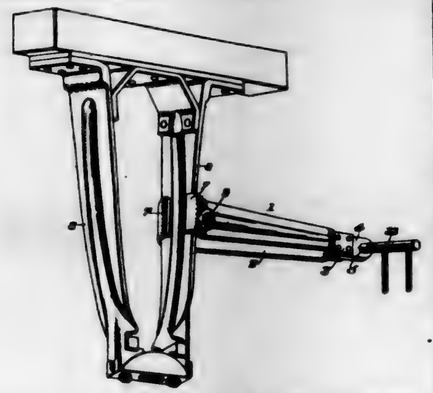
2. A metal belt-shifter arm made in sections, suitably fastened together, a clamping device, and a guide-piece secured to said arm and having an opening therethrough in which the belt-shifter is adapted to be supported.

3. A metal belt-shifter arm, made in sections, a guide-piece attached to said arm, said guide-piece and sections being riveted together, and a clamping device on the end of said arm opposite to said guide-piece.

4. A metal belt-shifter arm, made in sections, one extremity of said sections having inwardly-turned lips, a clamping device for causing said lips to engage a hanger-leg, and a guide-piece for a belt-shifter, attached to said arm and having an opening therethrough.

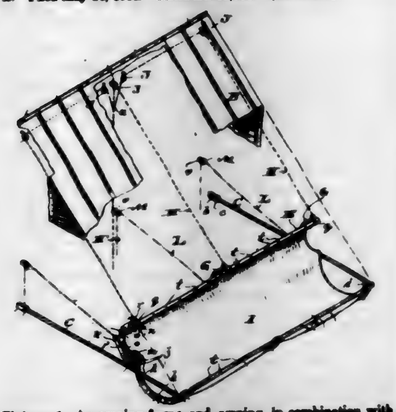
5. A metal belt-shifter arm, made in sections, each section having a longitudinal rib, a clamping device for holding said sections in position and a guide-piece carried by said arm and adapted to support a belt-shifter.

6. A metal belt-shifter arm made in sections, each section having a longitudinally-extending rib, a guide-piece attached to said arm, said guide-piece being in sections and riveted together, and a clamping device on the end of said arm opposite to said guide-piece.



7. A metal belt-shifter arm, made in sections, each of the latter having a longitudinally-extending rib, one extremity of said sections having inwardly-turned lips, a clamping device for causing said lips to engage a hanger-leg and a guide-piece for a belt-shifter attached to said arm and having an opening therethrough.

706,820. AWNING-PROTECTOR. CHARLES H. HAMER, Racine, Wis. Filed May 20, 1901. Serial No. 61,893. (No model.)



Claim.—1. An awning-frame and awning, in combination with a movable jointed supporting device pivotally attached to said frame, the holding said awning when raised, and cords or cables for drawing the outer end of said supporting device over the awning supported thereby.

2. An awning-frame, in combination with a series of jointed supports, pivotally secured to said frame, a cover secured to said frame and resting on said supports, and cords or cables for raising said frame and folding said jointed supports.

3. The combination with a supporting structure, of an awning-frame pivotally secured thereto; an awning secured to said structure and to said frame; a series of jointed supports, secured to said frame beneath the outer end of said awning; a cover secured to said frame and resting on said supports, beneath said awning, for receiving the latter when raised; and cords or cables for raising said frame and awning, and folding said jointed supports and said cover over said awning when raised.

4. In an awning-protector, the combination with the awning-frame having swinging lower arms and a pair of transverse rods united by a series of jointed supports, of levers projecting backward from the outer members of said supports; and series of cords or cables, one series leading from the inner members of said supports, and the other series leading from said levers.

5. In an awning-protector, the combination with the awning-frame having swinging lower arms and a pair of transverse rods, of a series of jointed supports centrally pivoted together and the extreme ends of said jointed supports being pivotally connected to said transverse rods; a lever projecting backward from the outer member of each jointed support; a cover secured to said transverse rods, and resting on said jointed supports; and series of cords or cables, one series being connected to the rear ends of the inner members of the supports, and the other series being connected to the rear ends of said levers.

6. The combination with an awning-frame having swinging lower arms and a pair of transverse rods, of series of jointed supports uniting said rods, each support having an inner and outer member pivotally united, and each member comprising two sections formed with slots therethrough, and adjustably bolted together, and the outer members having backward-projecting levers, together with series of cords and cables, connected, respectively, to the said inner members, and to the said levers.

7. An awning-frame and awning in combination with a jointed supporting device, pivotally attached to the outer end of said frame, and secured to the outer end of said awning, and cords or cables for raising said frame and folding said jointed supporting device.

8. An awning-frame and awning, in combination with a jointed supporting device pivotally secured to said frame beneath the outer ends of said awning, and cords or cables for raising said frame and folding said jointed supporting device.

706,821. PLANT POT OR HOLDER. HENRY HART, New York, N. Y. Filed Dec. 3, 1901. Serial No. 84,523. (No model.)

Claim.—1. A plant or flower holder comprising a tub or receptacle having a drawer in the bottom thereof, a supplemental tub or receptacle placed therein over said drawer, and provided with a transverse perforated partition and a perforated bottom, a post secured in said supplemental tub or receptacle, and a top tub or receptacle secured on the top of said post and provided with a transverse perforated partition, and a perforated bottom, the bottom of said last-named tub or receptacle being provided with a casing, the bottom of which is conical in form and perforated and a tubular casing connected with the bottom of said casing, and inclosing said post, substantially as shown and described.

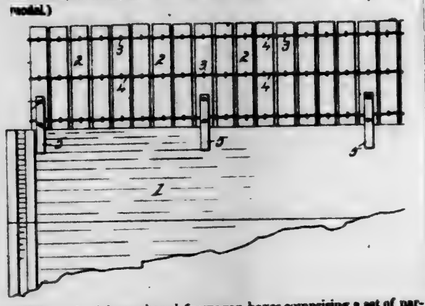
2. A plant or flower holder comprising a tub or receptacle having a drawer in the bottom thereof, a supplemental tub or receptacle placed therein over said drawer, and provided with a transverse perforated partition and a perforated bottom, a post secured in said supplemental tub or receptacle and a top tub or receptacle secured on the top of said post and provided with a transverse perforated partition, and a perforated bottom, the bottom of said last-named tub or receptacle being provided with a casing, the bottom of which is conical in form and perforated and a tubular casing connected with the bottom of said casing, and inclosing said post, said tubular casing being provided with side receptacles which are secured thereto, substantially as shown and described.

3. A plant or flower holder comprising a tub or receptacle having

a drawer in the bottom thereof, a supplemental tub or receptacle placed therein over said drawer, and provided with a transverse perforated partition and a perforated bottom, a post secured in said supplemental tub or receptacle and a top tub or receptacle secured on the top of said post and provided with a transverse perforated partition, and a perforated bottom, the bottom of said last-named tub or receptacle being provided with a casing, the bottom of which is conical in form and perforated and a tubular casing connected with the bottom of said casing, and inclosing said post, said tubular casing being provided with side receptacles which are secured thereto, and a tube connected with the bottom of the top tub or receptacle and extending downwardly adjacent to said post, through said tubular casing and communicating with the drawer in the bottom of the first-named receptacle, substantially as shown and described.

4. A plant or flower holder comprising a receptacle having a drawer in the bottom thereof, a perforated partition above said drawer, a tub placed over said perforated partition and provided with a perforated bottom, said tub being also provided with a perforated partition, charcoal placed between said partition and the bottom of said tub the top portion of said tub being adapted to receive earths, substantially as shown and described.

706,822. BUMP-BOARD FOR WAGON-BOXES. LYSANDER L. HAWORTH, Decatur, Ill. Filed June 10, 1902. Serial No. 111,050. (No model.)



Claim.—1. A bump-board for wagon-boxes comprising a set of parallel slats flexibly secured together, and clamps on the ends of some of the slats whereby the board is secured to the wagon-box.

2. A bump-board for wagon-boxes comprising a set of parallel slats flexibly secured together and clamps on the ends of some of the slats adapted to hold the board with the ends of the slats resting on the edges of the wagon-box.

3. A bump-board for wagon-boxes, comprising a set of parallel slats secured together by wires running lengthwise of the board and crosswise of the slats, and clamps for securing the board to the wagon-box.

4. A bump-board for wagon-boxes comprising a set of parallel slats secured together by wires running lengthwise of the board and interwoven with the slats, and clamps for securing the board to the wagon-box.

5. A bump-board for wagon-boxes comprising a set of parallel slats secured together by wires interwoven with the slats crosswise thereof, staples securing the wires to the slats and clamps securing the slats to the wagon-box.

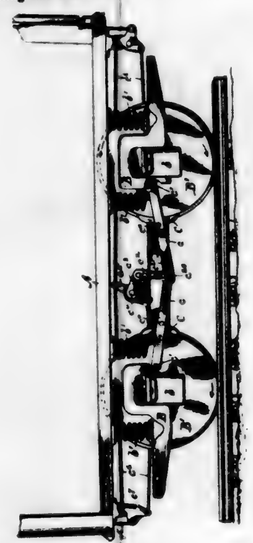
6. A bump-board, or wall, for wagon-boxes, comprising a flexible strip having clamps at intervals along one of its edges, whereby it may be secured to a wagon-box, substantially as described.

706,823. CAN-OPENER. MOSES L. HAWES, New York, N. Y. Filed Mar. 15, 1902. Serial No. 98,201. (No model.)

Claim.—A can-opener of the character described, comprising a handle or frame provided with a centering-spur at one end, a longitudinal slot, and short transverse slots near the end, with an elongated sliding plate having its end bent downward, one end of which is pointed and sharpened forming the knife, the other end being bent backward upon the under side of the frame thus securing the plate and knife to the frame—as shown and described.

706,824. BRAKE FOR VEHICLES. WILLIAM F. HITCHCOCK, Rochester, N. Y. Filed Mar. 10, 1900. Serial No. 8,168. (No model.)

Claim.—1. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, a lever pivotally connected to each brake-shoe and to a portion of the vehicle at such a point that said lever moves said brake-shoe in a path intersecting the circle of the rim of the wheel at a small angle thereto, and means for operating said two levers.



2. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, a lever pivotally connected to each brake-shoe and to a portion of the vehicle at such a point that said lever moves said brake-shoe in an arc of a circle intersecting the circle of the rim of the wheel and at a small angle thereto, and means for operating said two levers.

3. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, and a lever pivotally connected to each brake-shoe and to a stationary point on the vehicle adjacent to the wheel-axle and having a movement of said brake-shoe eccentric to the wheel and in an arc intersecting the circle of the rim at a small angle, and means for operating said two levers.

4. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, and a lever pivotally connected to each brake-shoe and to a stationary point on the vehicle adjacent to the wheel-axle and having a radius for movement of said brake-shoe less than the radius of the wheel, and means for operating said two levers.

5. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, two levers, one for each brake-shoe pivotally connected thereto and to a stationary point on the vehicle and having an arc of movement of the brake-shoe eccentric to the circle of the rim of the wheel and intersecting the circle of the rim thereof at a small angle, said levers being connected for simultaneous operation at all times and a single means for operating both levers.

6. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, two levers, one for each brake-shoe pivotally connected thereto and to a stationary point on the vehicle and having an arc of movement of the brake-shoe eccentric to the circle of the rim of the wheel and intersecting the circle of the rim thereof at a small angle, said levers being connected for simultaneous operation at all times, a rock-shaft having an arm thereon, means for connecting said arm to the free ends of both levers, and means for operating said rock-shaft.

7. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, two levers, one for each brake-shoe pivotally connected thereto and to a stationary point on the vehicle and having an arc of movement of the brake-shoe eccentric to the circle of the wheel and intersecting the circle of the rim thereof at a small angle, the free ends of said two levers being overlapped and being pivotally connected, and a single means for operating the common pivot of both levers.

8. In a vehicle-brake, a pair of wheels, a pair of brake-shoes for acting upon the oppositely-moving sides of said two wheels, two levers, one for each brake-shoe pivotally connected thereto and to a stationary point on the vehicle and having an arc of movement of the brake-shoe eccentric to the circle of the rim of the wheel and intersecting the circle of the rim thereof at a small angle, said levers being connected for simultaneous operation at all times, a rock-shaft, a rock-arm c^4 upon said rock-shaft and carrying the link c^3, an arm c^5 upon said rock-shaft, one or more rods c^6 for operating said arm c^5, a T-lever c^7 for operating said rod or rods, and means for operating said T-lever.

9. In a vehicle-brake, a wheel B', a brake-shoe C for acting upon the rim of said wheel, a lever c having said brake-shoe pivoted thereto, said lever being pivoted to a portion of the vehicle at such a point as to move the brake-shoe in an arc of a circle intersecting the circle of the rim of each wheel at a small angle thereto, a link c^3 pivotally connected to the free end of said lever, a rock-shaft c^4, a rock-arm c^5 upon said rock-shaft and carrying the link c^3, an arm c^5 upon said rock-shaft, one or more rods c^6 for operating said arm c^5, a T-lever c^7 for operating said rod or rods, and means for operating said T-lever.

10. In a vehicle-brake, a pair of wheels B', a pair of brake-shoes C for acting upon the rim of said wheels, a pair of levers c having said brake-shoes pivoted thereto, said levers being pivoted to portions of the vehicle at such points as to move the brake-shoes in arcs of circles intersecting the circles of the rims of the wheels at small angles thereto, and a link c^3 pivotally connected to the free ends of said levers, a rock-shaft c^4, a rock-arm c^5 upon said rock-shaft and carrying the link c^3, an arm c^5 upon said rock-shaft, rods c^6 for operating said arm c^5, a T-lever c^7 for operating said rods, and means for operating said T-lever.

706,825. ATTACHMENT FOR PLOWS. WILFORD H. HOLSCLAW, Louisville, Ky., assignor to B. F. Avery & Sons, a Corporation of Kentucky. Filed Jan. 6, 1902. Serial No. 88,644. (No model.)

Claim.—1. In a mechanism of the class described, the combination with a plow, of a wheel-carrying axle attached to said plow, a squared bearing inclosing said axle for a portion of its length, means for adjusting the ends of said axle to various planes, and locking means clamped about said squared bearing for receiving and retaining said adjusting means, substantially as described.

2. In a device of the class described, the combination with a suitable plow, of a transversely-arranged divided axle, means for securing the same to the beam of said plow, a squared bearing inclosing the inner ends of the sections of said axle, and means carried by said bearing for adjusting the outer ends of said axle to various horizontal planes with respect to each other, substantially as described.

3. In a mechanism of the class described, the combination with a suitable plow and its beam, of an axle, means carried thereby for securing same to said plow-beam, the said axle being formed of two parts each part being bent intermediate its length, the ends thereof lying in different horizontal planes, a squared bearing inclosing the inner ends of said parts, and means carried thereby for rotating the inner ends of the parts of said axle for altering the horizontal plane of the outer ends thereof, substantially as described.

4. In a mechanism of the class described, the combination with a suitable plow, of an axle designed to support the beam thereof, bent out of its plane and again bent into a plane parallel to the first-mentioned plane, that portion of said axle lying in said parallel plane being longer than the distance between the said first bends, and means for adjusting the wheel-carrying portions of said axle to various planes, substantially as described.

5. In a mechanism of the class described, the combination with a suitable plow, of a two-part axle, means for securing the same to the beam of said plow, each part of the said axle being bent from a horizontal to a diagonal outward plane and back to a horizontal again, and means carried by said axle for rotating the upper horizontal portion of each of its respective parts independently of the other, substantially as described.

6. A riding-plow attachment, comprising in its construction a two-part axle, each of the parts consisting of a bar having a wheel-carrying portion extending in a horizontal plane, said bar being bent from said plane to a diagonal plane outwardly, and then again bent inwardly to a horizontal plane, a squared tube surrounding the inner ends of said bars, means for securing said bars against lateral movement with respect to said tube, and means for rotating the ends of said bars within the tube, substantially as described.

7. A riding-plow attachment comprising an axle formed of two bars extending inwardly in a horizontal plane, then bent upwardly from said plane, and again inwardly in a horizontal plane, a squared bearing inclosing said bars, a lever pivotally engaging each of said bars outside the squared bearing, means carried by said squared bearing for engaging the said levers for preventing movement thereof, and means carried by said levers for rotating the inner ends of each of said bars upon movement of the same, substantially as described.

8. In a mechanism of the class described, the combination with a suitable plow, of an axle formed in two parts and bent centrally upward and flared outwardly, means retaining the parts of said axle against longitudinal movement with respect to each other, means for securing the beam of said plow to said axle, means carried by the center portion of said axle for moving the outer ends of the two parts thereof to different horizontal planes with respect to each other, substantially as described.

9. In a mechanism of the class described, the combination with a suitable plow, of an axle designed to support the beam thereof, said axle being bent centrally out of its horizontal plane, and again in a higher horizontal plane, a two-part casting clamped about each of the lower bends in said axle, and means engaging said castings for adjusting said lower horizontal portion of the axle to different planes, substantially as described.

10. In a mechanism of the class described, the combination with a suitable plow, of an axle designed to support the beam thereof bent centrally from its horizontal plane, flared outwardly and again bent to a higher horizontal plane, the said axle being formed in two parts, means inclosing the inner ends of said parts, means carried by the upper horizontal portion of said axle engaging the axle at the points of its lower bends and designed to be operated for moving the lower horizontal portions of the axle to various planes with respect to each other, substantially as described.

11. In a mechanism of the class described, the combination with a suitable plow of an axle designed to support the beam thereof, means for securing the said axle to said beam, the axle being bent centrally from its horizontal plane, the axle being formed in two parts, a squared bearing inclosing the inner ends of said parts, a sleeve clamped about each end of said bearing, a lever pivoted to said axle outside of each of said sleeves, means carried by said lever engaging said axle whereby movement of the lever is designed to rotate the upper horizontal portion of the respective part of said axle, and locking means carried by each of said sleeves designed to be engaged by its respective lever for preventing movement thereof, substantially as described.

12. In a mechanism of the class described, the combination with a suitable plow of an axle designed to be secured to the beam thereof, said axle being bent centrally from its horizontal plane, then again bent to a higher horizontal plane, said axle being formed in two parts, a squared bearing inclosing the inner ends of the parts of said axle, sleeves engaging the ends of said squared bearing, locking-sectors carried by said sleeves, a lever pivotally engaging said axle outside each of said sectors, means carried by said lever for engaging the sectors to prevent movement of the lever, and means carried by each of said levers pivotally engaging its respective part of said axle at the points of its lower bend, whereby movement of one of the levers is designed to rotate the upper horizontal portion of its respective part of the axle and to alter the plane of the lower portion thereof, substantially as described.

13. In a mechanism of the class described, the combination with a plow of an axle designed to be secured to the beam thereof, said axle being bent centrally and from its horizontal plane, and again bent to a higher horizontal plane, the axle being formed in two parts, a squared bearing inclosing the inner ends of the parts of said axle, a sleeve inclosing each of said squared bearings, means for clamping each of said sleeves in position upon said bearing, an inwardly-extending shoulder formed upon said sleeve and designed to snugly fit about its respective part of the axle outside the end of the squared bearing, a space being left between said end of the bearing and said shoulder, a lug carried by the respective part of said axle and occupying the space between said shoulder and the respective end of said squared bearing, whereby the parts of said axle are held against longitudinal movement, and means for rotating the upper horizontal portion of said axle, substantially as described.

14. In a mechanism of the class described, the combination of an axle bent centrally from the horizontal plane, and again bent to a higher horizontal plane, the said axle being formed in two parts, means for preventing longitudinal movement of the parts of said axle with respect to

each other, two-part castings clamped about and inclosing the lower bend of each part of said axle, levers pivotally carried by the upper horizontal portion of said axle, means carried by each lever pivotally engaging its respective castings, and means for locking each of said levers against movement, whereby the wheel-carrying horizontal portions of said hub may be moved to varying planes with respect to each other, and held in said relative positions, substantially as described.

15. In a mechanism of the class described, the combination of an axle centrally bent from the horizontal plane, and again bent to a higher horizontal plane, the said axle being formed in two parts, means for retaining said parts of the axle against longitudinal movement with respect to each other, levers each provided with an eye surrounding its respective part of said axle, a two-part casting, clamped about the lower bend of each part of said casting, an arm carried by each of said levers pivotally engaging one of said lugs, whereby movement of either lever is designed to alter the plane of the lower horizontal portion of the respective part of said axle and rotate the upper portion thereof, and means for locking said lever against movement, substantially as described.

16. In a mechanism of the class described, the combination of an axle bent centrally from a horizontal plane upward and again bent to a higher horizontal plane, the said axle being formed of two parts, divided centrally of the upper horizontal portion, a squared tube inclosing the inner ends of said parts, the inner walls of said tube being cut away to accommodate the contour of said axle, means for preventing longitudinal movement on the parts of said axle, and means for altering the plane of the lower horizontal portions of the axle, substantially as described.

17. In a mechanism of the class described, the combination with a suitable plow, of an axle bent centrally from a horizontal plane, and again bent to a higher horizontal plane, the said axle being divided approximately at the center thereof, a squared bearing inclosing the inner portion of said axle, means preventing a longitudinal separation of the parts of said axle, means carried by the respective parts of said axle for altering the horizontal plane of the wheel-carrying portion thereof, and clamping means carried by said bearing designed to engage the beam of said plow, substantially as described.

18. In a mechanism of the class described, the combination with a suitable plow of an axle and means for securing same to the beam of said plow, the said axle being bent centrally from its normal horizontal plane, flared outwardly, and again bent to a horizontal plane, and means carried by the second-mentioned horizontal portion of the axle for altering the plane of the first-mentioned horizontal portion thereof, substantially as described.

19. In a mechanism of the class described, the combination with a suitable plow, of a divided axle engaging the beam thereof, each part of said axle being bent out of its normal horizontal plane, and means for independently rotating the inner ends of the parts of said axle, said inner ends lying at times in the same transverse, vertical plane, substantially as described.

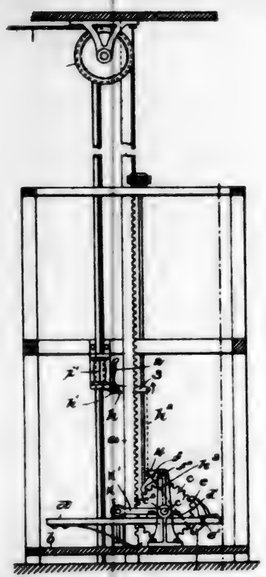
706,826. ELEVATOR-OPERATING MECHANISM. WILLIAM W. HUBBARD, Manchester, N. H. Filed Apr. 12, 1902. Serial No. 102,505. (No model.)

Claim.—1. The combination of a fixed vertical elongated rack, a vertically-movable lift, a pair of primary operating-levers each formed as a treadle pivoted on the lift and carrying a pawl which constitutes an extension of the lever, and a gear journaled on the lift and engaging both the pawls and the rack, said gear constituting a secondary lever which has the fixed rack for its fulcrum, whereby the weight of a passenger on the lift exerted alternately on the two primary levers and applied to retain the gear is supported wholly by the rack and caused to raise the lift, the latter being relieved of the weight of the passenger while the lift is rising.

2. The combination of a fixed vertical elongated rack, a vertically-movable lift, a pair of primary operating-levers each formed as a treadle pivoted on the lift and carrying a pawl constituting an extension of the lever, a gear journaled on the lift and engaging both the pawls and the rack, said gear being rotatable in a forward direction by the levers and pawls, and means for preventing backward rotation of the gear.

3. The combination of a fixed vertical elongated rack, a vertically-movable lift, a pair of primary operating-levers each formed as a treadle pivoted on the lift and carrying a pawl constituting an extension of the lever, a gear journaled on the lift and engaging both the pawls and the rack, said gear being rotatable in a forward direction by the levers and pawls, a stop-pawl pivoted on the lift and adapted to prevent backward rotation of the gear, and means for simultaneously disengaging the pawls from the gear to permit the descent of the lift.

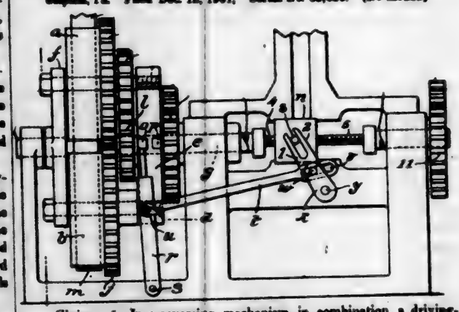
4. The combination of a fixed vertical elongated rack, a vertically-movable lift, a pair of primary operating-levers each formed as a treadle pivoted on the lift and carrying a pawl constituting an extension of the lever, a gear journaled on the lift and engaging both the pawls and the rack, said gear being rotatable in a forward direction by the levers and pawls, a stop-pawl pivoted on the lift and adapted to prevent backward rotation of the gear, means for simultaneously disengaging the pawls from the gear to permit the descent of the lift, and means for retarding the descent of the lift.



5. The combination of a fixed vertical elongated rack, a vertically-movable lift, a pair of primary operating-levers each formed as a treadle pivoted on the lift and carrying a pawl constituting an extension of the lever, a gear journaled on the lift and engaging both the pawls and the rack, said gear being rotatable in a forward direction by the levers and pawls, a stop-pawl pivoted on the lift and adapted to prevent backward rotation of the gear, means for simultaneously disengaging the pawls from the gear to permit the descent of the lift, and brake mechanism comprising a fixed vertical elongated friction member and a complemental sliding friction member movable with the lift and adapted to coöperate with the said fixed member.

6. The combination of a fixed vertical elongated rack, a vertically-movable lift, a pair of primary operating-levers each formed as a treadle pivoted on the lift and carrying a pawl constituting an extension of the lever, a gear journaled on the lift and engaging both the pawl and the rack, said gear being rotatable in a forward direction by the levers and pawls, an antifriction-roll in rolling contact with the back of the rack, and tension-rods connecting said roll with the axis of the gear.

706,827. REVERSING MECHANISM. CHARLES W. JAMES, Philadelphia, Pa. Filed Dec. 12, 1901. Serial No. 85,628. (No model.)



Claim.—1. In a reversing mechanism, in combination, a driving-belt, two pulleys, means for carrying said pulleys so that they can be rotated in a plane at right angles to their shafts, gears carried by each of said pulleys meshing with each other, a second gear carried by and rotating with one of said pulleys, a gear meshing with said second gear, a shaft upon which said second gear is carried, and means whereby either of said pulleys may be held in operative contact with said driving-belt.

2. In a reversing mechanism, in combination, a shaft, a bearing-piece rotatably carried by said shaft, means for engaging and disengaging said bearing-piece so as to prevent or permit its rotation, two superposed pulleys carried by said bearing-piece, gears connecting said pulleys, and gears connecting one of said pulley-connecting gears and said shaft.

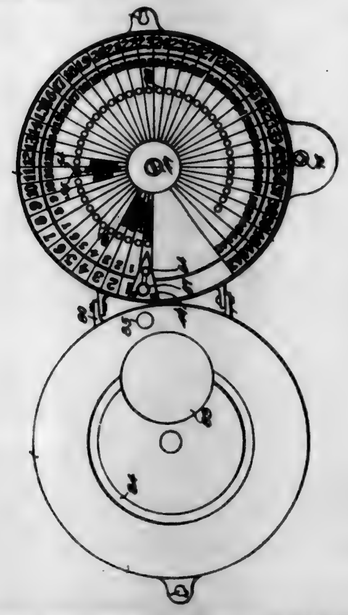
3. In a reversing mechanism, in combination, a shaft, a circular bearing-piece rotatably carried by said shaft and carrying upon opposite sides stops, two studs carried by said bearing-piece at diametrically opposite points, pulleys carried by said studs, gears carried by said pulleys meshing with one another, a gear carried by one of said latter gears meshing with a gear carried by said shaft, said latter gear, a stop adapted to engage alternately the stops on said bearing-piece and means for tripping said stops.

4. In a reversing mechanism, in combination, a shaft, a bearing-piece rotatably carried by said shaft, two superposed pulleys carried by said bearing-piece, and means carried by and turning with said shaft and pulleys, whereby a movement is given to one pulley, upon the rotation of said shaft, in the same direction as said shaft, and to the other pulley in the opposite direction, or vice versa.

5. The combination with a reciprocating block or frame and rotatable means for driving said block or frame in either direction, of a shaft, a bearing-piece rotatably carried by said shaft, two superposed pulleys carried by said bearing-piece, gears connecting said pulleys, gears connecting one of said pulley-connecting gears and said shaft, gears connecting said shaft and said block or frame driving means, means operated by the movements of said block or frame for bringing said pulleys alternately into engagement with a driving-belt, and said driving-belt.

6. The combination in a reversing mechanism of two superposed pulleys, gears carried by and connecting said pulleys, a bearing-piece carrying studs carrying said pulleys, and carrying upon opposite sides stops, said stops, a shaft carrying said bearing-piece, gears connecting said shaft and one of said pulleys, a reciprocating block or frame driven by the movements of said shaft, and means actuated by the movements of said block or frame for engaging and releasing said stops carried by said bearing-piece.

706,828. AUTOMATIC AIR-BRAKE ORDER SYSTEM. DANFORD W. JEWELL, Kalamazoo, Mich., assignor of two-thirds to Willis H. Ralston and Melvin O. Beattie, Kalamazoo, Mich. Filed Mar. 24, 1902. Serial No. 100,127. (No model.)



Claim.—1. The combination with means carried by the train for signaling at a predetermined period, of an operative mechanism having as one of its elements a removable member, the conformation of which compels the adjustment of said mechanism to a predetermined position.

2. A train-signaling mechanism comprising a train-order card, an adjustable mechanism arranged on the train for the reception and support of said card, the adjustment of such mechanism and the time of operation of the signaling mechanism being governed by the conformation of the card.

3. In a device of the class specified, a mechanism having as one of its elements a revoluble member, means for imparting motion thereto, means for effecting a preliminary adjustment of said revoluble member, and a train-order adapted to be carried by said revoluble member and governing the extent of adjustment of said revoluble member.

4. In a device of the class specified, a mechanism having as one of its elements a revoluble member, means for imparting motion thereto, means for effecting a preliminary adjustment of said revoluble member, and a train-order the conformation of which governs the adjustment of said revoluble member.

5. In a device of the class specified, a mechanism having as elements a fixed member and an adjustable revoluble member, each member bearing distinguishing-marks and the distance between such marks controlling the time or place of actuation, and a train-order the conformation of which governs the adjustment of the revoluble member and the distance between such distinguishing-marks.

6. In a device of the class specified, a mechanism having a stationary member, a revoluble dial, means for actuating the dial, means for adjusting the dial, and a train-order the conformation of which governs the extent of adjustment of such dial.

7. In a device of the class specified, a mechanism having a fixed member, a revoluble dial, means for adjusting the dial, a pin or stud carried by such dial, and a train-order having a perforation for the reception of the pin.

8. In a device of the class specified, a train-order, a revoluble dial for its reception and support, a train-order-engaging means carried by the dial, and means for adjusting the position of such train-order-engaging means in accordance with the conformation of the train-order.

9. In a device of the class specified, a stationary member, a movable member, a train-order, a train-order-engaging means carried by such member, and mechanism for adjusting the movable member, the degree of adjustment being governed by the conformation of the train-order.

10. In a device of the class specified, stationary and movable members each having a projecting stud, means for adjusting the movable member, and a train-order having perforations for the reception of the two studs, the distance between such perforations determining and governing the extent of adjustment of the movable member.

11. In a device of the class specified, a stationary ring, a revoluble dial, studs carried by the ring and dial, means for effecting a preliminary adjustment of the dial, a removable member having perforations for the reception of both studs and governing the extent of adjustment, and means for disengaging the stud carried by the stationary ring.

12. In a device of the class specified, a stationary ring, a revoluble dial, means for adjusting the dial, studs carried by the ring and dial, a removable member having perforations for the reception of both studs and governing the extent of adjustment, and means for automatically disengaging the stud carried by the ring from contact with the removable member.

13. In a device of the class specified, a stationary ring having an annular series of designating-marks, a dial having a pointer movable into radial alinement with any one of such marks, a fixed stud carried by the dial, a movable stud carried by the ring, means for adjusting the dial, and a train-order disk having perforations for the reception of both studs and governing the extent of adjustment, and a door or cover for the dial and ring adapted to engage with and force the movable stud from contact with the train-order disk.

14. A train-signaling mechanism, comprising a fixed casing, a ring carried thereby and having an annular series of designating-marks, a zero-indicator carried by the ring, a spring-pressed stud adapted to an opening in the ring, a pin carried by said stud, a revoluble disk rotated within the ring and having a pointer, means for adjusting the disk to aline the pointer with any one of the designating-marks of the ring, a fixed stud carried by the dial, a train-order disk having perforations to engage the pin of the stationary ring and the stud of the dial thereby to govern the extent of adjustment of such dial, a door carried by the casing and having means for engaging the spring-pressed stud to force the latter to inoperative position, said door having a transparent panel through which the movement of the train-order may be observed.

15. In a device of the class specified, a train-order of disk-like form and bearing on its surface designating-data including the names of railroad-stations, said disk having two concentric rows of designating-marks through which perforations may be formed.

16. In a device of the class specified, a casing, a dial, a hand or

pointer adapted to travel over the dial, a revolvable support for said hand or pointer, a gear-wheel, a ratchet-wheel and a cam forming part of such support, an adjusting-pinion intermeshing with the gear-wheel, means for imparting a step-by-step movement to the ratchet-wheel, and a train-controlling mechanism governed by said cam.

17. In a device of the class specified, a casing, a stationary spindle carried thereby, a dial, a pointer adapted to travel over the dial, a gear-wheel, a ratchet-wheel and a cam all carried by and revolvable on the spindle, an adjusting-pinion intermeshing with the gear-wheel, means for imparting a step-by-step movement to the ratchet-wheel, and a train-controlling mechanism governed by the cam.

18. In a device of the class specified, a casing, a stationary spindle therein, a cam mounted on said spindle, a train-controlling mechanism governed by said cam, a friction-drum carried by the cam, an adjustable band-brake for said drum, a ratchet-wheel and a gear-wheel secured to and revolvable with the cam and drum, a stationary dial, a pointer carried by the gear-wheel and adapted to travel over said dial, an adjusting-pinion intermeshing with the gear-wheel, and means for imparting a step-by-step movement to the ratchet-wheel.

19. In a device of the class specified, a stationary casing, a dial carried thereby, a hand or pointer adapted to travel over the dial, a revolvable support for the hand or pointer, a ratchet-wheel connected to such support, a pawl for engaging the ratchet-wheel, a pawl-guiding box in which the shank of the pawl is situated, a spring engaging the shank of the pawl and tending to force the latter into engagement with the ratchet-wheel, a revolvable disk carried by the shank of the pawl, and a pin carried by said disk and serving as a means for locking the pawl in disengaging position, substantially as specified.

20. In a device of the class specified, a casing, a train-controlling means, a cam for governing the same, a ratchet-wheel connected to the cam, a pawl in engagement with said ratchet-wheel, a cylinder, a piston located in the cylinder, a piston-rod connecting the piston and the pawl, and means for automatically admitting fluid under pressure to said cylinder.

21. In a device of the class specified, a casing, a train-controlling means, a cam for governing the same, a ratchet-wheel connected to the cam, a pawl in engagement with said ratchet-wheel, a cylinder, a piston situated in the cylinder and connected with the pawl, a spring for returning the piston to an initial position after each operative movement, and an automatically-operated valve controlling the admission of fluid under pressure to said cylinder.

22. In a device of the class specified, a train-controlling mechanism having as one of its elements a ratchet-wheel, a pawl in engagement with the ratchet-wheel, a cylinder, a piston situated in the cylinder and connected to the pawl, a valve-casing connected to the cylinder, a source of pressure-supply also connected to said valve-casing, a valve situated in the casing and controlling the flow of fluid under pressure to the cylinder, and means for automatically opening and closing said valve.

23. In a device of the class specified, a train-controlling mechanism having as one of its elements a ratchet-wheel, a pawl in engagement with the ratchet-wheel, a cylinder, a piston situated in the cylinder and connected with the pawl, a valve-casing connected to the cylinder, a source of pressure-supply also connected to the valve-casing, a valve controlling the flow of fluid under pressure to said cylinder, a valve-rod, a pivoted arm adapted to operate thereon, and a series of actuating devices provided along the line of the road for contact with said arm.

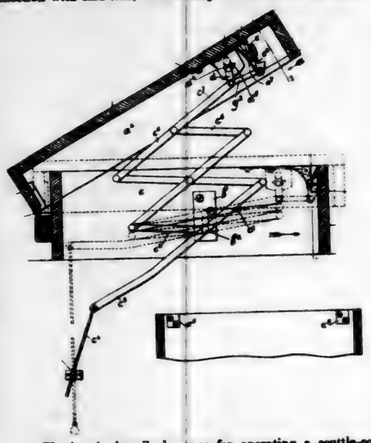
24. In a device of the class specified, a valve-casing having inlet and outlet ports, a valve controlling the flow of fluid between such ports, a valve-rod extending through the casing, a pivoted arm, a block or lug carried thereby, and an adjustable cut-over carried by the block or lug and adapted for contact with the valve-rod, means for limiting the downward movement of the arm, and a roller carried by the arm for contact with projections on the road-bed.

25. In a device of the class specified, an air-brake system having a train-pipe, a valved branch pipe connected to the pipe, a cam normally holding said valve in closed position, a ratchet-wheel connected to said cam, a pawl engaging the ratchet-wheel, and means for imparting a step-by-step movement to the cam through the pawl and ratchet-wheel.

26. In a device of the class specified, a pipe having a connection with the train-pipe of an air-brake system, a valve in said pipe, a valve-rod, a cam in contact with the valve-rod and normally serving to hold said valve-rod in an elevated position, a guiding-block for the valve-rod, a cushioned lug carried by the valve-rod and adapted for contact with said block, and means for rotating the cam to permit the opening movement of the valve.

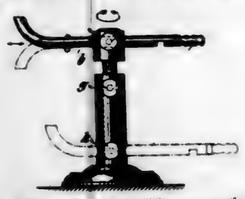
706,829. BRAKE FOR OPERATING AND LOCKING SCUTTLE-COVERS. EDWARD F. JOHNSON, Jersey City, N. J. Filed May 14, 1900. Serial No. 16,263. (No model.)

Claim.—1. The herein-described means for opening, closing and locking a scuttle-cover, transom, skylight or similar device, comprising a toggle-lever, two of the side arms of which are pivoted to the framework and one of which is projected and provided with an operating device, one of the opposite side arms of said toggle-lever being also projected and pivotally connected with a link which is pivoted to a plate secured to the scuttle-cover, transom or skylight, spring-operated locking-dogs hinged to said cover, transom or skylight, and catches secured in the frame and adapted to be engaged by said dogs, said dogs being also in operative connection with said link, substantially as shown and described.



2. The herein-described means for operating a scuttle-cover comprising a toggle-lever two of the side arms of which are pivoted to the framework of the scuttle and one of which is projected and provided with an operating device one of the opposite side arms of said toggle-lever being also projected and pivotally connected with a link which is pivoted to a support secured to said cover and a spring-operated dog hinged to said cover and adapted to engage a catch secured in said framework, said dog being also in connection with said link, substantially as shown and described.

706,830. BUNSEN BURNER. WILHELM KAPPEL, Berlin, Germany. Filed Oct. 8, 1901. Serial No. 77,974. (No model.)



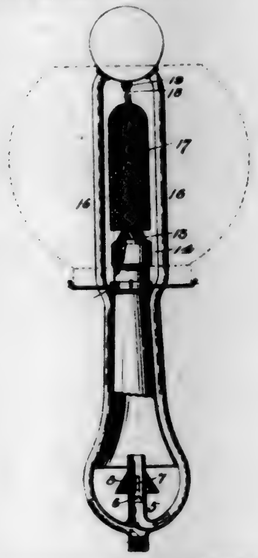
Claim.—1. A Bunsen burner comprising a supporting socket or stand with axial opening and an independent transverse opening, a stem constructed to fit either of said openings and having a head, a burner-tube axially and longitudinally adjustable in the head of said stem and means for holding the tube in either opening of the socket and means for holding the tube in said stem.

2. A Bunsen burner comprising a supporting stand or socket with axial and transverse openings, a stem adjustable in either of said openings, and a burner-tube axially and longitudinally adjustable in said stem, the said burner-tube having its burner end bent out of the axial line of the tube and its other end provided with a nozzle.

3. A Bunsen burner comprising a supporting stand or socket having axial and transverse openings intersecting each other, a head with transverse opening and a stem at right angles thereto, a burner-tube axially and longitudinally adjustable in the opening of the head, said stem being constructed to fit either the axial or transverse opening of the socket, means for securing the tube in its support, and means for securing the stem in its adjusted position in the socket.

706,831. REGENERATIVE GAS-BURNER. ROBERT H. KELLY, Buffalo, N. Y. Filed May 16, 1902. Serial No. 107,643. (No model.)

Claim.—1. A regenerative gas-burner having a head provided with gas-conducting branches, a regenerator connected to and supported by said branches, a gas-discharge branch provided with means for admitting air thereto, and a tapering gas and air mixing and heating chamber having a contractible and expansible discharge end.



2. A regenerative gas-burner having a head provided with gas-conducting branches, a regenerator connected to and supported by said branches, a gas-discharge branch provided with means for admitting air thereto and a conical hood surrounding the branch, and a tapering gas and air mixing and heating chamber engaged by the gas-conducting branches and provided with an adjustable discharge end.

3. A regenerative gas burner having a head provided with gas-conducting branches, a regenerator connected to and supported by said branches, a gas-discharge branch provided with means for admitting air thereto, a tapering gas and air mixing and heating chamber engaged by the gas-conducting branches, a collar on said tube, a globe supported by said collar, and a mantle suspended from the regenerator.

4. A regenerative gas-burner provided with gas-conducting branches, a regenerator connected to and supported by said branches, a gas-discharge branch, a tapering gas and air mixing and heating chamber engaged and supported by the gas-conducting branches, means for controlling the discharge end of said mixing and heating chamber, and a mantle suspended from the regenerator.

706,832. COVERING FOR AEROPLANES. ISAAC LANGLEY, Chicago, Ill. Filed Nov. 26, 1901. Serial No. 83,311. (No model.)

Claim.—1. A covering for an aeroplane having a reticulated body and an acting surface, the acting surface formed of thin material set edgewise, leaving interstices or spaces and having a curved rearwardly-deflecting edge, for pressure to pass through the interstices or spaces and give a forward thrust or projection in the direction of the front of the aeroplane, substantially as described.

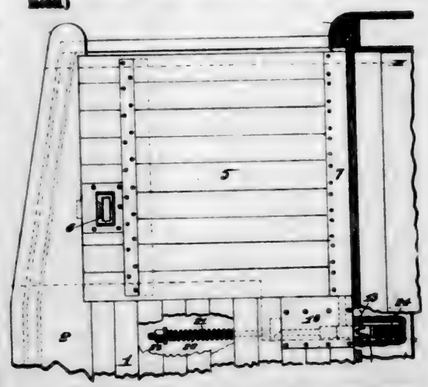
2. A covering for an aeroplane having its acting surface formed of thin material set edgewise with interstices or spaces, the edgewise-set thin material having a plane of curved rearwardly-deflecting edge, for pressure to pass through the interstices or spaces and give a forward thrust or projection in the direction of the front of the aeroplane, substantially as described.

3. A covering for an aeroplane consisting of longitudinal or fore-and-aft bars and cross-bars set into the upper edges of the longitudinal or fore-and-aft bars, and strips, sheets or plates of thin material set edgewise in the longitudinal or fore-and-aft bars and crosswise of the aeroplane with upwardly and rearwardly curved edges above the plane of the top surface of the bars, substantially as described.

4. A covering for an aeroplane having longitudinal or fore-and-aft bars and cross-bars set into the upper edge of the longitudinal or fore-and-aft bars forming a meshed body or support, and thin strips, sheets, or plates set edgewise in the longitudinal or fore-and-aft bars between the cross-bars, forming a filling with interstices or spaces for the meshes of the support or body and extending above the upper plane of the support or body with their extended edges rearwardly curved for rearwardly-deflecting pressure passing through the interstices or spaces and have the impact give a thrust or projection forward in the direction of the parallelism of motion for the aeroplane, substantially as described.

5. A covering for an aeroplane having a series of longitudinal or fore-and-aft bars and a series of cross-bars set into the upper edge of the longitudinal or fore-and-aft bars, forming a support or body with square meshes, and thin strips, sheets or plates set edgewise in the longitudinal or fore-and-aft bars between the cross-bars forming a filling with interstices or spaces within the square meshes and extending above the upper plane of the body, with the extending edges rearwardly curved for rearwardly-deflecting pressure passing through the interstices or spaces and have the impact give a thrust or projection forward in the direction of the parallelism of motion for the aeroplane, substantially as described.

706,888. TRAP-DOOR FOR CAR-PLATFORMS. JAMES G. LAWLER, St. Charles, Mo. Filed Mar. 31, 1902. Serial No. 100,609. (No model.)



Claim.—1. The combination with a trap-door for car-platforms, of a hinge member, a rock-shaft carried by said hinge member, a toothed segment carried by said rock-shaft, a pull-rod, a spring surrounding said pull-rod, and a rack carried by said pull-rod and having engagement with said segment, substantially as described.

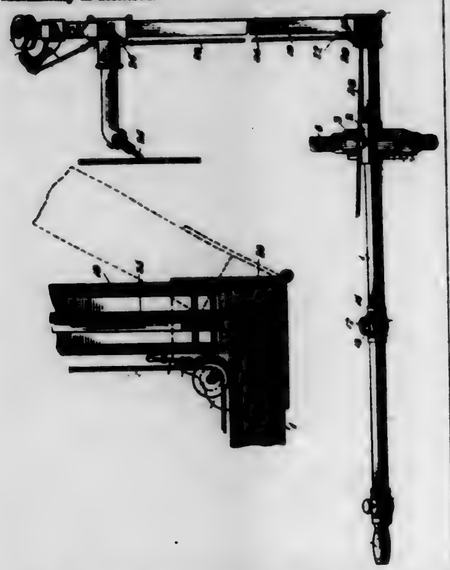
2. The combination in a trap-door for car-platforms, of a hinge member, a rock-shaft carried by said hinge member, a toothed segment carried by said rock-shaft, a pull-rod, a spring mounted on said pull-rod, a grooved rack carried by said pull-rod, and adapted for engagement with said segment, and a roller mounted beneath said rack adapted to enter the groove in said rack, substantially as and for the purpose set forth.

3. The combination with a trap-door for car-platforms, of a hinge member, a rock-shaft carried by said hinge member, a segment carried by said rock-shaft, a bearing-plate in which said rock-shaft is mounted, a pull-rod mounted in said bearing-plate, a longitudinally-grooved rack carried by said pull-rod and arranged to engage said segment, and a roller mounted upon said bearing-plate beneath said rack and adapted to rotate in the groove of said rack, substantially as and for the purpose set forth.

706,884. WINDOW-CLEANING APPARATUS. SIDNEY C. LAWLOR, Duluth, Minn. Filed July 24, 1901. Serial No. 69,546. (No model.)

Claim.—1. A window-washing apparatus comprising a supporting-bar, a handle-bar adapted to move thereon, a sliding sleeve supporting said handle-bar on the supporting-bar, a sleeve secured to the handle-

bar and provided with a bearing for partially surrounding the said sliding sleeve, and a latch for holding the said bearing upon the said sleeve, substantially as described.



2. In a window-washer, the combination with a supporting-bar, of a sleeve sliding thereon, a handle-bar extending across the sleeve, a second sleeve for supporting the handle-bar, the said second sleeve being provided with a semicylindrical bearing, the latch for holding the bearing in the said sliding sleeve comprising a bent piece of material engaging the bearings in the said semicylindrical bearing portion, the said latch being adapted to lock the semicylindrical bearing upon the sliding sleeve, substantially as described.

3. In a window-washer a handle-bar and a vertical standard, a hinge connecting the standard to the handle-bar, a housing inclosing the end of the handle-bar and adapted to receive the end of the standard for holding the same properly in position, and means for holding the standard normally in a vertical position, the structure being such that when said means is raised the said standard is straightened out to the plane of the handle-bar for moving the apparatus from a window or placing it therein, substantially as described.

4. A window-washer comprising a handle-bar, a standard hinged thereto, a sleeve sliding upon said standard and adapted to carry window-washing tools, means for pulling the sleeve upwardly comprising a cord connected with the sleeve and a spring-actuated drum for winding up said cord, and means for pulling the sleeve down against the action of said spring-drum, substantially as described.

5. A window-washer, comprising a handle-bar, a standard carried at the outer end thereof, an implement-carrying sleeve moving on said bar, a drum mounted on the upper end of the standard and having its axis in coincidence with the axis of the standard, a coil-spring secured to said drum at one end and to a portion of the standard at the other end, and a cord connecting the drum with the implement-carrying sleeve, the structure being such that the spring-drum will always tend to wind up the cord and draw the sleeve upwardly on the standard, substantially as described.

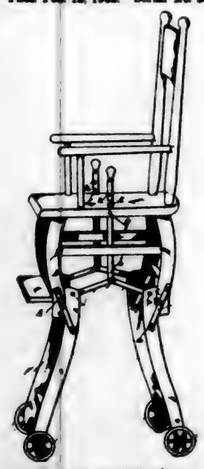
6. A window-washer comprising a handle-bar, a standard carried thereby, an implement-carrying sleeve moving on said standard, splines connecting the said sleeves with grooves in the standard for guiding the sleeve in its movement thereon, a rod mounted interiorly of the said standard, the said standard being hollow, the said rod projecting above the upper end of the standard, a drum journaled on the projecting end of the said rod, a spring surrounding the said rod and secured thereto at one end and to the said pulley at the other end for turning the pulley on its bearings, bearings interposed between the upper end of the standard and the said drum, a cord connecting the drum with the sleeve, a bracket mounted on the standard, guide-pulleys carried by the said bracket, the said cord passing around said guide-pulleys, a cord connected with the said sleeve and extending to a point near the handle-bar, so as to be within easy reach of the operator of the washer, the structure being such that by pulling on the cord the sleeve will be brought downwardly upon the standard and upon releasing the cord the spring-actuated drum will wind it up again and raise the sleeve upon the standard, substantially as described.

7. A window-washer comprising a supporting-rod, a handle-bar movably mounted thereon, the said handle-bar being jointed, to accommodate it to different positions occupied by the apparatus, a standard hinged to the outer end of the said handle-bar, a casing inclosing the outer end of the handle-bar and receiving the lower end of the standard, a spring-pressed latch pivoted in the standard and engaging a pin carried by the said casing, a pulley journaled in said casing, an implement-carrying sleeve movably mounted on the standard, an operating-cord connected with eyes on the said sleeve, the cord passing about the pulley in the said casing to a point within easy reach of the operator of the device, and spring-actuated means at the top of the standard for raising the sleeve, substantially as described.

8. A window-washing apparatus comprising a supporting-bar, a handle-bar adapted to move thereon, a bearing on the handle-bar partially surrounding the supporting-bar, and a latch for holding the said bearing upon the supporting-bar, substantially as described.

9. A window-washer comprising a handle-bar, a standard carried thereby, a washing-implement carrier moving on said standard, a spring-actuated drum mounted upon the upper end of said standard, and rotatable on a horizontal plane, a cord attached to said drum and secured to said carrier for moving the same in one direction, means guiding said cord in its movement, and means for moving said carrier in an opposite direction against the action of said spring, substantially as described.

706,835. COMBINATION HIGH CHAIR. GEORGE A. LEARNED, Detroit, Mich. Filed Feb. 12, 1902. Serial No. 93,718. (No model.)

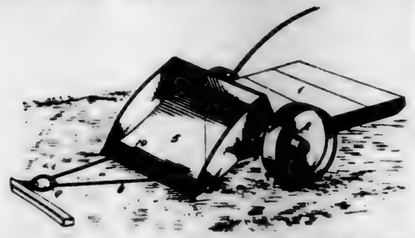


Claim.—1. In a combination-chair, the combination of a chair-frame, extension-legs pivotally secured thereto, a catch links connecting the ends of said extension-legs and a draw-rod extending through a slot in the chair-seat, pivotally connected at its lower end to said links, and provided with means for engaging the catch the pivotal connection between the legs, the links, and the draw-rod requiring the draw-rod to be raised as the initial movement in swinging the extension-legs, substantially as described.

2. In combination with a chair-frame, extension-legs secured thereto, links pivoted to the upper ends of said extension-legs, a catch on the chair-seat, a draw-rod pivotally connected to the links, extending through a slot in the chair-seat, provided with notches for engaging the catch on the chair-seat, and arranged to lift the engaging ends of said links and thereby swing inward the ends of the extension-legs, and outward the extremities of the extension-legs, substantially as described.

3. In combination with a chair-frame, extension-legs provided with wheels journaled to said legs, the extension-legs being pivotally secured intermediate their ends to the chair-frame, a holding means, links pivotally connected to the extension-legs to each other, and to a draw-rod reaching upward through a slot in the chair-bottom and which is provided with notches to engage the holding means, a spring arranged to hold the rod and the holding means in engagement, substantially as described.

706,836. SCOOP AND SCRAPER. WILLIAM R. LEE, St. Clair, Nev. Filed Dec. 4, 1901. Serial No. 84,673. (No model.)



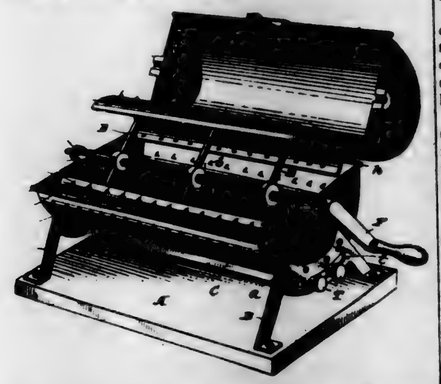
Claim.—1. A drag element having a vertically-movable member, in combination with a scoop, pivotally connected, at a point in advance of the center thereof, to said vertically-movable member of the drag element, a lever to overturn the scoop, and a draft element connected to the scoop, at a point in advance of the center thereof, whereby the stress of the draft, counting with the lag of the drag element, will return the scoop to operative position after the scoop has been overturned, substantially as described.

2. A drag element having a pivotally-supported platform the front end of which is movable in a vertical plane, in combination with a scoop pivotally connected at a point in advance of the center thereof to the front end of the platform, and a draft element connected to the scoop at a point in advance of the center thereof, substantially as described.

3. The combination of a platform having supporting-wheels, the axle of which is intermediate the ends of said platform, a scoop pivotally connected to the front end of the platform and thereby adapted to be overturned and a draft element connected to the scoop at a point in advance of the pivotal connection between said scoop and platform, substantially as described.

4. The combination of a drag element adapted to rock in a vertical plane, a scoop pivotally connected to said drag element and adapted to be overturned, a lever attached to and extending rearwardly from the scoop and a draft element connected to the scoop at a point in advance of the pivotal connection between the latter and the drag element, substantially as described.

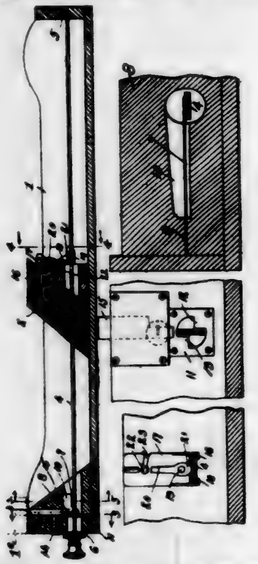
706,837. GRATER. HARRIS P. LOGAN, Washington, D. C. Filed Mar. 22, 1901. Serial No. 52,363. (No model.)



Claim.—1. In a grater, the combination of a trough formed with a slot in the lower portion thereof, extending longitudinally of the trough, longitudinal bars arranged in said slot and laterally adjustable with relation to each other and to the trough for regulating the granulation of the material operated upon, means for grating cooperating with the trough, consisting of a spindle having arms carrying wings, and means for rotating the spindle, substantially as described.

2. In a grater, the combination with a trough, of means for grating cooperating therewith, consisting of a spindle having arms carrying segmental wings, extending to a substantial distance on each side of said arms and roughened on the outside, the said wings on each side of the arms being of less radius of curvature than that of the trough, substantially as described.

706,838. CARD LIST OR INDEX. WILLIAM LOBLEY, Chicago, Ill. Filed July 19, 1897. Serial No. 645,048. (No model.)



Claim.—1. A device for the purpose described having in combination a drawer or receptacle, a rod journaled therein, the cards strung upon said rod, and a lock having a bolt arranged to alternately engage said rod and the casing in which said drawer or receptacle is situated for locking either the rod or drawer, substantially as set forth.

2. A device for the purpose described having in combination a drawer or receptacle, a casing or cabinet in which said drawer or receptacle is situated, a rod journaled in said drawer and having a flattened side, the cards strung upon said rod and a lock having a bolt arranged to be projected either against said rod or into said casing or cabinet, for alternately locking the rod and the drawer, substantially as set forth.

3. A device for the purpose described having in combination a drawer or receptacle, the rod 4 journaled therein, the cards on said rod, the block 8 through which said rod passes, having the saw-cut 9 and recess 10 and the blade-spring 7 inserted in said saw-cut and bearing against said rod said block 8 being arranged against the end of the drawer for holding said spring 7 against lateral movement, substantially as set forth.

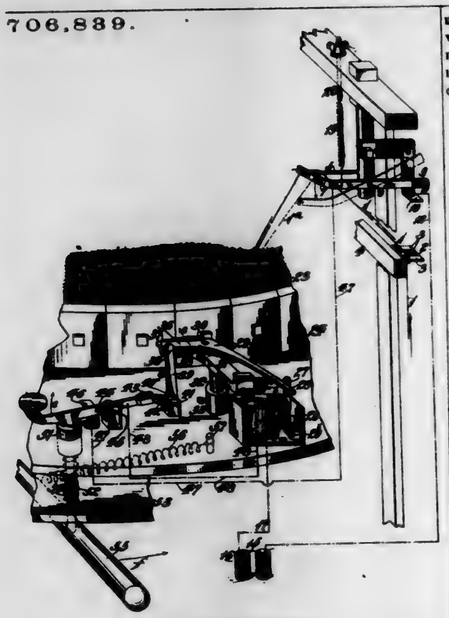
4. A device for the purpose described having in combination a rotatable rod, the cards strung thereon, a follower for said cards, a clamp for locking said follower detachably secured thereto and consisting of a plate extending across said rod and having the legs 18 engaging thereunder, and the pivoted lever 20 having an eccentric or cam 21 formed thereon and directly impinging said rod, substantially as set forth.

5. A device for the purpose described having in combination a rotatable rod, the cards strung thereon, the follower for said cards, a clamp for said follower consisting of the plate 17 extending across said rod and having the legs 18 engaging thereunder and the lever 20 having eccentric 21 pivoted to said plate and impinging said rod, said plate being provided with the slot 23 and the follower with the headed leg 22, substantially as and for the purpose set forth.

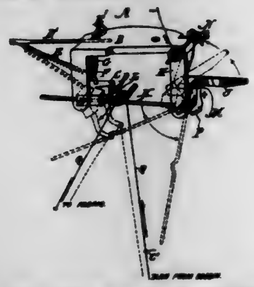
706,839. AUTOMATIC STOP-MOTION FOR KNITTING-MACHINES. GEORGE W. MARTIN and JOHN PALMER, Philadelphia, Pa., assignors to Edward H. Godshalk, Philadelphia, Pa. Filed Nov. 21, 1900. Serial No. 37,230. (No model.)

Claim.—In an electrically-operated stop-motion for a knitting-machine, a member or lever which is pivotally supported at substantially the center thereof, a spring secured to said lever to hold the lever in one position when the yarn is supported thereby and which yields when the tension thereof is overcome whereby the yarn is released from said lever a circuit-closing device on the other side of the pivotal point of said lever and with which the latter is brought in contact by the action of said spring and a stationary support over which the yarn passes before its engagement with said lever and which supports said yarn after released by said lever for convenience of resetting the parts.

706,889.



706,840. AUTOMATIC STOP-MOTION FOR KNITTING-MACHINES. GEORGE W. MARTIN and JOHN PALMER, Philadelphia, Pa., assignors to R. H. Goldsmith, Philadelphia, Pa. Filed June 26, 1901. Serial No. 66,087. (No model.)



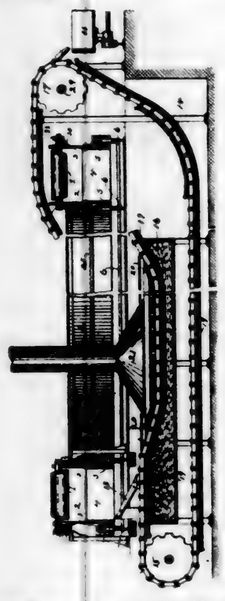
Claim.—In an automatic stopping device for knitting-machines, a body portion, a spring-clip carried by said body portion, an arm adapted to contact with said clip and close the circuit, a rod connected with said arm which is adapted to be supported by the yarn in substantially a horizontal position whereby said arm is held out of contact with said clip, pins which are adapted to support the yarn, and means for holding said pins in normal position and for permitting the same to be lowered and for returning said pins to their normal position after said yarn has been released.

706,841. CASTING APPARATUS. PATRICK MEEHAN, Lowellville, Ohio. Filed Apr. 21, 1900. Serial No. 13,668. (No model.)

Claim.—1. In a casting-machine, the combination with a series of open molds, of a trough or spout for conveying molten metal to the molds without permitting contact of the molten metal with the mold-carrier, means for moving the molds adjacent to the trough or spout, and automatic means for periodically checking the flow of metal to the machine.

2. In a casting-machine, the combination with a series of open molds, of a trough or spout for conveying molten metal to the molds without permitting the molten metal to contact with the mold-carrier, means for moving the molds adjacent to the trough or spout, and mechanism controlled by the moving part of the machine for periodically checking the flow of the metal to the machine.

3. In a casting-machine, the combination with the series of open molds, of a trough or spout for conveying molten metal to the molds, without permitting the molten metal to bear against the mold-carrier, means for moving the molds adjacent the trough or spout, and adjustable mechanism controlled by a moving part of the machine for periodically checking the flow of metal to the molds.



4. In a casting-machine, the combination with a series of open molds, of a trough or spout for conveying molten metal to the molds without permitting the molten metal to contact with the mold-carrier, means for moving the molds adjacent to the trough or spout, and means controlled by the mold-carrying means for periodically checking the flow of the metal to the machine.

5. In a casting-machine, the combination with the series of open molds, of a carrier therefor, a pouring-trough provided with an opening, for supplying molten metal to the molds without permitting the molten metal to bear against the mold-carrier, means for closing said opening, and automatic means for periodically actuating said closing means.

6. In a casting-machine, the combination with the series of open molds, of a carrier therefor, a pouring-trough provided with an opening for supplying molten metal to the molds without permitting the molten metal to bear against the mold-carrier, adjustable means for closing said opening, and automatic means for periodically actuating said closing means.

7. In a casting-machine, the combination with the series of open molds, of a carrier therefor, a pouring-trough provided with an opening for supplying molten metal to the molds without permitting the molten metal to bear against the mold-carrier, means for closing said opening, and adjustable means actuated by a moving part of the machine for periodically actuating said closing means.

8. In a casting-machine, the combination with the series of open molds, of a carrier for the molds, a pouring-trough provided with an opening for supplying molten metal to the molds without permitting the molten metal to bear against the mold-carrier, means for closing said opening, and means controlled from the mold-carrier for periodically actuating said closing means.

9. In a casting-machine, the combination with the molds, of a carrier therefor for carrying them beneath the charging-trough, a charging-trough provided with an opening, a valve for closing said opening, means adjustably connected to the valve for holding the same closed, and means adjustably connected with said holding means and actuated by a moving part of the machine for opening said valve.

10. In a casting-machine, the combination with the molds, of continuously-acting means for moving the molds adjacent the charging mechanism, automatic mechanism for charging molten metal into said molds without permitting the molten metal to bear against the mold-carrier, and means for throwing said charging mechanism out of operation to allow a mold or molds to pass without being charged.

11. In a casting-machine, the combination with the molds, of continuously-acting means for moving the molds adjacent the charging mechanism, mechanism controlled by a moving part of the machine for charging a fixed quantity of molten metal into the molds without permitting the molten metal to bear against the mold-carrier, and means for rendering said charging mechanism inoperative to allow a mold or molds to pass without being charged.

12. In a casting-machine, the combination with the molds, of means for moving the molds adjacent the charging mechanism, a charging-trough provided with a discharge, a weighted lever for closing said discharge, an arm actuated by a moving part of the machine, and means on said arm for connecting the same to the lever or disconnecting it therefrom at will.

13. In a casting-machine, the combination with the carrier provided with vertical slots, of molds trunnioned in said slots, an inclined plane arranged to engage the molds and raise the same in said slots, and means for simultaneously inverting the molds.

14. In a casting-machine, the combination with the molds, of means for moving the same, and automatic means for measuring out different portions of refractory material from a mass and spraying them in succession into the molds.

15. In a casting-machine, the combination with the molds, of means for moving the same, and intermittently-actuated means for measuring out different portions of refractory material from a mass and spraying them in succession into the molds.

16. In a casting-machine, the combination with the carrier, and the molds mounted thereon, of means intermittently actuated by a moving part of the machine for spraying refractory material into the molds.

17. In a casting-machine, the combination with the carrier, of the molds mounted thereon, means for spraying the molds, and means actuated by a moving part of the machine for moving said spraying means toward and from the molds.

18. In a casting-machine, the combination with the carrier, of the molds mounted thereon, a spraying device, means for moving said device toward and from the molds, and means for rendering said spraying device operative when moved toward the molds and inoperative when moved from the molds.

19. In a casting-machine, the combination with the carrier, of the molds mounted thereon, means intermittently actuated by a moving part of the machine for spraying the mold with a fixed quantity of refractory material, and means for rendering said spraying means inoperative at will.

20. In a casting-machine, the combination with the carrier, of the molds mounted thereon, a spraying device, means actuated by a moving part of the machine for moving the spraying device toward and from the molds, means connected with said last-named means for rendering the spraying device operative when moved toward the molds and inoperative when moved from the molds, and means for rendering the first-named means inoperative at will.

21. In a casting-machine, the combination with the carrier, of the molds mounted thereon, a spraying device, means actuated by a moving part of the machine for moving the spraying device toward and from the molds, and means connected with said last-named means for rendering the spraying device operative when moved toward the molds and inoperative when moved from the molds.

22. In a casting-machine, the combination with the carrier, and the molds mounted thereon, of adjustable means intermittently actuated by a moving part of the machine for spraying the molds with a fixed quantity of refractory material.

23. In a casting-machine, the combination with the carrier, of the molds mounted thereon, a spraying device, and adjustable means actuated by a moving part of the machine for moving said spraying device toward and from the molds.

24. In a casting-machine, the combination with the carrier, of the molds mounted thereon, a spraying device, adjustable means actuated by a moving part of the machine for moving the spraying device toward and from the molds, and means connected with said last-named means for rendering the spraying device operative when moved toward the molds and inoperative when moved from the molds.

25. In a casting-machine, the combination with the circular carrier, of the molds mounted thereon, a conveyer beneath the circular carrier and extending across the area inclosed thereby, means for discharging the pigs onto the conveyer on one side of the area inclosed by the circular carrier, means for discharging the pigs from the conveyer on the opposite side thereof and means in said area for cooling the pigs.

26. In a casting-machine, the combination with the circular carrier, of the molds mounted thereon, a conveyer extending across the area inclosed by the circular carrier and passing underneath the same on one side and over the same at the opposite side, means for discharging the pigs upon the conveyer on one side of the area inclosed by the circular carrier, means for discharging the pigs from the conveyer on the opposite side thereof, and means in said area for cooling the pigs.

27. In a casting-machine, the combination with the circular carrier, of the molds mounted thereon, a conveyer beneath the circular carrier and extending across the area inclosed thereby, means for discharging the pigs onto the conveyer on one side of the area inclosed by the circular carrier, means for discharging the pigs from the conveyer on the opposite side thereof, and a cooling-tank in said area through which the conveyer passes.

28. In a casting-machine, the combination with the circular carrier, of the molds mounted thereon, a conveyer extending across the area inclosed by the circular carrier and passing underneath the same on one side and over the same at the opposite side, means for discharging the pigs upon the conveyer, of a cooling-tank located within the said area and through which the conveyer passes, and a motor also located in said area for driving the carrier and conveyer.

706,842. VAPOR-BURNING TORCH. WILLIS MITCHELL, Malden, Mass., assignor to the Mitchell Gas Generator and Burner Company, Boston, Mass., a Corporation of West Virginia. Filed Feb. 14, 1901. Renewed June 5, 1902. Serial No. 110,327. (No model.)

Claim.—1. In combination with a hollow tool-handle serving also as a reservoir for liquid fuel an inner supplemental reservoir flexibly suspended therein with its receiving end downward, the burner-generator and body of the tool removably attached to the said handle and a tubular connection between the said generator and the said inner reservoir, the latter being removable with the said body from the said handle or main reservoir substantially as set forth.

2. In combination with a tool-handle which also serves as a main reservoir for easily-vaporizable liquid fuel, the body of the said tool removably attached to the said handle, a generator and burner, an inner reservoir suspended flexibly within the main reservoir at the front thereof and arranged to have its receiving end always in position to draw out the liquid from the bottom of the said main reservoir except when the tool is held downward, and a tube extending from the generator to the said inner reservoir and serving also as the suspending device of the latter substantially as set forth.

3. In combination with the body of the tool-handle which also serves as the main reservoir for easily-vaporizable liquid fuel, a removable disk or inner end piece for said handle, an implement-body to which said disk is rigidly attached, a generator and burner, a tube connecting said generator with an inner reservoir, the inner end of said tube being extended through the said disk and bent into a spring-coil in proximity thereto, an inner reservoir suspended by said spring-coil and arranged to have its receiving-tip at the lowest point of the main reservoir notwithstanding the change of position of the latter except when the tool is held downward substantially as set forth.

4. In combination with the burner-generator and gasoline-supply tube of a tool, a handle forming the main reservoir and provided at the outer end of said handle with an inwardly-extending tubular offset, which leaves an annular space between it and the wall of said reservoir, and an

inner reservoir suspended at the forward end of said outer reservoir by a spring-coil formed in the end of the said tool and having its tip in the said annular space in order that it may receive the fuel from the lowest part of the main reservoir notwithstanding the change of position except when the tool is held downward, and the said opening through the offset serving also to allow liquid to be poured into the said main reservoir substantially as set forth.

5. A tool provided with a hollow handle serving also as a main reservoir for liquid fuel and having at its outer end an inwardly-extending part which leaves an annular space between it and the wall of the reservoir, an inner reservoir flexibly suspended at the forward end of the main reservoir and having its tip or rear end which receives the liquid arranged to remain always within the said annular space while the parts of the tool are assembled, a burner, a generator, and a tubular communication between the said generator and the suspended end of the inner reservoir substantially as set forth.

6. In combination with a hollow tool-handle body, a fixed end piece for the outer end of the same, having a central hole and tubular inward and outward offsets l' and l'', having their bores in alinement therewith, and further provided with internal screw-threads and with a groove on its outer face concentric with the said hole, screw-cap adapted to screw into the said hole and to complete the ends of the said handle, said cap being provided with a passage for compressed air and with an annular flange adapted to fit against a packing-ring in the said groove, a burner, a generator, a tool-body, an inner reservoir suspended by one end within the said handle at the forward end of the same and having its tip or receiving end always in the space between the inner offset of the outer end piece of the handle and the annular wall of the latter, and a tube connecting the generator with the said inner reservoir and constituting an elastic suspending device for the latter substantially as set forth.

7. The body of a hollow tool-handle, serving also as a main reservoir for liquid fuel, in combination with a removable disk, which constitutes the forward end of said handle, an inner reservoir flexibly suspended by its forward end from the said disk for the purpose stated, the body or frame of a tool having another disk at its proximate end, a generator and burner mounted on the said body or frame of the tool, and a tubular connection between the said generator and the said inner reservoir, the said disks being rigidly fastened together, so that they with the inner reservoir and the other attached parts may be removed together from the said handle, said disks being further provided with intervening devices which make an air-space between them substantially as set forth.

8. In combination with the body of the tool-handle, constituting also a reservoir for liquid fuel, a disk removably closing the forward end of said handle, and provided with a series of studs on its forward face the body or frame of the tool provided at its rear end with a disk having recesses formed in its rear face to receive the said studs and having also a central hole, a bolt or screw-threaded stud rigid with the first disk and passing up through the said hole in the second, a nut engaging the said bolt or stud to lock the said disks together, a burner and generator carried by the said body of the tool, a tube extending from the said generator down through the said frame and disks and having its rear end coiled into a spring-support within the forward end of the said handle, and a supplemental inner reservoir attached at its forward end to the said spring-support and freely removable from the said handle or main reservoir with the said tool-body and the other parts named substantially as set forth.

9. In a vapor-heated tool, the combination with a mixing-chamber having an opening or openings through its side in front of the jet-block, of a casing surrounding the said mixing-chamber and provided with side openings, which allow external air to pass through to the openings in said chamber, a jet-block closing the end of the said chamber and imperforate excepting a jet-hole for vapor, a generator located between the said chamber and the said casing, a reservoir for volatile liquid and a tubular connection between said reservoir and said generator substantially as set forth.

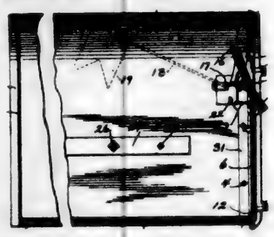
10. In a vapor-heated tool, the combination with a mixing-chamber having side openings and tapering from the forward to the rear end, of a casing surrounding the said mixing-chamber and having side openings for air, a jet-block closing the rear end of the said chamber and imperforate except a jet-hole for vapor, a generator located between the said chamber and casing, a reservoir for volatile liquid and a tubular connection between said reservoir and said generator substantially as set forth.

11. In a vapor-heated torch, a mixing-chamber and a casing which are separated by an interval and together constitute a burner discharging through the end of the said casing and which are provided with side openings, in combination with a jet-block discharging a jet of vapor into the rear end of the said mixing-chamber, a generator located between the said casing and mixing-chamber and discharging through the said jet-block, a reservoir for volatile liquid, and a tubular connection between the said reservoir and the said generator substantially as set forth.

12. In a vapor-heated tool, the combination of a burner consisting of a mixing-chamber and concentric casing with an intervening generator, a reservoir for volatile liquid, a tubular communication between the said reservoir and the said generator, means for admitting air into the said mixing-chamber means for admitting into the said mixing-chamber the vapor produced by the said generator, and a device for primarily heating the said generator and starting the tool, consisting of an alcohol-tray detachably suspended from the said casing and provided with an incombustible covering for the alcohol, permitting the fumes of the latter to be ignited above it substantially as set forth.

13. An alcohol-tray provided at its forward end with two upwardly-extending arms and at its rear end with a flange and having further a concave incombustible covering for alcohol in combination with the burner of a vapor-heated hand-tool, the said tray being attached to the sides and bottom of the casing of the said burner by screws passing through the said arms and flange substantially as set forth.

706,848. MAIL-BOX. WILLIAM H. MOORE, Joliet, Ill. Filed Nov. 4, 1901. Serial No. 80,996. (No model.)



Claim.—1. In a mail-box provided with a door and mail-receiving slot, a shutter normally closing said slot, a signal-lever mounted with its inner end in proximity to the shutter, a part on the shutter for moving the lever to display the signal when the shutter is opened, and a latch carried by and swinging with the door and adapted to engage the lever when oscillated by the shutter to lock it in signaling position until the door is opened, substantially as described.

2. In a mail-box provided with a door and mail-receiving slot, a shutter normally closing said slot, a signal-lever mounted with its inner end in proximity to said shutter, a part on the shutter for moving the lever to display the signal when the shutter is opened, a spring-latch carried by and swinging with the door and engaging the lever when oscillated by the shutter to lock it in signaling position until the door is opened, substantially as described.

3. In a mail-box provided with a door and mail-receiving slot, a shutter normally closing said slot, a signal-lever mounted with its inner end in proximity with said shutter, a part on the shutter for moving the lever to display the signal when the shutter is opened, a spring-latch carried by and swinging with the door and engaging the lever when oscillated by the shutter to lock in signaling position until the door is opened, said spring coacting with the tip of the lever to snap the lever away from engagement with the shutter and leave the latter free to swing, substantially as described.

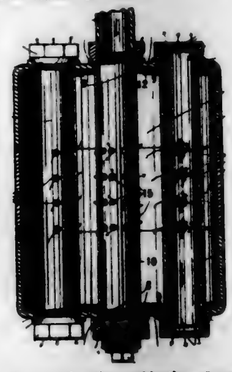
4. In a mail-box provided with a door and mail-receiving slot, a shutter normally closing the slot and pivoted near the lower margin thereof with its upper portion projecting through the slot into the box and its lower portion exterior thereto, a signal-lever mounted with its inner end in proximity to the shutter, a part on the shutter for moving the lever to display the signal when the shutter is opened, and a latch carried by and swinging with the door for locking the lever in signaling position while the door is closed, substantially as described.

5. A mail-box provided with a fastening device consisting of a bolt passing through a hole in the wall of the box and through a reinforcing-strip therein, bolts passing through holes in the wall of the box to secure the reinforcing-strip in place, similar bolt-holes on the opposite side of the box, and a card-plate bolted to the opposite wall of the box, through said holes and interchangeable with the fastening device, substantially as described.

6. A mail-box comprising a bottom wall, a rear end wall, top and side walls folded around an outwardly-projecting flange of the end wall and around downwardly-projecting flanges of the bottom wall, and a door and frame secured in the front end of the box, the ends of the bottom resting on inwardly-projecting flanges of the rear wall and door-frame, substantially as described.

7. A mail-box provided with a mail-receiving slot, a shutter pivoted near the lower margin of the slot with its upper portion normally closing the slot from within but adapted to be pressed back to disclose an opening above the shutter through which mail may be introduced into the box, the lower portion of the shutter projecting through the slot out of the box and normally overbalancing its upper portion to hold it in closed position and being cut away behind its lower edge to form a handle, and the outer or exposed face of the shutter being a smooth uninterrupted and substantially plane surface, the upper edge of the shutter and adjacent wall of the box being provided with interfitting projections and recesses, substantially as described.

706,844. MUFFLER. HOMER H. HOTTENROTH, Pendleton, Ind., assignor of one-half to J. B. Bartholomew, Peoria, Ill. Filed Sept. 23, 1901. Serial No. 76,163. (No model.)



Claim.—1. In a muffler, the combination of a pair of heads each having a similar set of openings therethrough, one or more pipes passing one through each pair of the said openings, means carried by said pipes for clamping said heads together and the pipes in position, and a pair of alined openings leading into the interior of each of said pipes.

2. In a muffler, the combination of a pair of heads each having a similar set of openings therethrough, a cylinder arranged between said heads and provided with ends adapted to mate with said heads, one or more pipes passing one through each pair of the said openings, a cap mounted upon each end of each pipe and adapted to engage the heads so as to close the openings and clamp the heads upon the cylinder, and openings leading from the cylinder into the interior of each of said pipes.

3. In a muffler, the combination of a receiving-chamber, and a plurality of pipes extending therethrough each of said pipes having openings leading through its walls from the receiving-chamber into its interior.

4. In a muffler, the combination of a receiving-chamber, a receiving-pipe extending through the middle thereof and having a series of openings through its wall into the chamber, and a plurality of discharge-pipes surrounding the receiving-pipe and extending through the receiving-chamber and having a series of openings leading through their walls into the interior.

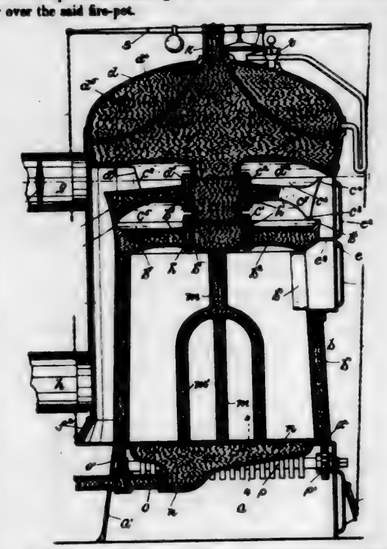
706,845. SASH-LOCK. VINCENT R. MCBRIDE, Stillwater, Okla. Filed May 17, 1902. Serial No. 107,861. (No model.)

Claim.—1. The combination of the casing-plate provided at its outer edge with a bent portion forming a catch, of a lever pivoted to the under side of said casing-plate and having a bent operating end, a handle pivoted to the same and adapted for engagement with the catch of the casing, and a pin or spur pivotally connected with the opposite end of the lever, extending through a staple attached to the casing-plate, and beyond the inner edge of the latter, substantially as set forth.

2. In a sash-lock, the combination with a casing-plate having a bent portion or catch, of a lever mounted pivotally upon said casing-plate and provided at its opposite ends with a handle adapted for engagement with the catch of the casing-plate, and with a pivotally-connected pin or spur, substantially as set forth.

706,846. STEAM-GENERATOR OR HOT-WATER HEATER. WILLIAM H. PAGE, Norwich, Conn., assignor to the Page Company, Plainfield, Conn. Filed Oct. 23, 1901. Serial No. 79,668. (No model.)

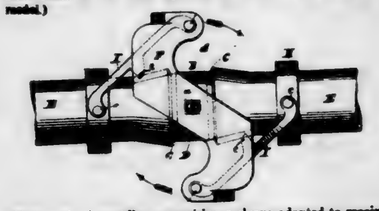
Claim.—1. In combination, an ash-pit section, a fire-pot section mounted thereon, a hollow water-bar n extending across said ash-pit section, and a water-passage of pipe form located substantially centrally of the said fire-pot and connecting the said water-bar with the water-chamber over the said fire-pot.



2. In combination, a water-jacketed fire-pot section, a hollow water-bar located below said fire-pot section, a water-passage of pipe form located in the fire-pot and connecting the said water-bar with the water-chamber over the fire-pot, and branch pipes m' connecting the said water-bar with the said central water-passage.

3. In combination, an ash-pit section, a superimposed water-jacketed fire-pot section, and a grate supported in and by the ash-pit section, said grate being formed of fixed hollow water-bar n and rocking sections, substantially as herein set forth, and a water-passage of pipe form located in the fire-pot and connecting the said water-bar n with the water-chamber over the fire-pot.

706,847. HOSE OR PIPE COUPLING. HENRY A. F. PETERSEN, New York, N. Y. Filed Apr. 10, 1902. Serial No. 102,947. (No model.)



Claim.—1. A coupling comprising a sleeve adapted to receive the ends of pipe, annular clamps adapted to embrace the ends of the sleeve and the pipe thereon, and a lever pivotally connected to said sleeve and annular clamps for locking said annular clamps in position upon said sleeve, substantially as specified.

2. A coupling comprising a sleeve adapted to receive the ends of pipe, annular clamps adapted to embrace the ends of the sleeve and the pipe thereon, and a lever pivotally secured intermediate its ends to said sleeve and at its ends to the annular clamps and adapted to lock said annular clamps in position upon the ends of said sleeve, substantially as specified.

3. A coupling comprising a sleeve adapted to receive the ends of pipe, collars adapted to embrace the ends of the sleeve and the pipe thereon, a double lever pivotally secured to said sleeve, and links pivotally secured to said collars, and the ends of said double lever, substantially as specified.

4. A coupling comprising a sleeve having tapering ends adapted to receive the ends of pipe, collars adapted to embrace the tapering ends of the sleeve and the pipe thereon, a locking device comprising two lever members united together at their ends, and pivotally secured midway between their ends to the sleeve, and links pivotally secured to the ends of said lever members, and the collars, substantially as specified.

5. A coupling comprising a sleeve having tapering ends adapted to receive the ends of pipe, collars adapted to embrace the tapering ends of said sleeve and the pipe thereon, a locking device comprising two substantially S-shaped members united at their ends, and pivotally secured midway of their ends to said sleeve, and links having their ends pivotally secured to the ends of said S-shaped members and to the opposite surfaces of said collars, substantially as specified.

6. A coupling comprising a sleeve having tapering ends adapted to receive the ends of pipe, square bosses arranged upon the opposite sides of said sleeve intermediate its ends, collars adapted to embrace the tapering ends of said sleeve and the pipe thereon, a locking device comprising two substantially S-shaped members united at their ends and pivotally secured midway of their ends to the square bosses on said sleeve, and links having their ends pivotally secured to the ends of said S-shaped members and to the opposite sides of said collars and provided with toes adapted to contact with the sides of said square bosses, substantially as specified.

706,848. CONVEYER-BELT-SUPPORTING MECHANISM. EDWIN S. PHILIPS, Kennett Square, Pa., assignor to American Road Machine Co., Kennett Square, Pa., a Corporation of Pennsylvania. Filed May 26, 1902. Serial No. 108,904. (No model.)

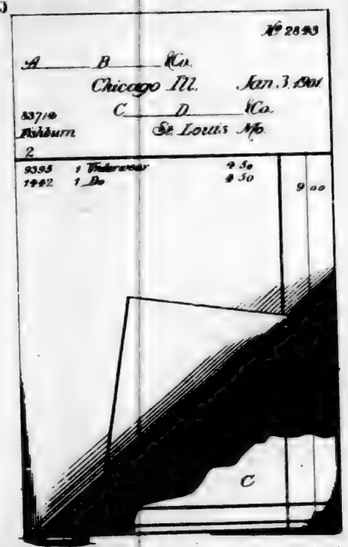
Claim.—1. In combination, with a traveling conveyer belt or apron, and a set of carrier-pulleys therefor comprising a horizontal and two obliquely-disposed pulleys, said pulleys having integral or fixed axle-journals arranged within their overhanging end rims; the intermediate bearing-standards between said pulleys, each provided with a hollow T-head consisting of a horizontally-projecting portion and an upwardly-inclined projecting portion, said projecting portions internally fitted for supporting the rotating pulley-journals within the rims of the adjacent pulley ends, and a pair of outside supporting-standards having oblique inwardly-projecting hollow bearing-heads that respectively extend into the overhanging rims, and sustain the journals within the outer ends of said obliquely-disposed pulleys, substantially as set forth.

2. In a conveyer-belt supporter, the carrier pulleys or rollers provided with internal short hubs and integral or fixed journals arranged within their endwise overhanging rims, the inclined pulley-journals having a central bore or passage therein partially, but not entirely, through their axis, with radial outlets from said passage to the journal-surface; in combination with the bearing-standards, having projecting hollow-head portions within which said pulley-journals are rotatably inclosed, in the manner set forth.

3. In a conveyer-belt supporter, a series of carrier-pulleys comprising a plurality of inclined pulleys provided with internal axle-journals fixed in the pulley and turning therewith, and having a hollow or bore extending from the end of one journal partially through said axis, with lateral holes therein; in combination with inner end bearing-standards, and outside end bearing-standards, said standards provided with head portions that project into the pulley ends and form bearings for the journals, and having hollow space within the heads, communicating with the bearing-surfaces and said axis-bore, for the purpose set forth.

4. In combination with the endwise-movable conveyer-belt, a set of carrier-pulleys comprising the horizontal pulleys, and two oppositely-inclined pulleys respectively provided internally with axle-journals centrally fixed within the pulley and turning therewith, each of said inclined pulleys having an axial bore or opening from the end of one journal nearly to the end of its opposite journal, with lateral outlets therefrom, a pair of intermediate standards provided with horizontal and inclined projecting portions with bearings therein, said bearings united by a hollow space within the standard-head, and a pair of separate outside standards each having an inwardly-projecting bearing, and an outwardly-upturned portion forming a seat for the lubricator-cup, and a passage from said cup to the open upper end of the pulley-journal, all substantially as shown and described.

706,849. COMBINED BILL-SHEET AND JOURNAL-LEAF. JOHN T. PIERE, Jr., Chicago, Ill. Filed Mar. 5, 1901. Serial No. 49,909. (No model.)



Claim.—1. A combined original and copy instrument for the purpose set forth, comprising two superimposed leaves having like identifying characters, said leaves being folded on a common line near one edge, the folded portion of the copy affording a binding-strip after separation, substantially as described.

2. A combined original and copy instrument for the purpose set forth, comprising two superimposed leaves, the original leaf having a user's card thereon, and the copy-leaf having a non-detachable folded margin joined to said original leaf at a line of folding, said margin affording a binding-strip after separation of the leaves, substantially as described.

3. A combined bill-sheet and journal-leaf for the purpose set forth, comprising a bill-sheet supplied with a user's card, and an underlying journal-leaf supplied with journal-rulings, said journal-leaf having a folded binding-margin connected with the adjacent edge of said bill-sheet and an opposite rearwardly-folded margin affording a memorandum-slip, substantially as described.

4. A combined bill-sheet and journal-leaf, comprising a bill-sheet supplied with a user's card and with an identifying character, and an underlying journal-leaf having a like identifying character and supplied with suitable journal-rulings, said bill-sheet and journal-leaf being folded rearwardly on a common line near one edge and joined at said edge at a perforate line, and said journal-leaf having at its opposite free edge a rearwardly-folded vertically-ruled margin, substantially as described.

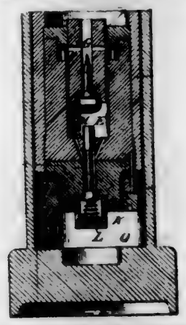
5. A combined bill-sheet and journal-leaf for the purpose set forth, comprising a bill-sheet supplied with a user's card, and an underlying journal-leaf supplied with journal-rulings, said journal-leaf having a folded binding-margin detachably connected at a weakened line with the adjacent edge of said bill-sheet, substantially as described.

6. A combined bill-sheet and journal-leaf for the purpose set forth, comprising a bill-sheet supplied with a user's card, and an underlying journal-leaf supplied with journal-rulings, said journal-leaf having a folded binding-margin detachably connected at a weakened line with the adjacent edge of said bill-sheet, said bill-sheet and journal-leaf having like identifying characters, substantially as described.

7. An instrument of the character described, comprising a bill-sheet supplied with a user's card and having a folded lateral margin affording a binding-strip, and an underlying journal-leaf formed integrally with said bill-sheet and supplied with rulings parallel with said folded margin and joined to said folded margin at a weakened line, said bill-sheet and journal-leaf having like identifying characters for the purpose set forth.

8. A combined bill-sheet and journal-leaf, comprising a single sheet of material folded to afford an original leaf of a certain width and a copy-leaf of greater width, the projecting free margin of said copy-leaf being folded rearwardly to afford a memorandum-slip, the connected margin of said leaves being folded rearwardly and that of the original leaf being detachable from its leaf and from the folded adjacent margin of the copy-leaf, substantially as and for the purpose set forth.

706,850. HYDRAULIC JACK. LEWIS S. PITCHER, Albany, N. Y., assignor to William M. Dudgeon, executor of Richard Dudgeon, deceased. Filed Mar. 29, 1902. Serial No. 100,553. (No model.)

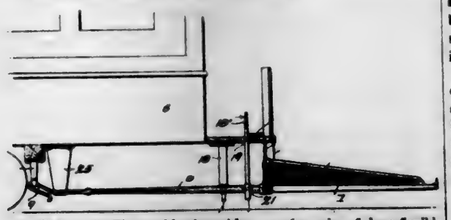


Claim.—1. In a hydraulic jack the combination of a ram provided with a passage-way connecting the force-chamber of the jack with the bore of the pump, backflow-openings connecting the bore of the pump with the passage-way, a lowering-valve having an upper part adapted to fit the passage-way and move through it to close the backflow-openings, the upper end of which valve extends into the bore of the pump sufficiently to enable the piston to depress the valve far enough to close the backflow-passages, a reduced stem past which the liquid can flow, a valve-head below the reduced part of the stem and sufficient space below the head to permit the stated downward movement of the valve, for the purpose set forth.

2. In a hydraulic jack the combination of a ram provided with a passage-way connecting the force-chamber of the jack with the bore of the pump, backflow-openings extending from the bore of the pump and connecting at substantially right angles with said passage-way, a lowering-valve having an upper part adapted to fit the passage-way and move through it to close the backflow-openings, the upper part of which valve extends into the bore of the pump sufficiently to enable the piston to depress the valve far enough to close the backflow-openings, means for permitting the liquid to flow past the stem of the valve, a valve-head at the lower end of the valve and sufficient space below the head to permit the stated downward movement, for the purpose set forth.

3. In a hydraulic jack the combination of a ram provided with a passage-way connecting the force-chamber of the jack with the bore of the pump, backflow-openings connecting the bore of the pump with the passage-way, a lowering-valve having an upper part which extends into the bore of the pump and which is adapted to fit the passage-way and move through it to close the backflow-openings, the upper end of which valve extends into the bore of the pump sufficiently to enable it to be depressed far enough to close the backflow-passages, means for depressing the said valve, a reduced stem past which the liquid can flow, a valve-head below the reduced part of the stem and sufficient space below the head to permit the stated downward movement of the valve, for the purpose set forth.

706,851. CAR-FENDER. OLLIE M. PROUSE, Tunis Mills, Md. Filed Jan. 9, 1902. Serial No. 89,070. (No model.)



Claim.—1. The combination with a car, of a series of short flexible connections depending from the car, a fender loosely suspended at the back by the said flexible connections and having an arm extending rearward beyond the latter, operating mechanism for moving the fender longitudinally of the car, and means for engaging the arm, whereby when the fender is swung rearward, its front end will be depressed, substantially as described.

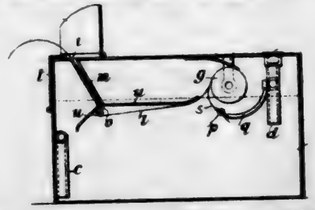
2. The combination with a car, of short flexible connections depending from the car, a fender loosely suspended at the back by the said flexible connections and having an arm extending rearward beyond the flexible connections and provided with an inclined portion, a bracket fixed to the car and receiving the inclined portion of the arm, and means for moving the fender longitudinally of the car, substantially as described.

3. The combination with a car having sand-boxes, of a fender loosely suspended at the back from the car and having central and side arms extending rearward beyond the supporting means, the side arms being connected with the sand-boxes and adapted to open the same, and means for engaging the central arm whereby the front of the fender will be depressed when the fender is swung rearward, substantially as described.

4. The combination with a car, of a fender loosely suspended at the back therefrom and having central and side arms extending rearward beyond the supporting means, a bracket receiving the central arm and adapted to raise the same when the fender is swung rearward, whereby the front of the fender will be depressed, and means for engaging the side arms to prevent the fender from rising bodily, substantially as described.

5. The combination with a car, of short flexible connections depending from the car, a fender suspended at its back by the flexible connections and provided with central and side arms extending rearward beyond the flexible connections, the central arm being provided with an inclined hook and the side arms being slotted, a bracket fixed to the car and receiving the inclined hook, and posts depending from the car and extending through the slots of the side arms and having shoulders for engaging the said side arms, substantially as described.

706,852. APPARATUS FOR DEVELOPING AND FIXING CARTRIDGE PHOTOGRAPHIC FILMS. MAX REICHERT, London, England. Filed Feb. 3, 1902. Serial No. 92,418. (No model.)



Claim.—1. In combination, a light-tight box, a spool-holder in the upper part of said box, means whereby the backing-paper may be drawn off from the spool without admitting light to the box and in a direction substantially horizontally and at the upper part of the box, and a device within the developing-box for holding the free edge of the film while that portion of the film intermediate of its ends is being drawn from the spool, the said box having a space beneath the plane of the spool and the drawing-off means to allow the film to fall from said plane into position to be acted on by the developer, substantially as described.

2. A developing-box having a spool-holder therein, a device within the box for holding the outer or free end of the film and means whereby the backing-paper may be drawn off to thus draw off also the main body portion of the film while both its ends are held one on the spool and the other by the said device, substantially as described.

3. Apparatus for the purpose set forth, comprising a box and a lid wherein is a light-trapped aperture through which the backing-paper may be drawn out, a spool-holder within the box, a clip adapted to grip the free edge of the film close up to the spool, and means for introducing and drawing off liquids without admitting light to the box, both the spool-holder and the clip aforesaid being carried by the lid, whereby the arrangement of the spool for development and its removal after treatment is facilitated, as specified.

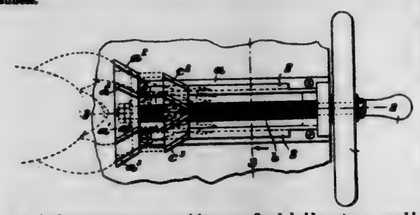
4. In apparatus or means for the purpose set forth, the combination of a box made light-tight by a lid wherein is a slot, a tube leading to said slot through which tube and slot the backing-paper is drawn out, a light-baffle to said tube, a clip connected with the lid by a flexible attachment and adapted to be placed on the free edge of the film close up to the spool, and means for introducing and drawing off liquids without admitting light, as specified.

706,853. SNOW-EXTRACTOR. JOSEPH C. SCANNELL, Boston, Mass., assignor, by mesne assignments, to Sadie Scannell, Boston, Mass. Filed Apr. 14, 1902. Serial No. 103,751. (No model.)

Claim.—1. A snow-extractor comprising two holders having channels adapted to receive one leg of a fowl, and provisions for relatively moving said holders into and out of a position substantially closing the said channels.

2. A snow-extractor comprising two holders having channels adapted to receive one leg of a fowl, and provisions for imparting a movement

of one of said holders relatively to the other in a path at an obtuse angle to the channels and into and out of a position substantially alining said channels.

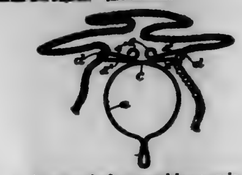


3. A snow-extractor comprising two fixed holders, two movable holders connected for operation in unison and located closer together than the fixed holders, said holders having channels adapted to receive the two legs of a fowl, and provisions for moving said movable holders in paths at an obtuse angle to the channels and into and out of positions substantially alining the channels.

706,854. PERAMBULATOR. CARL W. R. SCHULZE, Leipsic, Germany. Filed Oct. 16, 1901. Serial No. 78,899. (No model.)

Claim.—A safety device for perambulators, mail-carts or the like, comprising a spring-actuated guard or guards normally held depressed by a retaining device or devices, said retaining device or devices being operated to release said guard or guards and thus allow same to be raised by said spring action when pressure is exerted on a strap or equivalent device passing across the body of the vehicle, in the described manner and for the purpose mentioned.

706,855. GARTER. EDWARD W. SCHEELE, Brooklyn, N. Y., assignor of one-half to William V. Cole, New York, N. Y. Filed Jan. 27, 1902. Serial No. 91,308. (No model.)



Claim.—1. A garter device comprising a spring-ring having an integral projecting loop at one side, said ring being open opposite said loop and the sides thereof being crossed and extended and formed into oppositely-directed and independent loops which open inwardly adjacent to the point where the sides of the ring are crossed and form frictional holders, and the ends of the free sides of which are curved outwardly substantially as shown and described.

2. A garter device comprising a spring-ring having an integral projecting loop at one side, said ring being open opposite said loop and the sides thereof being crossed and extended and formed into oppositely-directed and independent loops which open inwardly adjacent to the point where the sides of the ring are crossed and form frictional holders, and the ends of the free side of which are curved outwardly, and a card which is adapted to be passed around the leg and into said loops, substantially as shown and described.

706,856. SHADE-HOLDER FOR INCANDESCENT ELECTRIC LAMPS. EDWARD W. SCHEELE, Brooklyn, N. Y., assignor of one-half to William V. Cole, New York, N. Y. Filed Feb. 5, 1902. Serial No. 92,511. (No model.)

Claim.—1. A shade-holder composed of spring-wire bent to form a spring-ring open at one side, the parts of said ring at the open side being crossed and extended in opposite directions and formed into outwardly-directed, vertically-arranged, loop-shaped shank members which are separated and arranged in separate vertical planes, and segmental clamp members connected with the lower end of said shank members and arranged concentrically with reference to said spring-ring and below said ring and outside thereof, substantially as shown and described.

2. A shade-holder composed of spring-wire bent to form a spring-ring open at one side, the parts of said ring at the open side being crossed and extended to form projecting loop-shaped shank members which are separated and arranged in separate vertical planes when the shade-holder is in its normal position and segmental members connected with the bottom of the shank members and below said ring when said holder is in its normal position, said segmental members being open at the side opposite the loop-shaped shank members substantially as shown and described.

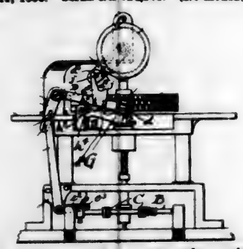
3. A shade-holder composed of spring-wire bent to form a spring-ring open at one side, the parts of said ring at the open side being crossed and extended to form projecting loop-shaped shank members which are separated and arranged in separate vertical planes when the shade-holder is in its normal position, and segmental members connected with the bottom of the said shank members and below said ring when said holder is in its normal position, said segmental members being open at the side opposite the loop-shaped shank members and being curved outwardly and backwardly, substantially as shown and described.

706,857. TONGUELESS BUCKLE. GEORGE SCHNEIDER, Newport, Ky. Filed Apr. 30, 1901. Serial No. 58,002. (No model.)

Claim.—1. The combination in a tongueless buckle, of a frame A; attaching-frame D provided with bar *d*; a strap looped over bar *d*; projection E on frame D; and hook F detachably secured to frame D by means of lugs *f* and *a'* and pin *f'*, substantially as specified.

2. The combination of buckle-frame A, having flanges *a*, *a'* and *a²* and the raised open bar B; attaching-frame D, having intermediate bar *d* and projection E; hook F, and strap C, looped over bar *d* and secured to projection E and hook F, substantially as specified.

706,858. TYPE-WRITER. CHARLES SEARS, Cleveland, Ohio. Filed July 19, 1899. Serial No. 724,579. (No model.)



Claim.—1. In a type-writing machine, the combination of a pivoted type-carrier, and means operated by finger-keys for bringing any character on said carrier to the impression-point with a rotatable inking-platen, an arm carrying an inking-roller, mechanism for swinging said arm to carry said roller into contact with the character at the impression-point and with said inking-platen, a ratchet secured to the platen, and a pawl operated by said arm, substantially as specified.

2. In a type-writer having a pivoted type-carrier, the combination of an inking-platen located above the type-carrier, with an oscillating pivoted lever carrying an inking-roller which is adapted to contact with the character at the impression-point and with said platen, the impression-hammer and mechanism, which moves synchronously with the impression-hammer, for moving said roller-carrying lever up whereby the roller contacts with the character at the impression-point and with said platen, and then down again to its normal position, substantially as and for the purpose specified.

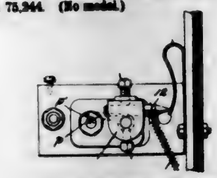
3. In a type-writer the combination of a movable shield having an opening which permits the paper to contact only with the character at the impression-point, and mechanism for moving said shield with a roller-carrying device, an inking-platen, and mechanism for moving said roller across the face of the character at the impression-point, and into contact with the inking-platen, substantially as and for the purpose specified.

4. In a type-writer having a pivoted type-carrier, the combination of a pivoted lever carrying inking-rollers, the impression-hammer and means which operate synchronously with the impression-hammer for moving said lever to carry the inking-rollers across the face of the character at the impression-point, with a movable shield having an opening through which the character may be printed which movable shield lies in the path of said inking-roller lever whereby it is moved in one direction, and a spring for moving it in the contrary direction, substantially as and for the purpose specified.

5. In a type-carrier, having an oscillating type-segment, the combination of a pivoted lever carrying inking-rollers, the impression-hammer and mechanism operating synchronously with the impression-hammer for moving said lever to carry the rollers across the face of the type at the impression-point, with a shield-lever having an opening through which the character at the impression-point may be printed, and mechanism for moving said shield, substantially as and for the purpose specified.

6. In a type-writer having an oscillating type-carrier, the combination of a rotary inking-platen located above the type-carrier, a ratchet-wheel secured thereto, a pawl-carrier mounted adjacent to and concentric with said ratchet, and a spring-pawl on said carrier, with an oscillating lever carrying inking-rollers which are adapted to move across the face of the character at the impression-point, and an arm attached to said lever and having two shoulders d^n d^1, and a pin on the pawl-carrier with which said shoulders are adapted to engage, substantially as and for the purpose specified.

706,859. SPARKER FOR EXPLOSIVE-ENGINES. HARRY H. SAGER and CHARLES B. SUMMER, Hagerstown, Md., assignors of one-third to Arthur S. Dorsbimer, Hagerstown, Md. Filed Sept. 13, 1901. Serial No. 75,244. (No model.)



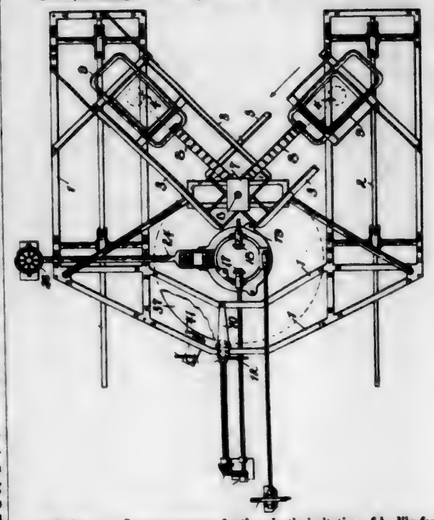
Claim.—1. In an explosive-engine, the electric sparker comprising a stationary electrode, a movable electrode, and a spring of the form described mounted on a rectilinearly-reciprocating rod and arranged to contact with a strike connected with said movable electrode and throw said movable electrode into contact with the stationary electrode, and then release the same, and means for separating said electrodes, substantially as set forth.

2. In an electric sparker for explosive-engines, the combination, of the base, the stationary electrode insulated from said base and connected with one wire of an electric circuit, a movable electrode adapted to contact with said stationary electrode, a strike thereon, a strike mounted on a rod, which rod is mounted to reciprocate in a fixed plane, said strike thereon being formed flexible and with a curved portion adapted to contact with the strike on the electrode and throw it into contact with the other to close the circuit and hold it closed during the down-and-up movement of the rod, and means for breaking the contact suddenly when the strikes separate, substantially as set forth.

3. In an electric sparker for explosive-engines, the combination of the base, the stationary electrode mounted thereon and insulated therefrom, one wire of an electric circuit connected therewith, the movable electrode mounted on a rock-shaft extending to the outside, a projecting strike carried thereby, and a spring mounted on a reciprocating rod alongside said strike to engage therewith, the spring having a curved portion adapted, and being of a form, to throw said electrode into contact with the stationary electrode on its down motion and hold the contact until freed therefrom on its up motion, substantially as set forth.

4. In an electric sparker for gasolene-engines, two electrodes adapted to be thrown together to close the circuit, and a spring on a rectilinearly-reciprocating part arranged and formed to strike a part and throw said electrodes into contact on one motion and hold them in contact until free therefrom on its return motion, substantially as set forth.

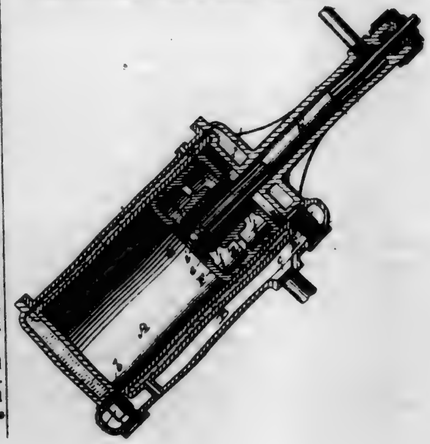
706,860. PHOTOSCULPTURE APPARATUS. WILLY A. C. SELKE, Berlin, Germany. Filed July 20, 1901. Serial No. 69,732. (No model.)



Claim.—1. In an apparatus for the plastic imitation of bodily forms by means of photography, the combination of a carriage, movable longitudinally and carrying two groups of lights and two screens, which groups of lights and screens are arranged on the said carriage in a fixed angular position each to the others, with a rotatable disk as carrier of the bodily object, to be reproduced, and with a photographic apparatus and means for moving the carriage, carrying the lights and screens, longitudinally and means for rotating the rotatable disk, and also means for throwing out of gear the gearing of the said carriage and the gearing of the said disk, substantially as described.

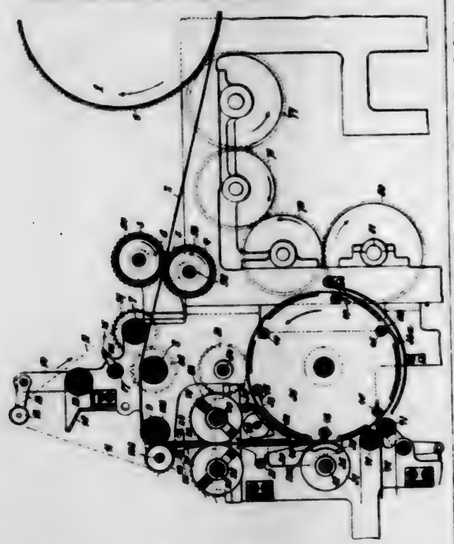
2. In an apparatus for the plastic imitation of bodily forms by means of photography, the combination of a carriage, movable longitudinally and carrying two groups of lights and two screens, which groups of lights and screens are arranged in the said carriage in a fixed angular position each to the others, with a rotatable disk as carrier of the bodily object, to be reproduced, and with a kinematographic apparatus, engaging with its gearing in the gearing of the movable carriage and the rotatable disk, and means for moving the movable carriage longitudinally and means for rotating the rotatable disk and also means for throwing out of gear the gearing of the said carriage and the gearing of the said disk, substantially as described.

706,861. FLUID-COMPRESSOR. EDWARD SEITZ, Ironridge, Wis. Filed Dec. 6, 1901. Serial No. 84,886. (No model.)



Claim.—A fluid-compressor cylinder having head-ports in valve-controlled communication with a chamber provided with an outlet, a hollow piston in the cylinder provided with valve-seats in its ends, an apertured hollow valve guided in the piston and having a hollow shank, a valve-cheek guide in the form of a cylinder-head neck having a fluid-inlet, and a rod that being in rigid connection with the valve extends through a stuffing-box with which the outer end of said neck is provided.

706,862. WEB-FOLDING MACHINE. RALPH C. SEYMOUR, New York, N. Y., assignor to C. B. Cottrell & Sons Co., Jersey City, N. J., and Bennington, Conn., a Corporation of New Jersey. Filed Aug. 4, 1898. Serial No. 687,720. (No model.)



Claim.—1. In a folding-machine, the combination of a pair of rotary cutters traveling at the same surface speed as the printed web, a folding-cylinder whose circumference is exactly equal to a plurality of the sheets detached by said cutters from the web, a plurality of sets of grippers on said cylinder, a plurality of folding-blades on said cylinder, and means cooperating with said folding-blades to take the sheets away from said cylinder in a doubled or folded condition.

2. In a folding-machine, the combination of a pair of rotary cutters, a folding-cylinder whose periphery is exactly equal to a plurality of the sheets detached by said cutters, the said cylinder, the said cutters and the printed web all traveling at the same surface speed, a plurality of sets of grippers, a plurality of folding-blades alternating therewith on said cylinder, and a pair of folding-rollers cooperating with said folding-blades.

3. In a folding-machine, the combination of a pair of rotary cutters, a folding-cylinder traveling at the same surface speed of said cutters and of the web, a plurality of sets of grippers on said cylinder, each set of which is adapted to seize the leading end of the web before detachment of the sheet, a plurality of folding-blades on said cylinder alternating with said sets of grippers, and a pair of folding-rollers; the combination and arrangement being such that each set of grippers takes the leading end of the web at the receiving-point and before it is detached by the cutters and such that every alternate set of grippers releases two superposed sheets to the pair of folding-rollers.

4. In a folding-machine, the combination of rotary cutters traveling at the same surface speed as the printed web, a folding-cylinder having mounted thereon three sets of grippers, and alternately-arranged folding-blades, the circumference of said cylinder being in length exactly equal to the length of three sheets of paper detached by the rotary cutters and traveling at the same speed as the web, a pair of folding-rollers, means for opening and closing a set of grippers so that it may take the head of a sheet at the receiving-point before it is detached from the web, means for opening every alternate set of grippers to release two superposed sheets to said folding-roller, and means for actuating the folding-blades so as to cause them to act alternately and double two superposed sheets into the bite of said folding-rollers when released by their associated grippers.

5. In a folding-machine, the combination of rotary cutters for detaching sheets from the body of the web, a folding-cylinder traveling at the same surface speed as the web and having its periphery proportioned, as described, to the length of the sheets detached by said cutters, a plurality of sets of grippers on said cylinder, a tucking device having a cut-away or space to enable the grippers to close, and provided with a nose or projection for positively directing the leading end of the web in between the said grippers and the surface of the folding-cylinder.

6. The combination of a cylinder provided with vibratory grippers which clamp the sheet upon the periphery of the cylinder, a tucker for tucking the loose leading end of the web between the points of said grippers and the periphery of the cylinder and means disconnected from said tucker for feeding the web between the tucker and the gripper-cylinder.

7. In a folding-machine, the combination of a folding-cylinder provided with vibratory grippers which clasp the sheet upon the periphery of the cylinder, and a rotary tucking device adapted to tuck the leading end of the sheet between the grippers and the periphery of the cylinder.

8. In a folding-machine, the combination of a folding-cylinder having vibratory grippers which clasp the sheet upon the periphery of the cylinder, a rotary tucking device having a nose or projection adapted to force the leading end of the sheet into the space between said grippers when open and the periphery of the folding-cylinder.

9. In a folding-machine, the combination of a folding-cylinder traveling at the same surface speed as the web, vibratory grippers for clasping the sheet upon the periphery of the cylinder, mechanism for detaching sheets from the web, a tucking device adapted when the grippers are open to force the leading end of the web in between the grippers and the periphery of the cylinder, means disconnected from said tucking device for feeding the web between the tucking device and the folding-cylinder, and means for closing said grippers before detachment of the foremost sheet from the body of the web.

10. In a folding-machine, the combination of rotary cutters, a folding-cylinder whose periphery is exactly equal to a plurality of sheets detached by said cutters and whose periphery travels at the same surface speed as the web, a plurality of equidistant sets of grippers on said cylinder and which clasp the sheet upon the periphery of the cylinder, a plurality of folding-blades alternating with said sets of grippers, means for taking away the doubled or folded sheets from said cylinder when the folding-blades are operated, and a tucking device that pushes the leading end of the web positively into the space between the grippers and the periphery of the cylinder before the closure of said grippers and before the detachment of the foremost sheet from the body of the web.

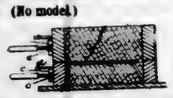
11. In a folding-machine, the combination of the rotary cutters, the folding-cylinder having a plurality of sets of vibratory grippers which clasp the sheet upon the periphery of the cylinder and a plurality of folding-blades, a pair of folding-rollers, and a series of rotatory disks registering with the gripper-fingers and provided each with means for directing the leading end of the web in between the open grippers and the periphery of the folding-cylinder before detachment of the foremost sheet from the body of the web.

12. In a folding-machine, the combination of a folding-cylinder having vibratory grippers which clasp the sheet upon the periphery of the cylinder, and a series of tucking-disks adapted to force the leading end of a sheet into the grasp of said grippers upon the periphery of the cylinder.

13. In a folding-machine, the combination of a folding-cylinder having grippers, and a series of tucking-disks each having a cut-away or space for the operation of said grippers and also a nose or projection to direct the leading end of a sheet into the grasp of said grippers.

14. In a folding-machine, the combination of a folding-cylinder having grippers adapted to receive the leading end of the web, and a tucking device adapted to act on the head of the web while the grippers are open and positively to break any fibrous or ligamental connection between the head of said web and the tail of the preceding sheet, in case said connection should exist, and to also positively force the leading end of the web into the space between said grippers and the periphery of the cylinder before the closure of said grippers.

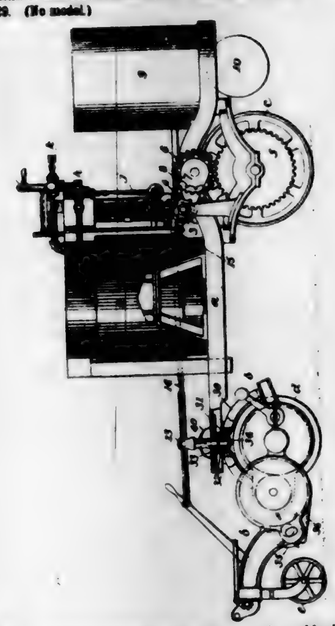
706,863. METHOD OF MANUFACTURING GLASS TOMBSTONES, &c. JOHN Q. SHAFFER, Pittsburg, Pa. Filed Sept. 16, 1901. Serial No. 75,584. (No model.)



Claim.—1. The method of manufacturing a block of glass, having an inclosed imprint or design, consisting in casting a mass of glass upon the face of a plate of glass, bearing the design or imprint, then casting a second mass of glass upon the back of the same.

2. The method of manufacturing solid sections of glass with an inclosed inscription or the like consisting in placing a plate of glass imprinted with the desired matter within and at the bottom of the mold, casting glass within the mold upon top of the plate, then reversing the position of the mass so cast, and then casting a second mass within another mold and upon the other side of the plate.

706,864. MOTOR-PROPELLED LAWN CUTTER AND ROLLER. WILLIAM P. SIMPSON, Overbrook, Pa. Filed Mar. 14, 1901. Serial No. 51,129. (No model.)



Claim.—1. The combination with a frame and combined traction and rolling rollers, of a second frame provided with supporting devices engaging the ground, and with cutting mechanism, said second frame pivoted to and supporting the forward end of the main frame, substantially as set forth.

2. The combination with a frame and combined traction and rolling rollers, of a second frame provided with supporting devices engaging the ground, and with cutting mechanism, said second frame pivoted by a universal joint to and supporting the forward end of the main frame, substantially as set forth.

3. The combination with a frame and combined traction and rolling rollers, of a second frame provided with supporting devices engaging the ground and with cutting mechanism, said second frame pivoted to and supporting the forward end of the main frame, and a motor operatively connected with said traction-rollers, substantially as set forth.

4. The combination with a frame and combined traction and rolling rollers, of a second frame provided with rollers supporting its entire weight and with cutting mechanism driven from said rollers, and with connections between the frames permitting them to rock longitudinally and transversely with respect to each other, substantially as set forth.

5. The combination with a frame and combined traction and rolling rollers, of a second frame provided with rollers supporting its entire weight and with cutting mechanism driven from said rollers, and with connections between the frames permitting them to rock longitudinally and transversely with respect to each other, and a motor operatively connected with said traction-rollers, substantially as set forth.

6. The combination in a lawn roller and mower, of a cutter-frame having supporting-wheels, a main frame supported partly by the cutter-frame and partly by rolling rollers, said frames connected to permit each to rock independently of the other, and a motor operatively connected to drive the apparatus, substantially as set forth.

7. The combination in a lawn roller and mower, of a cutter-frame having supporting-wheels connected to operate the cutter, a main frame supported partly by the cutter-frame and partly by rolling rollers, said frames connected to permit each to rock independently of the other, and a motor operatively connected to drive the apparatus, substantially as set forth.

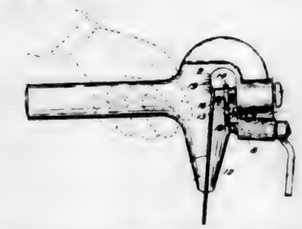
8. The combination in a lawn roller and mower, of a cutter-frame having supporting-wheels, a main frame supported partly by the cutter-frame and partly by rolling rollers, said frames connected to permit each to rock independently of the other, a motor operatively connected to drive the apparatus, and a hand device and connections whereby to turn the cutter-frame to guide the apparatus, substantially as set forth.

9. The combination with a frame, of a combined traction and lawn-rolling roller connected therewith, a second frame provided with supporting devices engaging the ground and supporting the entire weight of said frame, cutting mechanism carried by the second frame, means for operating said mechanism, connections between the frames permitting them to rock transversely in respect to each other, a motor carried by the main frame, a gear on the motor-shaft, a gear connected with the roller, and intermediate gear supported by the main frame, substantially as set forth.

10. The combination with a frame, combined traction and lawn-rolling rollers connected therewith, of a second frame, arranged in front of said traction and lawn-rolling rollers and provided with supporting devices engaging the ground and supporting the entire weight of the frame, cutting mechanism carried by said second frame, a motor operatively connected with said traction-rollers and connections between said frames permitting them to rock transversely with respect to each other to accommodate them to inequalities of the ground, substantially as described.

11. The combination with a frame and combined traction and lawn-rolling rollers connected therewith, of a second frame, arranged in front of said traction and lawn-rolling rollers and provided with rollers supporting the entire weight of the frame, cutting mechanism carried by said second frame, a motor operatively connected with said traction-rollers and connections between said frames permitting them to rock longitudinally and transversely with respect to each other, substantially as described.

706,865. SAW-SET. DAVID W. SOLOMON, Arlington, Wash., assignor of one-half to Nell Brown, Arlington, Wash. Filed Mar. 1, 1902. Serial No. 96,334. (No model.)



Claim.—1. A saw-set comprising a stock having an anvil, a jaw provided with a face inclined from the plane of the said anvil, and a supporting-bracket connected by a bend with the said anvil; a movable jaw having a flat end and a collar engaging with a setting-pin; supporting-springs connecting said movable jaw with the said bracket; means carried by the bracket for clamping said movable jaw; said setting-pin having a flat side and terminating in a shoulder extending through said bracket; a spring mounted on said setting-pin; and graduate-marks, substantially as described.

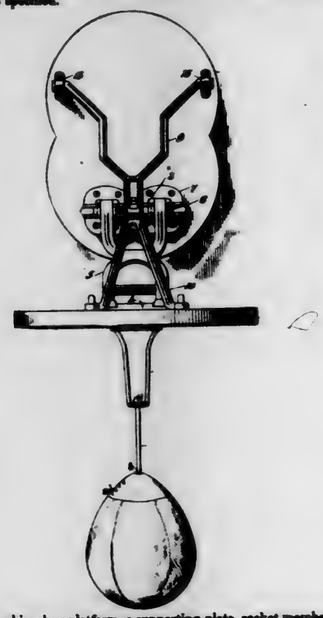
2. In a saw-set the combination with the stock having a jaw inclined from the anvil-face thereof and integrally connected to a supporting-bracket, a setting-pin and a clamp-screw carried by the said bracket; of a movable jaw supported adjacent to one end by springs from the said bracket and engaging with the said setting-pin to raise the same coincidently, substantially as described.

706,866. PUNCHING-BAG PLATFORM. SAMUEL TRESSIS, New York, N. Y. Filed Mar. 27, 1902. Serial No. 100,251. (No model.)

Claim.—1. A punching-bag platform, a bracket having removable connection therewith, a longitudinally-adjustable brace consisting of two sections having overlapped ends, the overlapping portions being corrugated on their engaging surfaces, and means for securing the sections as adjusted, substantially as specified.

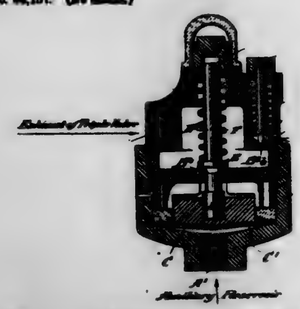
2. A punching-bag platform, a supporting-plate, a bracket-arm having removable connection with the platform and plate, a brace connection between the platform and plate, the said brace consisting of two sections mounted to slide one upon the other, one section being slotted, and a fastening-bolt extended from the other section through said slot, substantially as specified.

3. A punching-bag platform, a metal frame secured thereon and provided with sockets, a supporting-plate, a socketed member on said supporting-plate, a bracket-arm adapted to engage in said sockets of the plate and platform, and a brace consisting of two members, adjustable one upon the other, one member having pivotal connection with the platform and the other having pivotal connection with the supporting-plate, substantially as specified.



4. A punching-bag platform, a supporting-plate, socket members on the supporting-plate, socket members on the platform, a bracket-arm having its upper end adapted to engage in the socket members of the plate, lugs on said upper ends for engaging on the upper sides of the socket members, the lower end of said arm being adapted for removable engagement with the sockets on the platform, and an adjustable brace connection between the platform and supporting-plate, substantially as specified.

706,867. **RETAINING-VALVE.** WALTER V. TURNER and FRANKLIN C. FARNHAM, Raton, N. Mex., assignors to the Raton Air Brake Improvement Company, Raton, N. Mex. Filed June 26, 1901. Serial No. 66,157. (No model.)



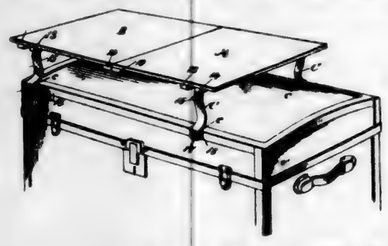
Claim.—1. A retaining-valve connected with the exhaust of the triple valve and the auxiliary reservoir, and comprising a diaphragm under pressure of the auxiliary reservoir, a release-valve controlled by the diaphragm, for releasing all the pressure from the brake-cylinder, and a graduated retainer-valve controlling some of the triple-valve exhaust-pressure to the atmosphere, as set forth.

2. A retaining-valve comprising a casing having a triple-valve exhaust-section and an auxiliary-reservoir section having a port to the atmosphere, a graduated release-valve controlling a seat between the said sections, a diaphragm in the auxiliary-reservoir section and under pressure of the auxiliary reservoir to control the said release-valve and a graduated retainer-valve in the said triple-valve exhaust-section for exhausting some of the triple-valve exhaust-pressure to the atmosphere, as set forth.

3. A retaining-valve connected with the exhaust of the triple valve and the auxiliary reservoir, and comprising a diaphragm under pressure of the auxiliary reservoir, a release-valve controlled by the diaphragm, for releasing all the pressure from the brake-cylinder, and a graduated retainer-valve controlling some of the triple-valve exhaust-pressure to the atmosphere, said retainer-valve being pressed by a graduated spring and controlling a discharge to the atmosphere, as set forth.

4. A retaining-valve connected with the exhaust of the triple valve and the auxiliary reservoir, comprising a graduated release-valve and a graduated retainer-valve, of which the graduated release-valve is controlled by auxiliary-reservoir pressure and the retainer-valve opens to the atmosphere under brake-cylinder pressure until the latter is reduced to the pressure to which the retainer-valve is set and the said graduated release-valve opens to completely exhaust the brake-cylinder pressure on recharging the auxiliary reservoir, as set forth.

706,868. **FOLDING TABLE.** EDWARD P. VAN ALSTYNE, Jr., Kinderhook, N. Y. Filed Mar. 4, 1902. Serial No. 96,587. (No model.)



Claim.—1. A table the top of which is constructed in hinged sections adapted to fold one upon the other, means for locking the sections in the same horizontal plane, legs for the sections, guideways on the sections in which the heads of the legs are adapted to slide and means substantially as described, for detachably and adjustably securing the said legs in said guideways, as set forth.

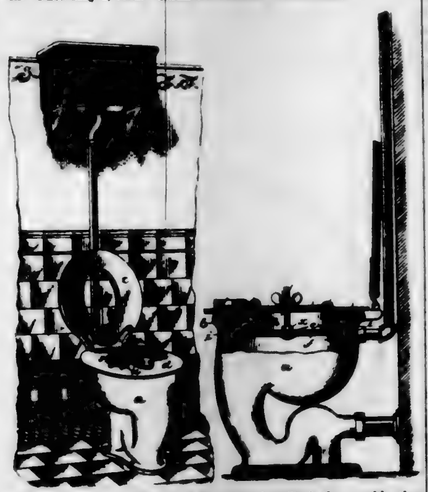
2. In tables, a top constructed in hinged sections adapted to fold one upon the other or outward so that their outer faces will be in the same horizontal plane, a locking device for holding the sections in their outer unfolded position, battens secured to the under faces of the said sections, provided with transverse apertures, the apertures in one batten corresponding in position to the position of those in the opposing batten, a space intervening between each pair of battens, and legs for the table provided with head-sections adapted to slide in the spaces between the battens, which head-sections have eyes adapted to be brought in alinement with opposing apertures in the battens, the lower ends of the legs terminating in vertical foot-sections, the foot-sections being at angles to the lower portion of the body-section of the legs, whereby inner lower shoulders are formed on the legs, and pins adapted to be passed through the apertures in the battens and through the eyes in the heads of the legs, for the purpose set forth.

3. In a table, the combination, with a top constructed in hinged connected sections, battens secured to the under faces of the sections at their hinged ends, a locking-pin adapted to be passed through said battens, and leg-supporting battens arranged in pairs upon the under faces of the sections near their outer ends, the battens of the said pairs having spaces intervening between them and being provided with transverse alining apertures, of legs comprising body-sections formed on the lines of a compound curve, head-sections at right angles to the body-section, the head-sections being provided with eyes and adapted to slide in the spaces between the end battens of the top sections, each leg being provided also with a perpendicular foot-section, and pins adapted to be passed through the apertures in the end battens and through the eyes at the head-sections of the legs, whereby the said legs are adjustably and removably attached to the top of the table, as described.

4. A table, comprising a top constructed in hinged sections adapted to fold one upon the other, legs for the sections terminating at their lower ends in vertical foot-sections, the foot-sections being at angles to the lower portion of the body-section of the legs, whereby inner lower shoulders are formed on the legs, guideways on the sections in which the heads of the legs are adjustable, and means for holding said legs in adjusted position, as set forth.

5. A table, comprising a top, legs each comprising a curved body-section, a head-section at right angles to the body-section and adjustable on the under face of the table-top, and a perpendicular foot-section forming a shoulder with the body-section and provided with a pad on its inner face, and means for holding the legs in the adjusted position as set forth.

706,869. **MECHANISM FOR TEMPORARILY LOCKING WATER-CLOSET BOWLS OR WASHBASINS.** EDWARD WOODRUFF, Chicago, Ill. Filed May 8, 1902. Serial No. 106,475. (No model.)



Claim.—1. In mechanism of the class described, the combination of a plate adapted to cover the opening in the receptacle to be closed, mechanism in a horizontal plane below said plate adjustable horizontally within said plane to fit inside of receptacles of different sizes and engage the under sides of the flanges of said receptacles, a bolt passing through said last-mentioned mechanism and said plate, mechanism for tightening said bolt, and mechanism for locking the tightening mechanism for the purposes set forth.

2. In mechanism of the class described, the combination of a plate adapted to cover the opening in the receptacle to be closed, a bolt through said plate, two arms crossing each other on the bottom of said bolt, adapted to be moved to and from each other, and also adapted to have their ends bear against the inside of the rim of the receptacle to be closed, adjustable means for securing said arms in different positions with reference to each other, mechanism for tightening said bolt, and mechanism for locking said bolt so that it cannot be loosened, for the purposes set forth.

3. In mechanism of the class described, the combination of a plate adapted to cover the opening in the receptacle to be closed, a bolt through said plate, two arms crossing each other on the bottom of said bolt adapted to be moved to and from each other, and also adapted to have their ends bear against the inside of the rim of the receptacle to be closed, means for varying the lengths of said arms, adjustable means for securing said arms in different positions with reference to each other, mechanism for tightening said bolt, and mechanism for locking said bolt so that it cannot be loosened, for the purposes set forth.

4. In mechanism of the class described, the combination of a plate adapted to cover the opening in the receptacle to be closed, a bolt through said plate, two arms crossing each other mounted on the bottom of said bolt adapted to be moved to and from each other and also adapted to have their ends bear against the under side of the rim of the receptacle to be closed, a hook loosely secured to one arm having its end bent so as to engage holes along one end of the other arm whereby said arms may be secured in different positions with reference to each other, mechanism for tightening said bolt, and mechanism for locking said bolt so that it cannot be loosened, for the purposes set forth.

5. In mechanism of the class described, the combination of a plate adapted to cover the opening in the receptacle to be closed, a bolt through said plate, two arms crossing each other mounted on the bottom of said bolt adapted to be moved to and from each other and also adapted to have their ends bear against the under side of the rim of the receptacle to be closed, a hook loosely secured to one arm having its end bent so as to engage holes along one end of the other arm whereby said arms may be secured in different positions with reference to each other, a thumb-nut on said bolt and a hasp secured to said plate adapted to fit over said thumb-nut and secure the same against rotation, and means for locking said hasp, for the purposes set forth.

6. In mechanism of the class described, the combination of a plate adapted to cover the opening in the receptacle to be closed, a bolt through said plate, two arms crossing each other mounted on the bottom of said bolt adapted to be moved to and from each other and also adapted to have their ends bear against the under side of the rim of the receptacle to be closed, a hook loosely secured to one arm having its end bent so as to engage holes along one end of the other arm whereby said arms may be secured in different positions with reference to each other, a thumb-nut on said bolt and a hasp secured to said plate adapted to fit over said thumb-nut and secure the same against rotation, and means for locking said hasp, all of the parts being arranged and disposed substantially as shown and described, for the purposes set forth.

706,870. **HANGER FOR TRANSFORMERS OR THE LIKE.** JAMES J. WOOD, Fort Wayne, Ind. Filed Nov. 29, 1901. Serial No. 83,963. (No model.)

Claim.—1. A hook for the suspension of transformers or the like, adapted for attachment at its upper end to a cross-arm and carrying means for clamping it in engagement with a complementary engaging means on the casing of a transformer, said hook having an uninterrupted flat rear face.

2. A hook for the suspension of transformers or the like, adapted for attachment at its upper end to a cross-arm and carrying on its front face means for clamping it in engagement with a complementary engaging means on the casing of a transformer and having an uninterrupted flat rear face.

3. A hook for the suspension of transformers or the like, adapted for attachment at its upper end to a cross-arm and carrying means for clamping it in engagement with a complementary engaging means on the casing of a transformer, said means being permanently connected to said hook.

4. Means for attaching a supporting member for the suspension of transformers or the like to a casing for such transformers, comprising a lug on one of said parts and means for locking said lug in engagement with the other of said parts, said locking means being entirely on the adjacent face of the latter of said parts.

5. Means for attaching a supporting member for the suspension of transformers or the like to a casing for such transformers, comprising a lug on one of said parts and means for locking said lug in engagement with the other of said parts, said locking means being permanently connected to the latter of said parts.

6. Means for attaching a supporting member for the suspension of transformers or the like to a casing for such transformers, comprising a pair of complementary engaging members of said parts, and a wedge adapted to maintain said engaging members in engagement.

7. Means for attaching a supporting member for the suspension of transformers or the like to a casing for such transformers, comprising a recessed lug on one of said parts, a stud on the other of said parts adapted to be engaged in said lug, and a wedge adapted to maintain such engagement.

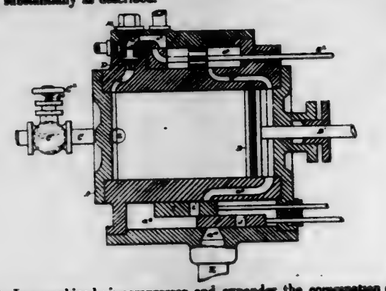
8. Means for attaching a supporting member for the suspension of transformers or the like to a casing for such transformers, comprising a recessed lug on one of said parts, a stud on the other of said parts adapted to be engaged in said lug, and a wedge carried at the end of a pivoted arm and adapted to maintain such engagement.

9. Means for attaching a supporting member for the suspension of transformers or the like to a casing for such transformers, comprising an undercut recessed lug on one of said parts, a stud on the other of said parts having a head adapted to engage in the recess of said lug, and a wedge adapted to hold said lug and bolt in engagement, said wedge having a rib M for holding said head against the outer wall of said recess.

10. A supporting member for the suspension of transformers or the like, comprising a hook having an uninterrupted flat rear face and carrying on its front face a stud permanently attached thereto.

706,871. **AIR-COMPRESSOR.** GEORGE H. ADAMS, Brooklyn, N. Y. Filed May 15, 1902. Serial No. 107,941. (No model.)

Claim.—1. In a combined air compressor and expander, the combination of a cylinder and piston for compressing air to a high tension, an outlet therefrom adapted for connection with a suitable cooling device, an inlet thereto adapted to receive the air upon its return from said cooling device, means whereby the compressed air may expand in the rear of the piston, and suitable means whereby the air first compressed may be led directly to the rear of the piston instead of first passing through a cooling device, substantially as described.



2. In a combined air compressor and expander, the concentsion of a cylinder and piston for compressing air to a high tension, an outlet therefrom adapted for connection with a suitable cooling device, an inlet thereto adapted to receive the air upon its return from said cooling device, means whereby the air may expand in the rear of the piston, means permitting the piston to partially recompress the air on its return stroke and suitable means whereby the air first compressed may be led directly to the rear of the piston instead of first passing through a cooling device, substantially as described.

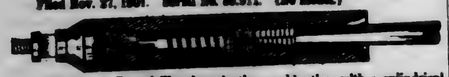
3. In a combined air compressor and expander, the combination of a cylinder and piston for compressing air to a high tension, a valve-controlled outlet from said cylinder adapted to communicate with the cylinder at the rear of the piston to permit the air to expand thereat, and valve mechanism adapted to be positively operated from a moving part to permit the expanded air to be recompressed on the return stroke of the piston but at a lower degree than that of its primary compression and allow its discharge from the cylinder while under such secondary compression for service expansively external to the cylinder.

4. In a combined air compressor and expander, the combination of a cylinder and piston, a passage for establishing communication between the front and rear ends of the cylinder by way of a chamber, a check-valve and a revolnble plug in said passage, the latter adapted to permit the compressed air to be directed to the aforesaid chamber or led away, suitable valves in said chamber controlling the inlet and outlet therefrom, and a valve-controlled passage from the cylinder at the rear side of the piston.

5. In a combined air compressor and expander, the combination of a cylinder and piston, a passage for establishing communication between the front and rear ends of the cylinder by way of a chamber, a check-valve in said passage, valve provision adapted to return the compressed air through the passage and chamber to the back end of the cylinder, a second chamber having a port communicating with the rear end of the cylinder and provided with an outlet-port; and valve mechanism in said second chamber controlling the outlet and adapted to be positively operated by a moving part to permit the expanded air to be recompressed on the return stroke of the piston but at a lower degree than that of its primary compression.

6. In apparatus for compressing air, the combination of a cylinder, a piston therein, a valved passage-way for externally conveying the compressed air directly from the front end of said cylinder, a second passage-way for establishing communication between the front and rear ends of said cylinder, a revolnble plug in said second passage-way provided with a suitable port whereby the compressed air may be returned to the rear of the piston to expand thereat, and valve mechanism adapted to be positively operated from a moving part to permit the expanded air to be recompressed on the return stroke of the piston but at a lower degree than that of its primary compression and allow its discharge from the cylinder while under such secondary compression.

706,872. DRILL-ROD GRAB. JAMES H. ADAMS, Fullerton, Cal. Filed Nov. 27, 1901. Serial No. 83,911. (No model.)

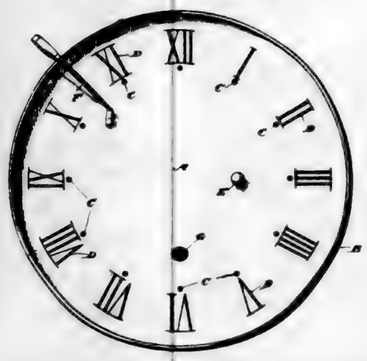


Claim.—1. In a drill-rod grab, the combination with a cylindrical casing, a cominbenber rigid jaw secured therein, a coinciding sliding jaw arranged adjacent said rigid jaw, and provided at its top with a collar, and a spring pressing against said collar for normally holding said sliding jaw against an upward movement.

2. In a drill-rod grab, the combination with a suitable casing, a rigid jaw retained therein, a coinciding sliding jaw arranged adjacent the rigid jaw and provided with a plurality of impinging teeth, the engaging surface of said sliding jaw being wedge-shaped, and means for normally holding said sliding jaw against an upward movement.

3. In a drill-rod grab, the combination with an outer casing, a rigid jaw secured therein and provided with a plurality of teeth, a coinciding sliding jaw arranged adjacent the rigid jaw and also provided with teeth, a collar on the upper end of said sliding jaw, a guide-pin projecting from said collar, and a spring surrounding said pin and adapted to bear against the collar to retain the sliding jaw normally against an upward movement.

706,873. GAME APPARATUS. JOHN S. AKERMAN, San Diego, Cal. Filed Dec. 11, 1900. Serial No. 39,511. (No model.)



Claim.—A game apparatus, comprising a board having a circular series of numbered starting-points arranged adjacent to its edge or periphery, and a hole or pocket located in the board at a distance from the center thereof adjacent to one of said starting-points.

706,874. MEANS FOR SETTING MOSAICS. FELIX ALGAN, New York, N. Y., assignor to American Encaustic Tiling Company, Limited, New York, N. Y., a Corporation of New York. Filed Apr. 5, 1902. Serial No. 101,472. (No model.)

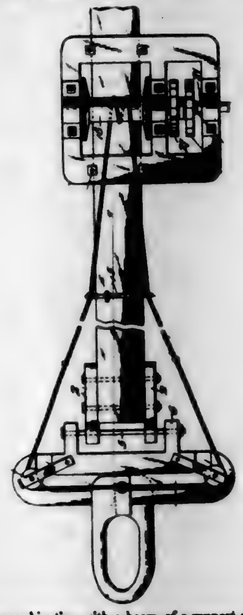
Brief.—A mosaic having an open-meshed fibrous woven backing, colored tile secured thereon by soluble cement, the color of tiles showing through backing, the pattern being placed face down in a bed of cement, the backing being saturated and stripped from the active face of the tiles.

Claim.—A mosaic pattern comprising an open-mesh absorbent backing made of fibrous woven material, and pieces of suitably-colored tile arranged in the desired order on the backing with open or unfilled spaces intervening the same, each piece of tile being firmly united to the backing by soluble cement; said backing material having its meshes so arranged as to make the color of the tiles plainly visible through the backing; the entire pattern adapted to be placed face downward in a bed of cementitious material and the backing being saturated with moisture and stripped from the active wearing-faces of the tiles.

706,875. ATTACHMENT FOR PLOWS OR THE LIKE. HERBERT H. ALLEN, Chicago, Ill. Filed Feb. 4, 1902. Serial No. 92,583. (No model.)

Claim.—1. The combination with a draft device, of a support attached to the front extremity thereof, a clevis laterally adjustable on the support, a windlass in rear of the latter, and a flexible connection between the windlass and the clevis, whereby said clevis may be shifted in opposite lateral directions.

2. The combination with a beam, of a support attached to the front extremity provided with upper and lower sheaves, a clevis shiftably engaging the said support, a windlass having means in connection therewith for locking it against movement when rotated in opposite directions, and a flexible connection between the windlass and the clevis and passing over the said sheaves.

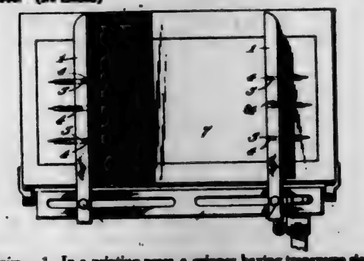


3. The combination with a beam, of a support adjustably and movably attached to the front extremity thereof, a clevis shiftably engaging the said support, a windlass rotatable in opposite directions and having means for locking it against movement, a lever for rotating the windlass by a step-by-step movement, and a flexible connection between the windlass and the clevis.

4. The combination with a beam, of a support attached to the front extremity thereof and having channels in the upper and lower sides thereof, a clevis having the rear extremities engaging the said channels, a windlass in rear of said support, and flexible means extending from the windlass to the clevis for shifting the clevis.

5. The combination with a beam, of a support movably attached to the front extremity thereof and having channels in the upper and lower sides and upper and lower sheaves adjacent to opposite terminals, a clevis having rear locked extremities shiftably engaging the said channels, a reversely-rotatable windlass having locking and operating means, and a flexible connection between the windlass and the clevis, said connection engaging the sheaves on the support.

706,876. GRIPPER FOR PLATEN PRINTING-PRESSES. ARTHUR L. ANDERSON, Grundy Center, Iowa. Filed Mar. 4, 1902. Serial No. 96,562. (No model.)



Claim.—1. In a printing-press, a gripper having transverse slots or notches in its edges adapted to receive the projecting portions of tympan gage-pins secured to the platen, substantially as and for the purpose set forth.

2. In a printing-press, a gripper having transverse slots or notches in its inner edge, said slots or notches being adapted to receive the projecting portions of tympan gage-pins secured to platen of the press.

3. In a printing-press, a gripper having transverse slots or notches in its edges, and transverse recesses or depressions in its under face, said recesses or depressions being adapted to receive the shank portion of tympan gage-pins secured to the platen of the press.

4. In a printing-press, a gripper having transverse recesses or depressions in its under face, adapted to fit over the ridge caused by the shank of a gage-pin in the tympan-sheet.

5. In a printing-press, a gripper having transverse recesses or depressions in its under face, said recesses or depressions extending across the width of the gripper, adapted to fit over the ridge caused by the shank of a gage-pin in the tympan-sheet.

6. In a printing-press, a gripper having transverse slots or notches in its edges, and transverse recesses or depressions in its under face, said recesses or depressions extending from the inner end of the slots to the opposite edge of the gripper, substantially as and for the purpose set forth.

7. In a printing-press, the combination with a platen, of a gripper having transverse slots or notches in its edges adapted to receive the projecting portion of tympan gage-pins secured to the platen, and means for securing the said gripper to the platen.

8. In a printing-press, a gripper having transverse slots or notches in its opposite edges alternately disposed.

9. In a printing-press, a gripper having transverse slots or notches in its opposite edges alternately disposed, and transverse recesses or depressions in its under face extending from the inner end of the slots to the opposite edge of the gripper.

10. In a printing-press, the combination with a platen, of a gripper having transverse slots or notches in its edges, transverse recesses or depressions in its under face extending from the inner end of the slots to the opposite edge thereof, and means for securing said gripper to the platen.

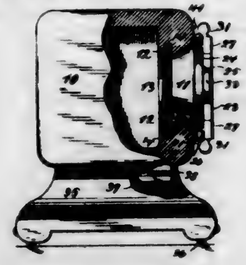
11. As an article of manufacture, a gripper having transverse slots or notches in its edges, and recesses or depressions in its under face, said recesses or depressions extending from the inner end of the slots to the opposite edge of the said gripper.

12. In a printing-press, a gripper having slots or notches in its edges, and recesses or depressions in its under face extending from the inner end of the slots to the opposite edge of the gripper, said recesses or depressions being of a greater width than the said slots in the edges of the gripper.

13. In a printing-press, the combination with the gripper-bar of the platen, of a gripper having transverse slots or notches in one of its edges, and means for securing the gripper to said platen, substantially as and for the purpose set forth.

14. A gripper for platen printing-presses, consisting of a bar having transverse slots on opposite edges extending across its width beyond the longitudinal center thereof.

706,877. SAFE. WILBER H. ARNOLD, Madisonville, Ohio. Filed Jan. 18, 1902. Serial No. 89,944. (No model.)



Claim.—1. A screw-door safe having its body cast in its entirety of non-workable metal, a circular opening in the front thereof adapted to receive the door of the safe, a ring 12 of workable metal lining part of the door-opening and having on the inside of its periphery the complementary female screw to receive the door and on the outside of its periphery integral parts projecting radially outwardly so as to extend into the metal which forms the safe-body, said ring being held in position by being placed accordingly during the act of casting the safe-body and whereby the outwardly-projecting parts mentioned become embedded into the molten metal of which the safe-body is formed in which position they also resist any strain in a peripheral direction which would tend to rotate ring 12 and due to the manipulation of the complementary male screw of the door when said screw is in engagement with the female screw on the inner side of ring 12.

2. A screw-door for a screw-door safe being cast of non-workable metal and provided on its inner side with a disk of workable metal, said disk formed with a screw-thread on its outer edge adapted to engage the

female thread within the door-opening of the safe-body and having integral projections on its outer side which reach into and are embedded within the non-workable metal of the safe-door and whereby said disk is connected to the inner side of this latter, said projecting parts being embodied into the metal of the safe-door while the same is cast.

3. A cast-metal safe having projecting from its under side strips 39 forming integral parts thereof, depressions 38 in the sides thereof, an independent base-frame fitted against the under side of the safe-body and connecting means passing through the upper part of this base-frame and engaging depressions 38.

706,878. **DOOR SIGNAL OR ALARM.** HENRY C. ATKINSON, Louisville, Ky. Filed May 10, 1902. Serial No. 106,764. (No model.)

Claim.—1. In a pneumatic signal, an air-compressing means; comprising a stationary end and a movable end, opposing it, a flexible air-tight connection joining the two ends, an air-operated sounder mounted on the movable end, and a means for imparting motion to said movable end, as set forth.

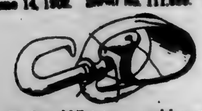
2. In a pneumatic signal, an air-compressing means; comprising a fixedly-held end, and a movable end opposing the fixedly-held end, a flexible air-tight body joining the two ends, the stationary end having a central aperture, a pull-rod reciprocable through said aperture and connected to the movable end, said movable end carrying a whistle or like wind-sounder, substantially as shown and for the purposes described.

3. The combination with a supporting-body, apertured for the pull-rod; of a pneumatically-operated signal means, comprising a plate having a central aperture and a packing-receiving socket surrounding said aperture, a disk opposing the said plate, a whistle or like sounding device mounted in the disk, a pull-rod slidable through the apertures in the supporting-body, and the plate having the packing, the inner end of said pull-rod being connected to and supporting the disk, and a flexible air-tight connection joining the aforesaid disk and the plate, substantially as shown and described.

4. The combination with the supporting-body, apertured for the passage of the pull-rod; of the plate 4, adapted to be rigidly secured to the inner side of the supporting-body, said plate having an inwardly-extending hub provided with a socket 4', the disk 7, the whistle 8 carried thereon, the air-tight flexible connection joining the plate and the disk, the pull-rod joined to the disk, and adapted to pass through the socketed hub of plate 4, and the aperture in the supporting-body, and the spring 13 having a flat bearing at one end and connected to the disk 7, and a metal sleeve at the other end to fit into the socket 4' of the plate 4, all being arranged substantially as shown and described.

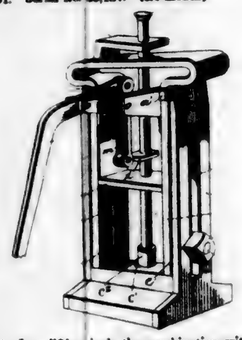
5. The hereinbefore-described improved pneumatic door-signal, comprising in combination; the plate 4, adapted to be fixedly secured to the back of the door or other support, said plate having a central aperture, a socket 4' on the rear side and a socket 4' on the front side, the latter being for holding an air-tight packing, said plate 4 having an annular projecting rim, the disk 7, a whistle carried on said disk, a flexible air-tight body connected to the disk periphery and the annular rim of plate 4, the spiral spring having its base or large portion secured to the inner side of the disk, a metal sleeve joined to its inner or apex end, said sleeve detachably fitting the socket 4', in plate 4, and the pull-rod connected to the disk 7, all being arranged substantially as shown and for the purposes described.

706,879. **WHIFFLETREE-CLIP.** WALTER B. AYER, Raccourci, La. Filed June 14, 1902. Serial No. 111,699. (No model.)



Claim.—A clip for whiffletrees comprising an elongated collar, having one flattened and broadened portion constructed to encircle approximately one-half the circumference, and provided at its other end with an internally-threaded boss, a fastening device consisting of a loop and a threaded shank fitted in said boss, and a swivel-block consisting of an arc-shaped metal plate constructed to fit against one edge of the whiffletree and provided with a step-bearing, the end of the shank being arranged to engage the step-bearing and when screwed up operating to force the swivel-block against the whiffletree and draw the flat and broadened portion of the collar against said whiffletree, the operative or inner face of the collar and swivel-block being smooth to permit the clip to be readily adjusted longitudinally on the whiffletree, substantially as described.

706,880. **LIFTING-JACK.** JOSEPH C. BARLEY, York, Pa. Filed Nov. 21, 1901. Serial No. 83,127. (No model.)



Claim.—1. In a lifting-jack, the combination with a main frame, a lifting-rod and mechanism for lifting the same step by step, an auxiliary frame carrying said rod and raising mechanism, said frame having depending leg members adjustably connected to the main frame, substantially as described.

2. In a lifting-jack, and in combination, a main frame including a base and vertical side standards, a lifting-rod and mechanism for raising the same, and an auxiliary frame carrying said rod and raising mechanism, said auxiliary frame having depending leg members adjustably connected to and guided by said side standards, substantially as described.

3. In a lifting-jack, and in combination, a main frame including a base and slotted side standards, a lifting-rod, and mechanism for raising the same step by step, an auxiliary frame carrying said rod and raising mechanism, said frame having leg members corresponding to and bearing against said standards, guides at the upper ends of the standards for the legs, threaded studs extending from the lower ends of the legs through the slots in said standards, and binding-nuts threaded on said studs, substantially as described.

4. In a lifting-jack, and in combination, a main frame including a base and slotted side standards, a lifting-rod, and mechanism for raising the same step by step, an auxiliary frame carrying said rod and raising mechanism, said frame having leg members corresponding to and bearing against the standards, threaded studs extending from the lower ends of the legs through the slots in said standards, and binding-nuts threaded on said studs, the opposing faces of the legs and standards being serrated to interlock with each other, substantially as described.

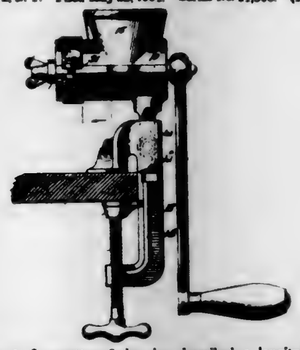
5. In a lifting jack, and in combination, a main frame including a base and vertical standards, a lifting-rod and mechanism for raising the same step by step, and an auxiliary carrying-frame including a top plate and integral depending legs adjustably connected and supported from said standards, a cross-plate extending between said legs, said plate and the top plate having alining openings to guide the lifting-rod, and overhanging portions on the top plate designed to find a bearing or rest upon the ends of the standards when the auxiliary frame is in its retracted position.

6. In a lifting-jack, and in combination, a main frame, an auxiliary frame including a top plate, and depending leg members adjustably secured to and supported from the main frame, a lifting-rod guided in the main frame, brackets secured to and extending laterally from the auxiliary frame, a lever pivoted between said brackets, a clutch-plate threaded on said rod, a link interposed between the end of said plate and the end of the lever, and a brace-plate extending between the legs of the adjustable frame, said plate providing a guide for the lifting-rod and a limiting-stop to arrest the downward movement of the clutch-plate and the movement of the lever operating the same, substantially as described.

7. In a lifting-jack, the combination with a vertically-movable lifting-rod, lifting mechanism including a lifting and a detent clutch, of a frame including a brace having a guiding-opening therein for the rod, and a yielding stop on said rod adapted to coact with said brace, substantially as described.

8. In a lifting-jack, the combination with a vertically-movable lifting-rod, lifting mechanism including a lifting and a detent clutch, of a frame including a brace having a guiding-opening therein for the rod, and a yielding stop on said rod adapted to coact with said brace, said stop comprising a pin secured in said rod and a sleeve of yielding material surrounding the rod and supported on said pin, substantially as described.

706,881. **VEGETABLE OR MEAT CUTTER.** FREDERICK BARR, New York, N. Y. Filed May 22, 1901. Serial No. 61,396. (No model.)



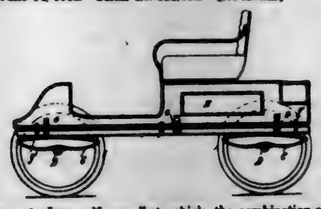
Claim.—1. In a cutter of the class described, a longitudinally-divided casing having the members thereof fitted snugly together, an annular series of external cam projections spaced on the outer surface of said casing members, and an axially-adjustable clamping-ring circumferentially embracing the members of the casing and provided with internal cam-surfaces coöperating with said cam projections and adapted to tightly force the casing members together, combined with a feed-screw and suitable cutters, as set forth.

2. In a cutter of the class described, a divided casing having the members thereof provided with an annular series of external cam projections spaced at intervals on the outer surface thereof, an external ring circumferentially embracing the members of the casing and having internal cam-surfaces coöperating with said cam projections, and a clamp carried by said ring and adapted to impinge said casing to hold the clamp against retrograde movement, combined with a feed-screw and suitable cutters, as set forth.

3. In a meat and vegetable cutter, a shell, a feed-screw mounted to revolve within said shell, a cutter constituting a continuation of the delivery end of the feed-screw, and an extension from the delivery end of the feed-screw, of a cutting-plate stationarily held in the said shell, the cutting-plate being provided with a series of large openings having cutting edges, a locking device for the outer cutter, carried by the extension of the feed-screw, and means whereby an auxiliary outer cutter may be located on said extension of the feed-screw in engagement with the cutter held in the shell, as and for the purpose set forth.

4. A cutter apparatus, comprising a divided shell provided with external clamping means and with an internal annular seat, a stationary cutter provided with arms forming openings and with cutting edges, said stationary cutter being received in said annular seat and clamped in position by the shell, a feed-screw having an extension which is partly plain and partly threaded, a revolvable cutter mounted fast on the feed-screw extension and disposed in coöperative relation to the stationary cutter, an auxiliary cutter, and means whereby the auxiliary cutter may be secured removably to the feed-screw extension.

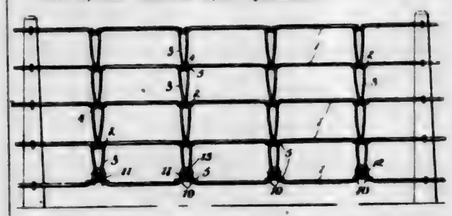
706,882. **AUTOMOBILE.** HARMON F. BATES, Lansing, Mich. Filed June 14, 1902. Serial No. 111,612. (No model.)



Claim.—1. In a self-propelled vehicle, the combination of the running-gear, driving mechanism secured upon said running-gear, and a body pivoted at one side at one side of said running-gear, substantially as and for the purpose described.

2. In a self-propelled vehicle, the combination of the running-gear, driving mechanism secured upon said running-gear, a body pivoted at one side at one side of said running-gear, and means for detachably securing the unpivoted edge of said body to said running-gear, substantially as and for the purpose described.

706,883. **WIRE FENCE.** CHARLES S. BURR, Racine, Wis. Filed Feb. 15, 1902. Serial No. 94,277. (No model.)



Claim.—1. A fence-stay consisting of a length of spring-wire having at one end portion an open coil whose axis is substantially transverse to the length of wire; the other end portion of the length being bent transversely to the main portion, and extending in a line substantially parallel with said axis.

2. A fence-stay consisting of a length of spring-wire having at one end portion an open coil inclosing a substantially elliptical bore, and whose axis is substantially transverse to the length of wire; the other end portion of the length being bent transversely to the main portion, and extending substantially parallel with said axis.

3. A fence-stay consisting of a length of spring-wire having at one end portion an open coil inclosing a substantially elliptical bore with the major axis transverse to the length of wire and whose axis is substantially transverse to the length of wire; the other end portion of the length being bent transversely to the main portion, and extending substantially parallel with said axis.

4. A line-wire fence, and a vertical series of stays extending from wire to wire, the stays being each formed of a length of spring-wire having a coil at one end and the other end portion bent laterally at an angle: the coil of one stay embracing a line-wire and the lateral portion of this stay being alongside of an adjacent line-wire; the adjoining stay having its coil embracing said latter line-wire and adjacent transverse portion of the stay, and thereby locking them together; and means locking the transverse end of the last-mentioned stay to the next line-wire.

5. A line-wire fence, and a vertical series of stays extending from wire to wire, each stay formed of a length of stiff spring-wire having a gripping-eye at one end with a side passage, whereby the loop can be slipped onto a line-wire and the stay swung down to rigidly grip the line-wire, the opposite end of the stay formed with a lateral end, the stay being bent under tension with its said lateral end beside another line-wire, another stay having its gripping-loop embracing said lateral end and line-wire and rigidly locking them together, and means locking the lateral end of the last stay to a line-wire, substantially as described.

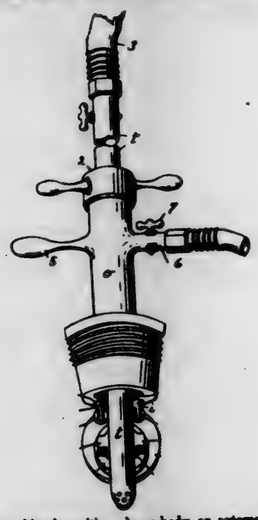
6. A fence having a series of line-wires, and a vertical series of stays, each stay extending from one line-wire to the next and looked thereto by gripping-loops, each stay having a gripping-loop at one end and being laterally bent at the opposite end, and a look to secure the lateral end of the last stay to a line-wire, said look comprising a stem at one end bent to form a locking-loop with a side passage, said loop locking the said lateral end and line-wire together, and the stem extending beside the stay, and means to lock the stem against releasing movement, substantially as described.

7. A fence comprising line-wires, and a vertical series of stays rigidly locking the line-wires together, the stays arranged in pairs between each pair of line-wires, the stays of each pair locking in opposite directions forming rights, and lefts, each stay bent to form a gripping-loop at one end and having its opposite end bent laterally and resting beside a line-wire and locked thereto by the loop of the next succeeding stay, substantially as described.

706,884. **VALVED BUNG AND CONNECTION FOR BEER-BARRELS.** DELLAS BEERS, Howard, N. J. Filed Jan. 17, 1902. Serial No. 90,146. (No model.)

Claim.—1. The combination with a bung having a valve and means for positively locking said valve against opening, of a key adapted to engage said locking means to unlock the same, and a slip-rod adapted to enter through the said key and open the valve.

2. The combination of a hollow bung-body, an automatically-closing valve at the inner end thereof, means at the inner side of said valve, for positively locking the valve in closed position, a rotary key adapted to operate said locking means and a reciprocating slip-rod adapted to push the valve open, said key and slip-rod being independently operable.



3. The combination with a bung-body, an automatic-closing valve thereon, and means for positively locking said valve when closed, of a tubular key adapted to unlock said valve, and a slip-rod adapted to be thrust through said key and bung-body to open the valve.

4. In a bung, a bung-body having at its inner end a swinging cap or valve-carrier, a valve and a locking device both arranged upon the side of said cap next the bung-body, said valve being adapted to make an imperious joint with the bung-body when the cap is closed and the locking device to project into said body, and means for operating said locking means from within the bung-body to lock the cap or carrier-plate to the bung-body.

5. A bung comprising a hollow body portion adapted to be permanently seated in a barrel and temporarily receive a flow device, a hinged cap or gate at the inner end of said body, a valve carried by said cap adapted to imperviously close the inner end of the bung, and locking means to engage the body carried on the inner face of said gate and adapted to be operated by the flow device.

6. The herein-described tubular key for operating a valved bung and entering into communication with the package, said key having hook from its end an exterior annular flange adapted to engage the top of the bung, and having in its end edge notches or recesses to serve as a wrench, and in its sides having slots or grooves extending from its end longitudinally toward the said flange and then turning and extending circumferentially and obliquely toward said flange.

7. The herein-described key for a valved bung having an interior locking-head with radial arms, said key comprising a tubular body portion adapted to enter the bung and having in its end edges notches or recesses adapted to receive the arms of the locking-head, an exterior shoulder on the key back from its said notched end, and the outer walls of the key having between said shoulder and notched end bayonet-joint slots or grooves therein whose inner end portions are circumferentially inclined.

8. A bung comprising a body portion having a passage therethrough and providing at inner end a valve-seat lying in from the end of the body, and opposite integral flanges projecting from the interior wall of said passage back of said valve-seat, a cap or valve-carrier adapted to automatically close against the inner end of the bung-body, a valve upon said cap or carrier to fit the valve-seat, and locking means carried by the cap or valve-carrier above said valve and adapted to engage the said flanges on the bung-body.

9. A bung comprising a body portion having a passage therethrough and providing at its inner end a valve-seat, a cap or valve-carrier adapted to automatically close against the inner end of the bung-body, a valve carried on said cap or carrier to fit the valve-seat on the body, and locking means carried by said cap or carrier above the valve and adapted to engage the bung-body.

10. A bung comprising a body portion having a passage therethrough providing at the inner end of the bung-body a valve-seat, flanges projecting from the interior walls of said passage in from said valve-seat and presenting at their inner sides opposite inclines, a cap or valve-carrier adapted to automatically close against the inner end of the bung-body, a valve on said carrier adapted to fit the said valve-seat in the bung-body, and a locking-head carried by the cap or valve-carrier above the said valve and having arms adapted to be brought by the closing of said cap into position to be turned into engagement with the said flanges on the bung-body.

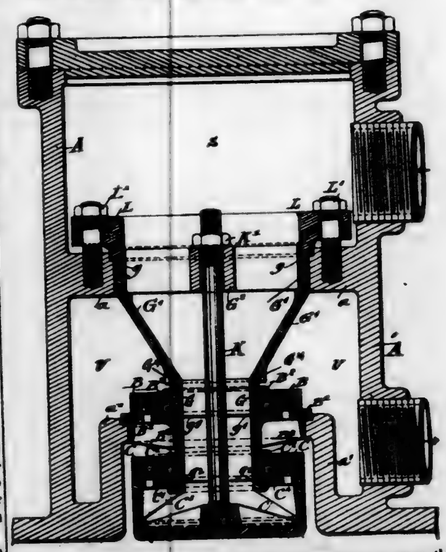
11. The combination with a bung-body having a longitudinal passage, of a cap adapted to automatically close against the inner end of said body, locking means carried by said cap, coöperating locking means within the bung-passage and adapted to be engaged by the locking means on the cap when said cap is closed, and a key for effecting such engagement.

12. A bung comprising a body portion having a longitudinal passage and a smaller chamber substantially parallel thereto and having a reduced opening at the inner end of the bung, a cap adapted to lie against the inner end of the bung-body and close the said flow-passage, a rod or plunger lying in the smaller chamber of the bung-body and having one end hinged to said cap and the other provided with a stop, and a spiral spring upon said rod or plunger between its stop and the reduced opening of the chamber at the inner end of the bung.

13. A bung comprising a body portion having a longitudinal passage and two smaller chambers adjacent thereto, a cap adapted to lie over the inner end of the bung-body and close the said passage, a rod or plunger in each of said chambers and pivotally hinged at one end to said cap, and a retracting-spring arranged on each rod within its chamber between a stop on the walls thereof at the inner end of the bung-body and a stop on the opposite end of the rod, whereby the cap is hinged to the bung-body at two points and held against edgewise twisting out of alinement therewith.

14. In a valved bung, the combination with a body having a longitudinal passage and adjacent recesses or chambers, of a cap adapted to lie against the inner end of the bung and close said passage, and hinge means pivoted to the inner face of said cap and adapted to lie in said recesses or chambers in the bung-body, whereby the said cap when closed covers not only the longitudinal passage but also the means of hinging itself to the bung-body.

706,885. VALVE MECHANISM. RUDOLF BERG, Pittsburg, Pa., assignor of one-half to Ferdinand Wenig, Pittsburg, Pa. Filed Aug. 17, 1901. Serial No. 72,343. (No model.)



Claim.—1. In a valve mechanism for compressors or pumps, the combination, with a valve-casing having an internal annular flange midway the ends thereof and an inwardly and upwardly extending seat at the lower end, of a suction-valve, a discharge-valve, valve-seats for said valves, a suction-tube, means for securing together the valve-seats and

suction-tube, and means for securing them between the internal flange and the upwardly-extending seat, substantially as set forth.

2. In a valve mechanism for compressors or pumps, the combination, with a valve-casing having an internal annular flange midway the ends thereof and an inwardly and upwardly extending seat at the lower end, of a suction-valve, a discharge-valve, annular valve-seats for said valves, a suction-tube arranged above said valve-seats, a bottom disk for the valve-seats and suction-tube, a hanger-bolt connecting them together, and means for securing them between the flange and the upwardly-extending seat, substantially as set forth.

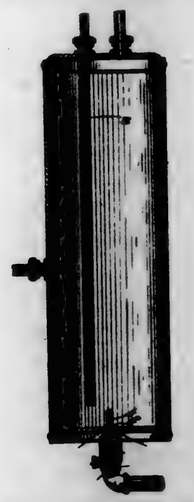
3. In a valve mechanism for compressors or pumps, the combination, with a valve-casing, of a suction-valve, a discharge-valve, seats for said valves, a suction-tube, a bottom disk for the valve-seats and suction-tube, a spider on the suction-tube, a hanger-bolt connecting the bottom disk with the spider, a seat in the lower part of said valve-casing for supporting the parts therein, an internal annular flange provided midway the ends of the valve-casing, and a ring bolted to said flange for securing the parts in the valve-casing, substantially as set forth.

4. In a valve mechanism, the combination, of a suction-tube, annular valve-seats arranged successively below said suction-tube and in line therewith, an annular discharge-valve provided at the lower end of the suction-tube and seated upon the upper one of said annular valve-seats, a suction-valve seated upon the lower annular valve-seat, a bottom disk, and a hanger-bolt for securing said suction-tube, valve-seats and bottom disk together, substantially as set forth.

5. In a valve mechanism, the combination, of a suction-tube having a reduced lower end, an annular upper valve-seat, an interior flange depending therefrom, an annular discharge-valve seated on said valve-seat and guided on the reduced lower end of said suction-tube, an annular lower valve-seat having an exterior flange depending therefrom, a suction-valve on the lower valve-seat, a bottom disk, and a hanger-bolt for securing the valve-seats, suction-tube and bottom disk together, substantially as set forth.

6. In a valve mechanism, the combination, with a valve-casing having an internal flange, of an annular suction-valve, an annular discharge-valve, valve-seats for the same, a suction-tube arranged in line with said valve-seats, said valve-seats and suction-tube being assembled and secured together, stud-bolts provided in said internal flange and a ring secured by said bolts for removably securing the assembled parts in position in the valve-casing, substantially as set forth.

706,886. DOMESTIC BOILER. JOSEPH A. BERNARD, Salem, Oreg. Filed May 2, 1901. Renewed June 26, 1902. Serial No. 113,316. (No model.)



Claim.—In a range or domestic boiler, the combination with the boiler having a supply-pipe arranged vertically therein, with a free and unobstructed lower end, and a screw-threaded central opening in the bottom of the boiler, of a sediment-chamber having at its side a projecting screw-threaded outlet connection, a screw-threaded projecting upper end, and a projection at its lower end having interiorly and exteriorly screw-threaded portions, a tube-pipe provided with exteriorly-screw-threaded lower portions connected to the interiorly-screw-threaded portion of the lower projection so that said tube will extend centrally and vertically through the sediment-casing and likewise through and above the upper screw-threaded projection, the said screw-threaded upper end of the upper projection adapted to be connected to the screw-threaded central opening in the bottom of the boiler with the free end of the tube extending above said bottom and at one side of the free end of the supply-pipe, a water-back pipe connected to the lower projecting screw-threaded opening, and means connected to the outlet-opening to relieve the sediment-casing and boiler of their contents, and a space surrounding the upper end of the tube for the passage of the sediments from the boiler into the sediment-casing, substantially as specified.

706,887. CLOTHES-DRAINER. HARRIET BLEECKER, Minneapolis, Minn. Filed Feb. 5, 1902. Serial No. 93,003. (No model.)

Claim.—1. A drainer having a flanged body which is perforated and channeled and provided with a solid flat portion at the rear, and a bracket or casting secured to said flat portion of the body and provided with a cross-bar and with pairs of legs, each pair of legs being joined by a web.

2. A drainer comprising a body and a bracket secured to the under side of the body, said bracket having a cross-bar and pairs of legs integral with the cross-bar, each pair of legs being united by an integral web and the two pairs of legs being disposed at different angles to the length of the cross-bar.

3. In a drainer, a bracket or casting comprising a cross-bar, pairs of legs at the ends of said cross-bars joined together by webs, and legs at the upper ends of the outer legs and disposed in the plane of said cross-bar, as and for the purposes described.

706,888. ELBOW AND PIPE. HERBERT K. BLYTH, Chicago, Ill., assignor of one-half to Robert L. Nelson, Chicago, Ill. Filed Nov. 6, 1901. Serial No. 81,302. (No model.)

Claim.—1. An elbow for pipes, consisting of intermediate sections of segmental form revolubly connected one to the other by means of interlying companion grooves and beads in the ends of the adjacent segments, a locking-section of cylindrical form revolubly attached by the same means to one of the segments and having its attached end lying in right-angle transverse relation to its longitudinal plane, in combination with a pipe united to the locking-section by suitable locking means, substantially as described.

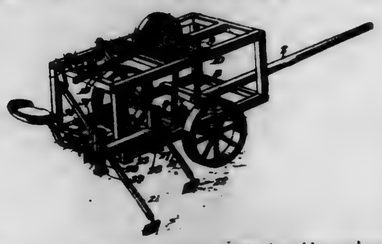
2. An elbow for pipes consisting of intermediate sections of segmental form revolubly connected one to the other, a locking-section of cylindrical form revolubly attached to one of the segments and having its attached end lying in right-angle transverse relation to its longitudinal plane, in combination with a pipe united to the locking-section by means of a bayonet catch-lock, substantially as described.

3. An elbow for sheet-metal seamed pipes, consisting of a series of intermediate sections of segmental form revolubly connected one to the other, an end locking-section of cylindrical form revolubly attached to one of the segments and having its attached end lying in right-angle transverse relation to its longitudinal plane, in combination with a pipe united to the locking-section by means of a bayonet catch-lock located transversely opposite to the seam of the pipe, substantially as described.

4. An elbow for sheet-metal seamed pipes, consisting of a series of intermediate sections of segmental form revolubly connected by means of interlying companion grooves and beads in the ends of the adjacent segments, an end locking-section cylindrical in form and revolubly attached by interlying companion grooves and beads to one of the segments and having its attached end lying in right-angle transverse relation to its

longitudinal plane, in combination with a pipe united to the locking-section by means of a bayonet catch-lock located opposite to the seam of a pipe, substantially as described.

706,889. COTTON-CHOPPER. JOHN T. BOYET, Lewisburg, Texas. Filed Oct. 18, 1901. Serial No. 79,179. (No model.)



Claim.—1. In a cotton-chopper, the combination with an axle and driving-wheels, of a frame mounted on said axle, a gear-wheel on the axle, a shaft located above the axle and having a gear-wheel fixed thereon, an operative device connecting the said gear-wheels, a friction-disk on the inner end of the second shaft, a crank-shaft loosely mounted in suitable bearings, the forward bearing being slidable, a friction-disk on the forward end of said crank-shaft, a series of choppers connected to said crank-shaft, adjustable holders for the choppers, means for adjusting the said holders, and means for shifting the crank-shaft to throw the disk thereof into and out of engagement with the disk on the shaft located above the axle.

2. In a cotton-chopper, the combination of a frame, an axle on which said frame is mounted, said axle having ground-wheels thereon, a longitudinally-disposed crank-shaft on the upper portion of the frame, actuating mechanism between the crank-shaft and axle, the said crank-shaft being adjustable to throw the same out of operative relation to said mechanism, chopping devices having bars connected to the crank-shaft and projected laterally from one side of the frame, holders with upper bifurcated heads in which the bars on the chopping devices are disposed, and means for vertically adjusting the holders to raise and lower the chopping devices.

3. In a cotton-chopper, the combination with an axle and driving-wheels, of a longitudinally-disposed shaft operated from the axle, mechanism intermediate of the axle and said longitudinally-disposed shaft, chopping devices having inner terminals connected to the shaft and projected laterally from one side of the machine, vertically-adjustable holders to engage said chopping devices, rods having their terminals secured to the holders, and fulcrums through which the said rods are transversely extended.

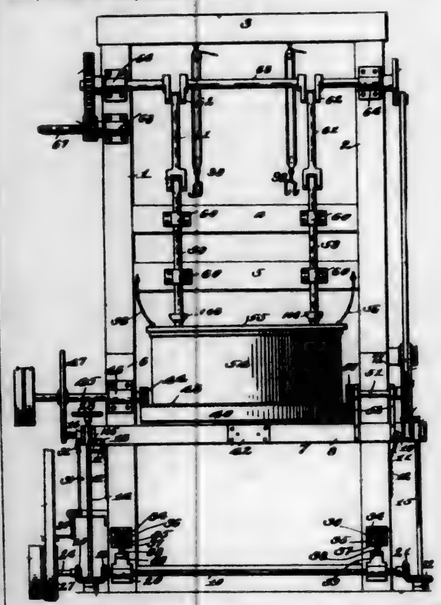
4. In a cotton-chopper, the combination with operating mechanism, of chopping devices having bars attached to a portion of said operating mechanism and projected laterally from one side of the machine, vertically-disposed holders having upper bifurcated heads in which the bars are disposed, and means for adjusting the said holders.

706,890. APPARATUS FOR MIXING AND KNEADING DOUGH. FREDERICK BRACKETT, Baltimore, Md. Filed Apr. 30, 1902. Serial No. 105,337. (No model.)

Claim.—1. In an apparatus for mixing and kneading dough, a vertically-adjustable pan-supporting frame, a rotary table carried thereby having a circular rack thereon, a kneading-pan on said table, kneading mechanism cooperating with said pan, a shaft mounted in bearings in said frame, a pinion on said shaft meshing with said rack, operating means for said kneading mechanism, and adjustable connections between said operating means and said shaft for intermittently rotating said table and the pan carried thereby.

2. In an apparatus for mixing and kneading dough, a vertically-adjustable pan-supporting frame, a rotary table carried thereby and having a circular rack thereon, a kneading-pan mounted on said table, reciprocating kneading mechanism operating in said pan, a pinion carried by said frame meshing with said rack, a rotary shaft having cranks thereon connected with said kneading mechanism for operating it, and adjustable connections between said shaft and said pinion for intermittently rotating the latter in any position of said frame.

3. In an apparatus for mixing and kneading dough, a vertically-adjustable pan-supporting frame, a rotary table carried thereby having a circular rack thereon, a kneading-pan mounted upon said table, reciprocating kneading mechanism operating in said pan, a pinion carried by said frame meshing with said rack, a ratchet-wheel connected with said pinion, a rotary shaft having cranks thereon connected with said kneading mechanism, a pitman eccentrically connected with said shaft and an adjustable engaging portion thereon cooperating with the teeth of said ratchet-wheel, as and for the purpose set forth.



4. In an apparatus for mixing and kneading dough, a rotary table having a circular rack thereon, a kneading-pan mounted on said table, reciprocating kneading mechanism operating in said pan, a pinion meshing with said rack, a ratchet-wheel connected with said pinion, a rotary shaft having cranks thereon connected with said kneading mechanism, a disk having a wrist-pin thereon secured to said shaft, a pitman pivoted to said wrist-pin, parallel arms secured to said pitman and embracing said ratchet-wheel, and an adjustable pin connecting said arms and adapted to engage the teeth of said ratchet-wheel, as and for the purpose set forth.

5. In an apparatus for mixing and kneading dough, a vertically-adjustable pan-supporting frame, a table mounted for rotation thereon, a kneading-pan carried by said table, vertically-reciprocating kneading mechanism operating in said pan, and means for intermittently rotating said table, the said means having an adjustable connection with said table whereby the same may operate to rotate said table in any position to which said table may be adjusted.

6. In an apparatus for mixing and kneading dough, a vertically-adjustable pan-supporting frame, a rotary table supported thereby having a circular rack thereon, a kneading-pan mounted upon said table, reciprocating kneading mechanism operating in said pan, a shaft mounted in bearings on said pan-supporting frame having a pinion thereon meshing with said rack and having a ratchet-wheel thereon, a crank-shaft operatively connected with said kneading mechanism, a pitman eccentrically connected with said crank-shaft, and an adjustable engaging portion carried by said pitman and cooperating with said ratchet-wheel, as and for the purpose set forth.

7. In an apparatus for mixing and kneading dough, a vertically-adjustable pan-supporting frame, a rotary table thereon provided with a circular rack, a kneading-pan mounted upon said table, a drive-shaft mounted in fixed bearings and having a pinion thereon meshing with said rack, when said frame is in its raised position, for imparting a continuous rotation to said table, an intermittently-rotatable shaft mounted in bearings on said pan-supporting frame having a pinion thereon meshing with said rack and having a ratchet-wheel thereon, reciprocating kneading mechanism operating within said pan, a crank-shaft operatively connected with said kneading mechanism, and an adjustable pin reciprocated by said crank-shaft and cooperating with said ratchet-wheel for imparting an intermittent movement thereto and to the parts connected therewith.

8. In an apparatus for mixing and kneading dough, the combination with two uprights of the main frame, having racks thereon, of a vertically-movable pan-supporting frame, means for raising and lowering said pan-supporting frame, and pivoted dogs carried thereby and cooperating with said racks for supporting said pan-supporting frame in adjusted position, the said dogs being normally held by gravity in operative relation to said racks.

9. In an apparatus for mixing and kneading dough, a vertically-movable pan-supporting frame and means for raising and lowering said frame, the said means consisting of vertically-disposed intergeared screw-shafts, internally-screw-threaded bearings in said frame through which said shafts pass, and means for rotating said shafts.

10. In an apparatus for mixing and kneading dough, a vertically-movable pan-supporting frame, means for raising and lowering said frame, and means for automatically arresting the upward movement of said frame when the same has reached a predetermined point.

11. In an apparatus for mixing and kneading dough, a vertically-movable pan-supporting frame, a rotary shaft having a fast pulley and a loose pulley thereon, operative connections between said shaft and said frame for raising and lowering the latter, a driving-belt, a belt-shifter therefor and connections between said belt-shifter and said frame for operating the former to shift said belt from the fast pulley to the loose pulley, when said frame reaches a predetermined point in its upward movement.

12. In an apparatus for mixing and kneading dough, a vertically-movable pan-supporting frame, a rotary shaft having a fast pulley and a loose pulley thereon, operative connections between said shaft and said frame for raising and lowering the latter, a driving-belt, a belt-shifter therefor, a bell-crank lever connected with said belt-shifter for operating it, and a rod connecting said bell-crank lever with said frame, whereby said belt will be shifted from said fast pulley to said loose pulley when said frame reaches a predetermined point in its upward movement.

13. In an apparatus for mixing and kneading dough, a vertically-movable pan-supporting frame, vertically-movable brackets, constituting buffers, within the path of downward movement of said frame, and springs for supporting said brackets.

14. In an apparatus for mixing and kneading dough, the combination with a kneading-pan, of a reciprocating kneading-frame comprising a plurality of arms set at an angle to each other and posties arranged in groups on one of said arms.

15. In an apparatus for mixing and kneading dough, a kneading-pan and a reciprocating kneading-frame comprising a plurality of arms set at right angles to each other, a group of posties secured to one of said arms, and deflecting-cutters carried by the other of said arms.

16. In an apparatus for mixing and kneading dough, a kneading-pan and a reciprocating kneading-frame operating within said pan, the same comprising a plurality of arms arranged at right angles to each other, each of said arms having notches or slots in its lower edge, a group of posties secured to one of said arms, and deflecting-cutters carried by the other of said arms.

17. In an apparatus for mixing and kneading dough, a reciprocating kneading-frame comprising an arm and kneading-posties arranged in groups on opposite sides of said arm, each of said posties having upwardly-inclined bottom walls.

18. In an apparatus for mixing and kneading dough, a reciprocating kneading-frame comprising an arm and kneading-posties arranged in groups on opposite sides of said arm, each of said posties having the sides thereof converging from its upper end downwardly.

19. In an apparatus for mixing and kneading dough, a reciprocating kneading-frame comprising an arm and kneading-posties arranged in groups on opposite sides of said arm, each of said posties having the front wall thereof converging toward the back from the upper end thereof downwardly.

20. In an apparatus for mixing and kneading dough, a group of separated kneading-posties connected to a common support, each having an upwardly-inclined bottom wall and sides which converge toward each other from the upper end downwardly.

21. In an apparatus for mixing and kneading dough, a kneading-postie having an upwardly-inclined bottom wall, side walls which converge from the upper end thereof downwardly and a front wall which converges toward the back from the upper end downwardly.

22. In an apparatus for mixing and kneading dough, a kneading-postie having an upwardly-inclined bottom, a curved or arched top, sides which converge from the upper end downwardly, and a front which converges toward the back from the upper end downwardly.

23. In an apparatus for mixing and kneading dough, a reciprocating kneading-frame comprising an arm and a group of kneading-posties arranged in pairs on opposite sides of said arm, the posties on each side of said arm being separated from each other by spaces which converge from the bottom upwardly.

24. In an apparatus for mixing and kneading dough, a group of kneading-posties having spaces between them which converge from the bottom upwardly and from the inner end outwardly.

25. In an apparatus for mixing and kneading dough, a group of kneading-posties having upwardly-inclined bottom walls and having spaces between them which converge from the lower end upwardly.

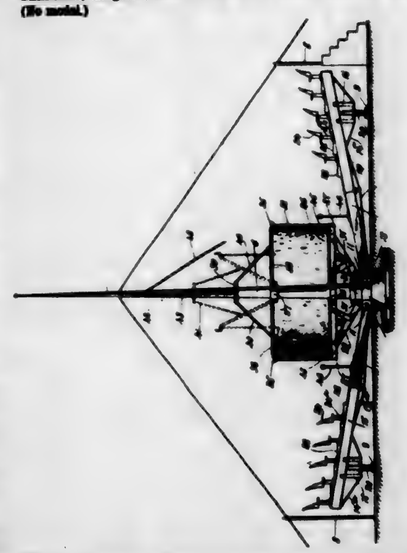
26. In an apparatus for mixing and kneading dough, a group of kneading-posties having upwardly-inclined bottom walls and having spaces between them which converge from the lower end upwardly and from the inner end outwardly.

27. In an apparatus for mixing and kneading dough, a reciprocating kneading-frame comprising an arm and posties secured to said arm on opposite sides thereof, the bottom walls of said posties being upwardly inclined from the points of connection with said arm, and the spaces between those posties which are arranged on the same side of said arm converging from their lower ends upwardly.

28. In an apparatus for mixing and kneading dough, a reciprocating kneading-frame comprising an arm, posties secured to said arm on opposite sides thereof, the bottom of each of said posties being upwardly inclined from its point of connection with said arm, and the spaces between the posties on the same side of said arm being tapering from their lower ends upwardly and from said arm outwardly.

29. In an apparatus for mixing and kneading dough, a reciprocating kneading-frame comprising an arm, posties arranged in pairs on opposite sides of said arm and screw-bolts for securing said posties to said arm, the said bolts extending through said arm and through openings in the posties on opposite sides thereof, nuts for locking said bolts to said arm located on opposite sides thereof and fitting within sockets in the inner faces of said posties, and nuts for securing said posties to said bolts, the latter nuts screwing upon the ends of said bolts and fitting within sockets in the outer surfaces of said posties.

706,891. PORTABLE REVOLVING THEATER. CHARLES F. BRANDALL, Kingman, Kans. Filed Jan. 7, 1902. Serial No. 88,764. (No model.)



Claim.—1. In a portable theater, a revolvable framework comprising outwardly and upwardly inclined members, each made up of the side and central bars united by cross-pieces, adjacent members of said framework having the side bars thereof separably fastened together, and each frame member equipped with a carrying-wheel which is disposed between and journaled in the cross-pieces thereof, and a stepped platform on the framework, combined with a central elevated stage below which are carried the inner ends of the central bars of said frame members, a central sleeve having said central bars of the frame members attached thereto, and means for rotating the framework and the platform.

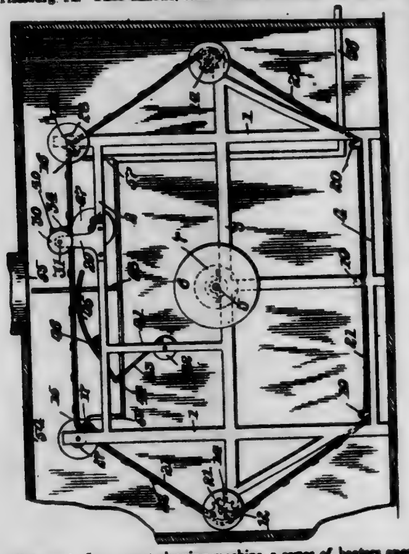
2. A portable theater, comprising a vertical mast or post, a revolvable auditorium formed by upwardly-inclined framework sections or members provided with carrying-wheels near their outer ends, a sleeve or collar loosely fitted on said mast and having attached thereto the inner ends of the converging frame members or sections, a stationary stage directly attached to said mast above said sleeve or collar, an annular curtain supported on said mast above the stage, and means for raising the curtain to expose the stage, or for lowering the curtain to inclose the stage.

3. A portable theater, comprising a mast, a revolvable auditorium having a collar loosely mounted on said mast which is adapted to serve as the axis of rotation of said auditorium, a stage supported directly by said mast in an elevated position above the lower part of the auditorium, an annular curtain adapted to inclose said stage, and curtain-operating mechanism supported on the mast and adapted to raise and lower said curtain with relation to the stage.

4. A portable theater, comprising a central mast, a stage supported in a stationary position thereon, a circular auditorium revolvable around the stage and disposed in concentric relation to the mast and the stage, an annular curtain arranged to inclose the stage, supporting-arms pivoted on the mast above the stage and connected to said curtain, an adjustable collar guided on the mast and linked to the curtain-arms, and means for raising and lowering said adjustable collar.

5. A portable theater, comprising a mast, an elevated circular stage supported in a stationary position on the mast, a circular auditorium having seats disposed in tiers and revolvable around said stage, a circular curtain operatively fitted to the mast and disposed to inclose the stage, and means for bodily raising or lowering said curtain with relation to the stage.

706,892. **CARPET-CLEANING MACHINE.** JAMES C. BRADY, Pittsburg, Pa. Filed Mar. 21, 1902. Serial No. 99,341. (No model.)



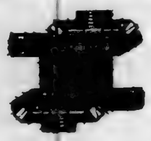
Claim.—1. In a carpet-cleaning machine, a series of beaters operating on the under side of the carpet, means for actuating said beaters, means for conveying the carpet continuously over said beaters, a brush operating on the upper side of the carpet, means for actuating said brush in a lateral direction, and means for continuously moving the carpet, substantially as described.

2. In a carpet-cleaning machine, the combination of a frame having a continuously-operated endless chain, with means for actuating said chain, means for securing the carpet to said endless chain, a series of beaters operating on the under side of the carpet, means for operating said beaters, a casing mounted on the frame, a laterally-movable brush operating in said casing, means for operating said brush across the upper face of the carpet, and a means connecting said last-named means to the means for operating the beaters whereby both may have a simultaneous movement, substantially as described.

3. In a carpet-cleaning machine, the combination with a frame, of a series of beaters pivoted at their ends to said frame, with means for operating said beaters on the under face of the carpet, a stationary casing supported by the frame, a block movable within said casing and carrying depending arms with a brush secured to the lower end of said arms and adapted to move in a lateral direction across the upper face of the carpet, and means for operating said block, substantially as described.

706,893. **SPINNING-HEAD.** FRANK A. BARBER, Forest Mills, Canada, assignor of one-half to James Wilson, Richmond, Province of Ontario, Canada. Filed Jan. 9, 1902. Serial No. 88,953. (No model.)

Claim.—1. An improved spinning-head comprising a tubular spindle through which the sliver is adapted to pass, drawing-rolls carried at its lower end, a sleeve carrying a pulley loosely mounted upon the lower end of the spindle above the rolls and supported by the spindle, connections for driving the rolls from the sleeve, and a bearing at the upper end of the spindle supporting the entire weight of the spindle, sleeve and rolls.



2. An improved spinning-head comprising a tubular spindle having at its lower end a footpiece, drawing-rolls carried by said footpiece, a sleeve loosely mounted on the spindle above the footpiece and supported thereby, a gear-wheel mounted on the sleeve and turning therewith, pinions carried by the drawing-rolls and intermeshing with said gear-wheel, and means for independently rotating the spindle and sleeve.

3. An improved spinning-head comprising a tubular spindle through which the sliver is adapted to pass and carrying at its lower end a branched footpiece, drawing-rolls mounted in the footpiece beneath the end of the spindle, a sleeve loosely mounted on the spindle and supported by the same, a gear-wheel carried by the sleeve, gear-pinions on the axes of the drawing-rolls intermeshing with said gear-wheel, and a thrust-bearing at the upper end of the spindle supporting the entire weight of the head and sleeve.

4. An improved spinning-head comprising a tubular spindle carrying a branched footpiece at the lower end thereof, drawing-rolls mounted beneath the lower end of the spindle between the two flanges of said footpiece, a sleeve loosely mounted on the spindle above the foot-piece and supported by the latter, a gear-wheel mounted on the sleeve and turning therewith, gear-pinions carried on the axes of the drawing-rolls and intermeshing with the said gear-wheel, a thrust-bearing at the upper end of the spindle carrying the entire weight of the rotating parts, and pulley-sheaves carried by the spindle and sleeve respectively and adapted to rotate them at differential velocities.

5. In a spinning-frame, a pair of journal-rails supporting a spinning-head, a tubular spindle forming the axis of said head mounted in bearings in said rails, a pulley-sheave mounted on the tubular spindle between the two journal-rails, a footpiece carried by the lower end of the spindle, drawing-rolls mounted in the footpiece beneath the end of the spindle, and means for rotating the drawing-rolls comprising a sleeve having connections therewith and loosely mounted on the spindle between the lower journal-rail and the footpiece and supported by the latter and carrying a pulley-sheave.

6. In a spinning-head, a branched footpiece, a pair of drawing-rolls carried in the flanges thereof, each of said rolls having a ball-bearing upon one side and a sliding-bearing on the other, and means for turning said rolls in unison.

7. In a spinning-head, a branched footpiece, a pair of drawing-rolls rotatably mounted in the flanges thereof, each of said rolls being adapted to have a slight oscillating motion about an axis in the plane of one bearing and an adjustable sliding step-bearing provided for the other end of the roll.

8. In a spinning-head, a branched footpiece, a pair of drawing-rolls journaled in the flanges thereof, each drawing-roll being extended outwardly through the side of one flange and having turning means upon its outer end, a sliding bearing provided for the other end of the roll comprising a coned step-piece for the roll and a transverse sliding member in which the coned step-piece is mounted.

9. In a spinning-head, a branched footpiece, drawing-rolls journaled in the flanges thereof, each flange being provided with a removable annular bearing-block for one end of one roll, and a sliding coned step-bearing for the opposite end of the other roll.

10. In a spinning-head, a branched footpiece, a pair of drawing-rolls journaled between the flanges thereof, a removable annular bearing-block provided with ball-bearings on its interior surface and a taper screw-thread on its exterior surface located in one side of each flange, and a sliding bearing located in the other side of each flange for the opposite ends of the drawing-rolls, said sliding bearing consisting of a bolt having a lateral transverse motion in an aperture in the flange, and a screw-threaded step-bearing adjustably fitted in said bolt.

11. In a spinning-head, a branched footpiece, a pair of drawing-rolls journaled between the flanges thereof, and a sliding step-bearing for one end of a roll located in each of said flanges, said bearings consisting of a bolt sliding in a transverse aperture in the flange, a step-bearing block having a screw-thread on its outer surface and adjustably screwed into a transverse aperture in said bolt, and a set-screw plug adjustably mounted in a longitudinal aperture in said bolt and abutting against said bearing-block.

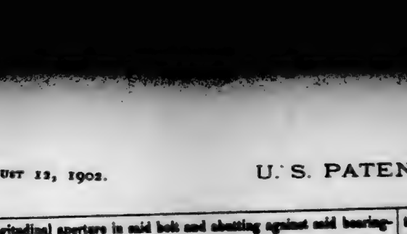
12. In a spinning-head, a branched footpiece, a pair of drawing-rolls journaled between the flanges thereof, and a sliding step-bearing for one end of a roll located in each of said flanges, said bearings consisting of a bolt sliding in a transverse aperture in the flange, a step-bearing block having a screw-thread on its outer surface and adjustably screwed into a transverse aperture in said bolt, a set-screw plug adjustably mounted in a horizontal aperture in said bolt and abutting against said bearing-block, a compression-spring bearing inwardly against said bolt, and a screw-plug closing the outer end of the aperture in the flange and forming an abutment for the opposite end of the spring.

13. In a rotating spinning-head, a branched footpiece, drawing-rolls journaled between the flanges thereof, each of said drawing-rolls having an axis extending through one flange and carrying a gear on the other side of the flange, a removable annular bearing-block carrying ball-bearings for said axle, and a sliding step-bearing for the opposite end of the roll comprising a cylindrical bolt sliding in a transverse aperture in the flange, a coned bearing-block adjustably mounted thereon, a set-plug adapted to hold said bearing-block from turning, and a spring pressing inwardly upon said bolt to press the two drawing-rolls toward each other.

14. An improved spinning-head comprising a tubular spindle and rotating means therefor, a branched footpiece carried by the lower end of the spindle, drawing-rolls mounted in and beneath the end of the tubular spindle, a sleeve loosely mounted on the tubular spindle and supported by a bearing on the footpiece and carrying a gear-wheel, gear-pinions on the outer ends of the rolls intermeshing with said wheel, a ball-bearing in each flange for the wheel end of a roll permitting of a slight lateral motion, and an adjustable sliding bearing for the other end of the roll carried by the opposite flange.

15. An improved spinning-head comprising a tubular spindle and rotating means therefor, a branched footpiece carried by the lower end of the spindle, drawing-rolls mounted in and beneath the end of the tubular spindle, a sleeve loosely mounted on the tubular spindle and supported by a bearing on the footpiece and carrying a gear-wheel, gear-pinions on the outer ends of the rolls intermeshing with said wheel, a ball-bearing in each flange for the wheel end of a roll permitting of a slight lateral motion, and a sliding bearing for the other end of the roll comprising a bolt sliding in a transverse aperture in the opposite flange, an adjustable step-bearing block mounted in said bolt, a set-plug for the bearing-block, a spring pressing inwardly against said bolt, and a screw-plug closing said aperture and forming an abutment for the other end of the spring.

706,894. **SHEET-METAL PULLEY.** CHARLES A. BRIDLEY, Philadelphia, Pa., assignor to the American Pulley Company, a Corporation of Pennsylvania. Filed Mar. 22, 1902. Serial No. 99,394. (No model.)



Claim.—1. A sheet-metal pulley composed of two sheet-metal halves secured together by their webs and each consisting of a circular band-rim, a circular hub-rim, a web connecting them of single thickness adjacent to the band-rim and double thickness adjacent to the hub-rim, there being an annular space between the rims, in combination with two substantially semicircular hub-blocks fitted to the interior of the hub-rims for connecting it with a shaft.

2. A sheet-metal pulley composed of two sheet-metal halves secured together by their webs and each consisting of a circular band-rim, a circular hub-rim, a web connecting them, there being an annular space between the rims, in combination with two substantially semicircular hub-blocks fitted to the interior of the hub-rims by projecting lugs or bosses extending into perforated or recessed portions of the hub-rims whereby they are held together against independent movement, said blocks being adapted for connecting it with a shaft.

3. A sheet-metal pulley composed of two sheet-metal halves secured together by their webs and each consisting of a circular band-rim, a circular hub-rim, a web connecting them, there being an annular space between the rims, in combination with two substantially semicircular hub-blocks fitted to the interior of the hub-rims by projecting lugs or bosses extending into perforated or recessed portions of the hub-rims whereby they are held together against independent movement said blocks being adapted for connecting the pulley with a shaft, and clamping-screws extending through the hub-blocks and projecting outwardly beyond the hub-rims.

4. In a sheet-metal pulley, the combination of the circular outer or band-rim sections A A having the radial flanges H directed inward almost to the hub and riveted together close to the rim, and the circular hub-rims C C having the circular radial flanges B fitting upon the outside of the flanges H and riveted upon them close to the hub to constitute a strong web.

5. In a sheet-metal pulley, the combination of the circular outer or band-rim sections A A having the radial flanges H directed inward almost to the hub and riveted together close to the rim, the circular hub-rims C C having the circular radial flanges B fitting upon the outside of the flanges H and riveted upon them adjacent to the hub to constitute a strong web, and internal hub-blocks E E fitted to the interior of the hub-rims and held therein against rotation.

6. In a sheet-metal pulley, the combination of the outer or band-rim sections A A having the radial flanges H riveted together, the hub-rims C C having the radial flanges B and apertures D fitting upon the outside of the flanges H and riveted upon them to constitute a strong web and internal hub-blocks E E fitted to the interior of the hub-rims and held therein against rotation by lugs or bosses F extending outwardly through the apertures.

7. In a sheet-metal pulley, the combination of the outer or band-rim sections A A having the radial flanges H riveted together, the hub-rims C C having apertures D and the radial flanges B fitting upon the outside of the flanges H and riveted upon them to constitute a strong web, internal hub-blocks E E fitted to the interior of the hub-rims and held therein against rotation by lugs or bosses F extending outwardly through the apertures, and clamping-screws K extending through the lugs or bosses.

8. A pulley provided with a radial web having two hub-rims formed each with one or more portions opening from their interior surfaces, in combination with hub-blocks fitting into said hub-rims each less than semi-cylinder and having projecting portions or bosses to fit into the inverse portions of the rims, whereby said blocks may be inserted in position and held against rotation independent of the pulley.

9. A pulley having a tubular hub of fixed shape, in combination with two substantially semicylindrical removable hub-blocks to receive the shaft and fit upon the internal surface of the pulley-hub and having their outer surfaces at one or more places formed with projections, and received upon or in corresponding inverse portions of the tubular hub.

10. A pulley having a tubular hub of fixed shape, in combination with two substantially semicylindrical removable hub-blocks to receive the shaft and fit upon the internal surface of the pulley-hub and having their outer surfaces at one or more places formed with projections, and received upon or in corresponding inverse portions of the tubular hub, and clamping-screws extending through the hub and carried by the hub-blocks.

706,895. **MACHINE FOR MAKING SUCKERS OR DRINKING-TUBES.** LOUIS H. BRITTON and HENRY W. MORROW, Lisbon, Ohio, assignors to Union Manufacturing Company, Lisbon, Ohio, a Corporation of Ohio. Filed Feb. 26, 1902. Serial No. 96,272. (No model.)

Claim.—1. In a machine of the class specified, a heating-box, an open coil inclosed by said heating-box, means for forming a paper-tube stream, said open coil being arranged to receive said stream from the forming means, and a coating-box containing an open coil, the latter being arranged to receive the stream from the heating-box, and means for feeding the stream.

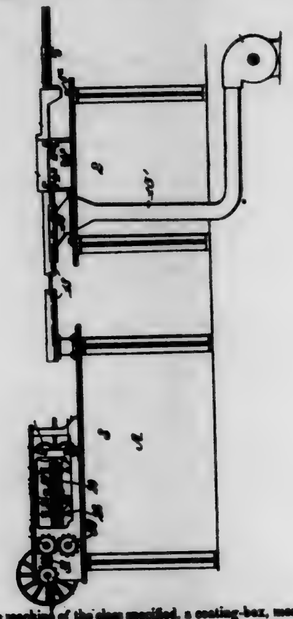
2. In a machine of the class specified a heating-box, an open coil inclosed by the heating-box, means for forming a paper-tube stream, and said open coil being arranged to receive the paper-tube stream from the forming means, a coating-box, an open coil arranged in said coating-box and adapted to receive said stream, means for advancing the paper-tube stream, and means for applying a blast of air to the latter when it emerges from the coating-box.

3. In a machine of the class specified, a coating-box, means for forming a paper-tube stream, said stream being arranged for passage through said box, and an open coil in said coating-box through which said stream is arranged to pass.

4. In a machine of the class specified, a coating-box, means for forming a paper-tube stream, said stream being arranged for passage through said box, an open coil in said coating-box through which said stream is arranged to pass, and means for removing an excess of coating from the stream as it emerges from said box.

5. In a machine of the class specified, a coating-box, means for forming a paper-tube stream, said stream being arranged for passage through said box, an open coil in said coating-box through which said stream is

arranged to pass, and means for applying heat to the stream before it enters the coating-box.



6. In a machine of the class specified, a coating-box, means for forming a paper-tube stream, said stream being arranged for passage through said box, an open coil in said coating-box through which said stream is arranged to pass, means for applying heat to the stream before it enters said coating-box and means for directing a blast of air to the stream after it leaves said coating-box.

7. In a machine of the class specified, means for forming a tubular stream, a coating-box arranged to receive the tubular stream, a tube through which the stream is adapted to pass after it leaves the coating-box, means for feeding the stream, and means for delivering a blast of air through said tube.

8. In a machine of the class specified, a heating-box, an open coil inclosed by said heating-box, means for forming a paper-tube stream, said open coil being arranged to receive said stream from the forming means, a coating-box containing an open coil, the latter being arranged to receive the stream from the heating-box, a pair of belts grooved to receive said stream and means for operating said belts.

9. In a machine of the class specified, a heating-box, an open coil inclosed in said heating-box, means for forming a paper-tube stream, said open coil being arranged to receive said stream from the forming means, a coating-box containing an open coil, the latter being arranged to receive the stream from the heating-box, a pair of belts grooved to receive said stream and adjustable plates carrying antifriction-rolls against which the working portions of the belts are arranged.

10. In a machine of the class specified, a heating-box, an open coil inclosed by said heating-box, means for forming a paper-tube stream, said open coil being arranged to receive said stream from the forming means, a coating-box containing an open coil, the latter being arranged to receive the stream from the heating-box, means for feeding the stream and means for severing the stream into desired lengths after it leaves the feeding means.

11. In a machine of the class specified, a heating-box, an open coil inclosed by said heating-box, means for forming a paper-tube stream, said open coil being arranged to receive said stream from the forming means, a coating-box containing an open coil, the latter being arranged to receive the stream from the heating-box, a pair of belts grooved to receive said stream, means for holding the working portions of the belts in contact with said stream, a roll to support the stream after it leaves the belts and a knife arranged to cut said stream while on said roll, the knife being arranged to come in contact with the roll.

12. In a machine of the class specified, a heating-box, an open coil inclosed by said heating-box and a forming device tapering from one end toward the other, the broader end being of segmental form, the curvature being gradually increased toward the smaller end and the edges of said forming device being overlapped and spaced apart at the small end, said coil being adapted to receive the tubular stream from said forming device, a coating-box containing an open coil, the latter being arranged to receive the stream from the heating-box, and means for feeding the stream.

13. In a machine of the class specified, a coating-box, a forming device adapted to form a tubular stream and the latter being adapted for passage through said coating-box, and an open-work tubular member in said coating-box through which said stream is arranged to pass, the internal diameter of said tubular member being substantially the same as that of the leaving end of the forming device.

14. In a machine of the class specified, a heating-box, means for forming a stream and the heating-box being adapted to receive the stream after it is formed, a coating-box adapted to receive the stream from the heating-box, means for guiding the stream through said heating and coating boxes, a tube adapted to receive the stream from the coating-box and having an opening for the admission of a blast of air, means for feeding the stream, and means for delivering a blast of air into said tube.

15. In a machine of the class specified, a heating-box having an open coil, means for forming a tubular stream and said open coil being adapted to receive the tubular stream, a coating-box having an open coil adapted to receive the stream after it leaves the heating-box, an elongated tube through which the stream is adapted to pass after it leaves the coating-box and having an opening for the admission of a blast of air, means for removing the excess of coating from the stream when discharged from the coating-box means for feeding the stream, and means for delivering a blast of air into said tube.

16. In a machine of the class specified, a heating-box, an open coil inclosed by said heating-box, and a forming device for forming a tubular stream and said coil being arranged to receive said tubular stream from the forming device, and the internal diameter of said coil being substantially the same as that of the leaving end of said forming device.

17. In a machine of the class described, a heating-box, an open coil inclosed by said heating-box, a forming device for forming a tubular stream and said coil being arranged to receive said tubular stream from the forming-means device, and the internal diameter of said coil being substantially the same as that of the leaving end of said forming device for applying a coating to the stream, and means for feeding the stream and cutting it into desired lengths.

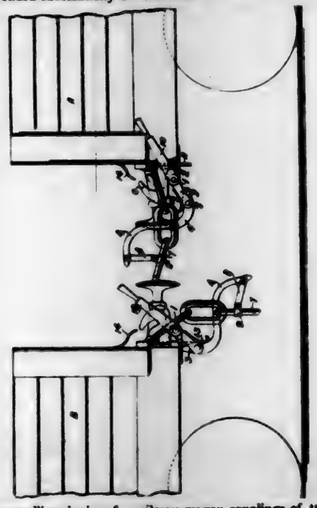
18. In a machine of the class specified, a heating-box and a forming device for forming a tubular stream, said stream being adapted to enter the heating-box after it leaves the forming device, and an open-work tubular member in said heating-box through which the stream is adapted to pass, and the internal diameter of said open-work tubular member being substantially the same as that of the leaving end of said forming device.

19. In a machine of the class specified, a forming device adapted to form a tubular stream, heating and coating boxes through which said stream is adapted to successively pass, and open-work tubular members in said boxes adapted to receive said stream, and the internal diameters of said open-work tubular members being substantially the same as that of the leaving end of said forming device.

706,896. CONTROLLING DEVICE FOR COUPLINGS OF RAILWAY-WAGONS. ALBERT BROOKES, Bentleigh, England, assignor of one-half to Dominic Fagioli and William Bailey, Bentleigh, England. Filed Oct. 2, 1901. Serial No. 77,261. (No model.)

Claim.—1. In controlling devices for railway-wagon couplings of that type wherein each wagon has a centrally-located draw-bar hook the stem of which carries a chain, the free end of which chain is to be passed on or off a like hook on the opposite wagon; the combination with the said chain, a horizontal operating-shaft extending transversely of the wagon from side to side thereof beneath the draw-bar hook, bearings on the end of the wagon to carry the shaft, operating-levers on each end of the shaft at the sides of the wagon, a single crank fixed on the shaft near the center of its length; of a carrying-arm 4, consisting of a single member, a knuckle-joint connecting one end of the carrying-arm 4 to the crank permitting the arm to only have an upward motion relatively to the said crank, a bend in the arm 4 to bring its upper end in the central vertical plane of the coupling, the said upper end of the arm 4 extending above the said coupling-links, a pendent forked yoke pivoted to the upper end of the arm 4, and pivot-pins connecting the side members of the end coupling-link with the pendent ends of the forked yoke whereby the end link is pivotally suspended, substantially as set forth.

2. In controlling devices for railway-wagon couplings of that type wherein each wagon has a centrally-located draw-bar hook the stem of which carries a chain, the free end of which chain is to be passed on or off a like hook on the opposite wagon; the combination with the said chain, a horizontal operating-shaft extending transversely of the wagon from side to side thereof beneath the draw-bar hook, bearings on the end of the wagon to carry the shaft and in which the shaft is capable of both rocking and endwise motions, a helical spring on the shaft to maintain the same in its normal lengthwise position, operating-levers on each side of the shaft at the side of the wagon, a notched plate on the wagon with which one of the operating-levers is normally brought into engagement by the spring to maintain the shaft in the angular position into which it has been placed, and a single crank fixed on the shaft near the center of its length; of a carrying-arm 4, consisting of a single member, a knuckle-joint connecting one end of the carrying-arm 4 to the crank permitting the arm to only have an upward motion relatively to the said crank, a bend in the arm 4 to bring its upper end in the central vertical plane of the coupling, the said upper end of the arm 4 extending above the said coupling-links, a pendent forked yoke pivoted to the upper end of the arm 4, and pivot-pins connecting the side members of the end coupling-link with the pendent ends of the forked yoke whereby the end link is pivotally suspended substantially as set forth.



3. In controlling devices for railway-wagon couplings of that type wherein each wagon has a centrally-located draw-bar hook the stem of which carries a chain, the free end of which chain is to be passed on or off a like hook on the opposite wagon; the combination with the said chain, a horizontal operating-shaft extending transversely of the wagon from side to side thereof beneath the draw-bar hook, bearings on the end of the wagon to carry the shaft, operating-levers on each end of the shaft at the sides of the wagon, a single crank fixed on the shaft near the center of its length, a carrying-arm 4, consisting of a single member, a knuckle-joint connecting one end of the carrying-arm 4 to the crank, permitting the arm 4 to move upwardly relatively to the crank, and a bend in the arm 4 to bring its upper end above and in the central vertical plane of the coupling; of a forked yoke 8, a tongue 8" on the upper arm of the yoke, a pivot-pin pivotally connecting the tongue of the yoke to the upper end of the arm 4, clips 9 bent around the side arms of the link 7, and pivot-pins pivotally connecting the ends of the pendent forks of the yoke to the said clips whereby the end link 7 of the coupling is pivotally suspended, substantially as set forth.

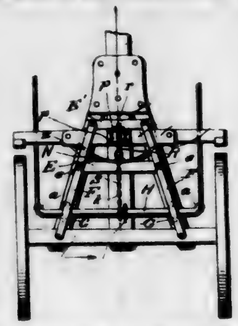
706,897. SINGLETREE-CLIP. CHARLES J. BUSER, Lena, Ind., assignor of one-half to Fred R. Lancaster and John H. Kanner, Lena, Ind. Filed May 19, 1902. Serial No. 108,081. (No model.)

Claim.—1. A singletree-clip comprising a resilient bow and a pair of arms integral therewith, one of the arms being provided with a reduced terminal to project through an eye in the other arm and to be upset.

2. A singletree-clip comprising a flat resilient bow and arms integral therewith, one of the arms being provided with an eye, and the other arm being bent to produce a ring-engaging loop and having its terminal reduced to engage the eye, the projecting end of the terminal being upset.

3. A singletree-clip comprising a resilient bow and a pair of arms integral therewith and having their terminals riveted together, the point of juncture between the arms and the bow on the inner side of the latter forming knife-edge lugs to engage with the singletree to hold the attachment from slipping thereon.

706,898. BRAKE FOR VEHICLES. GEORGE W. BURTON, Morehead, Ky. Filed Sept. 13, 1901. Serial No. 75,310. (No model.)



Claim.—In a vehicle-brake, the combination with the rear hounds, the two bracing transverse bars thereof, and the braces connecting said bars, and forming guideways between the same and the hounds, of the brake-beam having movement in said guideways, its grooved plate upon one side thereof, and engaging the wagon tongue or pole for prevention of lateral movement, the perforated lugs upon the opposite side of said beam centrally of the length thereof, the curved plate-spring having a bearing at its middle portion against one of said transverse bars, to which it is secured, and at its ends against the end portions of the brake-beam to equalize the application thereof, the transverse winding-shaft, its bearings supported by said hounds, and the chain connected by one end to said shaft at about the central portion thereof, and the adjustable screw connection with said lugs at its opposite end portion, substantially as specified.

706,899. EYEGLASSES. JOHN CARTER, Malden, Mass., assignor of one-half to Alfred G. Carter, Malden, Mass. Filed Jan. 16, 1902. Serial No. 89,142. (No model.)

Claim.—1. A screw-lock for eyeglasses, comprising a plate having a slot formed therein to receive the shank of the screw, a groove in the inner face of said plate adjacent to one edge, and an inwardly-extending flange at said edge, as set forth.

2. A screw-lock for eyeglasses, comprising a plate having a diagonal slot formed therein to receive the screw, and a groove in the inner face of the said plate adjacent to one edge, as set forth.

3. A screw-lock for eyeglasses, comprising an eyeglass-stud having flanges, a plate with a diagonal slot therein, said plate having adjacent to one edge a groove to receive the adjusting-stud flange, and the plate also having a laterally-turned tooth or flange adjacent to the groove, the tooth or flange lying on the outside of the flange of the stud of the eyeglasses.

4. The combination with an eyeglass-stud having flanges, of a screw-lock comprising a plate having a diagonal slot therein to receive the shank of the fastening-screw, the said plate being provided with a groove in its inner face adjacent to one edge and extending from the top to the bottom of the plate and adapted to receive one of the stud-flanges, the said plate being further provided with an inwardly-bent flange at the edge adjacent to the groove, as set forth.

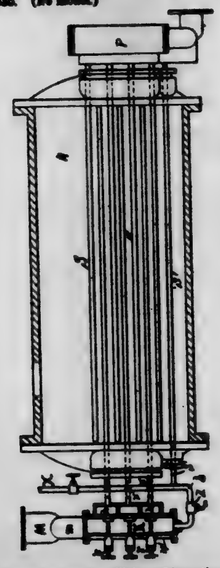
5. The combination with the eyeglass-stud having flanges adapted to receive between them the ends of the spring and guard-shank, one of said flanges being shorter than the other, of a screw-lock comprising a plate having a diagonal slot to receive the screw, the said plate being provided with a groove in its inner face adjacent to one edge to receive the shorter flange of the stud, the plate having at said edge inwardly-bent flanges or teeth adapted to engage the outer side of the shorter flange of the stud, the opposite edge of the said plate extending at the inner side of the longer flange of the stud, as set forth.

706,900. BOOT OR SHOE PROTECTOR. ROBERT CHRISTENSEN, Racine, Wis., assignor of one-half to Christ. Nelsen, Racine, Wis. Filed Oct. 18, 1901. Serial No. 79,198. (No model.)

Claim.—1. In a boot or shoe protector, a sole-plate comprising a sole and a heel portion formed from a single piece of sheet metal, an upturned sectional flange upon each of said portions, the heel-portion flange being wider than the sole-portion flange, two reverse and substantially right-angular bends in said plate intermediate the sole and heel portions causing the flange-sections upon said sole portion adjacent the heel portion to overlap the contiguous flange-sections of said heel portion, a vamp or body portion shaped to inclose the lower part of the shoe to be protected, and securing means passing through said overlapping flange-sections and vamp, together with means for securing the remaining flange-sections to said vamp, substantially as described.

2. A sole-plate for a boot or shoe protector, comprising a sole and a heel portion formed from a single piece of sheet metal, an upturned sectional flange upon each of said portions, the heel-portion flange being wider than the sole-portion flange, and said plate having two reverse and substantially right-angular bends intermediate the sole and heel portions causing the flange-sections upon the sole portion adjacent the heel portion to overlap the contiguous flange-sections of said heel portion, substantially as described.

706,901. STILL FOR ABSORPTION REFRIGERATING APPARATUS. NATHAN W. ORMSBY, Jersey City, N. J. Filed Nov. 16, 1901. Serial No. 82,535. (No model.)



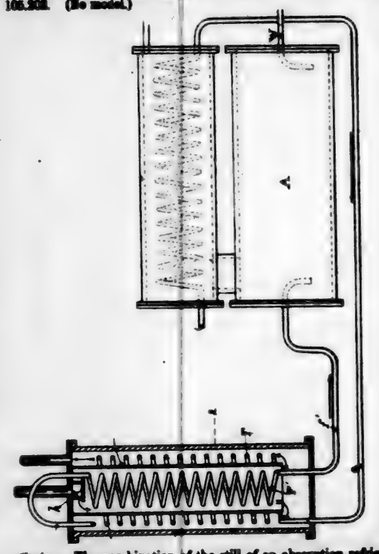
Claim.—1. In an ammonia-still for refrigerating purposes, the combination of the generating-chamber of the still and steam-coils therein with two connected headers at the inlet end and two connected headers at the outlet end, the headers at the inlet end having valves to control the admission of steam to the different coils and means for supplying steam from different sources to the inlet-headers.

2. In an ammonia-still for refrigerating purposes, the combination of the generating-chamber of the still with steam-coils in horizontal serpentine layers, these successive layers having their inlets at opposite sides of the still alternately and valved headers controlling the admission of steam to the said coils.

3. In an ammonia-still for refrigerating purposes, the combination of the generating-chamber of the still and steam-coils therein with headers having valves to control the admission of exhaust-steam to the coils, a live-steam pipe and valved connections from the latter to the inlets of said coils.

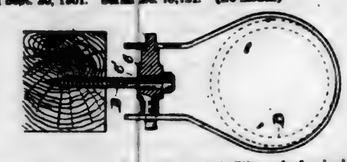
4. In an ammonia-still for refrigerating purposes, the combination of the generating-chamber of the still with steam-coils in independent sets and both a live-steam-supply pipe and an exhaust-steam-supply pipe and valves controlling admission therefrom to the several independent sets of coils, substantially as described.

706,902. ABSORPTION REFRIGERATING APPARATUS. NATHAN W. ORMSBY, Jersey City, N. J. Filed Apr. 29, 1902. Serial No. 106,202. (No model.)



Claim.—The combination of the still of an absorption refrigerating apparatus with a heating-cylinder containing two strong-liquor coils and connections and a cylindrical shield between the two coils, with steam inlet and outlet to the cylinder on opposite sides of the shield, as and for the purpose described.

706,903. PIPE-HANGER. JAMES CRAWFORD, Boston, Mass. Filed Sept. 20, 1901. Serial No. 75,731. (No model.)



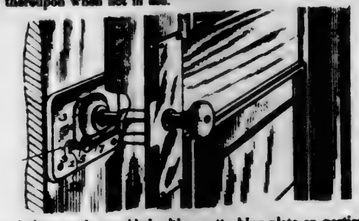
Claim.—A pipe-hanger consisting of a bail formed of a single piece of spring metal, the ends thereof each provided with a rectangular slot arranged parallel to the sides of the bail, in combination with a yoke consisting of a body portion, a cylindrical trunnion at each end of the body portion and a T-head integral with each of the trunnions, said T-heads adapted to pass through the slots of the bail when said T-heads are arranged longitudinally of said slots, and means extending through the yoke at right angles to the T-head for securing the yoke in position when suspending the bail.

706,904. COMBINED DOOR STOP AND CATCH. JACOB DANIEL, Los Angeles, Cal. Filed May 11, 1901. Serial No. 59,579. (No model.)

Claim.—1. A door-catch provided with an attaching portion and a device constructed to engage frictionally the door-knob when extended and to fold closely upon said portion when not in use.

2. A door-catch provided with an attaching portion, a receiving-pad thereon and a device constructed to frictionally engage a door-knob when extended and to fold closely upon said portion when not in use.

3. A door-catch provided with an attaching portion carrying a receiving-pad, an antifriction device movably connected with said portion constructed to be supported above the latter to engage the door-knob and to fold thereupon when not in use.

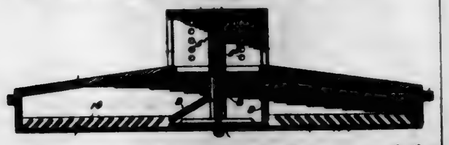


4. A door-catch provided with an attaching plate or portion to be secured to the wall behind the door when open, legs or ears upon said portion, a yoke movably connected with said legs and a roller carried by said yoke constructed to frictionally engage the under surface of the knob of the door when forced thereboyond.

5. A door-catch provided with an attaching portion or plate to be secured to the wall behind the door when open, a receiving-pad or bumper upon said plate, legs or ears secured in the former, a yoke movably connected with said legs and a roller carried by said yoke constructed to frictionally engage the under surface of the knob of the door when forced thereboyond.

6. A door-catch provided with a rectangular attaching portion carrying a receiving-pad, a yoke hinged to said portion and carrying a roller and constructed to be extended above said portion to engage a door-knob and to fold thereupon when not in use.

706,905. WINDOW-VENTILATOR. DAVID O. DAVIS, Atlanta, Ga. Filed Oct. 4, 1902. Serial No. 752,470. (No model.)



Claim.—1. In a ventilator, a casing comprising two communicating wings having apertures in their front walls permitting independent communication between each wing and the apartment to be ventilated; an extension projecting from the rear of the casing, open at both ends and communicating with the wings through an opening in its side, a central partition dividing the extension and a movable shutter controlling communication between the two wings, in line with the partition.

2. In a ventilator, a casing comprising two wings having apertures in their front walls permitting independent communication between each wing and the apartment to be ventilated, means for permitting the circulation of air through the rear wall, means for dividing the casing intermediately its length and doors for controlling the passage of air through the wings.

706,906. CAR-WHEEL. HARRIS T. DAVIS, Jr., Charleston, W. Va. Filed May 19, 1902. Serial No. 107,998. (No model.)

Claim.—1. The improvement in wheels herein described, comprising the hub having an annular chamber for the lubricant, and provided in its outer end with a rabbet for the nut and at its inner end with a rabbet non-circular in cross-section, with a stop-flange at the inner end of the rabbet and provided in its inner edge with notches for the passage of the lubricant, the perforated tubular bushing provided at its middle portion with perforations for the passage of the lubricant, threaded at its outer end to receive the securing-nut and provided at its inner end with a head to fit in the rabbet at the inner end of the hub and having adjacent to said head perforations registering at their outer ends with the notches in the stop-flange of the hub and opening at their inner ends adjacent to the inner end of the lubricating-bushing, and the nut on the threaded end of the lubricating-bushing, substantially as set forth.

2. The combination with the hub having the chamber for the lubricant, and provided at its inner end with an inwardly-projecting flange notched in its inner edge, and the lubricating-bushing having at its inner end a head abutting said flange and provided adjacent to said head with perforations which register at their outer ends with the notches in the flange of the hub, and discharge at their inner ends adjacent to the inner end of the bushing, substantially as set forth.

3. The combination with the hub provided in its inner side with a rabbet for the head of the bushing, said rabbet having a non-circular portion and at its inner side a stop-flange provided in its inner edge with notches, and the lubricating-bushing provided at its inner end with a head to fit the rabbet in the hub and having adjacent to said head perforations which register at their outer ends with the notches in the stop-flange and open at their inner ends adjacent to the inner end of the lubricating-bushing, substantially as set forth.

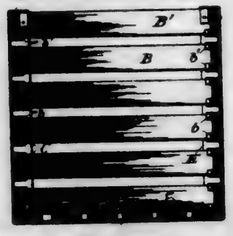
706,907. PAINT-OIL. WILLIAM H. DEMPSTER, Brunswick, Ga., assignor of one-half to C. P. Goodyear, Sr., and C. P. Goodyear, Jr., Brunswick, Ga. Filed Feb. 6, 1902. Serial No. 92,866. (No specimens.)

Claim.—1. The herein-described paint vehicle composed of rosin and kerosene, in the proportions substantially as specified.

2. The herein-described process of making paint-oil consisting in mixing rosin and kerosene, and then boiling the mixture.

3. The herein-described process of making paint-oil consisting in mixing rosin with kerosene, and boiling the mixture in the open air.

706,908. CRATE. RICHARD DE WEERDT, Saugatuck, Mich. Filed June 2, 1902. Serial No. 108,894. (No model.)



Claim.—1. In a knockdown crate, an end brace and slat-holder comprising an angular strip of sheet metal shaped to present parallel side members with tongues which are struck up therefrom, the tongues having parallel sides and straight ends at right angles with the sides, the tongues being bent inward from the side members of the angular strip and adjacent to the ends toward each other to provide slat-receiving sockets, registering perforations through each of the end portions of the angular strip, and perforations through the part which connects the parallel side members, the perforations being positioned adjacent to the side members; whereby when nails are passed through the perforations and the slats which enter the sockets adjacent to the perforations the crate will be maintained in position for use, substantially as set forth.

2. An angular brace and slat-holder for knockdown crates, comprising side pieces having tongues having blunt ends, the tongues being bent to provide sockets for the ends of the side and end slats, a connecting portion having sockets for the bottom slats, and perforations adjacent to the ends and the bent portions of the brace for the passage of nails to lock the brace and slat-holder to the slats, substantially as shown.

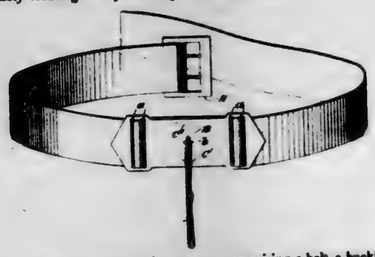
3. A sheet-metal end brace and slat-holder for knockdown crates, made up from a continuous strip which is angular in cross-section, bent tongues struck up from the strip to provide sockets, connecting portions between the tongues, an angular bar or connecting portion having a single line of sockets and a strip in line therewith, and perforations adjacent to the ends of the brace and slat-holder and near the transversely-bent portion thereof through which are passed nails for connecting the upper and corner slats to the braces, substantially as shown and for the purpose set forth.

706,909. GARMENT FASTENER AND SUPPORTER. WINFIELD L. DUNNOON, Portland, Oreg. Filed Dec. 2, 1901. Serial No. 84,356. (No model.)

Claim.—1. A garment fastener and supporter, comprising a belt securable on a person's waist, a plate secured to the rear of the belt, a staple projected from the center of the plate and adapted to pass through openings in female garments, and an elongated looped keeper-bar slidably held on the staple.

2. A garment fastener and supporter, comprising a belt securable on a person's waist, a plate secured to the rear of the belt and provided with

an opening at about the center, a removable staple projected through the opening in the plate, for engagement with eyelets in the waistbands or shirts near their plackets, the ends of the members of the staple being oppositely bent to form feet which lie against the inner face of the plate and an elongated looped keeper-bar slidably held on the staple and detachably securing the eyelets in place on the staple.

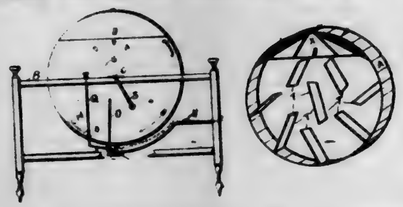


3. A garment fastener and supporter, comprising a belt, a buckle on one end of the belt, a back plate slidably mounted upon the belt and having a slot therein at about its center, a removable staple having the ends of its members bent to form feet adapted to rest on the inner face of the back plate when the staple is inserted through the slot, and an elongated looped keeper-bar slidably held on the staple and provided with a kink in one of its members at about the center of length thereof.

4. A garment fastener and supporter, comprising a belt, a buckle thereon, a back plate having slots at the ends adapted to receive the belt, whereby the plate is adjustably mounted upon the belt, and an opening at about its center, a removable staple having the ends of its members bent to form zigzag feet and passing loosely through the opening in the back plate with its feet resting against the rear face of the said plate, and an elongated keeper-bar formed with spaced side members and looped ends, and having slidable engagement with the staple, one member of the said bar having a kink therein at about the center of its length.

5. In a garment fastener and supporter, a plate provided at each end with two parallel transverse slots to receive a belt, and at its center with a slot, a removable staple having the ends of its members bent to form feet, the staple projecting through the center slot of the plate with its feet resting against the inner face of the said plate, and an elongated looped keeper-bar loosely engaging the staple and provided with a kink in one of its members at about the center of length thereof, as set forth.

706,910. BALLOT-BOX. HENRY DROUYLESS, Auckland, New Zealand. Filed Jan. 26, 1901. Serial No. 44,826. (No model.)



Claim.—1. A ballot-box comprising a revolvable drum provided with an exit-hole, a closure normally closing said hole, and means for actuating the closure automatically on the rotation of the drum to expose or uncover the hole.

2. A ballot-box comprising an axially-turning drum provided with a peripheral exhit-hole, leading-boards and agitators within said drum, and automatic means for closing the exit-hole when the drum is at rest and for exposing or opening the hole on the drum assuming a certain predetermined position when turning on its axis.

3. A ballot-box comprising a revolvable drum having an exit-hole, a closure to cover said hole, a guard arranged in a reverse position to the closure and adapted to also cover and uncover the hole, and means for actuating said closure and the guard on the rotation of the drum.

4. A ballot-box comprising a drum mounted to turn on an axis and provided with an exit-hole, a closure adapted to open and close said hole, and a guard arranged to close the hole when the closure is adjusted to an open position.

5. A ballot-box comprising a drum mounted to turn on an axis and provided with an exit-hole, a closure arranged to open and close said hole, and a guard operatively connected with the closure, and adapted to close the hole on the movement of the closure to an open position.

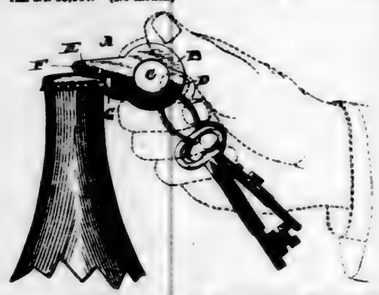
6. A ballot-box comprising a drum mounted to turn on an axis and provided with an exit-hole, a closure for said hole, and trip devices to automatically actuate the closure when the drum is turned on its axis.

7. A ballot-box comprising a drum mounted to turn on an axis and provided with an exit-hole, a closure actuated by a suitable retractor and normally covering said hole, a trip device occupying an abnormal position relative to the closure, and means actuated by a turning movement of the drum to automatically bring the trip device into coöperative relation to said closure.

8. A ballot-box comprising a drum having an exit-hole, a spring-actuated closure having a projecting shoulder, a track disposed in the path of said shoulder, a pivoted trip connected with the track, and means carried by the drum to ride against the pivoted trip.

9. A ballot-box comprising a drum mounted to turn on an axis and having an exit-hole, a closure therefor, a track controlled by a trip, and a retracting-rod to maintain the trip and the track in their abnormal positions on the turning movement of the drum.

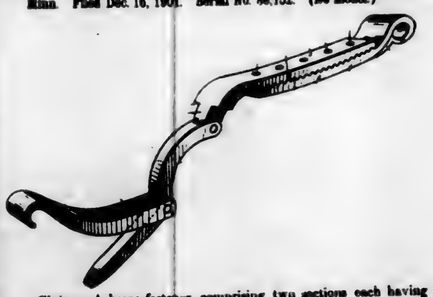
706,911. TOOL FOR REMOVING CAPS FROM BOTTLES. WILLIAM L. DURHAM, Washington, D. C., assignor to William R. Matthews and Franklin H. Hough, Washington, D. C. Filed Feb. 27, 1902. Serial No. 96,967. (No model.)



Claim.—1. The herein-described tool for removing caps from bottles, the same comprising a metallic ring provided at a point adjacent to one of its lower edges upon one side with a groove and upon its opposite side with integral arms adapted to engage the edge and top respectively of a bottle-cap, substantially as shown and described and for the purpose specified.

2. As an improved article of manufacture, a device for removing caps from bottles, comprising a metallic plate having a circular aperture with a recess D therein adapted to receive a key-ring, integral arms E and G of unequal length projecting laterally from said circular portion, one of said arms G being disposed at an angle to the arm E, as shown and described.

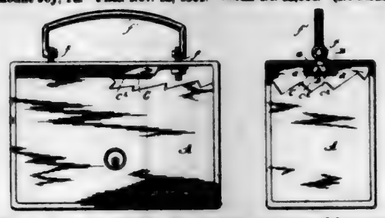
706,912. HAME-FASTENER. NILS P. ERICKSON, Red Wing, Minn. Filed Dec. 16, 1901. Serial No. 86,152. (No model.)



Claim.—A hame-fastener, comprising two sections each having a hook at its outer end, one of said sections having the end thereof opposite its hook contracted to form a tang and shoulders on opposite sides thereof, and the other of said sections having the end thereof opposite its hook bifurcated, the branches of which bifurcated end straddle said tang and engage said shoulders when the device is in its locked position, and an operating-lever pivoted at one end to said tang and at a point intermediate its ends to the branches of said bifurcated end, and the said lever being located between said branches and of the same thickness as said tang, whereby the pivotal point between said branches and said lever may

be moved inside the line of strain between the hooks on the outer ends of said sections, as and for the purpose set forth.

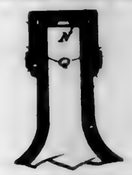
706,913. SLOT-GUARD FOR TOY BANKS. JOHN W. ERELEMAN, Mount Joy, Pa. Filed Nov. 12, 1901. Serial No. 82,006. (No model.)



Claim.—1. As a new article of manufacture, a slot-guard for money-boxes, comprising a block or casting having a central slot and grooves arranged transversely of said slot, balls located in the grooves at opposite sides of the slot, springs bearing against the balls to bring them together over the slot, a covering-plate having a slot on a line with the aforesaid slot, and perforated extensions or wings on the block to provide for securing it to the money-box, substantially as shown and described.

2. In a slot-guard for money-boxes, the combination of the box having a coin-slot and holes beyond the ends of said slot, a block provided with a slot and grooves arranged transversely of said slot, and a series of spring-actuated balls located in the grooves and adapted to close the coin-slots; together with screw-eyes passed through the holes in the box and apertured extensions of the block, a handle connected to said screw-eyes, and nuts holding the parts together, substantially as shown and described.

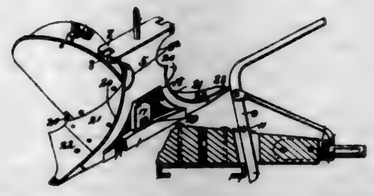
706,914. NON-REFILLABLE BOTTLE. JULIUS EWALD, Philadelphia, Pa. Filed Apr. 10, 1901. Serial No. 55,1604. (No model.)



Claim.—1. In a non-refillable bottle, a neck provided with a rim, vertically-extending recesses in said rim, one of said recesses inclining downwardly and outwardly so as to form a shoulder which is continuous of a shoulder around the bottle-neck, and a finger which is connected with the bottle-cap and adapted to spring under said first-named shoulder.

2. A non-refillable bottle consisting of a neck provided with a rim, a bead below the same, vertically-extending recesses in said rim, a headed pin at the side of the neck a cap having its lower edge adapted to interlock with said pin, and a finger connected with the cap on the interior thereof, one of said recesses being inclined downwardly and outwardly so as to form a shoulder which is continuous of a shoulder around the bottle-neck and said finger being adapted to spring under the first-named shoulder.

706,915. PLOW. SPENCER FARMER, Rust, Ky. Filed Aug. 30, 1901. Serial No. 103,232. (No model.)

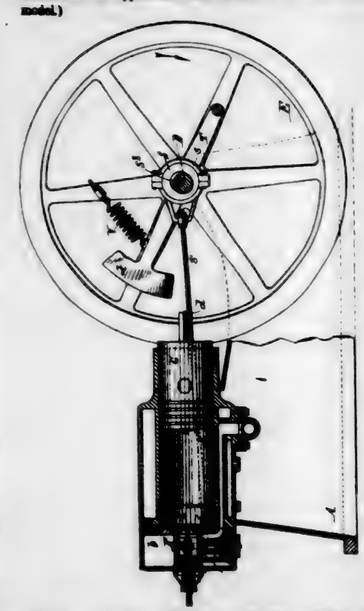


Claim.—1. The combination with a plow-beam, of a standard pivoted to said plow-beam, oppositely-disposed moldboards carried by said standard, hinged moldboards located to be set to form an extension of either of said boards when in operating position, a stud-shaft mounted on said beam and having a slot therein, a brace-bar connected to said hinged moldboards and engaging said slot, a catch-bar arranged to hold said brace against all movement, and a latch arranged to hold said standard against rotation, substantially as described.

2. The combination with a plow-beam, of a standard pivoted to said plow-beam and bearing oppositely-disposed moldboards, hinged moldboards arranged to be set to form an extension for either of said moldboards, a brace-bar connected to said hinged moldboards and provided with a notch, a latch-lever fulcrumed on said plow-beam and engaging the said standard to hold it against turning, and a notch-bar pivoted to said latch-lever and engaging said brace-bar, substantially as described.

3. In a plow the combination with a standard, bearing a flange, a T-shaped land-bar provided with a groove engaging said flange and having a recess in its stem, a pin seated in said standard and engaging said recess, substantially as described.

706,916. FUEL-VALVE FOR GAS-ENGINES. JESS B. FENNER, Buffalo, N. Y., assignor to the J. W. Ruger Manufacturing Company, Buffalo, N. Y. Original application filed Mar. 21, 1900, Serial No. 9,536. Divided and this application filed Oct. 26, 1901. Serial No. 80,094. (No model.)



Claim.—1. In a gas-engine, the combination with the cylinder, the piston arranged in the cylinder and the crank-shaft connected with the piston, of a valve-chest communicating by a main port with the cylinder, a main valve controlling the main port, a speed-reducing-gear mechanism which is interposed between the crank-shaft and the main valve and which is constructed to open the same once during every two rotations of the shaft, a rocking fuel-valve whereby the fuel-supply to the cylinder is controlled, and an actuating mechanism which is interposed between the crank-shaft and the fuel-valve and which is constructed to open the same once during each rotation of the shaft, substantially as set forth.

2. The combination with the cylinder and the piston therein, of a chest arranged at the end of the cylinder and having a valve-chamber communicating with the cylinder, a socket extending from the outer side of the chest into the valve-chamber, and a fuel-conduit opening into the side of the socket; a valve-case fitting in said socket and having ports in its side which communicate with said fuel-conduit; and a hollow rock-valve arranged in said case and having ports in its side which register with the ports of said case and opening at its inner end into the valve-chamber of said chest, substantially as set forth.

3. The combination with the cylinder and the piston therein, of a chest arranged at the end of the cylinder and having a valve-chamber communicating with the cylinder, a socket extending from the outer side of the chest into the valve-chamber, and a fuel-conduit opening into the side of the socket; a valve-case fitting in said socket and having ports in its side which communicate with said fuel-conduit; a hollow rock-valve arranged in said case and having ports in its side which register with the ports of said case and opening at its inner end into the valve-chamber of the chest;

a head bearing against the outer end of the valve and the valve-case and provided with a bearing; a screw-ring whereby said head is clamped against said case; and a rock-shaft journaled in said bearing and carrying said rock-valve, substantially as set forth.

706,917. SPLIT PULLEY. HIRAM W. FINCH, Tacoma, Wash. Filed Dec. 19, 1901. Serial No. 86,505. (No model.)

Claim.—In a split pulley, the combination with the segment-rims *a a* provided with cross-arms or spokes *a* each having a recess at its inner side, of the two-part box or hub fitting between the arms in the recesses thereof and having registering bolt-holes, said parts also having transverse recesses in their contiguous sides for the shaft and one of the parts further recessed centrally, a metal casing seated in the said central recess and provided with an eccentrically-curved wall terminating at one end in a straight wall, said casing being also provided with a flange projecting from the open end thereof and provided with holes registering with the aforesaid bolt-holes in the hub, and bolts passed through the parts for clamping them together; together with a curved wedge-piece having teeth on its concave edge adapted to engage the shaft, said wedge-piece being located in the casing to impinge against the curved wall thereof.

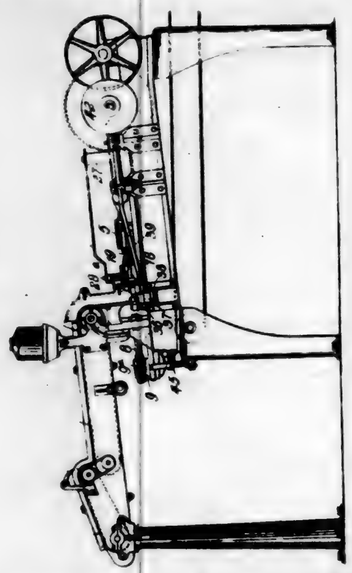
706,918. TOY. JOHN J. FITZPATRICK, Washington, Pa. Filed Oct. 3, 1901. Serial No. 77,492. (No model.)

Claim.—1. A whirligig toy comprising a blade formed with a handle and a rubbing edge provided with pointed teeth beveled at their sides, a headed pin located at the end of the blade, and a wheel loosely mounted on the pin and constructed with peripheral segments which are bent forward to provide angular wind-wings diagonal of the segments.

2. A whirligig toy comprising a blade formed with a handle and a rubbing edge provided with pointed teeth beveled at their sides, a headed pin located at the end of the blade, washers mounted on the pin, a large wheel loosely mounted on the pin between the washers constructed with peripheral segments which are bent forward to provide angular wind-wings diagonal of the segments on one side and a small wheel loosely mounted on the pin between the outer washer and the head of the pin, constructed with peripheral segments which are bent forward to provide angular wind-wings diagonal of the segments at the opposite side to those of the segments of the large wheel.

706,919. SOAP-PRESS. JOHN J. PENNOCK and ROBERT I. MITCHELL, Avalon, Pa. Filed June 21, 1901. Serial No. 65,461. (No model.)

Claim.—1. In a soap-press, the combination of a mold-box, main and auxiliary plungers, a stationary abutment, mechanism for causing said plungers to move together out of the mold-box and to carry the compressed cake into line with the abutment, mechanism for separating the plungers when the cake is in line with the abutment, a gripping-jaw, positively operating means for shifting the jaw to clamp the cake between it and the abutment, and means for imparting a sudden return movement to the jaw, substantially as set forth.



2. In a soap-press, the combination of a mold-box, main and auxiliary plungers, a stationary abutment, means for causing the plungers to bring a compressed cake into alinement with the abutment, a gripping-jaw arranged opposite the abutment, a lever connected to the jaw, an arm pivotally mounted on the main plunger and adapted to engage the lever and a stop for preventing the movement of the arm during the rearward movement of the main plunger, and a spring for effecting the return movement of the gripping-jaw, substantially as set forth.

3. In a soap-press, the combination of a mold-box detachably secured to the frame of the machine, a supporting-table arranged in the rear of the soap-box, means for shifting the table, an adjustable chute for directing cakes of soap onto the table, and an adjustable pusher for shifting the cakes along the table, substantially as set forth.

4. The combination of a soap-press, and a feed mechanism adapted to turn and space the cakes of soap while feeding them to the press, substantially as set forth.

5. The combination of a soap-press, two feed-belts driven at different speeds, and a turning-arm arranged in the path of movement of the upper edges of the cakes as carried along by one of the belts, substantially as set forth.

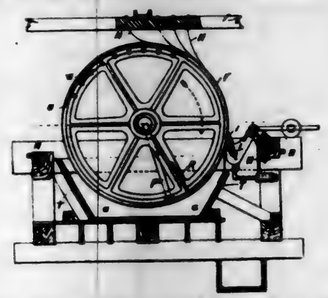
6. The combination of a soap-press, two belts arranged in or approximately in line with each other, one belt being driven at a higher speed than the other, a bridge connecting the belts, and a turning-arm arranged over the belt having the higher speed and in the path of movement of the upper portions of the cakes as carried forward by the belt, substantially as set forth.

7. The combination in a soap-press, of a mold-box, main and auxiliary plungers, means for moving said plungers simultaneously out of the box, and means for effecting a step-by-step movement of the auxiliary plunger to pressing position, substantially as set forth.

8. In a machine of the character described, the combination with the dies and means for operating them, of a charging-table and a charger for pushing bars placed thereon into the dies, conveying mechanism adapted to receive the bars to be pressed in a row standing upright side by side, and to move said bars toward the charging-table, and an intermediate feeding device for receiving the bars from the conveyer and transferring said bars to the charging-table, said conveying mechanism being arranged to turn each cake on its side as it is delivered to the intermediate feeding device.

9. The combination with the dies, the charging-table and the charger moving over the same, of a main driven conveyer-belt adapted to receive a row of bars standing on edge, an intermediate feeding device leading from the end of the main conveyer to the charging-table, said intermediate feeding device including a supplementary driven conveyer-belt passing below the end of the main conveyer for receiving the bars as they fall one by one over the end of the main conveyer, said bars being turned in falling.

706,920. REVOLVING VACUUM-FILTER FOR RECOVERING THE LIQUID FROM SLIMES, SANDS, PULP, OR SUCH LIKE IN CONNECTION WITH CYANID OR OTHER CHEMICAL APPLICATIONS. GEORGE FRASER, Jr., Auckland, and SAMUEL R. FRASER, Waikino, New Zealand. Filed Apr. 18, 1901. Serial No. 56,513. (No model.)



Claim.—1. The combination of a peripherally-perforated cylinder, a trough in which said cylinder is mounted to rotate, one or more blankets arranged to trail upon the periphery of said cylinder, and means for applying water to said blanket or blankets.

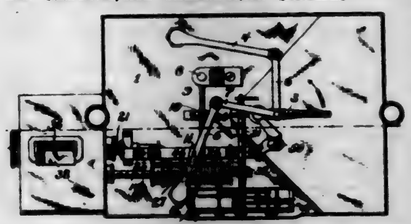
2. The combination of a peripherally-perforated cylinder, a trough in which said cylinder is mounted to rotate, one or more blankets arranged to trail upon the periphery of said cylinder, means for applying water to said blanket or blankets, and a knife arranged between the blanket or blankets and the trough and adapted to scrape said periphery.

3. The combination of a peripherally-perforated cylinder, a trough in which said cylinder is mounted to rotate, one or more blankets arranged to trail upon the periphery of said cylinder, means for applying water to said blanket or blankets, a hollow shaft for supporting said cylinder, and a plurality of pipes extending from said shaft and opening into the cylinder.

706,921. PROCESS OF MAKING BROMINDIGO. MEESS VON GALLADE, Höchst-on-the-Main, Germany, assignor to FARBWERKE, VORM. Meister, Lucius & Brüning, Höchst-on-the-Main, Germany, a Corporation of Germany. Filed May 27, 1902. Serial No. 109,165. (No specimens.)

Claim.—The herein-described process for the manufacture of brominated indigo which consists in causing bromin to react on indigo-white in the proportion requisite for the formation of the product of substitution and in oxidizing the bromindigo-white thus obtained to bromindigo, substantially as set forth.

706,922. PREPAYMENT GAS-METER. JAMES OSEN, Hoboken, N. J. Filed Nov. 2, 1901. Serial No. 80,839. (No model.)



Claim.—1. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shifting device having rotatable and longitudinal movement, a cam carried thereby for controlling said stop-bolt, a ratchet-wheel on each end of said shifting device, a revolvable plate carrying a pawl for engagement with one of said ratchets said plate being driven from said spindle, a second revolvable plate carrying a pawl for engagement with the other of said ratchets said second plate being controlled from a manually-operated shaft, and means for connecting said shifting device with one or the other of said revolvable plates, said shifting device carrying a cam for controlling a lever to indicate the position of said stop-bolt-controlling cam, substantially as described.

5. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shifting device having both rotative and longitudinal movement, a cam carried thereby for controlling said stop-bolt, a ratchet-wheel on each end of said shifting device, a revolvable plate carrying a pivoted pawl for engagement with one of said ratchets said plate being driven from said spindle, a second revolvable plate carrying a pivoted pawl for engagement with the other of said ratchets said second plate being controlled from a normally disengaged but manually-operated shaft, and means for connecting said shifting device with one or the other of said revolvable plates, said means also controlling a supplementary stop-bolt.

6. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shifting device having both rotative and longitudinal movement, a cam carried thereby for controlling said stop-bolt, a ratchet-wheel on each end of said shifting device, a revolvable plate carrying a pawl for engagement with one of said ratchets said plate being driven from said spindle, a second revolvable plate carrying a yielding pawl for engagement with the other of said ratchets said second plate being controlled from a manually-operated shaft, which also operates a cam and thus a sliding bar for throwing said shifting device in connection with one or the other of said revolvable plates, said sliding bar also operating a supplementary stop-bolt, substantially as described.

7. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shifting device having both rotative and longitudinal movement and a cam carried thereby for controlling said stop-bolt, a ratchet-wheel on each end of said shifting device, a revolvable plate carrying a pivoted pawl having its lateral face beveled for engagement with one of said ratchets said plate being driven from said spindle, a second revolvable plate carrying a pivoted pawl having its lateral face beveled for engagement with the other of said ratchets said second plate being controlled from a manually-operated shaft, and means for connecting said shifting device with one or the other of said revolvable plates.

8. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shaft driven from said revolvable spindle, a second shaft manually controlled and in line with said first shaft, a shifting device having both rotative and longitudinal movement upon the adjacent ends of said shafts, ratchets carried by each end of said shifting device, spring-pressed pawls carried by ends of said shafts adjacent said ratchets, and means for throwing said shifting device into engagement with either one of said pawls, said shifting device controlling the movement of said stop-bolt, substantially as described.

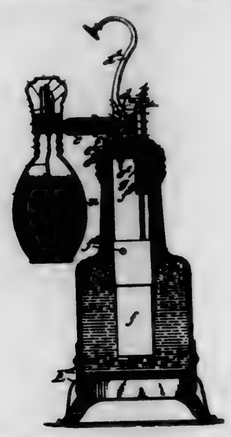
9. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shaft driven from said revolvable spindle, a second shaft manually controlled and in line with said first shaft, a shifting device having both rotative and longitudinal movement upon the adjacent ends of said shafts, ratchets carried by each end of said shifting device, pivoted

pawls carried by each of said shafts adjacent said ratchets, and means for throwing said shifting device into engagement with either one of said pawls, and a sliding bar controlled from said manually-operated shaft by a cam for longitudinally moving said shifting device and at the same time actuating a supplementary stop-bolt.

10. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shifting device for controlling said stop-bolt, a shaft carrying a double-notched cam for operating said shifting device, a manually-controlled shaft, and means for connecting said manually-controlled shaft and said cam-carrying shaft whereby said shifting device is returned to its normal position without returning said manually-controlled shaft to its normal position, substantially as described.

11. In a device of the character described, a revolvable spindle, a movable stop-bolt therefor, a shifting device for controlling said stop-bolt, a shaft carrying a double-notched cam for operating said shifting device, a manually-controlled shaft, and means for connecting said manually-controlled shaft and said cam-carrying shaft whereby said shifting device is returned to its normal position without returning said manually-controlled shaft to its normal position, and a supplementary bolt controlled by said cam, substantially as described.

706,923. LAMP. CHARLES R. GERVAIS, New York, N. Y., assignor to Gervais Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Apr. 17, 1902. Serial No. 103,263. (No model.)



Claim.—1. In a lamp, the combination, with the lamp-body, of a head applied to the same and provided at its upper portion with a shoulder, a hollow guard-cap fitting at its lower end on said shoulder and extending upwardly from said head and provided with openings in its side walls and an opening at the top, a wick-tube extending from said lamp-body through the head and terminating in the upper part of the guard-cap near the top opening of the same, a wick in said tube and exposed at the upper end of the same within the guard-cap, a resistance-wire within the cap adjacent the upper end of said wick for lighting the same, a swinging arm, and an extinguishing-cap carried by said arm and adapted to close the upper opening of said hollow cap, substantially as set forth.

2. In a lamp, the combination, with a lamp-body, of a head applied to the same and provided at its upper portion with a shoulder, a hollow guard-cap fitting at its lower end on said shoulder and extending upwardly from said head and provided with openings in its side wall and an opening at the top, a vertical wick-tube extending from said lamp-body through the head at one side of the center of the same and provided at its upper end, near the top opening, with an overhanging guard, a wick in said tube and exposed at the upper end of the same within the guard-cap, beneath said guard, a resistance-wire within the cap adjacent the upper end of said wick for lighting the same, a swinging arm, and an extinguishing-cap carried by said arm and adapted to close the upper opening of said guard-cap, substantially as set forth.

3. In a lamp, the combination, with a lamp-body, of a head applied to the same and arranged at its upper portion with a shoulder, a removable hollow guard-cap fitting frictionally at its lower end on said shoulder and extending upwardly from said head, a battery-receptacle, a cap on the same, a head on said cap, a vertically-movable spring-actuated rod passing through said receptacle cap and head, a battery element secured to the lower end of said rod, a knob at the upper end of said rod, above said head, lateral extensions connecting the receptacle-head with the lamp-head, an arm pivoted to the receptacle-head and extending over said guard-cap, an extinguishing-cap secured to said arm and adapted to close the opening in the top of said guard-cap, and a rear portion extending from said arm beneath the knob of said rod, said rear portion and arm being movable independently of said rod, substantially as set forth.

4. In a lamp, the combination, with a lamp body and wick, of a battery-receptacle, a cap and head on the same connected with the lamp-body, a vertically-movable arm pivoted to said head and provided with an extinguishing-cap for said wick, a resistance-wire connected with the elements of the battery in said receptacle and located adjacent the wick, a rear portion projecting from said arm at the rear of said pivot, a battery-rod passing vertically through said cap and head adjacent said rear portion of the arm, a concave seat on the head between said rod and the pivot of said arm, and a knife-edge on said rear portion of the arm opposite said seat, substantially as set forth.

706,924. LAMP. CHARLES R. GERVAIS, New York, N. Y., assignor to Gervais Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Apr. 17, 1902. Serial No. 103,264. (No model.)

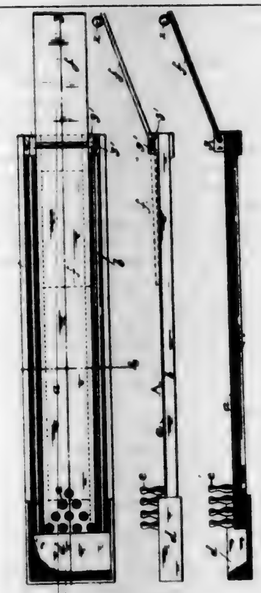
Claim.—1. In a lamp, the combination, with a suitable battery-receptacle, and an electric battery therein, of a cap on said receptacle, a head on said cap, a stem extending from said head, a lamp-body secured to said stem, a burner screwing into said lamp-body, a base arranged horizontally on said lamp-body at the upper end of the same, a clamping-plate, screws securing said plate to said base, an insulated contact-pin clamped in vertical position between said base and plate, and extending upwardly above the same, a conducting-wire attached to said pin and extending from the same to the battery, a base arranged horizontally on said burner, a clamping-plate, screws securing said plate to said base, a contact-piece, of spring metal, composed of an insulated upper portion clamped in approximately vertical position between said base and plate, and a lower portion extending horizontally from said upper portion and curved concentrically with the burner, a resistance-wire supported on the burner adjacent the wick, and a conductor connecting said resistance-wire with the insulated upper portion of said contact-piece, substantially as set forth.

2. In a lamp, the combination, with a suitable battery-receptacle, and an electric battery therein, of a lamp-body, a burner for the same, a wick-tube extending vertically through said burner, a wick in the wick-tube, a post attached to said wick-tube, a guard attached to said wick-tube, an insulated conductor in said guard, said wick-tube being provided in its side wall between said post and the upper end of the conductor with a notch extending downwardly from the upper end of the tube, and a resistance-wire extending between said post and conductor and in contact with or adjacent said wick at the notch, substantially as set forth.

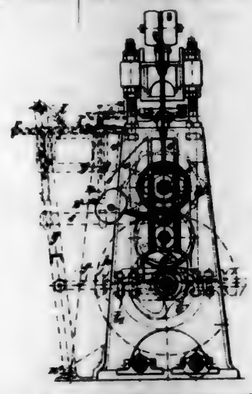
706,925. TOY BOWLING-ALLEY. FRANK W. GIBSON, St. Louis Mo. Filed June 5, 1901. Serial No. 63,295. (No model.)

Claim.—In a toy bowling-alley, a bed composed of a single board and having side gutters fixed thereto on its under side, the said gutters being U-shaped in cross-section and having their inner legs flush with the side edges of the bed, substantially as described.

706,925.



706,926. TILE-PRESS. XAVIER P. GILARDONI, Chatey-le-Rat, France, assignor to Ste Dite Gilardoni Fils, A. Brault et Cie., Chatey-le-Rat, France. Filed Nov. 12, 1901. Serial No. 82,083. (No model.)



Claim.—1. A tile-press comprising, a frame, a mold-section carried thereby, a rotary mold-carrier adapted to carry a plurality of mold-sections, means for rotating the mold-carrier at intervals, means for raising and lowering the mold-carrier toward and from the first-named mold-section, a molding-fork coacting with the mold-sections and means for actuating the said fork, substantially as described.

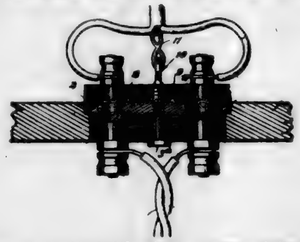
2. A tile-press comprising, a frame, a stationary mold-section, vertically-movable slides mounted in the sides of the frame, a horizontal rotary polygonal mold-carrier mounted in said slides, means for rotating said polygonal mold-carrier to bring its faces successively under the stationary mold-section, means for raising the said carrier toward the fixed mold at intervals a molding-fork movable vertically with the said carrier and also movable horizontally to coact with the mold-sections, and means for so actuating said fork; substantially as described.

3. A tile-press comprising, a frame, a stationary mold-section thereon, vertically-movable slides on the frame, a polygonal mold-carrier journaled in said slides and provided with an operating star-wheel, a shaft provided with a cam for rotating the star-wheel to bring its faces successively under the fixed mold, and also provided with means for raising and lowering the polygonal mold; substantially as described.

4. A tile-press comprising, a frame, a mold-section thereon, a rotary polygonal mold-carrier, vertically-sliding bearings for said carrier, means for rotating the carrier to bring its faces successively under the first-named mold-section, means for raising and lowering the carrier, and a molding-fork coacting with the said molding-sections and means for actuating the fork; substantially as described.

5. A tile-press comprising, the frame, the upper mold-section, the polygonal mold-carrier therebelow, means for rotating the carrier to bring its successive faces under said mold-section, means for raising and lowering the polygonal carrier, a vertically-movable table, means for automatically raising and lowering the table, a horizontally-movable molding-fork mounted on said table, swinging arms or levers for moving the fork toward and from the mold-sections and a cam mechanism timed to actuate the fork; substantially as and for the purpose set forth.

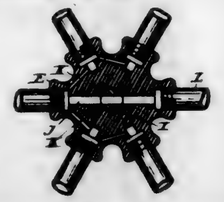
706,927. ELECTRICAL FLOOR-KEY. EZEKIEL C. GOODRICH, Houghton, Mich., assignor to himself and Nicholas Britz, Houghton, Mich. Filed Apr. 21, 1902. Serial No. 103,923. (No model.)



Claim.—1. An electrical floor-key, comprising a bottom plate provided with binding-posts insulated from each other and adapted to engage electric wires, a top plate provided with binding-posts insulated from each other and adapted to engage other electrical connections, a central link engaging said connections and also engaging said top plate, and snap-head contacts for temporarily connecting said binding-posts in said top plate with said binding-posts in said bottom plate.

2. An electrical floor-key, comprising a bottom plate provided with binding-posts insulated from each other and adapted to engage electric wires, a top plate provided with binding-posts insulated from each other and adapted to engage other electrical connections, a central link engaging said connections and also engaging said top plate, and a contact temporarily connecting each of said binding-posts in said upper plate with a binding-post in said lower plate, the arrangement being such that said contacts are detachable by strains upon said central link.

706,928. VALVE FOR GAS-FIXTURES. MICHAEL J. GRAHAM, Chicago, Ill., assignor to William G. King, Chicago, Ill. Filed Dec. 4, 1901. Serial No. 84,605. (No model.)

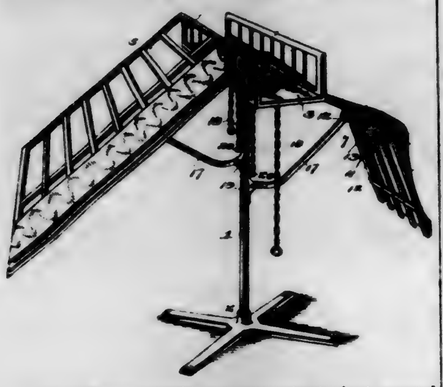


Claim.—A fitting for gas-fixtures comprising a shell made of a single piece of metal, provided with a plurality of gas-outlets and one gas-inlet, a conical valve mounted in the center of said shell, said valve being adapted to control the flow of gas through said fitting, and also adapted to be held to its seat by means of a screw in the small end of same, and said casing being provided with a gas-passage leading from said gas-inlet to said valve and also with a passage leading from said valve to one of said outlets, also with circumferential passages adapted to connect adjacent gas-outlets, to the end that all of said outlets will be supplied from the passage leading from said valve.

706,929. DISPLAY-RACK. BENJAMIN H. GRISWOLD, Pittsfield, Ill. Filed Feb. 6, 1902. Serial No. 92,834. (No model.)

Claim.—1. A display-rack comprising a post or pedestal, a head supported by the upper end of the post or pedestal, and a shelf consisting

of two parts arranged at angles to each other, one part being pivoted to the head, and a book-back-receiving frame for connecting the adjacent ends of the parts of the shelf together, substantially as set forth.



2. A display-rack comprising a post or pedestal, a head supported by the upper end of the post or pedestal, and a shelf consisting of two parts arranged at angles to each other, one part being pivoted to the head, a book-back-receiving frame for connecting the adjacent ends of the parts of the shelf together, and means for adjusting the shelf at various angles with respect to the post or pedestal, substantially as set forth.

3. A display-rack comprising a post or pedestal, a head supported at the upper end of the post or pedestal, a shelf consisting of two parts, one part hinged to the head, and combined book-supports and hinges, each consisting of a U-shaped frame having a lateral extension adapted to be secured to the inner part of the shelf, and a hinge extension adapted to be secured to the outer part of the shelf and provided with a stop adapted to abut against the U-shaped frame and support the outer part of the shelf at an angle to the inner part, substantially as set forth.

706,930. DISPLAY-RACK. BENJAMIN H. GREENAWAY, Pittsfield Ill. Filed Feb. 6, 1902. Serial No. 92,895. (No model.)

Claim.—1. In a display-rack of the character described, the combination with a post or pedestal, of a head secured thereto and consisting of side pieces 4 and a bottom piece 5 to form a tray, a shelf hinged at its forward end to the forward end of the head and adapted to serve as a cover for the tray, means for supporting the shelf in an inclined position, a second shelf, and book-holders connecting the second shelf with the head and adapted to receive and support the back of a book, and means for supporting the second shelf in an inclined position, substantially as set forth.

2. In a display-rack of the character described, the combination with a post or pedestal, of a head secured thereto and consisting of side pieces 4 and a bottom piece 5 to form a tray, a shelf hinged at its forward end to the forward end of the head and adapted to serve as a cover for the tray, means for supporting the shelf in an inclined position, a second shelf, and book-holders connecting the second shelf with the head and adapted to receive and support the back of a book, and means for supporting the second shelf in an inclined position, said means comprising a transversely-disposed shaft having a crank-arm slidably connected to the said second shelf, a hand-wheel for operating the shaft and provided with a ratchet, and a spring-pawl for engaging said ratchet, substantially as set forth.

706,931. CIGARETTE-FORMER. GEORGE S. HAMMOND, Chicago, Ill. Filed Oct. 15, 1901. Serial No. 78,637. (No model.)

Claim.—1. In a cigarette-former, the combination of a body or trough, a flap hinged to one edge of the body or trough, and end plugs or stops, one of which is adjustable for spacing the distance to suit the requirements of and furnish abutments for the ends of different lengths of paper, substantially as described.

2. In a cigarette-former, the combination of a body or trough for receiving the paper and tobacco, and a plug or stop at each end of the body or trough, for forming an abutment for each end of the paper against escape of tobacco in shaping the cigarette, one of the plugs being adjustable to vary the length of space in the body or trough, substantially as described.

3. In a cigarette-former, the combination of a body or trough for receiving the paper and tobacco, a clasp or socket at each end of the body or trough, and a plug or stop carried by each clasp or socket and forming an abutment for each end of the paper and the tobacco in shaping the cigarette, one of the plugs being adjustable to vary the length of space in the body of the trough, substantially as described.

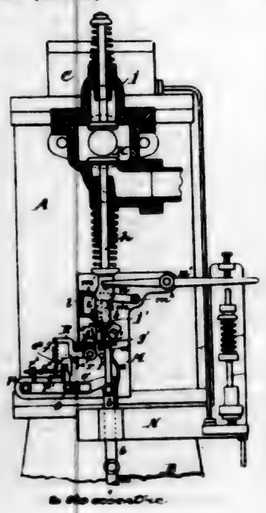
4. In a cigarette-former, the combination of a body or trough for receiving the paper and tobacco, a clasp or socket at each end of the body or trough, one of which is hinged to the body or trough, and a plug or stop carried by each clasp or socket and forming an abutment for each end of the paper in shaping the cigarette and permitting the withdrawal of the cigarette by swinging the hinged clasp or socket out of line of the end of the body or trough, substantially as described.

5. In a cigarette-former, the combination of a body or trough, a flap hinged to one edge of the body or trough, a clasp or socket at each end of the body or trough, and a plug or stop carried by each clasp or socket and forming an abutment for each end of the paper in shaping the cigarette and for the inner face of the end of the flap, substantially as described.

6. In a cigarette-former, the combination of a body or trough, a flap hinged to one edge of the body or trough, a clasp or socket at each end of the body or trough, a plug or stop carried by each clasp or socket, one plug or stop adjustable in its clasp or socket for spacing the distance between the plugs or stops to furnish abutments for the ends of papers of varying lengths, substantially as described.

7. In a cigarette-former, the combination of a body or trough receiving the paper and tobacco, a flap hinged at one edge of the body or trough, a clasp or socket at each end of the body or trough, and a plug or stop adjustably carried by each clasp or socket for spacing the distance between the plugs or stops to furnish abutments for the ends of papers of different lengths, substantially as described.

706,932. VALVE MECHANISM FOR EXPLOSIVE-ENGINES. RASMUS P. HANSEN, Brønderup Støre, Denmark. Filed May 4, 1900. Serial No. 715,671. (No model.)



Claim.—1. In an explosive-motor, the combination with the cylinder, the admission and inlet valves, a rod operated from the crank-shaft of the motor making two rearward reciprocations to each opening of the admission-valve, a petroleum-pump, an operating-lever therefor, a head carried by the stem of the admission-valve, means carried by the head coacting with the lever to operate the same as said head is raised, means carried by said rod for lifting said head, and speed-regulating mechanism operated by said reciprocating rod, adapted to coact with said head independent of said means carried by the rod, substantially as described.

2. The combination in an explosive-motor with the admission-valve, and stem carrying the same, and a reciprocating rod, of a head secured to the valve-stem, means carried by the reciprocating rod coacting therewith to lift the same to open said valve, means for returning the valve and speed-regulating mechanism independent of the means carried by the rod and operated from said rod also adapted to engage said head to prevent the return of the valve, substantially as described.

3. The combination in an explosive-motor, with the admission-valve and stem carrying the same and the reciprocating rod of a head carried by said stem, an arm oscillated by the rod, a governor-arm pivoted thereto, a second arm adapted to be engaged by the governor-arm whereby the same is tilted on one stroke of the piston-rod, and a block yieldingly connected to said arm adapted to coact with the head on the valve-stem, substantially as described.

706,933. ATTACHMENT FOR SUSPENDERS. CHARLES R. HARER, Williamsport, Pa., assignor of one-half to Joseph B. Austrian, New York, N. Y. Filed Feb. 24, 1902. Serial No. 95,304. (No model.)

Claim.—1. The combination with a frame of metal in the form of an elongated endless loop the ends of which project inward toward each other, of a clamping-lever hinged to corresponding sides of said ends, the gripping edge of the lever coöperating with the main portions of the frame to clamp the suspender-strap.

2. An attachment for suspenders comprising a frame of wire having the form of an elongated endless loop, the sides of which are parallel and the ends of which project inwardly toward each other parallel with and opposite the intermediate portion and a sufficient distance therefrom to allow space for the passage of a suspender-strap between the central portion and the ends, in combination with a clamping-lever hinged to corresponding sides of the two ends and provided with a gripping edge which coöperates with the intermediate portion of the frame to clamp the suspender-strap between them.

3. The combination with a frame of wire in the form of an elongated endless loop the ends of which project inward toward each other, of a clamping-lever hinged to one strand of the ends, its gripping edge coöperating with the main portion of the frame to clamp the suspender-strap.

4. The combination with a frame of wire in the form of an elongated endless loop, the ends of which project inward toward each other, said ends having shoulders, of a clamping-lever hinged to one strand of the ends, its gripping edge coöperating with the main portion of the frame to clamp the suspender-strap.

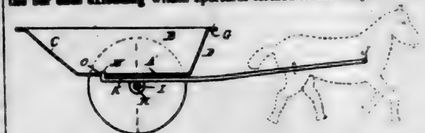
5. The combination of a frame composed of a single piece of wire in the form of two parallel bars connected together at their ends, these end portions projecting inwardly parallel with the intermediate portion and a sufficient distance therefrom for the passage of a suspender-strap therebetween, of a clamping-lever having bearings mounted on corresponding strands or wires of said ends and provided with a gripping edge which coöperates with the intermediate portion of the frame to clamp the suspender-strap.

6. The combination with a wire frame, the wire of which is in the form of an endless elongated loop the ends of which loop bend toward each other, of a clamping-lever hinged to one wire of each end and resting on the opposite wire of each end when in clamping position.

706,934. TOY CART. FRANK H. HARER, Toledo, Ohio. Filed Mar. 18, 1901. Renewed June 12, 1902. Serial No. 111,312. (No model.)

Claim.—1. A toy vehicle, comprising a body, an axle therefor beneath the body, a draft member interposed between the body and axle and extending to the rear of the latter, said draft member being immediately adjacent to the body and fulcrumed upon the axle to support the forward and rear portions of said body, and vertical connections between the rear end of the draft member and the vehicle-body.

2. A toy vehicle, comprising a body, axle-bearings projecting below the body, an axle mounted in said bearings, a U-shaped draft-bar having its ends arranged beneath the rear portion of the body and extending forwardly intermediate the latter and the axle, and vertical projections on the bar ends extending within apertures formed in the body.



3. A body for toy vehicles, comprising a bottom section, upwardly-extending end members therefor, flanges projecting laterally from the upper edges of said members and extending beyond the opposite ends thereof, and vertical side sections having lateral flanges at their free edges extending beneath and bearing against the flange extensions upon the ends.

4. In a toy vehicle, the combination with a bottom section, upwardly-extending sides and ends therefor and integral therewith, and drop-bearings for the axle comprising oppositely arranged and apertured ears struck out from the bottom section in proximity to the sides of the latter and an axle-journal within the bearings.

706,935. PLOW-BRACE. DAVID W. HARER, Alamo, Tenn. Filed Mar. 18, 1902. Serial No. 98,866. (No model.)

Claim.—1. In a brace for plows, the combination with a plow-beam, a plow-standard and a colter-standard held in the socket or receptacle of the plow-beam, of a brace connected to the colter-standard and running through the plow-beam and through the plow-standard and connected thereto.

2. In a brace for plows, the combination with a plow-beam, a plow-standard, and a colter-standard held in the socket or receptacle of the plow-beam, of a brace having a loop or yoke which embraces the colter-standard, said brace running through the plow-beam and through the plow-standard, adjustable taps on the brace and on opposite sides of the plow-standard, and an adjustable tap on the brace and bearing against the plow-beam.

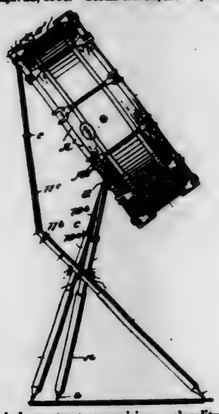
706,936. CASE AND BUTT-CUTTER FOR CIGARS. WILLIAM HEWLEY, Jackson township, Lebanon county, Pa., assignor of one-half to Henry R. Miller, Rehrersburg, Pa. Filed May 26, 1902. Serial No. 109,260. (No model.)

Claim.—1. A cigar-butt cutter, comprising a body-block having a channel in its upper face, a gage-bar crossing said channel, two cutting-blades, one blade having a guide thereon to slidably support the other blade, a spring pressing upon one cutting-blade for separating the cutting edges of both blades, a rockable handle-lever, a rock-arm on the lever, and

two link-bars pivoted at their ends on the rock-arm and cutting-blades for their reciprocal movement toward each other.

2. A cigar-bunt cutter, comprising a body-block, a face-plate held at one end of the body-block, a gage-bar adjustably held upon the body-block, two cutting-blades, each having a V-shaped notch adapted to form an angular cutting edge, guides on the face-plate wherein one cutting-blade is held to slide, means for slidably supporting the other cutting-blade so that it may be reciprocated on the first-mentioned cutting-blade, a fulcrum-stud projected from the face-plate through a slot in one of the cutting-blades, a connected rock-arm and handle-lever held to rock on the fulcrum-stud, two link-bars pivoted upon the ends of the rock-arm and respectively upon the cutting-blades, and a spring adapted to normally press the cutting edges of the blades apart.

706,937. DRUM-STAND. ALBERT B. HELLEBRAND, Cleveland, Ohio. Filed Apr. 26, 1901. Serial No. 57,626. (No model.)



Claim.—1. A drum-stand, comprising a plurality of longitudinally-adjustable legs, and clamping devices for pivotally connecting one end of each leg with a drum-hoop, the said legs when in contracted position being adapted to fold upon the drum, inside of the hoop, the clamping devices being arranged to engage and hold the legs in the folded position.

2. A drum-stand, comprising a plurality of longitudinally-adjustable legs, and a clamping device on one end of each leg, adapted to be detachably secured on the edge of a hoop on a drum.

3. A drum-stand, comprising three longitudinally extensible and contractible legs, means for holding said legs crossed intermediate of their ends, when the legs are extended, and clamping devices for securing said legs at one end on the hoop of a drum so as to flex thereon, the said legs when in the contracted position being arranged to fold upon the drum and adapted to be held in folded position by engagement with the clamping devices.

4. A drum-stand, comprising three legs, each composed of a plurality of telescoping sections, a jointed clamping device on the outer end of the top section of each leg, and a coupling device adapted to hold the legs crossed intermediately of their ends.

5. A drum-stand, comprising three legs, two of said legs having three sections and one of said legs five sections, all the legs having their sections telescopically engaged, a point on the lower end of each leg, a jointed clamping device on the upper end of each leg, and a coupling device adapted to hold the legs crossed intermediately of their ends.

6. A drum-stand, comprising three legs, two of said legs having three sections and the other leg five sections, two intermediate sections of the longer leg being hinged together, all the legs having their sections telescopically engaged, a point on the lower end of each leg, and a coupling device adapted to hold the legs crossed intermediately of their ends.

7. The combination with a hoop on one end of a drum, of a three-legged stand, the legs of which are formed of sections telescopically engaged, a clamping device on one end of each leg, said clamping devices being adapted to be secured on the drum-hoop, and a coupling device adapted to hold the legs crossed when the stand is erected to form a tripod, said legs in contracted form being adapted to fold flat upon the drum inside of the hoop to which they are secured.

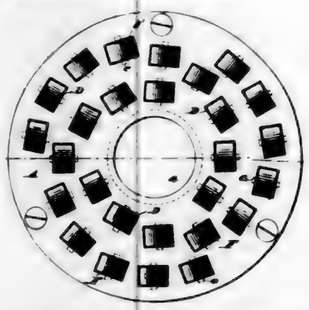
8. The combination with a hoop on one end of a drum, of a stand comprising a plurality of longitudinally-adjustable legs, and means for connecting one end of the legs with the drum-hoop, the said legs when in contracted form being adapted to fold upon the drum inside of the hoop.

9. In a drum-stand of the character described, the three telescoping legs, a clamping device for each leg, adapted to secure an end of the leg upon the hoop of a drum, a securing device adapted to hold the legs crossed when the frame is erected in tripod form, and a clamping-spring on one clamping device for holding the leg-securing device when the stand is not in use.

10. The combination with a hoop on one end of a drum, of a stand comprising three adjustable legs, a clamping device on one end of each leg, the said clamping devices being secured to the hoop at equal distances apart, the said legs being mounted to rock on the clamping devices, and adapted when in contracted form to fold upon the drum inside of the hoop, and means for holding the legs in the folded position.

11. A drum-stand, comprising a plurality of longitudinally-adjustable legs, and clamping devices adapted to be secured to a drum-hoop and on which one end of the legs are mounted to rock, the other end of each leg being pointed, the said legs being adapted when in contracted form to fold upon the drum inside of the hoop, and the clamping devices being provided with recesses adapted to receive the pointed ends of the legs.

706,938. BEARING. ELI R. HENDRICK, Carbondale, Pa. Filed Apr. 17, 1901. Serial No. 56,228. (No model.)



Claim.—1. In a bearing, the combination with two parallel separated disks, having mortises formed therein at varying distances from the center thereof, of rolls mounted between said disks, and the peripheries of which extend through and beyond said mortises and pins or studs upon said rolls, substantially as described.

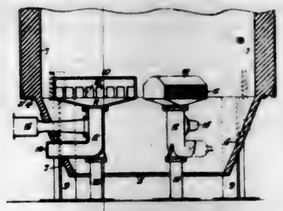
2. In a bearing, the combination with two parallel disks separated to form a recess and having mortises arranged at varying distances from the center thereof, of rolls provided with studs or gudgeons located in the recess between said disks, said rolls having movement in said mortises and said recess, substantially as described.

3. In a bearing, the combination with two parallel separated disks, having mortises formed therein, the major axes of said mortises being substantially at right angles to the radii of said disks, of rolls located in said mortises and having studs or gudgeons located in the recess between said disks, substantially as described.

706,939. GAS-PRODUCER. JAMES A. HERRICK, Philadelphia, Pa. Filed Dec. 14, 1901. Serial No. 86,201. (No model.)

Claim.—1. A gas-producer open at the bottom for the direct downward discharge of ashes and having in the lower portion of the same a series of blast-boxes, separated from each other at the center of the producer so as to provide between their inner ends an intermediate space for the descent of ashes and clinkers, substantially as specified.

2. A gas-producer open at the bottom for the direct downward discharge of ashes and having in the lower portion of the same a series of blast-boxes which do not extend outwardly to the lining of the producer so as to provide for the descent of ashes and clinkers between said lining and the outer ends of the blast-boxes, substantially as specified.



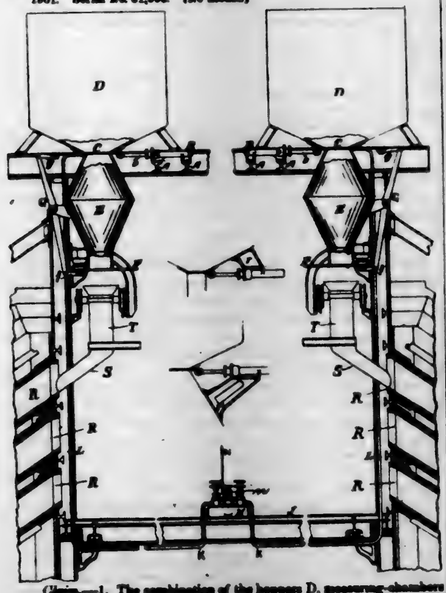
3. A gas-producer open at the bottom for the direct downward discharge of ashes and having in its lower portion a series of blast-boxes separated from each other at their inner ends and terminating some distance from the lining of the producer so as to provide for the descent of ashes between their inner ends and also between their outer ends and said lining, substantially as specified.

4. A gas-producer open at the bottom for the direct downward discharge of ashes and having in its lower portion a series of blast-boxes disposed between the center and the walls of the producer and above the open bottom of the producer and each provided with a central blast-pipe leading downwardly from the bottom of the box, substantially as specified.

5. A gas-producer open at the bottom for the direct downward discharge of ashes and having a series of blast-boxes located in the lower portion of the same and above the open bottom and disposed between the center of the producer and the lining, each of said boxes having side outlet-openings and a central air-blast pipe leading downwardly from the bottom of the box, substantially as specified.

6. The combination with a gas-producer, of a blast-box located in the lower portion of the same, an air-supply pipe communicating with the bottom of said box, said air-supply pipe comprising a vertical member connected to the bottom of the box and a horizontal member connected to said vertical member by an elbow and projecting outwardly through the wall of the ash-hopper, and an air-blast-supply pipe located above and vertically in line with the said horizontal member and communicating with the said vertical member of said air-supply pipe at a point above the said elbow, substantially as described.

706,940. MECHANISM FOR MEASURING COAL TO GAS-RETORTS. WALTER R. HERRIES, Edinburgh, Scotland. Filed Nov. 4, 1901. Serial No. 81,068. (No model.)



Claim.—1. The combination of the hoppers D, measuring-chambers E, coupled slides C and F hydraulic cylinders B having piston-rods *b* connected with the slides C for operating them, pipes L conveying operating-pressure to the several cylinders B; valves 1, 2, 3, &c., controlling the supply of fluid under pressure through the pipes L to the several cylinders B, water-supply valve M and operating-lever N, substantially as and for the purposes set forth.

2. The combination of hoppers D, measuring-chambers E, coupled slides C, F, hydraulic cylinder B having piston-rods *b* connected with the slides C for operating them, pipes L conveying operating-pressure to the several cylinders B; valves 1, 2, 3, &c., controlling the supply of fluid under pressure through the pipes L to the several cylinders B, water-supply valve M and operating-lever N, substantially as and for the purposes set forth.

3. The combination of hoppers D, measuring-chambers E, coupled slides C and F, hydraulic cylinders B, piston-rods *b* connected to the slides C, connecting-pipes L, pressure connection l^2, exhaust connection l^3, paired valves 1, 2, 3, 4, 5, 6, operating-lever N, rock-shaft *n*, arm *n'* carried thereby and pressure and exhaust valves n^2 operated by said arm, substantially as set forth.

706,941. TROLLING-BAIT. JOHN J. HILDEBRANDT, Logansport, Ind. Filed Nov. 21, 1901. Serial No. 83,115. (No model.)

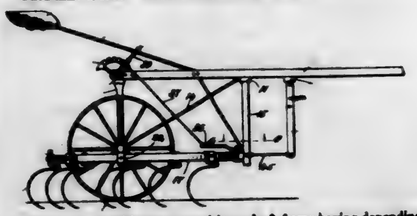
Claim.—1. A device of the class described having a stem carrying the artificial bait, and a flat metallic plate having a direct connection with said stem and projecting solely from one side thereof to constitute a keel.

2. In a trolling-bait, the bait-stem having a looped offset, and a keel-piece consisting of a flat plate doubled over said stem and clinched into the looped offset thereof, said keel-piece having a projection solely at one side of the stem to constitute a keel for the bait.

3. A trolling-bait having a bait-stem carrying the spoons and the hook, and a keel-piece rigid with the stem and interposed between the spoons.

4. A trolling-bait having a single-length bait-stem carrying the hook, and a pair of spoons loose thereon, and a plate having a non-rotative connection with the stem between the spoons and projecting at one side of the stem to operate as a keel to prevent turning of the stem.

706,942. CULTIVATOR. FRANK G. HAAS, Battlebrook, Mich. Filed Mar. 4, 1902. Serial No. 96,610. (No model.)



Claim.—1. A cultivator, comprising a draft-frame having depending hangers, side frames connected to said hangers, a removable frame-section having rearwardly-diverging arms attached to said side frames and having a forwardly-extending arm between the side frames, draft connections attached to said arm of the removable frame-section and to the hangers, and teeth secured to the side frames and the frame-section.

2. A cultivator, comprising a draft-frame having depending hangers, horizontal bolts secured in the lower parts of the hangers, rockable sleeves fitted individually on the bolts, shiftable collars fitted on said sleeves for adjustment lengthwise thereof and each having means for clamping the same fast with the sleeve to turn therewith, toothed frames having pivotal connection with the collars, and means for lifting said frames.

3. In a cultivator, the combination of a hanger formed by a pair of members, a horizontal bolt secured in said members of the hanger, a sleeve fitted loosely on the bolt and disposed between the members of the hanger, a collar shiftable lengthwise on the sleeve and having a clamp

for making the collar fast with the sleeve, a toothed frame, and a transverse pivotal connection between the collar and the frame.

4. In a cultivator, the combination with a hanger-supported sleeve, of a clip having a pivotal connection with said sleeve, a bowed toothed frame confined in said clip, and a lifting-arm having a pivotal and shiftable engagement with the clip.

5. In a cultivator, the combination with a sleeve, and a collar, of a clip united by a transverse pivot to the collar and having a lip or flange, a frame attached to the clip, and a lifting-arm connected to said transverse pivot and shiftably engaging with the flange of the clip.

6. A wheeled cultivator having a hanger-supported clip, a tooth-carrying frame attached to the clip, and a lifting-arm having a pivotal and shiftable connection with the clip.

7. A wheeled cultivator provided with a hanger, a collar supported therein and provided with an arm, a flanged clip pivoted to said arm of the collar, a tooth-carrying frame confined in the clip, a lifting-arm fitted to the pivotal bolt of the clip and having a finger which engages with said clip, and means for raising said lifting-arm.

706,943. DERRICK. ALVIN HOGGSON, South Ottumwa, Iowa. Filed Mar. 14, 1902. Serial No. 98,186. (No model.)

Claim.—In a derrick, a base comprising bottom rails, standards on the rails, a table supported on the standards and having an opening, a post having a step-bearing in the bottom rails, a plate secured to the post and having a bearing in said opening, a beam mounted to swing on the post, a winding-drum carried by the post, and rope connections between said drum and the end of the beam, substantially as specified.

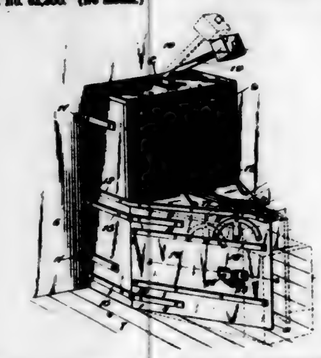
706,944. PNEUMATIC-TIRE VALVE. HAROLD W. ROGERS, New Haven, Conn., assignor of one-half to William J. Hodgetts, Wallingford, Conn. Filed Dec. 23, 1901. Serial No. 86,582. (No model.)

Claim.—1. In a valve for pneumatic tires, the combination with a tubular valve-body containing a valve-chamber formed at its outlet end with two annular valve-seats located one above the other, and one being larger in diameter than the other, of a ball-valve located in the said valve-chamber and adapted in diameter to be seated upon both of the said valve-seats, a tubular stem formed with a hub to which the said valve-body is secured, and with a grooved flange the groove of which receives the lower end of the said valve-body, a packing-washer located at the bottom of the groove in the said valve and prevented from being squeezed outwardly by the outer wall of the said groove, and means located in the longitudinal passage of the said stem for preventing the ball-valve from closing the said passage.

2. In a valve for pneumatic tires, the combination with a valve-body provided with a valve-chamber having a valve-seat at its outlet end, a cap for the said valve-body, a ball-valve located in the said chamber, a tubular stem formed with a hub to which the said valve-body is secured, and which contains a concavity adapted to receive the ball-valve and leading into the longitudinal passage of the stem, and a staple-shaped finger located in the said concavity and passage and preventing the ball-valve from seating upon the walls of the concavity so as to close the said passage.

3. In a valve for pneumatic tires, the combination with a valve-body containing a valve-chamber formed with a valve-seat, of a valve located within the said chamber, a stem to which the said valve-body is secured and which is formed with a longitudinal passage, and a finger adapted to be entered into the said passage in which it is retained by friction, and to prevent the valve from entirely closing the said passage when not on its seat.

706,945. MEANS FOR AUTOMATICALLY CLOSING SWINGING DOORS. EDWARD F. HUBER, Springfield, Mo. Filed May 20, 1901. Serial No. 62,380. (No model.)



Claim.—1. The combination with an apertured wall of an ice-holding vault or the like, of a box-like antechamber in communication with said vault-opening and having an exit-opening that allines with the vault-opening, hinged twin doors arranged to normally seal said exit-opening from the antechamber into the vault, and means for automatically closing said doors after the passage of an ice block through said chamber, substantially as described.

2. The combination with an apertured wall of an ice-holding vault or the like, of a box-like antechamber in communication with said vault-opening and provided with an exit-opening that allines with the vault-opening, a wing-wall extended over said exit-opening of the antechamber, twin doors disposed in converging relation and mounted to swing toward or from the wing-wall, and means for automatically closing said doors, substantially as described.

3. The combination with an apertured wall of an ice-holding vault or the like, of a box-like antechamber in communication with said vault-aperture and having an exit-opening in line with the vault-aperture, a wing-wall projected over said outlet-opening in the antechamber, converging twin doors hold to swing toward and from each other, and when closed having their upper edges closely contacting with the wing-wall, and their forward edges sealed by a joint strip when in contact, and means to automatically close the doors, substantially as described.

4. The combination with a vault-wall having an inlet-opening, of a box-like antechamber in communication with said opening and provided with an exit-opening in allinement with the vault-opening, converging doors arranged to normally swing inwardly and to lie in the path of blocks of ice which are adapted to traverse said antechamber, and means for automatically closing said doors across the exit-opening from the antechamber, substantially as described.

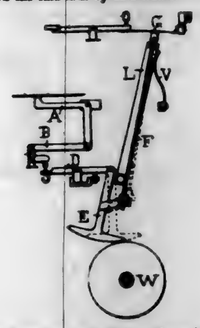
5. The combination with a vault-wall having an inlet-opening, of a box-like antechamber in communication with said opening and provided with an exit-opening in allinement with said vault-opening, converging doors arranged to swing inwardly toward each other and provided on the facing surfaces with yieldable buffers that lie in the path of blocks of ice arranged to traverse the antechamber and to impinge said buffers, and means for automatically closing said doors across the exit-opening from the antechamber, substantially as described.

6. In combination with a wall having an opening therein, a horizontally-disposed wing-wall projecting inwardly from said wall, twin doors arranged normally in converging relation and lying in the path of objects which pass through said wall-opening, and means for automatically closing said doors toward the wing-wall and toward each other.

706,946. MECHANISM FOR EFFECTING VARYING TOUCH OF KEY OR MUSICAL INSTRUMENTS. LUDWIG HUPFELD, Leipsic, Germany. Filed Jan. 8, 1901. Serial No. 42,521. (No model.)

Claim.—1. A musical instrument embodying a key, an arm free at one end, said free end bearing against the key, a pivotally-supported frame, means to control the position of the frame, and a pusher for engaging said arm, guided toward the said arm by said frame.

2. A musical instrument embodying a key, a spring-arm free at one end, said free end bearing against the key, a pivotally-supported frame, means to control the position of the frame, and a pusher for engaging said arm, guided toward the said arm by said frame.



3. A musical instrument embodying a key, a yieldable arm one end free and said free end bearing against the key, a swinging frame, a spring bearing against said frame, means to move the frame in opposition to its spring, and a pusher to engage the arm, guided by said frame.

4. A musical instrument embodying a key, a yieldable arm bearing against the same, a swinging frame, a pusher for said arm guided by said frame a spring bearing against said frame, two operatively-connected levers one of which is attached to said frame, and a note-disk controlling the other lever.

5. In a musical instrument, the combination with the note-striking mechanism, of a spring through the medium of which said striking mechanism is actuated; and means to vary the operative length of such spring.

6. In a musical instrument, the combination with the note-striking mechanism; of a spring through the medium of which the said striking mechanism is operated, a striker arranged to operate on such spring and actuate the note-striking mechanism through the medium thereof; and means for altering the position of the striker relatively to the spring so as to vary the strength thereof.

7. In a musical instrument, the combination of a note-striking mechanism; a spring through the medium of which said striking mechanism may be operated; a mechanical striker arranged to operate on said spring and actuate the note-striking mechanism through the medium thereof; and means for shifting the striker relatively to the spring so as to vary the operative length and consequent strength of the latter.

706,947. SASH-LOCK. HOAS M. HUTTON, Chicago, Ill. Filed May 5, 1902. Serial No. 106,092. (No model.)

Claim.—1. A burglar-proof lock for window-sashes, comprising in combination with the rack-bar secured to the sash, a swiveled locking-lever carried by the meeting-rail of the sash, and means for gripping the opposite edges of the rack-bar to hold the sash locked together, as set forth.

2. A sash-lock, comprising in combination with a rack-bar, adapted to be attached to the sash of a window, a swiveled locking-lever mounted on the meeting-rail of the sash, and provided with a recessed portion having an inclined or cam-outlined wall adapted to receive one of the teeth of the rack-bar, and means actuated by said lever for gripping the opposite edge of the rack-bar, as set forth.

3. A sash-lock, comprising in combination with the rack-bar secured to the sash of a window, a swiveled locking-lever having a recess, the wall of which is inclined and adapted to receive one of the teeth of said rack-bar, and a second pivotal lever actuated by the first lever and adapted to grip the outer edge of the rack-bar, as set forth.

4. A sash-lock, comprising in combination with a rack-bar secured to the sash of a window, a swiveled lever having a recess adapted to receive one of the teeth of said rack-bar, a lug projecting from said lever, a pivotal hooked lever having a recess engaged by said projection and adapted to be rotated as said pivotal lever is swung upon its pivot, as set forth.

706,948. STAY-WIRE TIE. JOHN IMBLER, Clay township, Hamilton county, Ind. Filed Mar. 17, 1902. Serial No. 98,543. (No model.)

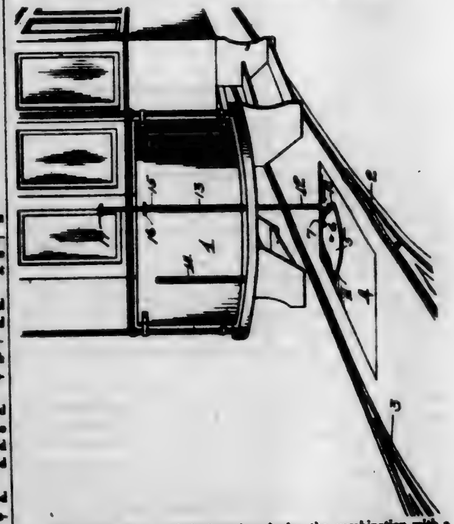
Claim.—1. A tie for crossing portions of wire fences, said tie consisting of a length of wire engaging one of the crossing wires near its middle; its ends wrapped about the other crossing wire upon opposite sides of the first wire; and then wrapped about the first wire on the opposite side of the second wire.

2. A tie for crossing portions of wire fences, said tie consisting of a length of wire engaging one of the crossing wires near its middle; its ends wrapped about the other crossing wire upon opposite sides of the first wire; and the said ends brought together upon the opposite side of the second wire and both wrapped about the first wire in the same direction.

706,949. LOOSE-SHEET BINDER. JAMES R. IRVINE, Kansas City, Mo., assignor of one-half to Joseph D. Havens, Kansas City, Mo. Filed Nov. 4, 1901. Serial No. 80,988. (No model.)

Claim.—In a loose-sheet binder, two members hinged to each other and provided each with a plurality of sheet-holding arms comprising each a sheet-metal body the lower end of which is provided with a plurality of projections extending through the body of the member for securing the arm thereto, and the upper portion of the said body curving upwardly toward the other member, the said arm above the upper edge of the member being, in cross-section concave on its upper and convex on its lower side, the arm being secured on the side of the member adjacent to the opposite member, substantially as described.

706,950. RAILWAY-SWITCH. CHARLES JOHNSTON, Memphis, Tenn. Filed May 3, 1902. Serial No. 105,899. (No model.)



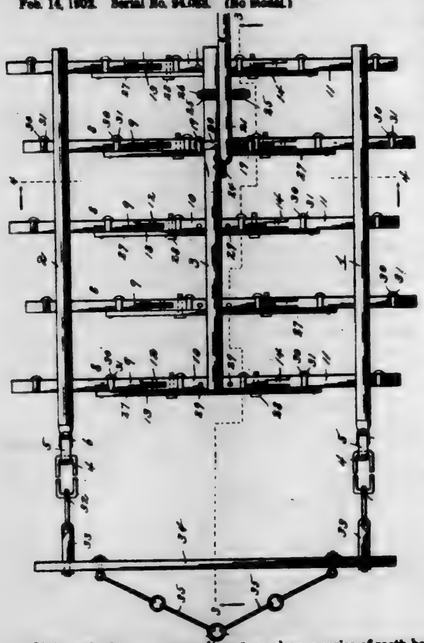
Claim.—1. In a switch-throwing device the combination with a throwing-lever a cam-bar pivoted to said lever a spring locking-bar, resting on said cam-bar, a locking-pin depending from said bar a switch-

throwing bar having holes therein to be engaged by said locking-pin, a slot in said throwing-bar and a pin in said throwing-bar and a pin in said throwing-lever a cam-plate having a pin depending therefrom to move said throwing-lever and means carried by the car for operating said cam-plate, substantially as shown and described.

2. In a switch-throwing device the combination with a depressed box, a throwing-lever in said box, a cam-bar operated by said lever, a locking-pin operated by said cam-bar, a switch-throwing bar, a slot in said bar and a pin in said lever having a limited motion in said slot, of a plate, pivoted on the top of said box a pin depending from said plate to operate said throwing-lever and means carried by the car of rotating said plate, substantially as described.

3. In a switch-throwing device the combination with a throwing-lever, a bar connecting said lever with the switch point and a cam-plate operating said lever, of the car, two tubular holders on the front of said car, a rod having a spring thereon resting in one of said holders and removable therefrom, and projecting through said holder, substantially as and for the purposes set forth.

706,951. HARROW. MORRIS E. JOHNSON, Laurel, Nebr. Filed Feb. 14, 1902. Serial No. 94,063. (No model.)



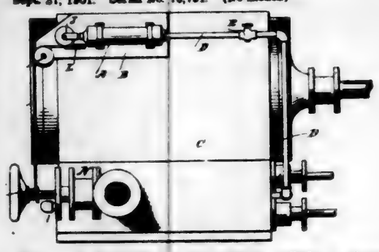
Claim.—1. A harrow comprising frame-bars, a series of tooth-bars each consisting of pivoted sections to adapt it to conform to inequalities of the ground-surface, the said tooth-bars being pivotally suspended from the frame-bars, and means for unitedly shifting the tooth-bars to rock them in relation to the frame-bars to vary the angle thereof and the teeth carried thereby.

2. A harrow comprising a plurality of pivotally-mounted tooth-bars which are adjustable to vary the angle of the teeth thereof relatively to the ground-surface, each of the said bars being made up of a series of pivoted sections and adapted to conform to irregularities in the contour of the ground-surface, and means for locking each tooth-bar to prevent the sections thereof from moving.

3. A harrow comprising a plurality of tooth-bars composed of pivoted sections, a locking-bar applied to each tooth-bar and pivoted at opposite extremities to the outer sections of said tooth-bar, and pins for insertion through the locking-bar and the intermediate section of the tooth-bar to prevent the sections of the latter from moving.

4. A harrow comprising a series of frame-bars, a plurality of tooth-bars pivotally suspended from the frame-bars, the said tooth-bars being composed of movable sections, means for adjusting all of the tooth-bars simultaneously to vary the angle of the teeth thereof relatively to the ground-surface, and means for locking the sections of the individual tooth-bars to prevent movement thereof.

706,952. ENGINE-STOP. HENRY JONES, Watertown, N. Y. Filed Sept. 27, 1901. Serial No. 76,791. (No model.)



Claim.—1. An engine-stop, comprising a cylinder, a pipe leading to the cylinder from a motive-agent supply, a valve in the said pipe, a piston reciprocating in the said cylinder, a flexible connection between the piston and the throttle-valve, a governor, and means for opening the said pipe-valve from the governor when the stem thereof drops, as set forth.

2. An engine, comprising a cylinder, a pipe leading to the cylinder from a motive-agent supply, a valve in the said pipe, a piston reciprocating in the said cylinder, a flexible connection between the piston and the throttle-valve, means for opening the said pipe-valve in case of an emergency, and a vacuum-breaker actuated with the said valve for breaking the vacuum in the condenser-pump to prevent the pump from pumping water into the cylinder, as set forth.

3. An engine-stop, comprising a cylinder, a pipe leading to the cylinder from a motive-agent supply, a piston reciprocating in the said cylinder and carrying at the outer end of its piston-rod a pulley, a flexible connection passing over the said pulley and secured at one end to a fixed part, the other end of the flexible connection winding on a pulley attached to the stem of the throttle-valve, a valve in the said supply-pipe, a governor, and means for actuating the said valve from the governor-stem to open the latter and allow steam to pass through the pipe into the said cylinder, as set forth.

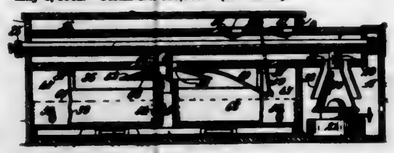
4. In an engine, the combination of a cylinder, a pipe leading to the cylinder from the motive-agent supply, a piston in the cylinder, a flexible connection between the piston-rod and throttle-valve stem, a valve in the motive-agent-supply pipe and provided with a lever on its stem, a governor, and an arm on the governor-stem and adapted to engage the lever of the valve-stem as set forth.

5. In an engine, the combination with a cylinder, a pipe leading to the cylinder from the motive-agent supply, a piston in the cylinder, a flexible connection between the piston-rod and the throttle-valve stem, a valve in the motive-agent-supply pipe and provided with a lever on its stem, a governor, and an arm on the governor-stem and adapted to engage the lever of the valve, of an exhaust-pipe, an air-valve connected with the exhaust, and a lever operated by the lever of the valve in the supply-pipe and operating the air-valve, as set forth.

6. In an engine, the combination with a cylinder, a piston reciprocating in the cylinder, and a connection between the piston and throttle-valve, for operating the latter from the former, of a pipe leading to the cylinder from the motive-agent supply, a valve in said pipe, means for automatically opening said valve in case of accident, and a vacuum-breaker actuated by the said valve whereby the vacuum will be broken at the time the steam is shut off, as set forth.

7. In an engine, the combination with a cylinder, a piston reciprocating in the cylinder, and a connection between the piston and throttle-valve for operating the latter from the former, of a pipe leading to the cylinder from the motive-agent supply, a valve in said pipe, a governor, means for operating said valve from the governor in case of accident thereto, and a vacuum-breaker, actuated from the said valve to break the vacuum at the time the valve is opened to admit the fluid agent to the cylinder, as and for the purposes set forth.

706,958. BROODER. WALTER P. JONES, Gloucester, Va. Filed May 8, 1902. Serial No. 106,288. (No model.)



Claim.—1. In a brooder, a pipe for carrying off products of combustion, extending through the upper part of the brooding-chamber, a lamp communicating with said pipe at a point intermediate its ends, a branch leading from said pipe at a point intermediate its ends, and removable caps on the opposite ends of said pipe, as and for the purpose set forth.

2. In a brooder, a lamp or heating device, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a branch leading from said pipe at a point intermediate its ends, a removable cap on one end of said pipe having a restricted opening therein and a contracted neck, and a second cap removably mounted on said neck.

3. In a brooder, a lamp, a vertically-movable pipe extending through the brooding-chamber for carrying off the products of combustion from said lamp, and a chimney for said lamp carried by said pipe and communicating with the interior thereof.

4. In a brooder, a lamp, a pipe extending through the brooding-chamber for carrying off the products of combustion from said lamp, a chimney for said lamp carried by said pipe and communicating with the interior thereof, a vertically-movable conduit in which said pipe is mounted, the said conduit surrounding said pipe and forming therewith an annular passage which communicates with the brooding-chamber, and a funnel carried by said conduit, surrounding said chimney and communicating with said passage, for the admission of fresh air thereto.

5. In a brooder, a casing having openings in the ends thereof, a lamp, a pipe extending through the brooding-chamber for carrying off the products of combustion from said lamp, a chimney for said lamp carried by said pipe and communicating with the interior thereof, a vertically-movable conduit in which said pipe is mounted, the said conduit extending through the openings in the ends of said casing, surrounding said pipe and forming therewith an annular passage which communicates with the brooding-chamber, a funnel carried by said conduit, surrounding said chimney and communicating with said passage for the admission of fresh air thereto, and a pivoted flap or filling-piece at the upper end of the opening in one of the ends of said casing, as and for the purpose set forth.

6. In a brooder, a floor for the brooding-chamber having a space beneath the same, a lamp, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, connections between said pipe and the space beneath said floor, extending vertically through the center of the brooding-chamber, a conduit surrounding said pipe, forming an annular passage, the said conduit being provided with an opening adjacent to said lamp for the admission of air and with an opening communicating with the brooding-chamber, and escape-passages to the atmosphere leading from the lower part of said brooding-chamber and from said space at the corners of the brooder.

7. In a brooder, a floor for the brooding-chamber having a space beneath the same, a lamp, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a chimney for said lamp carried by said pipe and communicating with the interior thereof, a slip-joint connection between said pipe and the space beneath said floor, a vertically-movable conduit in which said pipe is mounted, the said conduit surrounding said pipe, forming therewith an annular passage, and having an opening therein adjacent to said lamp for the admission of fresh air and a second opening communicating with the brooding-chamber, and escape-passages to the atmosphere leading from the lower part of said brooding-chamber and from said space.

8. In a brooder, a lamp or heating device, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a conduit surrounding said pipe, forming an annular passage, the said conduit being provided with an opening adjacent to said lamp for the admission of air and with an opening communicating with the brooding-chamber, and a deflector in the brooding-chamber adjacent to the latter opening.

9. In a brooder, a lamp or heating device, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a conduit surrounding said pipe, forming an annular passage, the said conduit being provided with an opening adjacent to said lamp for the admission of air and with an opening communicating with the brooding-chamber, and a hood-shaped deflector in the brooding-chamber having a tubular stem thereon which fits within the latter opening.

10. In a brooder, a hover in the brooding-chamber, having an opening in the top thereof, and a conduit for hot air communicating with said opening for introducing a current of warm air from above the hover downwardly through the upper part thereof.

11. In a brooder, a hover in the brooding-chamber, means for introducing a current of warm air through the upper part thereof, and a deflector within said hover for causing the downward movement of said current of air.

12. In a brooder, a conduit for heated air having an opening therein communicating with the upper part of the brooding-chamber, a hover in said chamber beneath said conduit and surrounding said opening, and a hood-shaped deflector within said hover having a tubular stem thereon, which fits within said opening.

13. In a brooder, a conduit for heated air having an opening therein communicating with the upper part of the brooding-chamber, and a hover in said chamber beneath said conduit and surrounding said opening, the said hover having its top or cover made in sections pivoted to said conduit.

14. In a brooder, a conduit for heated air having an opening therein communicating with the upper part of the brooding-chamber, and a hover in said chamber beneath said conduit and surrounding said opening, the said hover comprising two cover-sections hinged to opposite sides of said conduit, transversely-extending strips secured to the lower sides of said sections, projecting beyond the inner edges thereof, cut away to receive said conduit and bearing against the under side of said conduit, whereby said sections are supported, and a hover-cloth attached to and projecting down from the lower edges of said strips and from the outer edges of said cover-sections.

15. In a brooder, the combination with the floor of the brooding-chamber having a space beneath the same, a lamp, means for conveying the products of combustion from said lamp to said space, and means for admitting fresh air to said brooding-chamber, of compartments in the brooder-casing outside said chamber, the said compartments communicating with the lower end of the brooding-chamber and discharging at their upper ends into the atmosphere, and escape-flues leading from said space and extending through said compartments.

16. In a brooder, the combination with the casing thereof, a floor therein having a space beneath it, a lamp, means for conveying the products of combustion from said lamp to said space, and means for admitting fresh air to the brooding-chamber, of compartments at the corners of said casing separate from the brooding-chamber but communicating therewith at the lower end of the latter, and discharging at their upper ends into the atmosphere, and vertically-disposed escape-flues leading from said space and extending through said compartments.

17. In a brooder, the combination with the casing thereof, a floor therein having a space beneath it, a lamp, means for conveying the products of combustion from said lamp to said space, and means for admitting fresh air to the brooding-chamber, of diagonally-arranged vertically-disposed partitions at the corners of said casing, forming compartments separate from the brooding-chamber, the said partitions having openings communicating with the lower part of said brooding-chamber and discharg at their upper ends into the atmosphere, and vertically-disposed escaping-flues leading from said space and extending through said compartments.

18. In a brooder, the combination with the casing thereof, a floor therein having a space beneath it, a lamp, means for conveying the products of combustion from said lamp to said space, and means for admitting fresh air to the brooding-chamber, of chimneys carried by and extending through the top or cover of said casing at the corners thereof, diagonally-arranged vertically-disposed partitions in said casing, forming compartments beneath said chimneys, the said partitions having openings therein communicating with the lower part of said brooding-chamber, and vertically-disposed escape-flues in said compartments communicating at their lower ends with said space and projecting at their upper ends into said chimneys.

19. In a brooder, a lamp or heating device, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a conduit surrounding said pipe, forming an annular passage, the said conduit being provided with three openings, one adjacent to said lamp for the admission of air, one communicating with the brooding-chamber, and the third at a point between the other two, and a damper controlling the latter opening.

20. In a brooder, a lamp or heating device, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a conduit surrounding said pipe, forming an annular passage, the said conduit being provided with three openings, one adjacent to said lamp for the admission of air, one communicating with the brooding-chamber, and the third at a point between the other two, a damper controlling the latter opening, and a thermostat in the brooding-chamber connected with said damper for operating it.

21. In a brooder, a casing having openings in the ends thereof and a removable top, a hollow floor in said casing having exit-flues leading therefrom, a lamp, a pipe for carrying off the products of combustion from said lamp having a detachable connection with said hollow floor, and a conduit surrounding said pipe, fitting within the openings in the ends of said casing, and having openings therein, one communicating with the brooding-chamber and the other located adjacent to said lamp for the admission of air to said conduit, the said pipe and conduit being permanently secured to each other and removable from said casing.

22. In a brooder, a casing having openings in the ends thereof and a removable top, a removable hollow floor in said casing having exit-flues

leading therefrom, a lamp, a pipe for carrying off the products of combustion from said lamp having a detachable connection with said hollow floor, a conduit surrounding said pipe, fitting within the openings in the ends of said casing, and having openings therein, one communicating with the brooding-chamber and the other located adjacent to said lamp for the admission of air to said conduit, and a lamp-box, the said pipe, conduit and lamp-box being permanently secured to each other and removable from said casing.

23. In a brooder, a floor for the brooding-chamber having a space beneath the same, a lamp, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a perforated cap on the end of said pipe opposite said lamp, a branch leading from said pipe at a point intermediate its ends and communicating with the space beneath said floor, a conduit surrounding said pipe, forming an annular passage, the said conduit being provided with an opening adjacent to said lamp for the admission of air and with an opening communicating with the brooding-chamber, and escape-passages to the atmosphere leading from the lower part of said brooding-chamber and from said space.

24. In a brooder, a floor for the brooding-chamber having a space beneath the same, a lamp, a pipe extending through the upper part of the brooding-chamber for carrying off the products of combustion from said lamp, a removable cap on the end of said pipe opposite said lamp, a branch leading from said pipe at a point intermediate its ends and communicating with the space beneath said floor, a valve or cut-off in said branch, a conduit surrounding said pipe, forming an annular passage, the said conduit being provided with an opening adjacent to said lamp for the admission of air and with an opening communicating with the brooding-chamber, and escape-passages to the atmosphere leading from the lower part of said brooding-chamber and from said space.

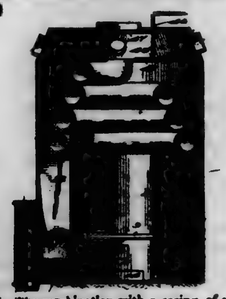
25. The combination with the brooding-chamber of a brooder, of a removable partition for dividing said chamber into a plurality of compartments.

26. The combination with the brooding-chamber of a brooder, having vertical openings in the floor thereof, of a partition for dividing said chamber into a plurality of compartments, the said partition having dowel-pins projecting from the lower edge thereof and adapted to fit within said openings.

27. In a brooder, the combination with the hollow floor of the brooding-chamber having a vertical pipe extending upwardly therefrom for conveying a heating medium to the interior of said hollow floor, of a partition for dividing the brooding-chamber into a plurality of compartments having means thereon for detachably connecting the same to said floor, the said partition comprising two sections and a semicircular flexible connecting-strap between said sections designed to embrace said pipe when the partition is in operative position.

28. In a brooder, a hover having the top or cover thereof made in sections pivoted to a common support and having openings therein for the admission of light to the interior of the hover.

706,954. HEATING AND VENTILATING APPARATUS. JOHN KALLGREN, New Haven, Conn. Filed Jan. 13, 1901. Serial No. 43,083. (No model.)



Claim.—1. The combination with a casing, of a fire-box therein inclosed by an air-chamber, an air-inlet to the chamber, a receptacle within the chamber adjacent to the inlet and adapted to contain water, a coil-pipe arranged above the fire-box and communicating with the interior of the air-chamber, a partition within the casing arranged about the outlet of the coil-pipe and means for closing said outlet.

2. The combination with a casing, of a fire-box therein, an air-chamber inclosing the fire-box, an air-inlet to said chamber, an ash-box, a smoke-chamber inclosing said ash-box, parallel flues communicating at their lower ends with the smoke-chamber, an inlet to one of the flues whereby the products of combustion from the fire-box are admitted thereto, outlets from said flues, means for closing the outlet in the flue communicating with the fire-box, a coil-pipe arranged above the fire-box and communicating with the interior of the air-chamber, an air-chamber within the top of the casing and above the fire-box, the coil-pipe opening into said chamber, an outlet from said chamber and means for closing the air-inlet and the said outlet alternately.

3. The combination with a casing, of a fire-box therein, an air-chamber inclosing the fire-box, an inlet to said chamber, a box inclosing the inlet, a door within said box, a receptacle within the air-chamber adjacent to the inlet, an ash-box, a smoke-chamber inclosing said ash-box, parallel flues communicating at their lower ends with the smoke-chamber, an inlet within one of the flues whereby the products of combustion from the fire-box are admitted thereto, an outlet from the remaining flue, a damper mounted adjacent to an aperture connecting the flues, said damper adapted to either close said aperture or the inlet-flue, a coil-pipe arranged above the fire-box and communicating with the interior of the air-chamber, an air-chamber arranged above the fire-box, said pipe opening therefrom, an outlet from the upper air-chamber and a damper within said chamber adapted to open and close the air inlet and outlet of said chamber alternately.

4. The combination with a heater, of a fire-box therein, an air-chamber inclosing the fire-box, an air-inlet to said chamber, a coil-pipe arranged above the fire-box and communicating with the interior of the air-chamber, an air-chamber arranged above the fire-box and adapted to receive air from the coil-pipe, an outlet from said chamber, a pipe inclosing and extending upward from said outlet, an air-inlet pipe communicating with the inlet of the heater, and air-distributing pipes extending from the sides of the upper air-compartment of the heater, and provided with outlets.

5. The combination with a heater, of a fire-box therein, an air-chamber inclosing the fire-box, an air-inlet to said chamber, a coil-pipe arranged above the fire-box and communicating with the interior of the air-chamber, an air-chamber arranged above the fire-box and adapted to receive air from the coil-pipe, an outlet from said chamber, a pipe inclosing and extending upward from said outlet, an air-inlet pipe communicating with the inlet of the heater and having inlets at opposite ends, branch inlet-pipes extending from the air-inlet pipe, a damper within the air-pipe below the branch pipes, dampers within the air-pipe to control the inlets thereof, air-distributing pipes extending from the walls of the upper air-chamber of the heater and having outlets and a damper within said chamber adapted to close the end of the coil-pipe and of the outlet-pipe alternately.

6. The combination with a structure having apartments therein, of a casing within one of said apartments, a fire-box within the casing, an air-chamber inclosing the fire-box, an air-inlet to said chamber, a coil-pipe arranged above the fire-box and communicating with the interior of the air-chamber, an air-chamber arranged above the fire-box, said coil-pipe being adapted to conduct air thereto, an outlet from the upper air-chamber, a damper within said chamber adapted to open and close the air inlet and outlet thereof alternately, a pipe inclosing and extending from the outlet and through the top of the structure, an air-inlet pipe extending from the top of the structure and communicating with the air-inlet of the casing, a branch pipe extending from the air-inlet pipe to a point within one of the apartments, an inlet to said pipe, an air-distributing pipe extending from the upper air-chamber in the casing, an outlet from said pipe suitably arranged within the apartment and dampers within the air inlet and distributing pipes.

706,955. NUT-LOCK. RALPH KAUFFMER, Pottsville, Pa., assignor of one-half to Otto Gintzler, Pottsville, Pa. Filed Dec. 31, 1901. Serial No. 87,900. (No model.)

Claim.—1. The combination with a longitudinally peripherally grooved bolt, of a nut provided in one of its faces with a transverse perforation, a dog slidably arranged in said perforation and provided at its inner end with a beveled point arranged to engage one of said grooves and prevent the nut from turning in a backward direction, the outer end of said dog having a longitudinal socket formed therein, a coiled spring arranged in said socket and operating to force the dog into engagement with the bolt, and means for holding the spring in place in its socket, substantially as described.

2. The combination with a longitudinally peripherally grooved bolt, of a nut provided in one of its faces with a transverse perforation, a dog

slidably arranged in said perforation and provided at its inner end with a beveled point arranged to engage one of said grooves and prevent the nut from turning in a backward direction, the outer end of said dog having a longitudinal socket formed therein, a coiled spring arranged in said socket and operating to force the dog into engagement with the bolt, and a pin inserted in a transverse perforation in the nut and operating to hold the spring in place in its socket, substantially as described.

3. The combination with a longitudinally peripherally grooved bolt, of a nut provided in one of its faces with a transverse perforation, a dog slidably arranged in said perforation and provided at its inner end with a beveled point arranged to engage one of said grooves and prevent the nut from turning in a backward direction, the outer end of said dog having a longitudinal socket and oppositely-disposed longitudinal slots formed therein, a coiled spring arranged in said socket and operating to force the dog into engagement with the bolt, and a pin inserted in a transverse perforation in the nut and passing through said slots, said pin operating to hold the spring in place in its socket and prevent the dog from turning, substantially as described.

4. The combination with a longitudinally peripherally grooved bolt, of a nut provided in one of its faces with a transverse perforation, a dog slidably arranged in said perforation and provided at its inner end with a beveled point arranged to engage one of said grooves and prevent the nut from turning in a backward direction, the outer end of said dog having a longitudinal socket and oppositely-disposed longitudinal slots formed therein, a coiled spring arranged in said socket and operating to force the dog into engagement with the bolt, a pin inserted in a transverse perforation in the nut and passing through said slots, said pin operating to hold the spring in place in its socket, one side of the inner end of the dog being recessed to form a shoulder, and a transverse perforation formed in the nut in alinement with said shoulder to permit the insertion of a key to retract the dog from engagement with the bolt, substantially as described.

706,956. GARMENT-FASTENER. OSWALD E. KAMELMAN, Detroit, Mich. Filed Feb. 11, 1902. Serial No. 93,548. (No model.)

Claim.—1. As a garment-fastener, the combination with an elongated pliable prong member having one end sharpened and adapted to be bent over at its extremity, and terminating at the other end in a hook and a cloth-penetrating point, said hook and point being arranged one opposite the other upon opposite sides of the prong member and extending in substantially parallel planes in the direction of the sharpened end of the prong, and a loop member.

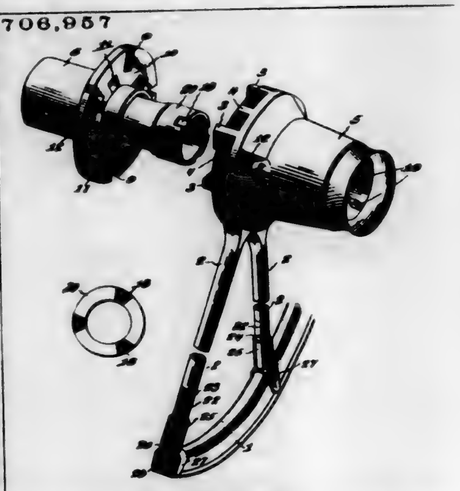
2. In a garment-fastener, the combination with an elongated pliable prong member having one end sharpened and adapted to be bent over at its extremity and terminating at the other end in a hook and a cloth-penetrating point arranged one directly opposite the other, said hook and point being formed integral with and arranged upon opposite sides of the prong member and extending in substantially parallel planes in the direction of the sharpened end of the prong, and a loop member adapted to be engaged by the hook.

3. In a garment-fastener, the combination with two pliable and sharpened prong members opened from each other, of a connecting member integral with the prongs and joining the ends of the latter opposite the points, a hook and a cloth-penetrating point carried by and formed integral with the connecting member, said hook and point being arranged one directly opposite the other and projecting from the opposite sides of said connecting member in the direction of the sharpened ends of the prongs, and a loop member adapted to be engaged by the hook.

706,957. VEHICLE-HUB. ELIAS KERR, Mulberry, Pa. Filed Dec. 26, 1901. Serial No. 87,205. (No model.)

Claim.—The herein-described hub construction comprising the members 5 and 6 having interoperating members whereby when said members are brought together they will be held against relative movement, in combination with the boxing 17 having means upon its outer end to engage cooperating devices upon the outer hub-sections that said boxing may be held against rotation, and spoke-tightening cooperating with said hub and the spokes carried thereby comprising the thimble 25, the members 22 and 27, all operatively combined substantially as specified and for the purpose set forth.

706,957



706,958. VEHICLE. ALBERT A. KELLOGG, Clinton, Mo., assignor of one-third to G. C. Raynor, Clinton, Mo. Filed May 3, 1902. Serial No. 105,767. (No model.)

Claim.—1. As an improvement in vehicles, the combination with the wagon-body, the body-springs, and the supporting-bar for each spring, said springs being connected to the wagon-body, and the front and rear axles; of a pair of crossed reach members, having their opposite ends pivotally joined with the front and rear axles, a fifth-wheel comprising an upper and a lower opposing plate, each plate having integral apertured lugs, adapted to engage sockets in their respective spring-bar, and axle-engaging members, and having integral angle members for engaging the inner sides of the spring-bar and the axle, said angle members having sockets, said sockets adapted to be in alinement and to receive the king-bolt, for the purposes specified.

2. As an improvement in vehicle running-gears, the combination with the axle, the crossed reaches pivotally connected at each end with the said axles, the body-springs, and the supports for the said springs; of the fifth-wheel connections, each comprising a pair of superimposed plates, one of which is rigidly secured to the axle, and the other is rigidly secured to the body-spring holder, each of said plates having sockets at a point inside of the said axle and holder members, to receive the king-bolt, and spring-metal braces rigidly connected to the upper one of said fifth-wheel members, said braces extending in a longitudinal plane of the wagon-body, and having their inner ends fixedly connected thereto, for the purposes specified.

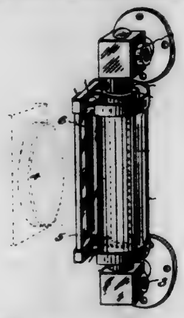
706,959. WATER-GAGE ATTACHMENT. FRANK J. KNOX, Hartford, Conn. Filed Jan. 7, 1902. Serial No. 88,727. (No model.)

Claim.—1. An attachment having means for clamping to a water-gage and a reflector having a narrow central opening in front of the gage-glass and arranged to throw light backward toward the gage-glass, substantially as specified.

2. An attachment having means for clamping to a water-gage, a screen with an opaque stripe parallel with and back of the gage-glass and a reflector extending on each side of the glass and having reflecting-walls that converge toward a narrow opening in front of the glass and arranged to throw light backward toward the front of the glass, substantially as specified.

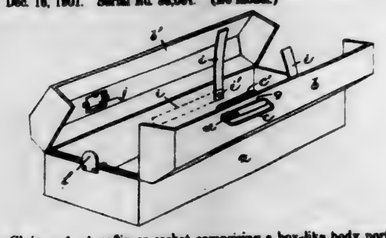
3. An attachment having means for clamping to a water-gage, an opaque stripe parallel with and back of the gage-glass and a reflector extending each side of the glass and having reflecting-walls that converge

toward a narrow opening in front of the glass and arranged to throw light backward toward the front of the glass, substantially as specified.



4. An attachment having means for clamping to a water-gage, a translucent screen with an opaque stripe back of and parallel with the gage-glass, and an opaque reflector with a central opening in front of the glass, substantially as specified.

706,960. **BURIAL-CASKET.** JULIUS KOBER, Newark, N. J. Filed Dec. 16, 1901. Serial No. 86,097. (No model.)



Claim.—1. A coffin or casket comprising a box-like body portion, covers hinged to the opposite side walls of said body portion at their outer edges and adapted to meet at their inner edges along a longitudinal line of the casket, and outer and inner handles pivoted on one cover to turn in unison and being adapted to project beyond the edge of said cover and engage the other cover.

2. A coffin having a body portion *a*, covers hinged to the opposite side walls of said body portion at their outer edges and adapted to meet at their inner edges, outer and inner locking-handles pivoted on one cover to operate in unison to engage the other cover, and springs arranged within the coffin on the body portion and adapted to engage said covers to throw them open.

3. A coffin having a body portion, a cover hinged thereto at one edge, and a leaf-spring secured at its lower end to the side wall of the body portion and extending vertically upward and adapted to be bent into fixed position by closing the cover, and means to exert strain to open said cover, said spring being at its said lower end secured to the side wall of the coffin-body by a single pivotal screw or bolt and being adapted to be turned on said screw or bolt in a plane parallel to the wall on which it is mounted and brought to lie wholly within the coffin-body out of any possible operative engagement with the cover.

4. In a coffin having a body portion *a*, and covers hinged thereto at their outer edges and adapted to meet at their inner edges, a bolt *d*, having a cylindrical middle portion passing through one of said covers and squared extensions projecting at both sides and handles secured on said extensions and adapted to cooperate to engage the other cover.

5. The combination with a coffin having oppositely-opening hinged covers adapted to meet at their free edges, of a handle pivoted on one cover and adapted to be turned to overreach the other cover, said handle having on its face next the covers a notch or recess, and a projecting spur or catch on the cover not having the handle pivoted thereon and adapted to enter said notch or recess in the handle.

6. The combination with a coffin having oppositely-opening covers hinged at their outer edges and adapted to meet at their inner edges when closed, of a handle recessed on its inner face and pivoted on one cover and adapted to be turned into transverse position to overlie the other cover, a projecting catch on said other cover to enter said recess of the handle, and a retaining-clasp A, longitudinally disposed upon said other cover and adapted to receive the handle when in locking position and engage the opposite sides of the same.

706,961. **PAINT-OIL AND PROCESS OF MAKING SAME.** JOHN F. KREBS, Colorado Springs, Colo., assignor of one-half to Constantine Casser, Colorado Springs, Colo. Filed May 3, 1902. Serial No. 105,840. (No specimens.)

Claim.—1. The process herein described, of producing a paint-oil, which consists in mixing together marine oil, acetic acid, white copperas and litharge, dissolving manganese dioxid in benzin by the aid of heat, adding said solution, together with sugar of lead, to the ingredients above mentioned, stirring all of the ingredients mentioned and allowing them to stand, then adding linseed-oil, turpentine and chlorid of lime.

2. The process herein described, of making paint-oil, which consists in dissolving manganese dioxid in benzin, mixing the solution thus made with acetic acid, zinc sulfate, litharge and sugar of lead, mixing the substance thus formed with a large proportion of marine oil, allowing the mixture to stand for some time, then adding linseed-oil, turpentine and chlorid of lime.

3. A paint-oil containing the following ingredients in the proportions stated: marine oil, two thousand pounds; acetic acid, thirty-five gallons; zinc sulfate, ten pounds; litharge, fifteen pounds; manganese dioxid, five pounds; benzin, five gallons; sugar of lead, five pounds; linseed-oil, ten gallons; turpentine, five gallons; chlorid of lime, one hundred pounds.

706,962. **AUTOMATIC TENSION DEVICE FOR CHAINS OR OTHER TRACTION MEANS.** MARTIN T. A. KUHLEMEIER, Berlin, Germany. Filed Oct. 17, 1901. Serial No. 78,832. (No model.)

Claim.—1. In a power-transmitting system, the combination with a flexible member made fast at each end, of two driving-wheels, and two smooth tension-wheels, one on each driving-wheel shaft and of larger diameter than the driving-wheels, said flexible member passing around both driving-wheels and both tension-wheels.

2. In a power-transmitting system, the combination with two driving-wheels, of two smooth tension-wheels, one on each driving-shaft and of larger diameter than the driving-wheels, and a chain or rope, or the like, made fast at each end and passing first around one driving-wheel, then around both tension-wheels, and then around the other driving-wheel.

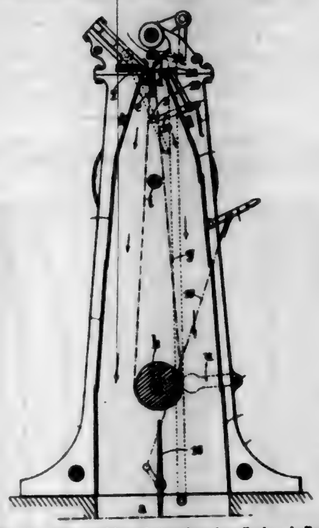
706,963. **VALVE-LUBRICATOR.** PETER F. LABAR, Altona, Germany, assignor to Julius Labar, Brooklyn, N. Y. Filed Apr. 12, 1902. Serial No. 102,556. (No model.)

Claim.—1. A valve-lubricator, comprising a series of distributing-channels in the exposed face of the valve-seat and adjacent to the steam-ports therein, a feed-trough in an exposed part of the valve, distributing-passages formed in the valve so as to communicate at all times with the feed-trough and adapted to register with different distributing-channels on the movement of the valve, and means for supplying lubricant to said trough.

2. A valve-lubricator, comprising a valve-seat having parallel distributing-channels in the exposed surface thereof and between the series of ports, a valve having in its exposed face a trough and also provided with transverse channels which are normally in communication with said trough, said transverse channels arranged on the movement of the valve to register with different distributing-channels in the face of the valve-seat, and means for supplying lubricant to the distributing-trough.

3. A valve-lubricator comprising a valve-seat having distributing-channels in its exposed face and between the ports therein, a valve provided in its top face with a transverse trough, vertical passages in said valve, said passages communicating normally with the feed-trough and adapted to register with different distributing-channels on the movement of the valve, a feed-pipe having a nozzle disposed in overhanging relation to the feed-trough and adapted to deliver lubricant thereto at all points in the movement of the valve, and means for making a steam-tight connection between the feed-pipe and the valve-chest.

706,964. **MACHINE FOR REMOVING HAIR AND STIFF HAIRS FROM FURS OR SKINS.** GABRIEL LAFFARGUE, Paris, France, assignor to the Société Lafargue, Hudson et Cie., Paris, France. Filed Apr. 22, 1901. Serial No. 56,269. (No model.)



Claim.—1. In a machine of the class described, a hollow column constituting the framework of the machine, the walls of the column being imperforate to permit the direct passage through said column of an air-blast and a beam within the column, the beam being arranged between opposite walls of the column and one of said walls consisting of a plurality of vertically-slidable plates in overlapping relation.

2. In a machine of the class described, a hollow column constituting the framework of the machine, the walls of the column being imperforate to permit the direct passage through said column of an air-blast, and the front and rear walls consisting of a plurality of overlapping plates supported for vertical sliding movement by the side walls, a beam within the column, the beam being arranged between opposite walls of the column, an air-enhancing channel below and in communication with said hollow column, and a valve for controlling the admission of air into said channel.

3. In a machine of the class described, a beam mechanism for operating the beam including a pulley, a loose pulley, a belt shiftable from one of said pulleys to the other, a belt-shipper, means for positively operating the same in one direction, a holding device for engaging said belt-shipper, a pulley operative with the beam-operating mechanism, and a cord on said last-mentioned pulley connected with and adapted to operate said holding device.

706,965. **APPARATUS FOR CALCINING PLASTER.** ARMAND LAWRENCE, Acme, Tex. Filed Mar. 13, 1902. Serial No. 97,841. (No model.)

Claim.—1. An apparatus for calcining plaster, comprising a ventilative shaft open for the admission of air, a revolvable drum mounted loosely on the shaft, means for locking the shaft against rotation and for making the shaft fast with the drum to rotate therewith, and means for interrupting the direct circulation of air through said shaft.

2. An apparatus for calcining plaster, comprising a ventilative shaft open at one end and provided with hollow branches, a revolvable drum loose on said shaft, means for making the shaft rotate with the drum and to allow the shaft to remain at rest, and a valve fitted to the shaft and adapted to interrupt the direct circulation of air through the same.

3. An apparatus for calcining plaster, comprising a shaft, a revolvable drum, a series of scrapers carried by the shaft, and means for making the shaft fast to the drum and for locking the shaft in a non-revolvable condition to thereby sustain the scrapers in a stationary position within the drum.

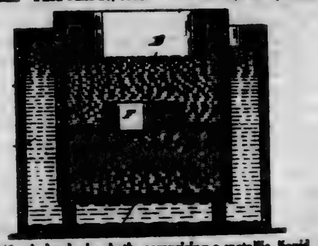
4. An apparatus for calcining plaster, comprising a shaft having ventilative branches and scrapers, a revolvable drum having a clutch member, a stationary part having a clutch member, and a shiftable clutch member keyed to the shaft and arranged to engage with the clutch member either on the drum or the stationary part, as and for the purposes set forth.

5. An apparatus for calcining plaster, comprising a hollow shaft, a series of collars thereon, a drum, a series of internal bands fastened to the drum and united by arms to the collars, a series of longitudinal scrapers disposed in the spaces between the internal bands and in active relation to the inner surface of the drum, means connecting the scrapers to the shaft, hollow branches on the shaft, means for closing the shaft at a point intermediate of its length, and means for holding the shaft in a non-revolvable condition and for making said shaft fast with the drum.

6. An apparatus for calcining plaster, comprising a hollow shaft having hollow arms or branches in communication therewith, a drum mounted idly on said shaft, means for rotating said drum, means for locking the said shaft against rotation and for locking the shaft fast with the drum, and means for creating suction through said hollow shaft.

7. An apparatus for calcining plaster, comprising a tubular shaft having hollow arms, a drum mounted on the shaft, means for creating a suction through said shaft and its arms, and means for closing said shaft at a point between two of its arms.

706,966. **TEMPERING-BATH.** JAMES B. LAWRENCE, West Sheffield, Canada, assignor of one-half to Victor Marchessault, West Sheffield, Canada. Filed June 20, 1901. Serial No. 65,603. (No model.)



Claim.—1. A hardening-bath, comprising a metallic liquid, and a superimposed liquid of less specific gravity than the metallic liquid, as set forth.

2. A hardening-bath, comprising a metallic liquid and oil superimposed thereon, as set forth.

3. A hardening-bath, comprising mercury, and a superimposed liquid of less specific gravity than the mercury, as set forth.

4. The herein-described hardening-bath, consisting of oil superimposed on mercury, as set forth.

5. The herein-described hardening-bath, comprising a vessel containing oil, superimposed on mercury, and a second vessel in which the first-named vessel is set, the second vessel containing a cooling liquid, as set forth.

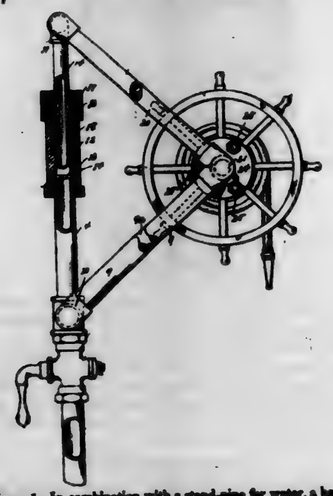
706,967. **POLISHING-BLOCK FOR LAUNDRY PURPOSES.** MAX LEHMANN, Berlin, Germany. Filed Aug. 20, 1900. Serial No. 27,442. (No model.)

Claim.—1. A polishing-block for laundry purposes, composed of talc, wax, and an aromatic compound, substantially as set forth.

2. A polishing-block for laundry purposes, composed of powdered talc, carnauba-wax, beeswax, and an aromatic compound, substantially as set forth.

3. In a block for laundry purposes, a composition consisting of talc, carnauba-wax and beeswax, substantially as herein described.

706,968. **SWIVELED HOSE-REEL.** GEORGE B. LE MOND, Detroit, Mich., assignor of two-thirds to Walter Bogart and Chester Given, Detroit, Mich. Filed May 2, 1902. Serial No. 105,880. (No model.)



Claim.—1. In combination with a stand-pipe for water, a hose-reel, provided with a hollow drum, a bracket-support for said reel swiveled on the stand-pipe below its upper terminal, a revolvable pipe swiveled in a packing-coupling on said stand-pipe, bracket-arms connecting the upper end of said revolvable pipe to the reel, one of said bracket-arms being hollow and affording communication between the pipe and the reel-drum, substantially as described.

2. In combination with a stand-pipe for water, a hose-reel, an arm supporting said hose-reel and swiveled to the stand-pipe below its upper end, a second arm extending to a water-pipe in alinement with the stand-pipe and revolvable with respect thereto, substantially as described.

706,969. **BLACK SULFUR DYE AND PROCESS OF MAKING SAME.** IVAN LEVINSTEIN and CARL HERBERDEN, Manchester, England. Filed May 23, 1902. Serial No. 108,603. (No specimens.)

Claim.—1. The manufacture of black sulfur coloring-matters which consists in heating with sulfur and alkali sulfid, a nitro derivative of phenol-dinaphthylamin, substantially as set forth.

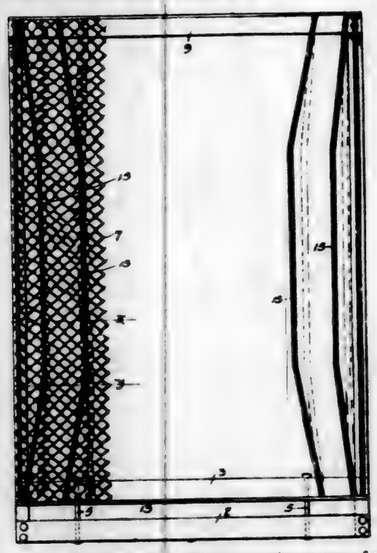
2. As products, the black sulfur coloring-matters obtained by heating with sulfur and alkali sulfid, a nitro derivative of phenol-dinaphthylamin in equimolecular proportion with para-oxy-dinitro-diphenylamin, substantially as set forth.

3. As products, the black sulfur coloring-matters obtained by heating with sulfur and alkali sulfid, a nitro derivative of phenol-dinaphthylamin in equimolecular proportion with para-oxy-dinitro-diphenylamin, which are insoluble in alcohol and in concentrated sulfuric acid, dissolve in caustic lye and more freely in sodium-sulfid solution with greenish-blue shade, and which dye unmordanted cotton deep greenish-black shades fast to light and to washing.

3. The manufacture of black sulfur coloring-matters, which consists in heating with sulfur and alkali sulfid, a nitro derivative of phenol-dinaphthylamin, substantially as set forth.

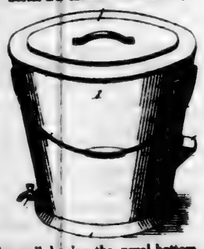
4. As products, the black sulfur coloring-matters obtained by heating with sulfur and alkali sulfid, a nitro derivative of phenol dinaphthylamin, which are insoluble in alcohol and in concentrated sulfuric acid, dissolve in caustic lye and more freely in sodium-sulfid solution with greenish-blue shades, and which dye unmordanted cotton deep black shades fast to light and to washing.

706,970. **WIRE MATTRESS.** CYRUS S. LLOYD, Sowerby Bridge, England, assignor to Marshall S. Lloyd, Minneapolis, Minn. Filed Apr. 8, 1901. Serial No. 54,519. (No model.)



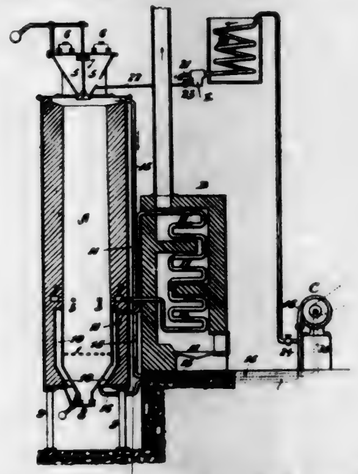
Claim.—The combination, with a woven-wire mattress, of a series of stretching devices connected thereto and consisting of wires or cables arranged at intervals throughout the fabric passing through coils of the fabric parallel to its sides and for a portion of its length, and then extending diagonally under the fabric and secured to the end rails of the mattress, means for adjusting one of said end rails in the direction of the length of the mattress, whereby as said rail is moved the mattress fabric is stretched both longitudinally and laterally, substantially as described.

706,971. **SLOP-PAIL.** ROBERT LOGAN, Sharpstown, N. J. Filed Nov. 20, 1901. Serial No. 83,022. (No model.)



Claim.—A slop-pail having the usual bottom, an inclined supplemental bottom arranged at an elevation above the said pail-bottom to form a hot-water compartment, the body of the pail having an inlet-opening therethrough at the highest portion of the said compartment and from which point the supplemental bottom inclines downwardly toward the opposite portion of the pail to contract the said chamber, the portion of the pail-body above the supplemental bottom being free of obstructing devices and adapted to serve as a containing-receptacle, an outwardly-projected, upwardly-inclined inlet-spout around the inlet-opening of the body at a plane below the highest portion of the supplemental bottom and provided with a covering device, and a faucet communicating with the lowermost contracted portion of the said compartment at a point diametrically opposite the said opening.

706,972. **APPARATUS FOR THE PRODUCTION OF PURE CARBONIC-ACID GAS FROM CARBONATES IN A CONTINUOUS MANNER.** EDUARD LUHMANN, Münster, Germany. Filed Nov. 18, 1901. Serial No. 82,735. (No model.)



Claim.—1. In an apparatus of the class described, the combination with a shaft-furnace for the reception of the carbonate to be treated and having a jacket circumferentially arranged in its lower part, of the auxiliary heating-furnace having a coil arranged therein, a fan, a pipe leading from the top of said furnace to said fan, a pipe leading from the fan to one end of the jacket, a branch pipe leading from said last-named pipe for withdrawing gas from the apparatus, a pipe leading from the other end of the jacket to the coil, and a pipe leading from the other end of the coil to the lower part of the furnace, substantially as described.

2. In an apparatus of the class described, the combination with a shaft-furnace for the reception of the carbonate to be treated, of an auxiliary heating-furnace having a coil arranged therein, a fan, a pipe leading from the top of the shaft-furnace to said fan, a jacket circumferentially arranged in the lower end of the shaft-furnace, a pipe leading from the fan to one end of the jacket, a pipe leading from the other end of the jacket to the coil, and a pipe leading from the other end of the coil to the lower part of the furnace, a condenser and a pipe arranged to withdraw a portion of the gas as it is discharged from the fan and lead it to the condenser, substantially as described.

3. In an apparatus of the class described, the combination with a furnace for the reception of the carbonate to be treated, of an auxiliary heating-furnace having a coil arranged therein, a fan, a pipe 15 leading from the top of the furnace to said fan, a pipe 16 leading from the fan to one end of the coil, a pipe leading from the other end of the coil to the lower part of the furnace, a condenser, a branch pipe leading from the pipe 16 to the condenser, a water-separator, and a pipe leading from the condenser to said separator and from the latter to convey the gas to its place of consumption of storage, substantially as described.

4. In an apparatus of the class described, the combination with a furnace for the reception of the carbonate to be treated and provided with an internal hollow jacket in its lower end, of an auxiliary heating-furnace having a coil arranged therein, a fan, a pipe leading from the top of the furnace to said fan, a pipe leading from the fan to said jacket and from said jacket to one end of the coil, a pipe leading from the other end of the coil to the lower part of the furnace, and a pipe for withdrawing a part of the gas as it is discharged from the fan, substantially as described.

706,973. **GAS-BURNER.** GEORGE LOUD, Victoria, Canada. Filed Oct. 19, 1901. Serial No. 79,242. (No model.)

Claim.—1. The combination with a gas-burner, comprising a casing having outlets for the mixture of gas and air, and perforated pipes arranged within the said casing, of a gas-chamber connected with a valve-controlled gas-supply pipe, a pipe fitting into one end of the gas-chamber, and connected with the perforated pipes of the casing, and an air-pipe passing through the gas-chamber from the opposite end and extending into the pipe connected with said perforated pipes, the said air-pipe being provided with a valve near its point of entrance into the gas-chamber, as set forth.

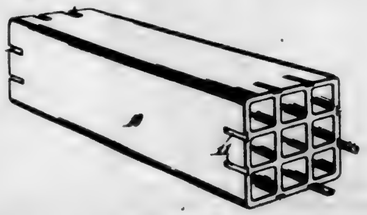
2. In a gas-burner, a burner-casing comprising a pan, a lining of refractory material at the inside of the pan, a roof having perforations and also formed of refractory material, perforated pipes arranged within the casing, a gas-chamber connected with a gas-supply and communicating with the perforated pipes of the casing, an air-pipe also communicating with the perforated pipes, and valves for regulating the amount of gas and air, as set forth.

3. A gas-burner, having a burner-casing, comprising a pan, a lining at the inside of the pan, a roof integral with the said lining, and a support for the said roof, as set forth.

4. A gas-burner, having a burner-casing, comprising a metallic pan, a lining of refractory material on the inside of the said pan, a roof having perforations and formed of refractory material and integral with said lining, and a support for the said roof and formed of wires having legs resting on the said pan, as set forth.

5. A gas-burner, having a burner-casing comprising a metallic pan, a lining of refractory material on the inside of the pan, a roof having perforations and also formed of refractory material, perforated pipes arranged within the said casing, and a gas-inlet and an air-inlet for the said pipes, as set forth.

706,974. **CONDUIT FOR ELECTRIC WIRES.** ROBERT W. LYLE, Perth Amboy, N. J. Filed Apr. 10, 1902. Serial No. 102,168. (No model.)



Claim.—1. A conduit-section having a relatively short external groove in its side wall at an end of the section, one end of said groove being closed and the other end opening into the end of the section, and the side walls of said groove being undercut, substantially as described.

2. A conduit-section having short external grooves at its opposite ends, one end of each groove being closed and the other end opening into the end of the section, the side walls of said grooves being undercut, substantially as described.

3. A conduit-section having a relatively short external groove in its side wall at an end of the section, one end of said groove being closed to form an abutment for a key, and the other end opening into the end of the section, and the side walls of said groove being beveled.

4. A hollow conduit, comprising abutting tile sections, each section having relatively short external grooves at its opposite ends, one end of each groove being closed and the other end opening into the end of its respective section, and the side walls of the grooves being undercut, and a key having side walls shaped to correspond with the undercut side walls of the grooves, the said keys being fitted in the grooves of abutting tile sections in such manner as to bridge the joint between said sections, the closed ends of the grooves acting as stops to prevent the keys from moving longitudinally.

5. A hollow conduit, comprising abutting tile sections, each section having a relatively short external groove at its opposite ends, one end of each groove being closed and the opposite end opening into the end of its respective section, and the side walls of the groove being beveled, combined with a key having beveled side walls to take under the beveled side walls of the grooves, the said keys being fitted in the grooves of abutting sections in such manner as to bridge the joint between said sections, the closed ends of the grooves constituting stops to prevent longitudinal movement of the keys.

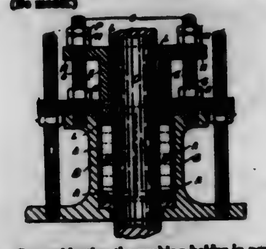
706,975. DEVICE FOR PROTECTING THE EAR-DRUM. FRANK B. HAGNER, Baltimore, Md., assignor of one-half to William A. Bullock, Baltimore, Md. Filed June 6, 1901. Serial No. 62,260. (No model.)

Claim.—1. An appliance permanent in character for conducting sound, air, and water from the auditory canal, comprising a hollow curving inflatible by the heat of the body and having a longitudinally-extended tubular open-end portion, *a*, adapted to be inserted in the auditory canal, and a closed bulb-like hollow head, *b*, larger than the open-end tube and forming at the point of junction between said tube and said head an abrupt shoulder adapted to abut against the walls of the concha and thereby prevent the appliance from being pushed inwardly too far.

2. An appliance permanent in character for conducting sound, air, and water from the auditory canal, comprising a hollow rubber curving adapted to be inserted in the auditory canal and coated with paraffin; and a filling in said curving.

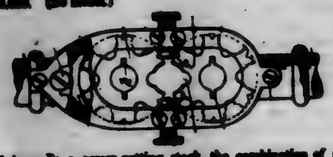
3. An appliance permanent in character for conducting sound, air, and water from the auditory canal, comprising a curving provided with a tubular body portion open at one end and having an exterior bead near its open end and said curving also provided at the other end of said body portion with a hollow bulged head having a protuberance, *c*, and fibrous material in said curving.

706,976. PACKING-HOLDER FOR PISTON-RODS. ALFRED E. HAGGERTY, Auckland, New Zealand. Filed July 30, 1901. Serial No. 70,132. (No model.)



Claim.—In combination the packing-holder in parts fitted into the stuffing-box around the piston-rod with the flange of each part bored to pass over screws and kept in position by nuts, nuts for securing said packing-holder to said stuffing-box, screws and nuts for fitting said packing-holder above said stuffing-box, means for checking in said opposing parts of said packing-holder, gland and sleeve for fitting over said packing-holder and said stuffing-box, and nuts for securing said gland and sleeve all for the purpose set forth substantially as described and illustrated.

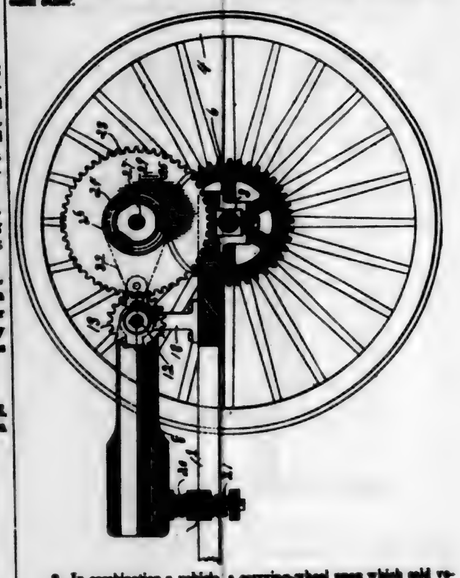
706,977. STOCK AND DIE. HENRY L. HAGNER and JOSEPH KAUFFMAN, Amsterdam, Netherlands. Filed May 6, 1902. Serial No. 106,668. (No model.)



Claim.—In a screw-cutting stock, the combination of a recessed stock-plate, two circular die-plates mounted in the recess in said plate and having several pairs of screw-cutting openings on their edges and notches between said screw-cutting openings, two adjusting-screws mounted in the sides of the stock-plate, and central wheels on the inner ends of said adjusting-screws said central wheels being adapted to simultaneously engage in the edges of both die-plates, whereby said plates may be adjusted and locked as required.

706,978. MOTOR-VEHICLE. HARRY J. HAHN, New York, N. Y. Filed Sept. 28, 1901. Serial No. 76,608. (No model.)

Claim.—1. In combination a vehicle, a carrying-wheel upon which said vehicle travels, a motor hung on a transverse pivot at one side of its center of gravity and eccentric to said carrying-wheel, a spring-support for said motor, a driving-wheel concentric with said pivot and driven by said motor and vibrating with said motor on said pivot, a wheel substantially fixed with relation to said motor and transmitting power therefrom to said carrying-wheel and driven by said driving-wheel, and means to hold the centers of said driving-wheel and fixed wheel at a fixed distance from each other.



2. In combination a vehicle, a carrying-wheel upon which said vehicle travels, a motor hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a driving-wheel driven by said motor and eccentric to said carrying-wheel but substantially concentric with said pivot, and a connection between said driving-wheel and said carrying-wheel to drive the latter.

3. In combination a vehicle, a carrying-wheel upon which said vehicle travels, a motor hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a geared driving-wheel driven by said motor and eccentric to said carrying-wheel but substantially concentric with said pivot, and a connection between said driving-wheel and said carrying-wheel to drive the latter.

4. In combination a vehicle, a carrying-wheel upon which said vehicle travels, a motor hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a driving-shaft driven by said motor and eccentric to said carrying-wheel but substantially concentric with said pivot, and a connection between said driving-shaft and said carrying-wheel to drive the latter.

5. In combination a vehicle, a carrying-wheel upon which said vehicle travels, a motor hung on a transverse pivot at one side of its center of gravity, a spring-support for the other side of said motor, a driving-shaft driven by said motor and eccentric to said carrying-wheel but substantially concentric with said pivot, and a connection between said driving-shaft and said carrying-wheel to drive the latter.

6. In combination a vehicle, a plurality of independently-rotatable carrying-wheels located on either side of said vehicle and upon which said vehicle travels, a motor hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a driving-wheel driven by said motor and eccentric to said carrying-wheels but substantially concentric with said pivot, and a connection between said driving-wheel and said carrying-wheels to drive the latter, said connection including a compensating train to automatically rotate one of said carrying-wheels when the other one is held.

7. In combination a vehicle having a frame and an integral axle, a carrying-wheel on each end of said axle, at least one of which wheels is rotatable thereon, a motor pivoted at one side of its center of gravity on a transverse pivot concentric to said carrying-wheel and spring-supported from said frame, compensating mechanism located between said motor and carrying-wheels and including a pair of independently-rotatable wheels rotated by said motor, and connections between said latter wheels and carrying-wheels, whereby, when one of said carrying-wheels is held, the power of said motor is automatically applied to rotate the other wheel.

8. In combination a vehicle having a frame and a fixed integral axle, a carrying-wheel on each end of said axle and rotatable thereon, a motor pivoted at one side of its center of gravity on a transverse pivot concentric to said carrying-wheel and spring-supported from said frame, compensating mechanism located between said motor and carrying-wheels and including a pair of independently-geared wheels rotated by said motor, and geared connections between said latter wheels and carrying-wheels, whereby, when one of said wheels is held, the power of said motor is automatically applied to rotate the other wheel.

9. In combination a vehicle having a frame and an integral axle, a carrying-wheel on each end of said axle, at least one of which wheels is rotatable thereon, a motor pivoted at one side of its center of gravity on a transverse pivot concentric to said carrying-wheel and spring-supported from said frame, compensating mechanism located between said motor and carrying-wheels and including a pair of independently-geared wheels rotated by said motor, and geared connections between said latter wheels and carrying-wheels, whereby, when one of said wheels is held, the power of said motor is automatically applied to rotate the other wheel.

10. In combination a vehicle having a frame and a fixed integral axle, a carrying-wheel on each end of said axle and rotatable thereon, a motor pivoted at one side of its center of gravity on a transverse pivot concentric to said carrying-wheel and spring-supported from said frame, compensating mechanism located between said motor and the carrying-wheels and including a pair of independently-rotatable geared wheels rotated by said motor, and geared connections between said latter wheels and carrying-wheels, whereby, when one of said wheels is held, the power of said motor is automatically applied to rotate the other wheel.

11. In combination a vehicle having a frame and an integral axle, a carrying-wheel on each end of said axle, at least one of which wheels is rotatable thereon, a motor pivoted at one side of its center of gravity on a transverse pivot concentric to said carrying-wheel and spring-supported from said frame, compensating mechanism located between said motor and carrying-wheels and including a divided shaft, the divisions of which may be independently rotated by said motor, and connections between said divisions of said shaft and said carrying-wheels, whereby, when one of said carrying-wheels is held, the motive power is automatically applied to said other wheel to rotate the same.

12. In combination a vehicle having a frame and an integral axle, a carrying-wheel on each end of said axle, at least one of which wheels is rotatable thereon, a motor pivoted at one side of its center of gravity on a transverse pivot concentric to said carrying-wheel and spring-supported from said frame, compensating mechanism located between said motor and carrying-wheels and including a divided shaft, the divisions of which may be independently rotated by said motor, a geared wheel on each division of said shaft, and geared connections between said wheels on said shaft and said carrying-wheels, whereby, when one of said carrying-wheels is held, the motive power is automatically applied to said other wheel to rotate the same.

13. In combination a vehicle having a carrying-wheel, a motor carried by said vehicle and hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a driving-wheel driven by said motor and eccentric to said carrying-wheel but substantially concentric with said pivot, a connection between said driving and carrying wheels including a wheel engaging with said driving-wheel, and means holding the centers of said last two wheels substantially at a fixed distance from each other.

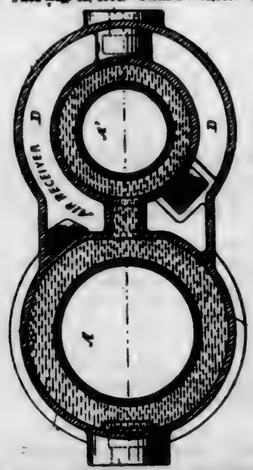
14. In combination a vehicle having a carrying-wheel, a motor carried by said vehicle and hung on a transverse pivot at one side of its center of gravity, a spring-support for the other side of said motor, a driving-wheel driven by said motor and eccentric to said carrying-wheel but substantially concentric with said pivot, a connection between said driving and carrying wheels including a wheel engaging with said driving-wheel, and means holding the centers of said last two wheels substantially at a fixed distance from each other.

15. In combination a vehicle having a carrying-wheel, a motor carried by said vehicle and hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a geared driving-wheel driven by said motor and eccentric to said carrying-wheel but substantially concentric with said pivot, a connection between said driving and carrying wheels including a geared wheel meshing with said driving-wheel, and means holding the centers of said last two wheels substantially at a fixed distance from each other.

16. In combination a vehicle having a fixed integral axle, a carrying-wheel at each end of the same and rotatable thereon, a motor carried on said vehicle and hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a geared driving-wheel driven by said motor and eccentric to said carrying-wheels but substantially concentric with said pivot, a geared connection located between said driving-wheel and carrying-wheels, a geared wheel meshing with said driving-wheel, and means holding the centers of said last two wheels at substantially a fixed distance from each other, said geared connection including a compensating mechanism having a pair of wheels independently rotatable by said motor and connected with said carrying-wheels, whereby, when one of said carrying-wheels is held, the motive power is automatically applied to the other carrying-wheel to rotate the same.

17. In combination a vehicle having a fixed integral axle, a carrying-wheel at each end of the same and rotatable thereon, a motor carried on said vehicle and hung on a transverse pivot at one side of its center of gravity, a spring-support for said motor, a geared driving-wheel driven by said motor and eccentric to said carrying-wheels but substantially concentric with said pivot, a geared connection located between said driving-wheel and carrying-wheels, a geared wheel meshing with said driving-wheel, and means holding the centers of said last two wheels at substantially a fixed distance from each other, said geared connection including a compensating mechanism having a divided shaft provided with a pair of wheels fixed thereon and independently rotated by said motor and geared to said carrying-wheels, whereby, when one of said carrying-wheels is held, the motive power is automatically applied to the other carrying-wheel to rotate the same.

706,979. COMPOUND AIR-COMPRESSOR. GEORGE H. MARTIN, Philadelphia, Pa., assignor to the Penbrit and Ayer Company, Philadelphia, Pa. Filed Aug. 13, 1901. Serial No. 72,115. (No model.)



Claim.—1. A compound air-compressor provided with an air-receiver intermediate of and adjacent to the respective compression-cylinders having its inner wall in contact with the circulating water-jackets of said cylinders, and cooling-jackets inclosing the connecting air-spaces, whereby the air is in contact with cooled surfaces during the entire period of its passage, as set forth.

2. In a compound air-compressor, an air-receiver intermediate of and adjacent to the respective compression-cylinders having its inner wall in contact with the circulating water-jackets of said cylinders and its outer wall exposed to the atmosphere as set forth.

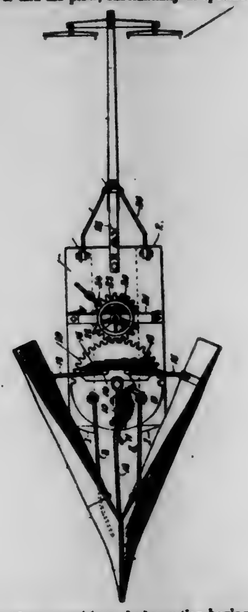
3. A compound air-compressor having an air-receiver intermediate of the respective compression-cylinders, its inner wall forming the outer surrounding wall of the circulating water-jacket of the smaller cylinder and adjacent wall of the water-jacket of the larger cylinder, as set forth.

706,980. SNOW-PLOW. PETER W. MARTIN, Thumb Lake, Mich. Filed May 3, 1902. Serial No. 105,761. (No model.)

Claim.—1. In a snow-plow, a body portion having runners, a plow-point or nosepiece, rearwardly-extended divergent mold-boards having swinging connection with said point or nosepiece, means for swinging the plow laterally with relation to the body portion, and means for adjusting the mold-boards inward and outward, substantially as specified.

2. A snow-plow comprising a body portion having runners, a turn-table mounted on the body portion, means for rotating said turn-table, a plow, arms extended from said plow and having pivotal connection with

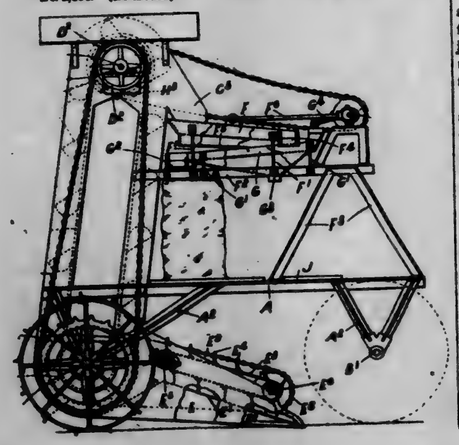
the turn-table, a lever mounted on the turn-table, and a link connection between said lever and the plow, substantially as specified.



3. A snow-plow comprising a body portion having runners, a plow consisting of a point or nosepiece, moldboards arranged to swing laterally on said point or nosepiece, and means for moving said moldboards inward and outward independently one of the other, substantially as specified.

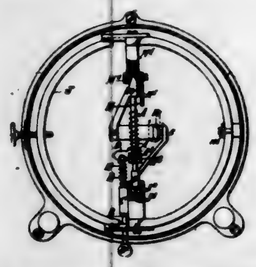
4. A snow-plow comprising a body portion having runners, a draft-pole extended rearward from the body portion, a turn-table arranged on the body portion, means for rotating the turn-table, a plow consisting of a point and moldboards mounted to spring laterally on said point, arms extended from the point and having pivotal connection with the turn-table, a lever mounted on the turn-table, means for holding the lever as adjusted, a link connection between said lever and the plow-point, levers mounted on the turn-table, means for holding said last-named levers as adjusted, and connections between said last-named levers and the moldboards, substantially as specified.

706,981. APPARATUS FOR HARVESTING POTATOES. EDWARD MAGNY, Holmes Chapel, England. Filed Feb. 14, 1900. Serial No. 5,190. (No model.)



Claim.—In a potato-digger, the combination with a traveling carriage having a main frame, of a digging-blade, an inclined sieve receiving the earth dug up by the digging-blade, a conveyer for conveying the potatoes over the said sieve, all placed beneath said frame, of a second conveyer centrally located within said frame and extending from a point below to a point above said frame, of platforms on said frame, above and at each side thereof, a grading apparatus carried on brackets above said platforms and having delivery-spouts leading to convenient receptacles carried by said platforms, an eccentric device for vibrating said grading apparatus, said second conveyer adapted to convey the potatoes delivered by said first conveyer, to said grading device, and suitable chain mechanism operated by the wheels of the carriage for independently operating said conveyers and said eccentric device.

706,982. GALVANOMETER. CHARLES L. R. R. MEISSER, The Hague, Netherlands. Filed Dec. 22, 1897. Serial No. 663,342. (No model.)



Claim.—1. The combination of a magnet, a movable electrically acting device situated in the magnetic flux produced by said magnet, means for measuring the said magnetic flux, and means for varying the said magnetic flux and adjusting it to the required magnitude as indicated by the said measuring means, substantially as described.

2. The combination of a magnet, a movable electrically-acting device in the field produced by said magnet, a magnetic circuit including an adjustable part and a movable part, and means for adjusting and measuring the magnetic attraction acting on said movable part so as to adjust the magnetic flux to the required magnitude as shown by the said means for measuring the magnetic attraction, substantially as described.

3. The combination of a magnet, a movable electrically-acting device arranged in the field of said magnet, a magnet-circuit provided with a movable part, means for measuring the magnetic attraction on that movable part, and means for varying the magnetic flux so that the magnetic attraction balances the effect of the counteracting force on the said movable part of the magnetic circuit, substantially as described.

4. The combination of a magnet, a magnetic circuit provided with a movable part and an adjustable part, means for varying the relative position of the said adjustable part in order to adjust the magnetic flux so as to produce a definite attraction on the movable part of the magnetic circuit, and means for measuring said attraction, substantially as described.

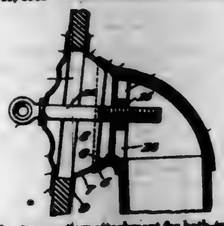
5. The combination of a magnet, a magnetic circuit provided with a movable part, an adjustable magnet-shunt to the magnetic circuit, means for adjusting said shunt relatively to said magnetic circuit in order to adjust the main magnetic flux so as to produce a definite attraction on the said movable part of the magnetic circuit, and means for measuring said attraction, substantially as described.

6. In a galvanometer, the combination of a magnet, an armature adjustable toward and from said magnet, pole-pieces projecting toward each other, a deflectable device arranged vertically between said pole-pieces, and means for raising said device toward the upper pole-piece to the position where the magnetic attraction counteracts the force of gravity, substantially as described.

7. In a deflectable device for a galvanometer, the combination of a vertical rod or spindle of non-magnetic material, a magnetic piece or pole extending from the top of said rod in an inclined direction and terminating in a curved piece, a stationary segmental coil or solenoid acting on said curved piece; and a second magnetic piece or pole extending upward from the lower end of the aforesaid rod, and terminating opposite the end of the curved portion of the first pole-piece, substantially as described.

8. In a galvanometer, the combination of a magnet, pole-pieces having recesses to receive the extremities of a deflectable device, a magnet-piece on said device forming an extension of the upper pole-piece and terminating in a curved portion, a segmental solenoid acting on said curved portion and a second magnetic piece forming an extension of the lower pole-piece, substantially as described.

706,983. OVERFLOW ATTACHMENT FOR BATH-TUBS OR THE LIKE. ENOS MERRIT and ALFRED B. DOBBITT, Jr., Cincinnati, Ohio. Filed May 19, 1902. Serial No. 108,025. (No model.)

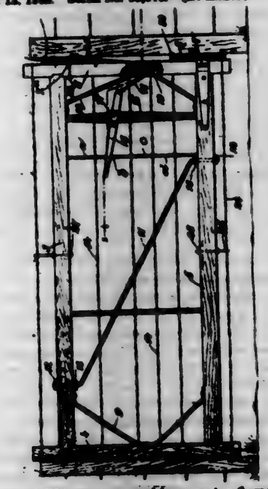


Claim.—1. An overflow attachment for bath-tubs and the like comprising two members one of which is adapted for connection with the overflow-pipe and has an annular concave seat and the other of which is formed from a piece of sheet-metal having a central opening and provided with a flat annular marginal portion adapted for engagement against the wall of the tub around the overflow-opening therein said last-named member having an annular projecting portion inside the flat marginal portion and surrounding its central opening with a semispherical convex surface adapted to fit inside the concave seat of the first-named member and means for holding said members in relation, substantially as set forth.

2. An overflow attachment for bath-tubs and the like comprising an overflow-pipe having a coupling member provided in its interior with a concave semispherical seating-surface, another coupling member formed from sheet metal with a central opening and a flat marginal portion adapted to fit against the wall of a tub around the overflow-opening therein and having a projecting portion formed exteriorly with a convex semispherical surface adapted for engagement within the first-named member and in contact with the concave seating-surface therein, and means for holding the coupling members to a bath-tub or the like, substantially as set forth.

3. An overflow attachment for bath-tubs and the like comprising an overflow-pipe having a coupling member provided in its interior with a semispherical seating-surface and having arms extended across its interior, an interiorly-screw-threaded part carried by said arms, an overflow-guard adapted to be rested on the inside of a bath-tub with its central portion extended across the overflow-opening therein, a screw passed through the guard and engaged in the screw-threaded part of the member on the overflow-pipe and another coupling member formed from thin metal with a flat-turned marginal portion adapted to fit outside the bath-tub around the overflow-opening thereof and with an annular projecting portion the outer surface of which is formed to correspond and fit upon the internal semispherical surface of the first-named member, substantially as set forth.

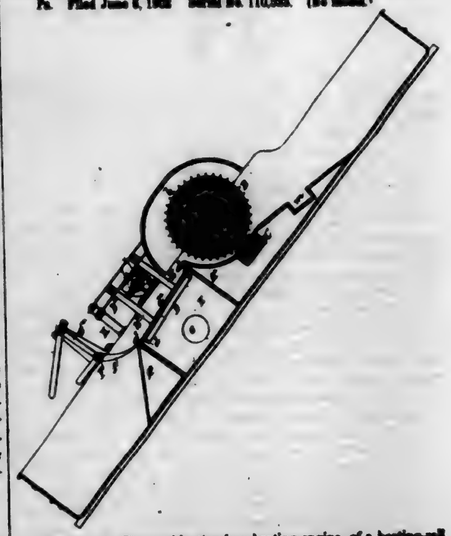
706,984. LIFTING GATE. ANDREW HILLIS, Shelbyville, Ind. Filed Feb. 13, 1902. Serial No. 93,670. (No model.)



Claim.—1. A lifting gate comprising a post, a frame hinged thereto and free to move vertically, said frame comprising top, bottom and side members, a rod connecting said top and bottom members and serving to brace the same, a lever pivoted upon said rod, angle-braces secured to said top and bottom members at points adjacent to the ends of said rod and engaging one of said side members at a point intermediate of the ends thereof, a revoluble pulley mortised within said side member immediately adjacent to said post, and a flexible member engaging said lever and said post and partially encircling said pulley.

2. A lifting gate comprising a post, a rectangular frame hinged thereto and free to move vertically, said frame comprising top, bottom and side members, braces disposed diagonally of the corners of said frame, a longitudinal compression member secured to the top and bottom members and extending diagonally of the center of said frame, a rod connecting the top and bottom members and serving to brace the same, a lever mounted upon said rod, a pulley mortised within said side member and free to revolve, and a flexible member secured to said lever and to said post and partially encircling said pulley.

706,985. HEATING-ENGINE. FRANK P. MILLER, Downingtown, Pa. Filed June 6, 1902. Serial No. 110,933. (No model.)



Claim.—1. The combination in a heating-engine, of a heating-roll, a screen back of the heating-roll, and a chest under the screen, substantially as described.

2. The combination in a heating-engine, of a vat, a heating-roll, a backfall, a screen at the rear of the backfall, and a chest under the screen so that the material will pass over the screen and the finished product will pass through the perforations of the screen and into the chest, substantially as described.

3. The combination in a heating-engine, of a heating-roll, a screen back of the heating-roll, a chest under the screen, and means for agitating the screen, substantially as described.

4. The combination in a heating-engine, of a heating-roll, a backfall, a screen at the rear of the backfall and below the level of the liquid in the vat, a chest under the screen, and means for agitating the screen, substantially as described.

5. The combination in a heating-engine, of a heating-roll, a backfall, an inclined screen at the rear of the backfall and below the level of the liquid in the vat, a chamber under the screen, an outlet for said chamber, spring members from which the screen is suspended, and a cam for actuating the spring members to agitate the screen, substantially as described.

6. The combination in a heating-engine, of a heating-roll, a backfall, a screen at the rear of the backfall, and a first back of the screen upon which strings and like material will collect, substantially as described.

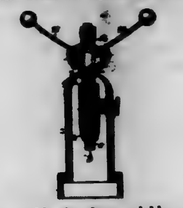
7. The combination in a heating-engine, of a heating-roll, a backfall, a screen at the rear of the backfall, and a first back of the screen, with means for raising the first, substantially as described.

8. The combination in a heating-engine, of a heating-roll, a backfall, a screen at the rear of the backfall consisting of a frame, with notched plates forming slots when assembled, and a chamber directly under the screen, substantially as described.

9. The combination in a hunting-engine, of a hunting-cell, a backfall, a screen at the rear of the backfall, a lip on the backfall overlapping the screen, and means for agitating the screen, substantially as described.

10. The combination in a hunting-engine, of a hunting-cell, a backfall, a screen at the rear of the backfall, a continuation of the backfall beyond the screen, a flexible lip on the backfall overlapping the screen, and a flexible lip on the screen overlapping the continuation of the backfall, substantially as described.

706,986. LAWN-SPRINKLER. PAUL HEINEMANN, Fruitvale, Cal. Filed Nov. 7, 1901. Serial No. 81,416. (No model.)



Claim.—1. The combination in a sprinkler of a nozzle, means for conducting water thereto, a stem or spindle supported in the line of the axis of said nozzle, and wings turnable with relation thereto and adapted to divert and spread the water discharged from the nozzle, said wings having two sets of members with the members of one set adapted to receive water on their outermost sides, and the members of the other set adapted to receive water on their innermost sides.

2. The combination of a discharge-nozzle, means for conducting water thereto, a spindle fixed axially in line with said nozzle, distributing-wings turnable upon the spindle exterior to the nozzle, and certain of said wings adapted to receive water on their outermost sides and certain other of the wings adapted to receive water on their innermost sides, and a diverging cone upon the spindle and located in the discharge-orifice.

3. A nozzle, means for conducting water thereto, a spindle supported axially in line with said nozzle, distributing-wings freely turnable upon the spindle exterior to the nozzle, and certain of said wings adapted to receive water on their outermost sides and certain other of the wings adapted to receive water on their innermost sides, a diverging cone located between the nozzle and the wings and means for adjusting said cone and regulating the discharge through the nozzle.

4. The combination with a nozzle and a support, of alternate concaved and convexed distributing-wings carried by the support in such manner that water is received upon the lower outer face of one set of vanes, and upon the upper and inner side of the other set of vanes, whereby the water discharged by one set of vanes falls within a lesser radius than the water that is discharged by the other vanes.

5. The combination in a sprinkler of a nozzle, a spindle fixed axially in line with the discharge-orifice thereof, distributing-wings upon said spindle, said wings having certain members adapted to receive the water on their outermost sides, and other of said members adapted to receive the water on their innermost sides.

6. The combination in a sprinkler of a nozzle, a spindle fixed axially in line with the discharge-orifice thereof, distributing-wings turnable upon said spindle, said wings having certain of their members adapted to receive the impingement of the water on their outermost faces, other of said members having their surfaces oppositely curved and alternating with the first-mentioned members, said second members having their lower edges disposed at a distance from the hub of the wings so that a passage is formed whereby the impingement of the water is upon the innermost of said wing-surfaces.

7. The combination in a sprinkler of a nozzle, distributing-wings supported and revolvable axially in line with said nozzle, said wings having two sets of members with the members of one set adapted to receive water on their outermost sides and the members of the other set adapted to receive water on their innermost sides, radial weighted arms revolvable with and carried by said wings, and means whereby a portion of the discharge-orifice of the nozzle is closed.

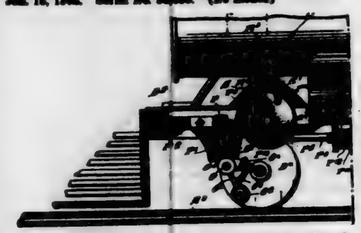
8. In a lawn-sprinkler, the combination of a nozzle having its walls at its discharge end converging sharply, a spindle supported within and in axial alinement with said discharge-orifice, said spindle having an outer groove coincident with the edges of the converging walls of said nozzle and distributing-wings revolvable upon said spindle, said wings arranged in two sets, one concaved and the other convexed, and one of said sets receiving water upon the outermost sides and the other set receiving water upon the innermost sides.

9. In a lawn-sprinkler, the combination of a nozzle, a spindle axially in line therewith, an annular discharge-orifice between the nozzle walls and the spindle, revolvable distributing-wings upon the spindle exterior to the nozzle, and a flexible band normally inclosing the nozzle and adapted to close a portion of said orifice to limit the flow of water therethrough.

706,987. COMBINED ADVERTISING MATCH-BOX AND CIGAR TIP CUTTER. WILLIAM B. HOOPER, Bloomingdale, N. Y. Filed Dec. 2, 1901. Serial No. 84,946. (No model.)

Claim.—In a match-box of the character described, the same being provided with the curvilinear short arm integral with the wall thereof having an aperture in its free end, the cover having a corresponding slot therein adapted to be closed by said arm, a double-edged cutting-blade secured to the inner side of the cover and located across said slot, whereby the tip of a cigar may be clipped off when passed through the aperture in the arm by said blade, in opening or in closing the cover, and vertically-arranged strips secured to the side of the box, substantially as and for the purpose set forth.

706,988. EMERGENCY-GEAR FOR LOCOMOTIVES. WILLIAM W. HUBER, Brooklyn, N. Y., assignor of one-half to John B. Parker, Brooklyn, N. Y. Original application filed Nov. 9, 1900, Serial No. 36,469. Divided and this application filed June 5, 1901. Renewed Jan. 16, 1902. Serial No. 89,959. (No model.)



Claim.—1. A safety gear and signal system for railroads, comprising a track device and a controller for controlling signals and for controlling mechanism on a locomotive, to automatically shut off the motive agent and to apply the brakes, said device having a lever adapted to be depressed by a train-wheel, a cross-head, a connection between the lever and the cross-head to move the latter forward on the downward movement of the lever, and a rod attached to the cross-head and extending rearwardly, said rod carrying means for actuating said controller, to set the latter to danger position, as set forth.

2. A safety gear and signal system for railroads, comprising a track device and a controller for controlling signals and for controlling mechanism on a locomotive, to automatically shut off the motive agent and to apply the brakes, said device having a lever adapted to be depressed by a train-wheel, a cross-head, a connection between the lever and the cross-head to move the latter forward on the downward movement of the lever, a rod attached to the cross-head and extending rearwardly, said rod carrying means for actuating said controller, to set the latter to danger position, and a spring device for said connection, to move the latter and the lever back to a normal position after the cross-head is moved and the lever is relieved of pressure of the wheel, as set forth.

3. A safety gear and signal system for railroads, comprising a track device and a controller for controlling signals and for controlling mechanism on a locomotive, to automatically shut off the motive agent and to apply the brakes, said device having a lever adapted to be depressed by a train-wheel, a cross-head, a connection between the lever and the cross-head to move the latter forward on the downward movement of the lever, a rod attached to the cross-head and extending rearwardly, said rod carrying means for actuating said controller, to set the latter to danger position, and means connected with the rear end of said rod for moving the cross-head of the preceding track device into a normal position, as set forth.

4. A safety gear and signal system for railroads, comprising a track device and a controller for controlling signals and for controlling mechanism on a locomotive, to automatically shut off the motive agent and to apply the brakes, said device having a lever adapted to be depressed by a train-wheel, a cross-head, a connection between the lever and the cross-head to move the latter forward on the downward movement of the lever, a rod attached to the cross-head and extending rearwardly, said rod carrying means for actuating said controller, to set the latter to danger position, and signals connected with and set by said rod, as set forth.

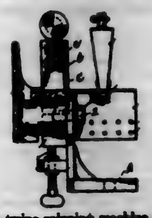
5. A safety gear and signal system for railroads, having a track device, comprising a lever adapted to be engaged by a train-wheel, a link-lever engaging with one end the said wheel-lever and traveling freely at its outer end on a fixed incline, a spring-pressed piston, and a link connection between said lever and the piston-rod of said piston, as set forth.

6. A safety gear and signal system for railroads, having a track device provided with a track-lever adapted to be engaged by a train-wheel, a second lever hung on links and having a friction-roller engaged by the under side of said track-lever, an adjustable block having an incline engaged by another friction-roller on said link-lever, a cylinder, a spring-pressed piston therein, and a connection between said piston and said link, as set forth.

7. A safety gear and signal system for railroads, having a track device provided with a casing having an opening in the top, a lever fulcrumed within the casing and having a portion extending through said opening, and a packing in the walls of said opening, for engaging the portion of said lever extending in the opening, as set forth.

8. A safety gear and signal system, provided with a track device having a track-lever adapted to be engaged by a train-wheel, a shaft connected with and adapted to be turned by said lever, wipers on said shaft, and a cross-head mounted to slide longitudinally and having a rod extending rearwardly from the cross-head to actuate a controller and the signals, as set forth.

706,989. TWINE-SPINNING MACHINE. RICHARD A. MYERS, Dayton, Ohio, assignor to the Hoover & Gamble Company, Miamisburg, Ohio, a Corporation. Filed Jan. 28, 1902. Serial No. 91,570. (No model.)



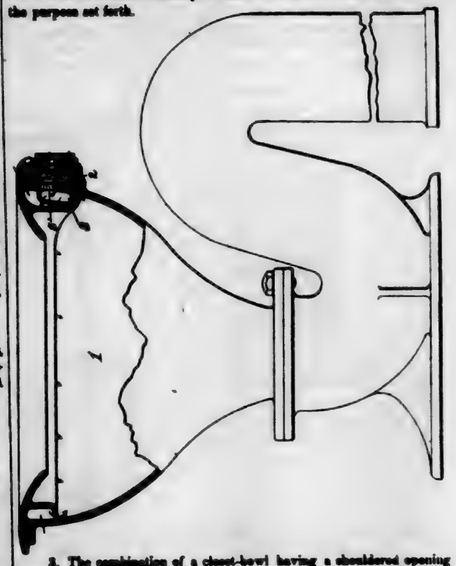
Claim.—1. In a twine-spinning machine the combination of a funnel-shaped receiver converging to a throat, a two-part nipper, the lower section having bifurcated limbs, the upper section fitting and engaging between said limbs telescopically in vertical planes, a throat and a nipper-point formed on the opposing surfaces of said nipper-sections, substantially as specified.

2. In combination with a twine-spinning machine, a funnel-shaped receiver having a converging throat, a cast formed in said receiver transversely to said throat, a lower nipper-section adjustably supported in said cast, said section having two upwardly-extended, bowded limbs, an upper nipper-section yieldingly and detachably engaging with said lower section telescopically in vertical planes, a throat formed between the meeting surfaces of said sections, the said upper section being substantially triangular-shaped, having the apex projected between the said limbs of the lower section, and a nipper-point formed on the lower end of said apex adapted to impinge upon the silver, substantially as specified.

706,990. WATER-CLOSET BOWL. PETER J. MCGUIRE, Hulmeville, Pa., assignor to the Crampton Sanitary Enamel-Ware Co., a Corporation of Pennsylvania. Filed Nov. 5, 1900. Serial No. 35,505. (No model.)

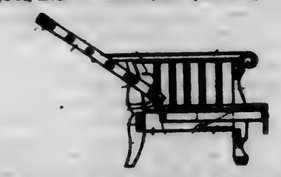
Claim.—1 The combination of a closet-bowl having a shouldered opening formed through the wall thereof, and having recesses extending from the shouldered portion into the lower portion of the opening, a shouldered flushing-spud fitted into said bowl-opening which is provided at its rear end with a nut to secure it thereto and lugs upon the rear or engaging side of the shoulder to enter said recesses, and a bridge formed upwardly across the shouldered face of the spud which is open at each side and is provided with an additional opening in its lower connecting end, the face of said spud around the bridge and at the lower edges of said openings being flush with and of the same concavity as that of the bowl-surface, as and for the purpose set forth.

2. The combination of a closet-bowl having a shouldered opening formed through the wall thereof, and having recesses extending from the shouldered portion into the lower portion, said shoulder having a greater depth at its lower side and decreasing proportionally therefrom at and toward the upper side in conformity with the concavity of the bowl-surface, a flushing-spud fitted into said bowl-opening which has a shouldered inner end to conform with and fill the shouldered portion of said opening, lugs formed upon the rear or engaging side of the spud-shoulder to enter the recesses in said bowl-opening, a bridge formed upwardly across the shouldered face of the spud which is open at each side and has an additional opening at its lower connecting end, and a nut arranged upon the rear end of the spud to secure it to said bowl, the face of said spud around the bridge and at the lower edges of its openings being flush with and of the same concavity as that of the bowl-surface, as and for the purpose set forth.



3. The combination of a closet-bowl having a shouldered opening formed through the rear wall thereof with recesses in said opening, a shouldered spud fitted into said opening flush with the inner surface of the bowl, lugs formed upon said spud to engage within the recesses of said opening, a bridge formed across the inner or shouldered end of said spud to cause water to issue from the sides thereof around the bowl, an opening in the lower end of said bridge through which a portion of the water flows downward, a nut arranged upon the rear of said spud to secure it to the bowl, and an abutment formed upon the interior of said spud.

706,991. AUTOMATIC ADJUSTABLE CHAIR. THOMAS H. MCKEE and GILES B. HAWKINS, Indianapolis, Ind., assignors to National Adjustable Chair Company, Greenfield, Ind., a Corporation of Indiana. Filed Sept. 30, 1901. Serial No. 77,088. (No model.)



Claim.—1. An automatically-adjustable chair comprising a main frame provided with inclined supports having smooth surfaces, a seat-frame having the forward part thereof supported on the inclined supports, a back pivoted to the rear part of the seat-frame and thereby supporting the same, and pivots connecting the back to the main frame and thereby supporting the back and the rear part of the seat-frame, whereby the seat may be employed as a gravity force in operating the back and the back may be employed as a lever in operating the seat-frame.

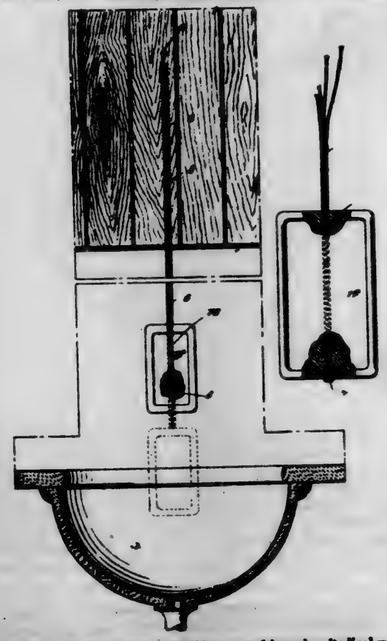
2. In an adjustable chair, a main frame, a back pivoted near its lower end to the main frame, a seat-frame pivoted at its rear part to the lower

end of the back, inclined supporting members attached to the main frame near the forward parts thereof and supporting the forward part of the seat-frame, whereby the forward part of the seat may be caused to rise and fall and also to move longitudinally in unison with the rear part thereof.

3. In an adjustable chair, the combination of the main frame provided with the blocks having the inclined upper faces, the pivots connected to the upper portions of the rear legs, the back connected to said pivots above the lower ends thereof, the seat-frame having the forward end thereof mounted on said blocks, and the pivots connecting the lower end of the back to the rear part of the seat-frame, whereby an operator sitting on the seat may automatically cause the seat to recede and the back to rise, and also by leaning against the back cause the same to recede and the seat to rise.

4. In an adjustable chair, the combination of the main frame, the back pivoted to the rear legs of the main frame, the seat pivoted to the back, the inclined ways at the front part of the main frame, and the blocks attached to the seat-frame and bearing on said inclined ways.

706,992. PENDENT SOAP-HOLDER. ROBERT H. HARAHIN, New York, N. Y. Filed July 30, 1901. Serial No. 70,088. (No model.)



Claim.—1. A pendent soap-holder, comprising a longitudinal member provided with an anchor for holding a free bar of soap, and composed of a plurality of separate cords each capable of use independently of the other, for the purpose of removing dirt from the hands, and means for suspending said member from a fixture.

2. A pendent soap-holder, comprising a longitudinal inelastic section, consisting of a plurality of flexible but inelastic cords arranged parallel with each other so as to be readily separated by the insertion of a finger, and each provided with a rough surface for the purpose of removing dirt, an elastic section secured to one end of said inelastic section, and means for securing a bar of soap to the other end of said elastic section.

3. A pendent soap-holder, comprising a multifiber section of separate cords for the double purpose of cleansing the hands and of suspending a bar of soap, said multifiber section being provided with an anchor for holding said bar of soap.

4. As an article of manufacture, a soap-holder comprising a longitudinal member made in sections, one of the said sections being of material elastic in the direction of its length, and another section being made of rough cords; said cords being provided with a needle and threaded through the eye of the same, for purposes of passing said cords through a free bar of soap.

5. A pendent soap-holder, comprising a multifiber member consisting of hard and soft cords, and means upon such cords for securing a bar of soap.

6. A pendent soap-holder, comprising a multifilor member consisting of large and small cords, and means upon such cords for securing a bar of soap.

706,993. ROD-ROLLING MILL. CHARLES A. HIGGINS, Jersey City, N. J. Filed Jan. 2, 1902. Serial No. 88,095. (No model.)

Claim.—1. A rod-rolling mill having, in combination, a set of rolls having their pass-forming grooves constructed with rib-forming enlargements, means for guiding the rod by its ribs as it issues from said rolls to prevent any twisting thereof, and a set of rolls arranged to receive the ribbed rod from the guiding means and to roll the ribs into the body of the rod.

2. A rod-rolling mill having, in combination, a set of rolls having their pass-forming grooves constructed with rib-forming enlargements, a guide, conformed internally to the continuously-ribbed rod so produced, arranged to receive the ribbed rod as it issues from said rolls and to prevent any twisting thereof, and a set of finishing-rolls arranged to receive the ribbed rod from said guide and to roll the ribs into the body of the rod.

3. A rod-rolling mill having, in combination, a set of horizontal rolls having their pass-forming grooves constructed with rib-forming enlargements, a guide, conformed internally to the continuously-ribbed rod so produced, arranged to receive the ribbed rod as it issues from said rolls and to prevent any twisting thereof, and a set of vertical rolls arranged to receive the ribbed rod from said guide and to roll the ribs into the body of the rod.

4. A rod-rolling mill having, in combination, a set of rolls having their pass-forming grooves constructed at their lateral edges with rib-forming enlargements, a guide, conformed internally to the continuously-ribbed rod so produced, arranged to receive the ribbed rod as it issues from said rolls and to prevent any twisting thereof, and a set of rolls arranged to receive the ribbed rod from said guide and to roll the ribs into the body of the rod.

5. A rod-rolling mill having, in combination, breaking-down rolls, oval rolls, a guide for the oval rod, as hereinbefore specified, rib-rolls arranged to receive the oval rod through said guide with their pass-forming grooves perpendicular to the major diameter of such oval rod and constructed with rib-forming enlargements, a guide, conformed internally to the continuously-ribbed rod so produced, arranged to receive the ribbed rod as it issues from said rib-rolls and to prevent any twisting thereof, and finishing-rolls, arranged to receive the ribbed rod from said last-named guide, with their pass-forming grooves perpendicular to said ribs.

6. A rod-rolling mill having, in combination, a line-train composed of breaking-down rolls, oval rolls, and rib-rolls, the latter constructed with rib-forming passes, a guide arranged to feed the oval rod into a pass of said rib-rolls with a quarter-turn, a guide, conformed internally to the continuously-ribbed rod so produced, arranged to receive the ribbed rod as it issues from said rib-rolls and to prevent any twisting thereof, and vertical finishing-rolls arranged to receive the ribbed rod from said last-named guide and to roll the rib into the body of the rod.

7. A rod-rolling mill having, in combination with a set of horizontal rib-rolls having a number of passes of graduated size each constructed with rib-forming enlargements, a guide, conformed internally to the continuously-ribbed rod so produced, adjustable for rods of different sizes and movable horizontally into line with any pass of said rolls, a set of vertical rolls arranged to receive the ribbed rod from said guide and having a number of passes of graduated size, and means for moving said vertical rolls horizontally and vertically to bring any of their passes into alinement with the corresponding pass of said horizontal rolls and with said guide.

8. In a rod-rolling mill, the combination with a set of horizontal rolls and a set of vertical rolls, each having a number of passes, of a movable housing for said vertical rolls, means carried by said housing for alining the grooves of the respective vertical rolls with each other and for pressing these rolls into close contact with each other, an apron supporting said housing, means for sliding said housing upon said apron and thereby moving said vertical rolls horizontally into alinement, means for raising and lowering said apron and therewith said housing and vertical rolls, and a stationary main frame supporting said apron and housing.

9. In a rod-rolling mill, the combination with a set of horizontal rolls and a set of vertical rolls, each having a number of passes of a movable housing for said vertical rolls, means carried by said housing for alining the grooves of the respective vertical rolls with each other and for pressing these rolls into close contact with each other, an apron supporting said housing, means for sliding said housing upon said apron and thereby moving said vertical rolls horizontally into alinement, means for raising and lowering said apron and therewith said housing and vertical rolls, a stationary main frame, and means for fixedly clamping thereto said apron and therewith said housing.

10. In a rod-rolling mill, the combination with a set of horizontal rolls and a set of vertical rolls, each having a number of passes of graduated size, of a movable housing for said vertical rolls, means carried by said housing for alining the grooves of the respective vertical rolls with each other and for pressing these rolls into close contact with each other, an apron supporting said housing, means for sliding said housing upon said apron and thereby moving said vertical rolls horizontally into alinement, means for raising and lowering said apron and therewith said housing and vertical rolls, a stationary main frame, and means for fixedly clamping thereto said apron and therewith said housing.

706,994. METHOD OF ROLLING RODS. CHARLES A. HIGGINS, Jersey City, N. J. Filed Jan. 2, 1902. Serial No. 88,096. (No model.)

Claim.—1. The method of producing steel or iron rods by hot rolling which consists in breaking down an ingot into a square rod of suitable size, rolling said square rod into an oval shape, rolling such oval rod into a rod, partly of the final shape and size, having continuous laterally-projecting longitudinal ribs of uniform shape and of sufficient proportions to retain the rolling heat, guiding the ribbed rod and keeping it from twisting by means of said ribs, and finishing the product by rolling said ribs into the body of the rod, and thereby filling out and perfecting the rod.

2. In the method of producing steel or iron rods by hot rolling the improvement which consists in rolling the rod into a shape and size which are partly those of the final product, providing it from end to end at the same operation with laterally-projecting longitudinal ribs of uniform shape and of sufficient proportions to retain the rolling heat, guiding the ribbed rod and keeping it from twisting by means of said ribs, and finishing the rod by rolling said ribs into the body of the rod, and thereby filling out and perfecting the rod, substantially as hereinbefore specified.

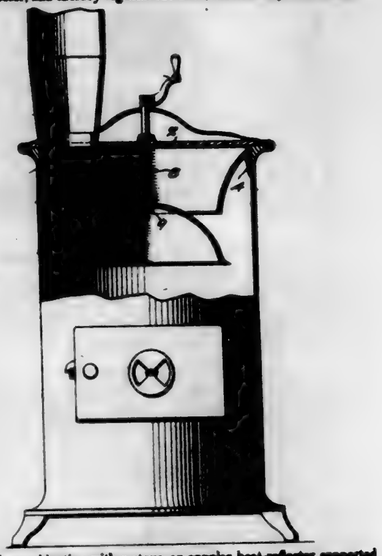
706,995. FASTENING MEANS FOR DOORS OR WINDOWS. JOHN W. HUTCHIN, Forsyth, Mont. Filed Feb. 28, 1902. Serial No. 96,500. (No model.)

Claim.—A fastener for storm or screen doors and windows consisting of a keeper to engage a door or window frame formed from a single metal plate bent at an angle to correspond to the thickness of a door or window sash and the angularly-bent portion again bent in reverse and parallel with the front or main body of the plate and provided with a series of teeth, and a turn-button also made up from a single metal plate with opposite reduced terminals bent to form intermediate outwardly-projecting duplicate flanges, the said button being centrally pivoted to the front portion of the bracket.

706,996. HEAT-REFLECTOR FOR STOVES. ROBERT G. DUNLEVY and ALBERT H. G. BRATTY, Independence, Mo. Filed Aug. 10, 1901. Serial No. 72,547. (No model.)

Claim.—1. A stove having a smoke escape-opening in the top of its combustion-chamber, a reflector depending from its top and extending around its sides, said reflector being at its upper edge tightly joined to the top of the stove, having downwardly-converging sides and being open on its lower side, the smoke escape-opening being within the radius of the reflector and at one side thereof, and a ball of approximately the same diameter as the mouth of the reflector and disposed mouth downward below the reflector, whereby the ball and reflector become highly heated, retard the escape of unconsumed combustible gases and ignite the same, substantially as described.

2. A stove having a smoke escape-opening in the top of its combustion-chamber, a reflector depending from its top and extending around its sides, said reflector being at its upper edge tightly joined to the top of the stove, having downwardly-converging sides and being open on its lower side, the smoke escape-opening being within the radius of the reflector and at one side thereof, a ball of approximately the same diameter as the mouth of the reflector and disposed mouth downward below the reflector, whereby the ball and reflector become highly heated, retard the escape of unconsumed combustible gases and ignite the same, and means to adjust the ball vertically to vary the width of the space between the same and the reflector, and thereby regulate the draft, substantially as described.



706,997. RAZOR-CLEANER. ERNEST F. OSBORN, Converse, Ind. Filed May 29, 1901. Serial No. 62,405. (No model.)

Claim.—1. A lather-cup formed of a single piece of flexible material and embodying an imperforate flat bottom, and a single transversely-flat marginal rim rising from the outer edge of the bottom and inclined inwardly and having a flat upper peripheral edge, the interior of the cup being entirely open between opposite sides of the rim from the top to the bottom thereof, whereby the inner downwardly and outwardly inclined face of the rim is exposed to facilitate the depositing of lather within the bottom of the cup.

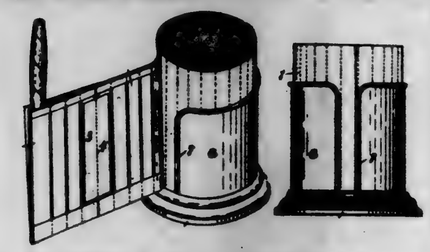
2. A razor-cleaner comprising a cup having a bottom and an upstanding marginal rim, an elastic wrist-engaging loop-shaped strap carried by the bottom portion of the cup, and an elastic finger-engaging loop-shaped strap also carried by the bottom portion of the cup and located diametrically opposite the other loop.

706,998. PAPER CIGAR-POCKET. CRYELL L. PARRISH, Racine, Wis. Filed May 14, 1902. Serial No. 107,518. (No model.)

Claim.—1. A cylindrical roll formed by spirally rolling or winding a continuous sheet of compressed parallel detachably-connected paper cigar-pockets, in combination with a dispensing-holder shorter than and loosely receiving and displaying said roll, substantially as described.

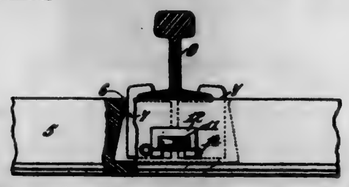
2. A cylindrical roll formed of an elongated sheet of parallel de-

tachably-connected paper cigar-pockets all having their open ends at the upper end of the roll, in combination with an open-end display-stand having a side opening, said roll rotatable in and at one end projecting beyond said stand, as described.



3. A continuous elongated sheet of parallel detachably-connected paper cigar-pockets wound into a cylindrical roll with the open ends of all the pockets at the upper end of the roll, in combination with a stand having a base and a vertical cylindrical wall with its ends separated to form a vertical side opening, said roll centered and rotatable in and projecting above said wall, for the purpose described.

706,999. RAIL-FASTENING. WILLIAM P. PATTERN, Moundsville, W. Va., assignor of two-thirds to Allen G. Scroggins, Jr., and James R. Heston, Moundsville, W. Va. Filed Mar. 24, 1902. Serial No. 99,746. (No model.)



Claim.—1. In a rail-fastener, a pair of jaws adapted to grip a rail, a support for said jaws, a wedge adapted to enter between the jaws and to put them in their effective position, and the reduced end of the wedge having notches in its opposite sides, and a bifurcated key, the branches of which are adapted to enter said notches.

2. In a rail-fastener, a pair of jaws adapted to grip a rail, a support having a vertical recess to receive said jaws and the inner and outer faces of the walls of the recesses being inclined and converging toward the top of the support, and a wedge adapted to enter between the jaws and to put them in their effective position.

3. In a rail-fastener, a pair of jaws adapted to grip a rail, a support for said jaws, a wedge adapted to enter between the jaws and to operate the same, the reduced end of the wedge having notches at its opposite sides, a bifurcated key, the branches of which are adapted to be seated in said notches, and said branches having alined perforations, and a pin adapted to enter said perforations.

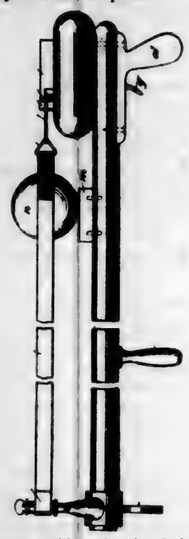
707,000. SPRING-GUN. WILLIAM H. PEASE, Joliet, Ill. Filed Feb. 10, 1902. Serial No. 93,561. (No model.)

Claim.—1. A spring-gun, comprising a barrel or body, projecting devices, a fork on the barrel and connected to the projecting devices, the fork having a collar fitted on the barrel to mount it, and a set-screw working in the collar, and having an enlarged head forming a footrest for facilitating the cocking operation.

2. A spring-gun, comprising a barrel or body, a fork attached to the end thereof, sleeves mounted loosely on the ends of the fork, an elastic structure connected to the sleeves, and fastening devices entered into the ends of the fork and having portions lying over the sleeves to hold them in place.

3. A spring-gun, comprising a barrel or body, a collar mounted thereon, means for fastening the collar in place, said means also having a projected portion serving as a footrest in cocking the gun, arms carried by the collar, said collar and arms forming a fork, sleeves mounted loosely on the ends of the arms, an elastic structure connected to the sleeves, and means for releasably holding the elastic structure.

4. A spring-gun, comprising a barrel or body, an elastic structure connected with the end portion of the body, a stop on the other end portion of the body, a keeper for holding the elastic structure engaged with the stop, said devices for actuating the keeper, the said stop having a rounding surface with a cavity therein, and the keeper having a tongue working in the cavity in the manner specified.



5. A spring-gun, comprising a barrel or body, an elastic structure connected with one end portion of the body, a stop on the other end portion of the body, a keeper for holding the elastic structure engaged with the stop, devices for actuating the keeper, the said actuating devices comprising a trigger-arm connected with the keeper, a trigger releasably holding the trigger-arm, and a spring connected with the parts and tending to release the keeper.

6. A spring-gun, comprising a barrel or body, an elastic structure connected with one end portion of the body, a stop on the other end portion of the body, a keeper for holding the elastic structure engaged with the stop, devices for actuating the keeper, the said actuating devices comprising a trigger-arm, a link connecting said arm with the keeper, a spring tending to release the keeper, and a trigger releasably engaging the trigger-arm.

7. A spring-gun, comprising a barrel or body, an elastic structure connected with one end portion of the body, a stop on the other end portion of the body, a keeper for holding the elastic structure engaged with the stop, devices for actuating the keeper, the said actuating devices comprising a trigger-arm, a link connecting said arm with the keeper, a spring tending to release the keeper, and a trigger releasably engaging the trigger-arm, the trigger-arm having a rounding end terminating in a square portion and the trigger having a hook coacting with the rounding end and square portion of the trigger.

8. A spring-gun, having a body part with a cavity therein, an elastic structure connected with the body part, casing-plates fitted in the cavity in the body to form a chamber between them, and means for releasably holding the elastic structure, said means including the inverted channel-iron keeper arranged on the top edges of the casing-plates, and the actuating devices arranged within said chamber.

9. A spring-gun having a body, an elastic structure, means for releasably holding said structure and actuating devices for said means, the actuating devices comprising a trigger-arm, a connection between the trigger-arm and the said holding means, a trigger working with the trigger-arm, and a spring actuating the parts normally to release the holding means.

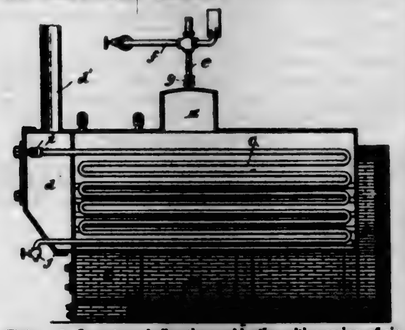
10. A spring-gun having a body, an elastic structure, means for releasably holding said structure and actuating devices for said means, the actuating devices comprising a trigger-arm, a connection between the trigger-arm and the said holding means, a trigger working with the trigger-arm, and a spring actuating the parts normally to release the holding means, the trigger-arm having a rounding surface terminating in a square portion, and the trigger having a hook coacting with said rounding surface and square part of the trigger-arm.

707,001. HYDROCARBON-BURNER. CHARLES T. PEPPER, Los Angeles, Cal., assignor to Charles F. Pepper, Los Angeles, Cal. Filed Mar. 14, 1902. Serial No. 98,393. (No model.)

Claim.—1. A hydrocarbon-burner comprising a flame-spreader on the end of the fuel-supply pipe; a combustion-cup disposed below said flame-spreader, said cup having a central draft-opening in the bottom thereof, a perforated conical-shaped fuel-spreader in said cup having legs to hold it elevated above the bottom of the cup; a smaller imperforate conical-shaped fuel-spreader having legs to hold it elevated above the perforate spreader.

2. The combination of an imperforate bed-plate, having a central draft-opening therethrough, adapted to extend across the combustion-chamber of the structure in which the burner is to be used; a combustion-cup having a central draft-opening in the bottom thereof registering with the draft-opening in the bed-plate and resting thereon; a perforate conical-shaped fuel-spreader, having legs, in said combustion-cup; an imperforate conical-shaped fuel-spreader having legs adapted to rest upon the perforate spreader; a flame-spreader above said imperforate spreader having a central opening extending therethrough.

707,002. STEAM-BOILER. JOHN PLATER, Newton, Pa., assignor of one-fourth to Brix & Joseph, Bradford, Pa., a Firm. Filed Jan. 27, 1902. Serial No. 91,304. (No model.)



Claim.—1. In a steam-boiler, the combination with a casing, of air-flues passing therethrough, a horizontally-extending vertically-arranged coil between the air-flues and the upper end thereof having direct communication with the casing and the lower end with the outside atmosphere, substantially as described.

2. In a steam-boiler, the combination with a casing, of air-flues arranged therein and having a central open space, a horizontally-extending vertically-arranged coil with said open space and the upper end of said coil having direct communication with the casing and the lower end with the outside atmosphere, substantially as described.

3. In a steam-boiler, the combination with a casing, of air-flues extending therethrough on each side, and a coil within the casing between the flues and having one end in communication with the casing and the opposite end with the outside atmosphere, substantially as described.

4. In a steam-boiler, the combination with a casing, of a steam-dome carried by the upper portion thereof, a pipe in communication therewith and having a steam-gage, said pipe having its opposite end entering the end of the casing, and a coil with the casing having one end connected to said pipe and the opposite end in communication with the outside atmosphere, substantially as described.

5. In a steam-boiler, the combination with a casing, of a steam-dome carried by the upper portion of said casing, fire-tubes carried by each side of said casing, a coil within the casing between the fire-tubes, and having its lower end in communication with the outside atmosphere, a cock for closing said end, a pipe in communication with said dome, and connected to the upper end of said coil, a cock intermediate the coil and the dome, and a gage on each side of said cock, whereby the pressure in the boiler and the pressure in the coil is readily determined, substantially as described.

6. In a steam-boiler, the combination with a casing, of fire-tubes carried by said casing, a coil within the casing and having its lower end in communication with the outside atmosphere, a pipe in communication with the casing and the upper end of the coil, a cock intermediate the coil and the casing, and a gage on each side of said cock, whereby the pressure in the casing and the coil is readily determined, substantially as described.

7. In a steam-boiler, the combination with a casing, fire-tubes carried by each side of said tube, a horizontally-extending vertically-arranged coil within the casing between the fire-tube and having its lower end in communication with the outside atmosphere, a pipe in communication with the casing and the upper end of the coil, a cock intermediate the coil and the casing and a gage on each side of said cock, whereby the pressure in the boiler and the coil is readily determined, substantially as described.

707,003. ROTARY ENGINE. JAMES P. PELLARD, Silverlake, Wash. Filed Jan. 7, 1902. Serial No. 88,791. (No model.)

Claim.—1. In a rotary engine, the combination of a shell or casing, a piston concentrically mounted therein and having an annular chamber communicating with radial pockets, wings mounted in the said pockets and having abutments and blades dividing said pockets and movably extending into the body of the piston at a distance inward from the inner terminals of the pockets, and means for supplying a motive agent to the said chamber and the compartments formed between the wings.

2. In a rotary engine, the combination of a shell or casing comprising a piston-chamber and a chest for the reception of the motive agent, the chest having ports communicating with the piston-chamber and the latter also provided with exhaust-ports, a piston concentrically mounted in the said piston-chamber and having an annular steam-chamber inwardly from the periphery thereof and communicating with radial pockets opening outwardly through the periphery of said piston to receive a motive agent, a valve in the chest, and wings radially mounted in the piston and held projected by the motive agent and provided with means confined within the pockets for engagement by the motive agent entering the latter from the said annular chamber.

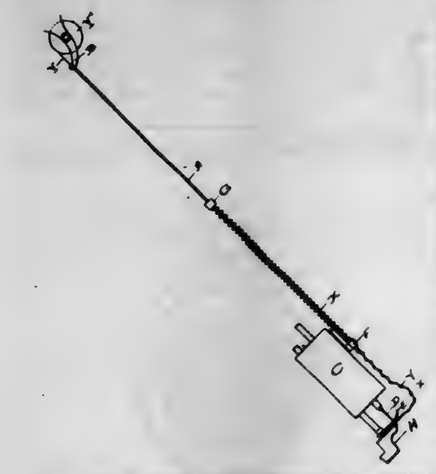
3. A rotary engine having a piston with an annular chamber and radial pockets in communication with said chamber, wings mounted in said pockets and having portions dividing the latter, and means for introducing a portion of the motive agent to the said chamber and divided pockets.

707,004. TAPE INSERTING AND STITCHING MECHANISM. MYRON H. POWELL, Chicago, Ill., assignor, by mesne assignments, to himself, Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois, and Edward P. Hatch, Lagrange, Ill. Filed Aug. 17, 1899. Renewed June 13, 1902. Serial No. 111,570. (No model.)

Claim.—1. In combination with the stitch-forming mechanism and feed of a sewing-machine, a tubular holder upon the exterior of which the edging is threaded and gathered, and through the interior of which the tape is passed, said holder being arranged with respect to the said feed to cause the edging and tape to be simultaneously drawn thereby from the holder and fed to the stitch-forming mechanism.

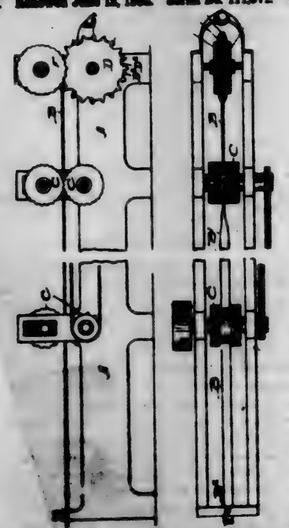
2. In combination with the stitch-forming mechanism and feed of a sewing-machine, a tubular holder upon the exterior of which the edging is threaded and through the interior of which the tape is passed, and a bearing or retarding device to hold the edging against a too free movement from off the holder, said holder being arranged with its discharge end adjacent to the feed to cause the latter to draw the taped edging from the holder and feed it to the stitching mechanism.

3. In combination with the stitch-forming mechanism and feed of a sewing-machine, an edging and tape feeding and threading mechanism comprising, a tape-reel, a tubular open-ended holder suspended from the reel-frame with its lower end in proper relation to the feed, the said holder being adapted to have the edging threaded upon its exterior and the tape pass through its interior, substantially as and for the purposes set forth.



4. In combination with the stitch-forming mechanism and feed of a sewing-machine, a vertically-arranged tubular holder upon the exterior of which the edging is threaded and gathered, and through the interior of which the tape is passed, said holder being arranged with respect with the said feed to cause the edging and tape to be simultaneously drawn thereby over the holder and fed to the stitch-forming mechanism, and a sliding weight as G; substantially as described.

707,005. MACHINE FOR INSERTING TAPE INTO EDGING. EVERT H. POWELL, Chicago, Ill., assignor, by mesne assignments, to Emmett, Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois, and Edward P. Habich, Lagrange, Ill. Filed Aug. 17, 1899. Renewed June 12, 1902. Serial No. 111,571. (No model.)



Claim.—1. The combination with an edging-holder, of the supporting-wheel and means located on the supporting-wheel for positioning the cross or connecting bars forming the meshes of the edging alternately at opposite sides of the forward end of the edging-holder, and means for threading the edging onto the holder, substantially as described.

2. In a machine of the kind described, the combination with the holder upon which the edging is to be strung, of a wheel having teeth adapted to enter the meshes of the edging, said teeth being constructed to position the cross-bars of said edging alternately at opposite sides of the forward end of the holder, substantially as described.

3. In a machine of the character described, the combination with the edging-holder, a rotatable supporting device for the edging arranged adjacent the forward end of the holder, said device being provided with means for positioning the cross-bars of the edging upon opposite sides of the forward end of the holder; substantially as described.

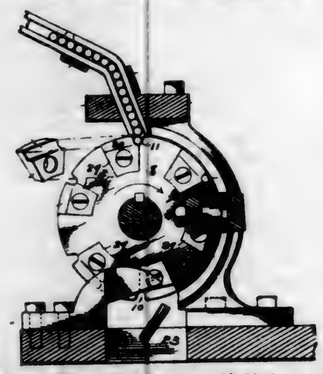
4. In a machine of the character described, the combination with the edging-holder, of a supporting-wheel for the meshed edging provided with teeth and having a series of alternately deep and shallow spaces between the teeth whereby the cross or connecting bars of the edging are alternately positioned upon opposite sides of the forward end of the edging-holder and means for threading the edging onto the holder; substantially as described.

5. In a machine of the character described, the combination with the edging-holder of a regulating-wheel having a peripheral groove in which the point of the holder may ride, a series of teeth spaced to conform to the meshes or openings in the edging, and a series of alternately deep and shallow spaces between the teeth whereby the cross or connecting bars of the edging are alternately positioned upon opposite sides of the forward end of the edging-holder, substantially as described.

6. In a machine of the character described, the combination with the edging-holder, of a supporting-wheel having a series of teeth spaced to conform to the meshes or openings in the edging, and a series of alternately deep and shallow spaces between the teeth whereby the cross or connecting bars of the edging are alternately positioned upon opposite sides of the forward end of the edging-holder, the deep spaces being provided with an undercut; substantially as described.

7. In a machine for threading edging, a bodkin or holder, a supporting device for the meshed edging, means for positioning the edging upon opposite sides of the plane of the bodkin, and a spreading device adapted to engage the meshes of the edging and exert the proper tension upon said edging; substantially as described.

707,006. WIRE-BENDING MACHINE. GEORGE F. PROSS and ANDREW P. TUCKER, Cincinnati, Ohio, assignors to Ernst H. Enzenhild, Cincinnati, Ohio. Filed Mar. 17, 1902. Serial No. 98,847. (No model.)



Claim.—1. The combination of a movable blank-receptacle and a rigidly-supported abutment adjacent to the end of the blank-receptacle and normally in the path of the protruding end of a blank carried by said receptacle, against which abutment, said protruding end of the blank is bent as the receptacle moves.

2. The combination of a rotary blank-receptacle and a rigidly-supported abutment at one end of said receptacle, against which the protruding end of the blank is bent as the receptacle rotates.

3. The combination of a rotary blank-receptacle and a rigidly-supported roller at one end of the receptacle against which the protruding end of the blank is bent.

4. The combination with a rotary blank-receptacle, of means for feeding blanks of greater length than the receptacle therefrom, and rigidly-mounted abutments at the ends of said receptacle against which the blank is bent as the receptacle rotates.

5. The combination with a rotary disk or cylinder having a blank-receptacle in its periphery, of a concave in proximity to said cylinder or disk and an abutment in the path of the blank and against which the blank is bent by the rotary disk or cylinder.

6. The combination with a rotary disk or cylinder having blank-receptacles in its periphery, of a concave in proximity to said cylinder or disk, a rigidly-supported abutment at one end of the cylinder or disk and in the path of the protruding ends of the blanks in said receptacles to bend said blanks as the receptacle or cylinder rotates and means for feeding the blanks to the cylinder or disk.

7. In a wire-bending machine, the combination with a shaft, of a series of disks or cylinders secured thereon and having slitted notches or pockets in their peripheries to receive wire blanks, means for feeding the blanks to said pockets, concaves to hold the blanks in the pockets, and an abutment in the path of the protruding ends of the blanks against which the ends are bent by the turning of said disks or cylinders.

8. In a wire-bending machine, the combination with a shaft, of a series of disks or cylinders keyed to said shaft and having slitted notches or pockets in their peripheries to receive the wire blanks and project the ends thereof beyond the end disks or cylinders, concaves in close proximity to the disks or concaves to hold the blanks in the pockets, and rollers mounted in the path of the protruding ends of the blanks and against which the blanks are bent.

9. In a wire-bending machine, the combination with a bed-plate, standards thereon, a grooved shaft mounted in the standards and means for driving said shaft, of a series of disks or cylinders keyed to said shaft and having slitted notches or pockets in their peripheries to receive wire blanks and project their ends beyond the end disks or cylinders, brackets secured to the standards, rollers mounted to revolve in the brackets and located in the path of the protruding ends of the wires, concaves to hold the wires in the pockets, and guide-strips to direct the wires into the pockets.

10. In a wire-bending machine, the combination with a bed-plate, standards thereon, a shaft mounted in the standards, means for driving the shaft, means for permitting the adjustment of the disks or cylinders and one standard and the disks or cylinders provided with slitted notches or pockets to receive wire blanks, of cross-bars connecting the standards and spaced apart, concaves secured to the bed-plate and one cross-bar and located in close proximity to the disks or cylinders, abutments carried by the standards against which the ends of the wires are bent, guide-strips projecting between the cross-bars to direct the wires into the pockets, guide-bars connected to the strips to guide the ends of the wires, a platform or tray carried by said strips, and a removable guide-bar and strips to be secured between the first-mentioned guide-bars to accommodate short wires.

11. In a wire-bending machine, the combination with a disk or cylinder having notches or pockets in its periphery for wire blanks and means for turning said disk or cylinder, a concave to hold the wires in the notches or pockets, an abutment beside the disk or cylinder and against which the wires are bent and hard-metal blanks secured in recesses in the disks or cylinders at the notches or pockets therein and having grooves in one side to permit play of the bent ends of the wires.

12. In a wire-bending machine, the combination with a rotary disk or cylinder having pockets therein for wire blanks, of a concave to hold the blanks in the pockets, an abutment in the path of the protruding ends of the wires against which the wires are bent, and inclined fingers to eject the wires from the pockets after the wires have passed the concave.

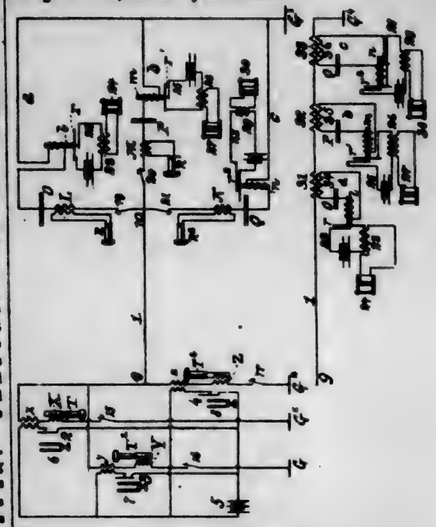
707,007. MULTIPLE TELEGRAPHY. MICHAEL I. PUPIN, New York, N. Y. Filed Feb. 23, 1894. Serial No. 501,022. (No model.)

Claim.—1. The method of distributing electrical energy which consists in throwing upon a common conductor a number of alternate currents of different frequencies and distributing the several energies of these currents each selectively to a separate electrical device, substantially as described.

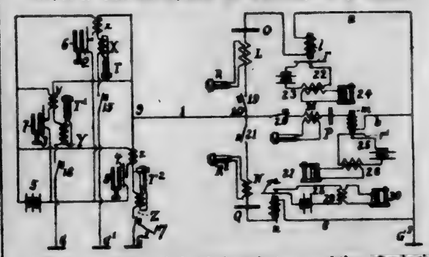
2. The method of distributing electrical energy which consists in throwing upon a common conductor simultaneously a number of alternate currents of different frequencies and distributing the several energies of these currents each selectively to a separate electrical device, substantially as described.

3. The method of rendering selective by electrical resonance various parts of a set of interrelated conductors wherein each part to be made selective contains a condenser and a self-induction coil, which consists in properly proportioning the electromagnetic constants of the various parts to be made selective so that each such part becomes resonant to an electromotive force of predetermined periodicity, substantially as described.

4. The method of multiple telegraphy by rendering selective by electrical resonance the various parts of a multiple telegraphic system made up of a set of interrelated conductors and corresponding transmitting and receiving instruments in which each receiving instrument is controlled by one of the parts to be made selective and each such part contains a condenser and a self-induction coil, the method consisting in properly proportioning the electromagnetic constants of each selective part, so that it becomes resonant to an electromotive force of predetermined periodicity to be impressed on the line by the corresponding transmitting instrument, substantially as described.



707,008. MULTIPLE TELEGRAPHY. MICHAEL I. PUPIN, Yonkers, N. Y. Filed Dec. 20, 1897. Serial No. 664,307. (No model.)



Claim.—1. A set of electrical conductors consisting of selective parts connected to each other, each such part containing a condenser and a self-induction coil, whereby it can be made resonant to an electromotive force of predetermined periodicity by properly proportioning its electromagnetic constants, and means for impressing upon the system electromotive forces of different predetermined periodicities, substantially as described.

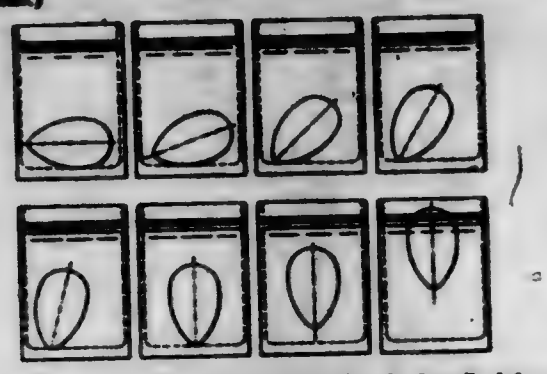
2. A system of multiple telegraphy consisting of transmitting and receiving instruments and a set of electrical conductors made up of selective parts connected to each other, each selective part which controls a receiving instrument containing a condenser and a self-induction coil, whereby it can be made resonant to an electromotive force of predetermined periodicity by properly proportioning its electromagnetic constants, and means controlled by the transmitting instruments for impressing upon the system electromotive forces of predetermined periodicities, substantially as described.

3. A system of a set of conductors consisting of a common conductor and selective parts all directly connected to the common conductor, each part having directly connected therein a condenser and a self-induction coil whereby it can be made resonant to an electromotive force of predetermined periodicity by properly proportioning its electromagnetic constants, and means for impressing upon the system electromotive forces of predetermined periodicities, substantially as described.

4. A system of multiple telegraphy consisting of transmitting and receiving instruments, a common conductor, one or more conductors con-

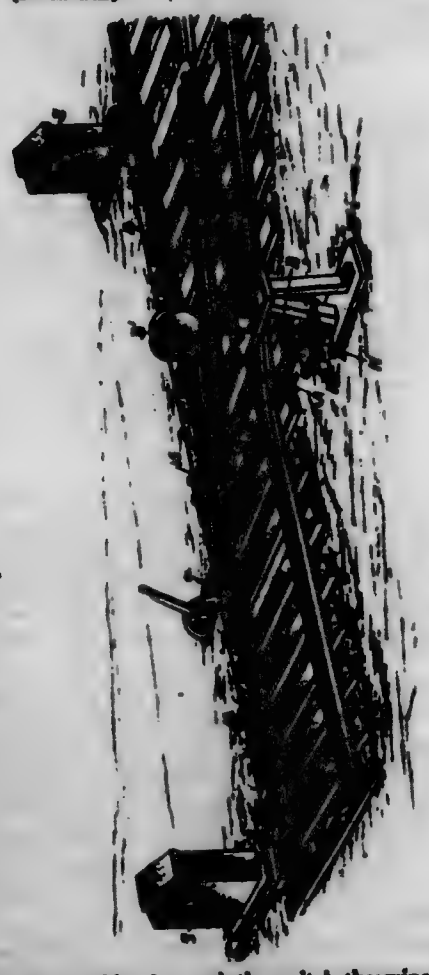
taining transmitting instruments, and two or more conductors containing receiving instruments, all connected directly to the common conductor, each exhaustive conductor which controls a receiving instrument containing directly connected therein a condenser and self-induction coil, whereby it can be made resonant to an electromotive force of predetermined periodicity by properly proportioning its electromagnetic constants, and means controlled by the transmitting instruments for impressing upon the system from the transmitting conductor or conductor exhaustive forces of predetermined periodicity, substantially as described.

707,008. METHOD OF TESTING EGGS. CARL REINHARDT, Kattenhausen, Germany. Filed Aug. 17, 1901. Serial No. 72,396. (No specimens.)



Claim.—The new and improved method herein described for ascertaining the age and condition of an egg or eggs, consisting in preparing a liquid by adding glycerin, common salt and salicylic alcohol to water in or about in the proportions mentioned, so as to obtain a liquid of about 1.035 specific weight and immersing the eggs to be tested in said liquid in proximity to a series of lines or marks which with the position assumed by the eggs in the liquid indicates the age or condition thereof.

707,010. AUTOMATIC RAILROAD-SWITCH DANGER-SIGNAL. CHARLES H. RENWICK, Roswell, N. Mex. Filed June 2, 1902. Serial No. 109,954. (No model.)



Claim.—1. The combination with the switch-throwing mechanism a signaling means, comprising a housing including a removable top section, a signal-head secured thereto and movable therewith, devices for normally holding the said top section in a closed position and the signal-head within the housing, and connections joining the said signal-head with the switch-throwing mechanism, and adapted to raise the said head with the detachable top section when the switch is shifted to its open position, substantially as shown and for the purposes described.

2. The combination with the switch-throwing mechanism; a signal, comprising a housing, a signal-head, means for normally holding the head within the housing and for returning it to its normal position, and flexible connections joining the said head with the switch-throwing mechanism, adapted to extend the head up above the housing when the switch is moved to an open position, as set forth.

3. The combination with the vertically-movable signal, a switch-throwing mechanism, a series of extensible levers connected with the vertically-movable signal; means for normally folding the said levers, whereby to lower the signal, and connections joining the said levers with the switch-throwing mechanism, adapted when the switch is moved to an open position to extend the levers and elevate the signal, substantially as shown and described.

4. The combination with the switch-throwing mechanism; of a signal, comprising a housing, a signal inclosed therein and movable vertically above the housing, means for actuating said signal held within the housing, said means including devices for automatically returning the signal to a point below the housing-top, and intermediate mechanism joining the signal-actuating means with the throw-bar, substantially as shown and for the purposes described.

5. A signal mechanism for the purposes described, comprising a housing, a signal-head normally held within the housing, and adapted to move vertically above the said housing, an actuating means for the signal within the housing, said means including a series of toggle-levers connected with each other and fulcrumed relatively to each other to extend in a vertical plane, means for normally adjusting the said levers at an angle to each other, and devices operable without the casing for moving the said levers to a vertically-extended position, for the purposes described.

6. In a signal mechanism of the character described, the combination of the housing, said housing including a detachable top section, a signal-head secured thereto, said head having a pendent lever member, slotted longitudinally, a fixed fulcrum in the housing for engaging the slot in the said lever, a second lever pivoted in the housing with its fulcrum in the vertical plane of the fulcrum for the first-mentioned lever, an intermediate lever pivotally joined to the adjacent ends of the other levers, a changeable fulcrum for the intermediate lever, automatically-operated means for normally pulling the said levers out of a vertical plane with each other, and manually-operated mechanism for extending the said levers in a vertical plane with each other, for the purposes specified.

7. In a signal mechanism, as described, the combination with the casing, said casing including a removable top section, a signal-head secured to said top section, and movable therewith, said head having a longitudinal slotted pendent shank, a fixed fulcrum in the casing for engaging the slot of said shank, a second lever fulcrumed in the vertical plane of the fixed fulcrum for the first lever, an intermediate lever pivotally connected with the adjacent ends of the two other levers, a curved slotway in the casing, said slot terminating in the vertical plane of the fulcrum of the two first-named levers, a fulcrum carried by the intermediate lever, and movable in the said curved slot, a counterpoise engaging the said levers for automatically holding the levers out of a vertical alinement with each other, and a pull member connected to the lowermost one of the levers at a point below its fulcrum, said pull member being extended outside of the casing, all being arranged substantially as shown and for the purposes described.

707,011. MILK-CAN. HENRY S. REYNOLDS, Brooklyn, N. Y., assignor to Elizabeth C. Seaman, New York, N. Y. Filed Sept. 30, 1901. Serial No. 76,782. (No model.)

Claim.—1. The combination of a can-mouth, a cover fitted thereto and means for maintaining the cover in place, comprised in part by a rotary yoke or cross-bar carried by the cover, a rotary jamming means adapted to bear upon the cover to put the cross-bar under strain and means connected to said jamming means and rotatable therewith for locking the said jamming means in its adjusted position.

2. In a milk-can the combination of a can-mouth provided exteriorly thereof with means adapted to be engaged by a yoke, a rotary cover

carrying a suitable yoke, rotatable therewith, and means carried by the yoke for putting the said yoke under stress to firmly hold the cover in place, substantially as described.

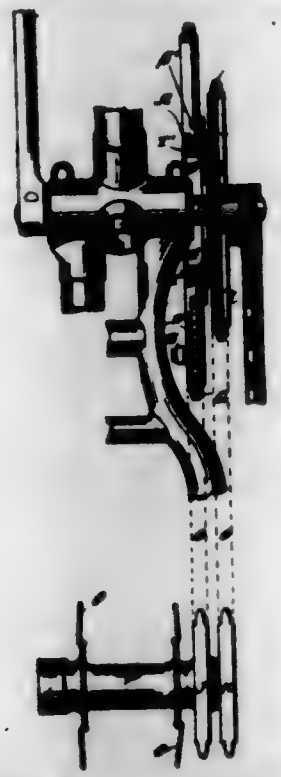
3. In a milk-can the combination of a mouth provided with means adapted to be engaged by a yoke, a cover provided with a yoke, means for putting the said yoke under stress to firmly hold the cover in place, and locking means carried by the yoke for the means for putting the said yoke under stress.

4. In a milk-can the combination of a can-mouth provided with means adapted to be engaged by a yoke, a cover provided with a rotary yoke, means for putting the yoke under stress to hold the cover firmly in place, and means carried by the yoke whereby the parts may be locked in their adjusted positions.

5. In a milk-can the combination of a can-mouth, lugs carried thereby, a cover fitted to the can-mouth, said cover being provided with a yoke and being adapted to rotate independently of the can-mouth, and means for putting the yoke under stress, comprising in its structure an adjusting-screw adapted to bear upon the cover and having a lever pivotally connected thereto.

6. In a can the combination of a cover, a rotary yoke, a screw adapted to put the yoke under tension to hold the cover firmly in place on the can, and a locking means for the screw connected thereto and adapted to be locked with a projection on the can.

707,012. VELOCIPEDE DRIVING-GEAR. FRANCIS A. RICH, Ea-rangahaka, New Zealand. Filed Oct. 31, 1900. Serial No. 35,022. (No model.)



Claim.—1. A changeable-speed gear for velocipedes, comprising an ordinary friction-clutch free-wheel sprocket and a sprocket consisting of inner and outer members normally loose relative to each other, means for shifting a driven mechanism into operative engagement with said free-wheel sprocket or with said outer member at will, a rocking clutch for connecting together and for disconnecting said inner and outer members, a friction-roller revolubly mounted upon said rocking clutch, and a rocking plate provided with guides for engaging said roller for the purpose of shifting said clutch.

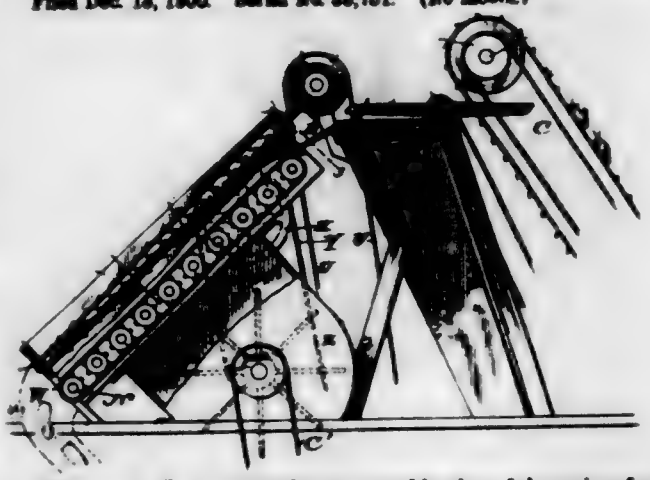
2. A changeable-speed gear for velocipedes, comprising an ordinary sprocket and a sprocket consisting of outer and inner members normally loose relatively to each other, traction members engaging said ordinary sprocket and said outer member, and also engaging the mechanism to be driven, a clutch for connecting together, and disconnecting, said inner and outer members, means for shifting the position of said clutch, and a spring for holding said clutch either in or out of gear.

3. A changeable-speed gear for velocipedes, comprising a sprocket free to rotate in one direction only, a sprocket comprising inner and outer members normally loose relatively to each other, means for shifting the driven mechanism at will into operative engagement with the first-mentioned sprocket or with said outer member, a clutch for connecting together and disconnecting said inner and outer members, a friction-roller revolubly mounted upon said clutch, and a rocking plate provided with guides for engaging said roller for the purpose of shifting said clutch.

4. A changeable-speed gear for velocipedes, comprising a middle sprocket and a sprocket consisting of inner and outer circular members, concentric and normally loose relatively to each other, means for shifting the driven mechanism into operative engagement with said middle sprocket or with said outer member at will, a radially-movable clutch for connecting together and disconnecting said inner and outer members, a friction-roller revolubly mounted upon said clutch, and a rocking plate provided with guides for engaging said roller for the purpose of shifting said clutch.

5. A changeable-speed gear for velocipedes, comprising a middle sprocket and a sprocket consisting of inner and outer members normally loose relatively to each other, means for shifting the driven mechanism into operative engagement with said middle sprocket or with said outer member at will, a rocking clutch for connecting together and disconnecting said inner and outer members, said rocking clutch being provided with oppositely-disposed beveled faces, means for shifting the position of said rocking clutch, a plunger for engaging either of said beveled faces, and a leaf-spring for holding said plunger into engagement therewith.

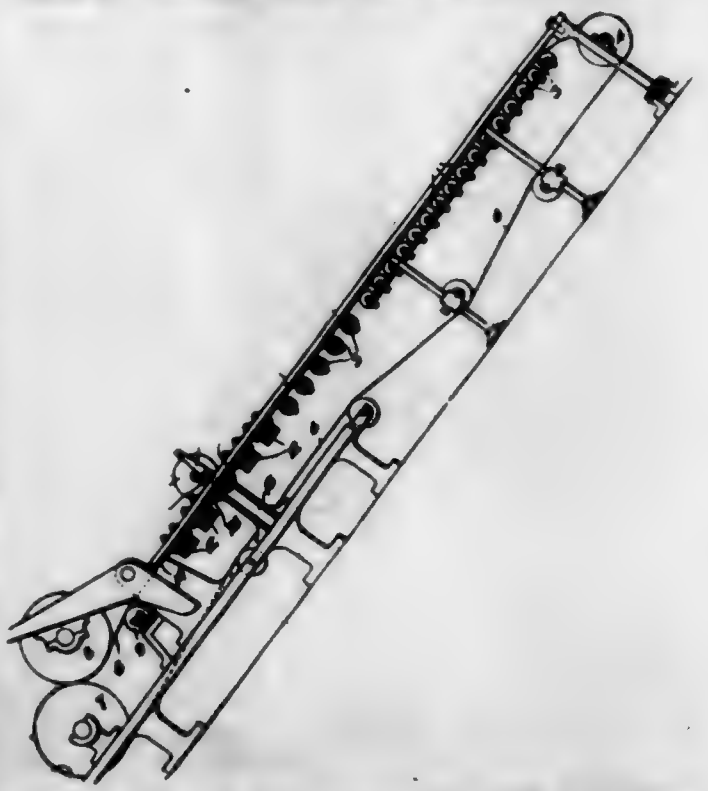
707,018. CORN-HUSKER. ARTHUR W. RICHARDS, Indianola, Iowa. Filed Dec. 13, 1900. Serial No. 39,731. (No model.)



Claim.—1. In a corn-husker, the combination of the series of rollers provided with pointed teeth and a second set of toothed rollers arranged at right angles to the first set and underneath the same, both sets being in downwardly-inclined parallel planes, and means for rotating them simultaneously, whereby husks adhering to the corn-ears are pierced by the teeth and shredded and stripped from the latter as shown and described.

2. In a corn-husker, the combination of the rectangular frame having transverse slots in its lower portion, two sets of rollers arranged in said frame one beneath the other and at right angles as specified, the lower journals of the upper rollers having vertical play in said slots, as shown and described.

707,014. PAPER-MAKING MACHINE. JAMES F. RICHARDS, Lake, Md. Filed May 29, 1902. Serial No. 109,496. (No model.)



Claim.—1. In a Fourdrinier paper-making machine, the combination with a traveling apron, of a shaking-section pivotally mounted at a

point adjacent to one of its ends, and suction-boxes mounted upon the shaking-section at the front and rear of the pivotal connection, substantially as described.

2. In a Fourdrinier paper-making machine, the combination with a traveling apron, of a shaking-section pivotally mounted at a point adjacent to one of its ends, suction-boxes mounted upon the shaking-section at the front and rear of the pivotal connection, and means for varying the position of the pivotal connection, substantially as specified.

3. In a Fourdrinier paper-making machine, the combination with a traveling apron, and a shaking-section, of suction-boxes located at different points longitudinally of said shaking-section, and means for pivotally mounting the shaking-section at a point between the boxes, substantially as set forth.

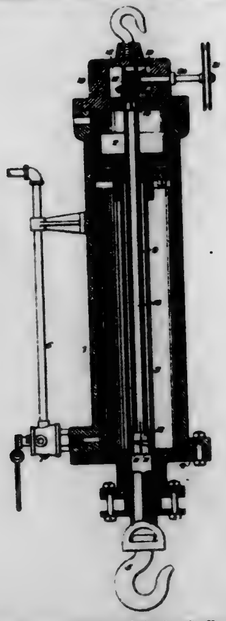
4. In a Fourdrinier paper-making machine, the combination with the couch-frame, and a traveling apron, of posts mounted upon said frame, a shaking-section, means for pivotally connecting the shaking-section to the posts, and suction-boxes upon the shaking-section at the front and rear of the pivotal connection, substantially as and for the purpose set forth.

5. In a Fourdrinier paper-making machine, the combination with the couch-frame, and a traveling apron, of posts mounted upon said frame, pivot-bolts upon the posts, a shaking-table slotted to receive said bolts, suction-boxes upon the table at the front and rear of the pivotal point, and means for adjusting the bolts in said slots to vary the pivot-point, substantially as described.

6. In a Fourdrinier paper-making machine, the combination with a traveling apron, of a shaking-section pivotally mounted at a point adjacent to one of its ends, suction-boxes mounted upon the shaking-section at the front and rear of the pivotal connection, and means for securing the shaking-section against movement, substantially as described.

7. In a Fourdrinier paper-making machine, the combination with a traveling apron, of a shaking-section pivotally mounted at a point adjacent to one of its ends, suction-boxes mounted upon the shaking-section at the front and rear of the pivotal connection, means for varying the position of the pivotal connection, and means for securing the shaking-section against movement, substantially as specified.

707,015. FLUID-PRESSURE-ACTUATED HOIST, &c. ELLIS B. RIDGWAY, Centerville, Pa. Filed Oct. 22, 1901. Serial No. 79,566. (No model.)



Claim.—1. The combination of the longitudinally-movable piston-rod of a fluid-pressure-actuated machine with a friction-clamp having a ball-race with balls constituting a contact-face of the clamp, substantially as specified.

2. The combination of the longitudinally-movable piston-rod of a fluid-pressure-actuated machine, with a friction-clamp therefor having a spiral ball-race with connection between the upper and lower ends thereof, a series of balls interposed between said race and the rod, and means for tightening and loosening the clamp, substantially as specified.

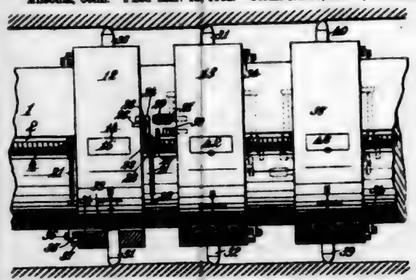
3. The combination of the hollow piston-rod of a fluid-pressure-actuated machine, with a friction-clamp located on the inside of said hollow rod, and means for expanding and contracting said clamp, substantially as specified.

4. The combination of the hollow piston-rod of a fluid-pressure-actuated machine, with a tube contained within said hollow piston-rod, and split at the lower end of the same so as to form a clutch, a wedge for expanding said clutch, a rod connected to said wedge, and passing through the clutch-tube, and means for projecting and retracting one of said clutch members, substantially as specified.

5. The combination of the hollow piston-rod of a fluid-pressure-actuated machine, with a tube contained within said hollow piston-rod, and split at the lower end of the same so as to form a clutch, a wedge for expanding said clutch, a rod connected to said wedge and passing through the clutch-tube but prevented from rotating therein, and means for projecting and retracting one of said clutch members, substantially as specified.

6. The combination of the hollow piston-rod of a fluid-pressure-actuated machine, with a tube contained within said hollow piston-rod, and split at the lower end of the same so as to form a clutch, a wedge for expanding said clutch, a rod connected to said wedge, and passing through the clutch-tube, but prevented from rotating therein, and gearing for projecting and retracting one of said clutch members, one of the wheels of said gearing forming a nut which is adapted to a threaded portion of the movable clutch member, substantially as specified.

707,016. METAL-BORING MACHINE. CHARLES C. ROGERS, Ansonia, Conn. Filed Mar. 15, 1902. Serial No. 98,416. (No model.)



Claim.—1. In a boring-machine, a pair of cutter-heads operating toward each other, and means carried by one of the said cutter-heads and operated by the other of said cutter-heads for discontinuing the operation of one of the said cutter-heads.

2. In a boring-machine, a pair of rotary and longitudinally-moving cutter-heads operating toward each other, means for operating the said heads, and means operated by one of the said cutters for automatically discontinuing the operation of the other of said heads.

3. In a metal-boring machine, a pair of cutter-heads operating toward each other, means carried by the said heads for causing a rotary and longitudinal movement thereof, and mechanism operated by one of the said heads for discontinuing the cutting movement of the other of the said heads.

4. In a boring-machine, a pair of oppositely-moving cutter-heads, feed-nuts for operating the same, means engaging the feed-nuts for causing the operation of the heads, and mechanism operated by one of the heads for automatically disengaging one of the feed-nuts to arrest the movement of its respective cutter-head.

5. In a metal-boring machine, a pair of cutter-heads moving toward each other, a feed-nut carried by each of the said heads, means engaging the feed-nuts for causing the operation of the cutter-heads, means for retaining the feed-nuts in engagement with said operating means, and means carried by one of the said cutter-heads and adapted to engage and operate the said retaining means carried by the other of the cutter-heads for discontinuing the movement of the latter.

6. In a metal-boring machine, a pair of cutter-heads moving toward each other, mechanism carried by each of the said cutter-heads for imparting a longitudinal and a rotary movement thereto, and means carried by one of the cutter-heads and adapted to engage and operate the mechanism carried by the other of the cutter-heads for discontinuing the movement of the latter.

7. In a metal-boring machine, the combination with an operating-shaft carrying a pair of feed-screws, of a pair of cutter-heads mounted upon said shaft and adapted to move toward each other, feed-nuts carried by the cutter-heads and engaging the feed-screws for moving the said cutter-heads toward each other, a spring-actuated means carried by one of the cutter-heads for disengaging its feed-nut from its respective feed-screw, and means carried by the other cutter-head and engaging said mechanism for automatically operating the same.

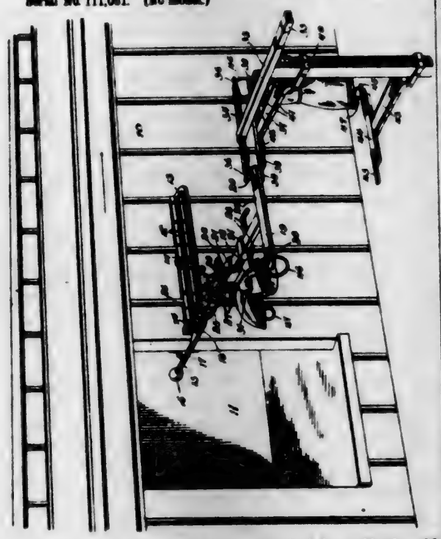
8. In a metal-boring machine, cutter-heads adapted to move toward each other, mechanism carried by one of the cutter-heads and adapted when operated to discontinue the movement of the said cutter-head carrying said mechanism, and means carried by the other of said cutter-heads and adapted to engage said mechanism for operating it.

9. In a metal-boring machine, a pair of cutter-heads moving in opposite directions toward each other, means for rotating said cutter-heads, a feed-screw for imparting a longitudinal movement to said cutter-heads simultaneously with the rotary movement thereof, feed-nuts carried by the cutter-heads and engaging the said screws for causing the said longitudinal movement to be given thereto, a shaft provided with an eccentric carried by the cutter-heads and engaging the said nuts for releasing them from their engagement with the feed-screws, means for retaining the said nuts in engagement with the said screws, and means carried by one of the cutter-heads and adapted to engage the said retaining means for operating it to release one of the feed-nuts from its engagement with its respective screw to arrest the movement of one of the cutter-heads.

10. In a metal-boring machine, a pair of cutter-heads operating toward each other in opposite directions, and mechanism carried by one of the said heads and operated by the other of said heads for discontinuing the movement of one of the said heads.

11. In a metal-boring machine, a pair of cutter-heads operating in opposite directions and toward each other, mechanism carried by one of the said heads for discontinuing the movement thereof, and means carried by the other of the said heads and adapted to engage the said mechanism for automatically operating it.

707,017. MAIL-BAG CATCHING AND DELIVERING MECHANISM. WILLIAM B ROEHER, Bay St. Louis, Miss. Filed June 10, 1902. Serial No. 111,061. (No model.)



Claim.—1. In apparatus of the class described, the combination with a mail-bag-catcher arm adapted to receive and support a mail-bag, of a keeper slidably mounted upon the arm and arranged to retain the bag upon the catcher.

2. In apparatus of the class described, the combination with a catcher-arm having a cross-head arranged to engage the ring of a mail-bag, of a keeper slidably mounted upon the arm and having a retaining-finger arranged to prevent the detachment of the mail-bag ring from the head.

3. In apparatus of the class described, the combination with a catcher-arm having a cross-head arranged to engage the ring of a mail-bag, of a keeper slidably mounted upon the arm and having a retaining-finger that is movable into engagement with the cross-head to prevent the detachment of the mail-bag ring.

4. In apparatus of the class described, the combination with a catcher-arm having a cross-head arranged to engage the ring of a mail-bag, of a keeper slidably mounted upon the arm and having a retaining-finger that coacts with the cross-head to prevent the detachment of the mail-bag ring, and a spring for moving the keeper toward the cross-head.

5. In apparatus of the class described, the combination with a catcher-arm having a cross-head arranged to engage the ring of a mail-bag, of a keeper slidably mounted upon the arm and having a retaining-finger that coacts with said cross-head to prevent the detachment of the mail-bag ring, and a coiled spring surrounding the arm and bearing against the keeper to move the same.

6. In apparatus of the class described, the combination with a catcher-arm having a cross-head that extends beyond both sides of the same, said head being adapted to receive the ring of a mail-bag, of a keeper-sleeve slidably mounted upon the arm, said sleeve carrying outstanding fingers that coact with the oppositely-projecting portions of the head to prevent the detachment of the mail-bag ring, and a coiled spring surrounding the arm and bearing against the sleeve to move said sleeve and the fingers carried thereby into their coacting relations.

7. In apparatus of the class described, the combination with a car having a doorway, of a supporting-frame slidably mounted upon the side of the car and movable across the doorway, and a catcher-arm secured to the frame.

8. In apparatus of the class described, the combination with a car having a doorway, of a supporting-frame pivotally and slidably mounted upon the side of the car at oneside of the doorway, said frame being movable across the doorway, and a catcher-arm secured to the frame.

9. In apparatus of the class described, the combination with a car having a doorway, of a supporting-frame comprising spaced bars one of which is slidably and pivotally attached to the side of the car contiguous to the doorway, a catcher-arm attached to one end of the frame and projecting outwardly, and an operating-handle secured to the frame and extending through the doorway of the car.

10. In apparatus of the class described, the combination with a mail-bag catcher and deliverer, of a keeper mounted thereon and adapted when in operative position, to prevent the detachment of the bag caught, said keeper being automatically movable, means for holding the keeper in inoperative position, said means being released by the detachment of the bag to be delivered.

11. In apparatus of the class described, the combination with a mail-bag catcher and deliverer comprising an arm having a cross-head, of a keeper movably mounted upon the arm and movable toward and from the cross-head, means for moving the keeper toward the cross-head, and locking mechanism for holding the keeper retracted, said mechanism being released by the detachment of the bag to be delivered.

12. In apparatus of the class described, the combination with a mail-bag catcher and deliverer comprising an arm having a cross-head, of a keeper movably mounted upon the arm and movable toward and from the cross-head, means for moving the keeper toward the cross-head, and a holding device for maintaining the keeper in retracted position, said device being carried by the bag to be delivered.

13. In apparatus of the class described, the combination with a mail-bag catcher and deliverer comprising an arm having a cross-head, of a keeper movably mounted upon the arm and movable toward and from the cross-head, a spring bearing against the keeper to urge it toward the cross-head, eyes arranged respectively upon the keeper and the arm, said eyes being in alinement when the keeper is retracted, and a pin arranged to be passed through the eyes when alined to hold the keeper in its retracted position.

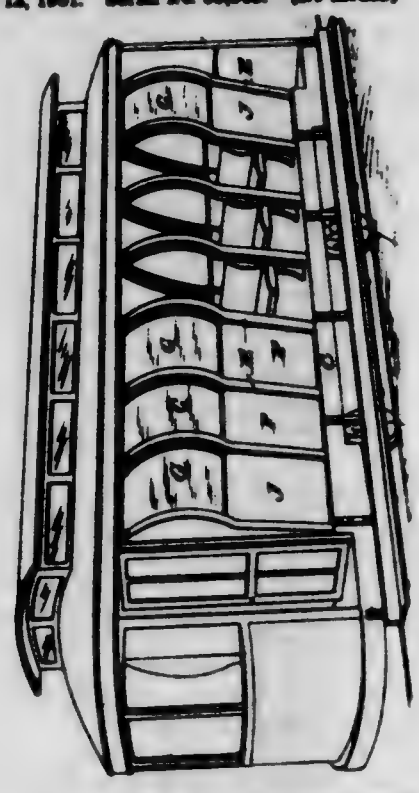
14. In apparatus of the class described, the combination with a mail-bag catcher and deliverer comprising an arm having a cross-head, of a keeper movably mounted upon the catcher and deliverer and comprising a sleeve slidably mounted upon the arm and having retaining-fingers movable into coacting relation with the cross-head, a coiled spring surrounding the arm and bearing against the sleeve to urge the keeper toward the cross-head, eyes arranged respectively upon the sleeve and the arm, said eyes being in alinement when the keeper is retracted, and a pin arranged to be passed through the eyes when alined to hold the keeper in retracted position, said pin being carried by the bag to be delivered.

15. In apparatus of the class described, the combination with a standard, of a deliverer-arm pivotally mounted at the top of the standard and having a bag-supporting cross-bar, a catcher-arm pivotally mounted upon the standard below the delivery-arm and having a bag-receiving cross-bar, and a positioning-arm pivotally mounted upon the standard below the catcher-arm, said positioning-arm being also provided with a cross-bar.

16. In apparatus of the class described, the combination with a standard, of a strap embracing the standard and having its terminals projecting beyond one face of the same, a bag-supporting arm, plates secured

to the opposite side faces of the arm and projecting beyond one end of the same, the projecting ends of the strap and plates being pivotally connected.

707,018. CONVERTIBLE CAR. HERMANN ROSENBERG, Newark, N. J., assignor to the Convertible Car Company, Bloomsbury, N. J. Filed Apr. 12, 1901. Serial No. 55,558. (No model.)

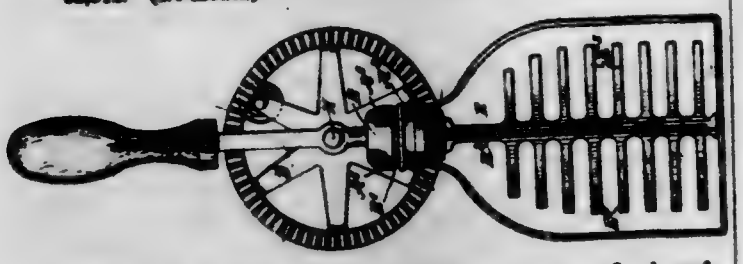


Claim.—1. A convertible car the sides of which are composed of grooved interchangeable and reversible metal posts and side sections consisting of window-sashes and side walls sliding therein and so arranged that when the sides are closed the sashes rest above the side walls and when the sides are open the sashes and side walls are separately raised and held in separate grooves in the upper part of said posts said grooves communicating with the lower groove by means of a lock substantially as set forth.

2. An interchangeable side post for convertible cars, the lower portion of which contains a groove for the side wall and the upper portion of which contains concentric grooves for the side wall and sash, the upper grooves communicating with the lower groove by means of a lock substantially as and for the purpose set forth.

3. A side post for convertible cars the grooved lower portion of which is substantially vertical and the upper portion runs on the arc of a circle and is provided with two concentric grooves the lower groove communicating with either of the upper grooves by means of a lock substantially as shown and described.

707,019. POTATO-CREAMER. FREDERICK W. RICHTOFEL and ADELE POHLMANN, New York, N. Y. Filed Feb. 3, 1902. Serial No. 92,312. (No model.)



Claim.—1. A creamer comprising a frame, having a fixed perforate bottom for mashing potatoes, and a manually-controlled creamer-wheel journaled in the frame to rotate over the said bottom, to reduce the mashed potatoes to a creamy consistency, as set forth.

2. A creamer comprising a handled frame, having a perforate bottom provided with a central stop, a revolvable wheel set in the said stop and having laterally-extending arms or blades, a pinion journaled in the frame and engaged by the upper end of the said wheel, and a manually-controlled gear-wheel journaled on the frame and in mesh with the said pinion, as set forth.

3. In a creamer, the combination with a frame having a perforate bottom, side arms extending upward from the said bottom, a head having a depending bearing, and means for fastening the upper ends of the side arms to the said head, of a handled gear-wheel journaled on a stud carried by the said head, a pinion journaled on the said bearing and in mesh with the said gear-wheel, the pinion having a recess in its under side, a creamer-wheel having a central post stepped on the said bottom and engaging with its upper forked end the recess in the said pinion, and spaced, flat side arms extending from the said post on opposite sides thereof and in a horizontal direction, as set forth.

707,020. CALF-WEANER. LEWIS H. SAUNDERS, Colby, Kans. Filed Apr. 18, 1902. Serial No. 103,530. (No model.)

Claim.—1. A calf-weaner comprising a frame consisting of rigid side bars, a nosepiece bridging the said side bars at their front ends and arranged at an angle thereto, said nosepiece being arched and passing around and resting upon the upper jaw of an animal, a strap or band secured to the side bars at their front ends and extending around the lower jaw of an animal, spurs or points radiating from the nosepiece, and means for securing the rear end of the frame to the head of an animal, whereby when pressure is applied to the spurs from the front, the strap passing around the lower jaw will close said jaw.

2. A calf-weaner comprising an inner frame consisting of flat rigid cheek-pieces adapted to extend along the cheeks of an animal, an integral nose-yoke curved upwardly and forwardly from said cheek-pieces, an outer one-piece frame consisting of rigid side members pivoted to the inner frame and a yoke extending in front of the nose-yoke of the inner frame, a jaw-strap secured to the rear ends of the outer frame and passing around the lower jaw of an animal, spurs or barbs secured to the outer frame, whereby when pressure is applied to said spurs or barbs in an upward or downward direction, the jaw-strap will close the lower jaw, and means for securing the inner frame to the head of an animal.

3. In a calf-weaner, the combination with an inner frame provided with suitable attaching means, and consisting of flat cheek-pieces, and an upwardly-arched nose-yoke, of an outer barbed frame consisting of flat side pieces and a front curved yoke, said outer frame being pivoted to the inner frame at or about the base of the arched nose-yoke, a jaw-strap secured to the rear ends of the outer frame and passing around the lower jaw of an animal, spurs or barbs projecting from the yoke of the outer frame, whereby when said spurs or barbs are moved upwardly or downwardly the jaw-strap will close the lower jaw of the animal to which the device is attached.

4. A calf-weaner comprising an inner frame, consisting of flat cheek-pieces and an arched nose-yoke, said cheek-pieces being spread apart at their rear ends, an arched outer barbed frame pivoted to the inner arched frame and swinging in front of the inner frame, a jaw-strap secured to the rear ends of the outer frame and passing around the lower jaw of an animal, and means for securing the inner frame to the head of a calf or other animal.

707,021. COMBINED SUPERHEATER AND STEAM-GENERATOR. RICHARD SCHULZ, Berlin, Germany. Filed Sept. 20, 1901. Serial No. 75,832. (No model.)

Claim.—1. The combination with a water-tube boiler provided with a casing, a steam-drum, and a water-drum, and water-tubes connecting them, of a tubular superheater between the casing and water-tubes, and means to cause furnace-gases to pass downward between the water-tubes and the tubes on one side of the superheater and then between the casing and other side of the superheater-tubes, substantially as set forth.

2. The combination with a water-tube boiler having steam and water drums, and water-tubes connecting them, of a superheater comprising a series of tubes both ends connected to a head forming part of the steam-drum, one end of said tubes opening into the steam-space of the steam-drum and the other end into a steam-chamber formed in said drum, substantially as set forth.

3. In a water-tube boiler, the combination with the steam and water drums and water-tubes connecting them, of a superheater connected to the steam-drum and comprising a series of tubes, the water-tubes arranged to form a deflecting-wall with passages near the steam-drum, whereby furnace-gases will be admitted to the superheater at the top and means to direct the gases downward and then upward through the superheater, substantially as set forth.

4. In a water-tube boiler, steam and water drums, and water-tubes connecting them, a superheater comprising an upper and a lower water-head, steam-tubes connecting them, said tubes having the same general direction and located beside the water-tubes, said water-tubes arranged to form a wall with passages near the steam-drum to admit furnace-gases at the top of the superheater and means to direct said gases downward and then upward through the superheater, substantially as set forth.

5. In a water-tube boiler, the combination with the steam and water drums, and water-tubes connecting them, of a superheater comprising an upper head formed within the steam-drum and a lower head forming part of the water-drum, and steam-tubes connecting said heads, substantially as set forth.

6. The combination with a water-tube boiler having steam and water drums, and tubes connecting them, of a superheater comprising a head forming part of the steam-drum, one end of said tubes entering the steam-space and the other end terminating within a chamber forming part of and within the steam-drum, substantially as set forth.

7. In a water-tube boiler, the combination with the steam and water drums, and water-tubes connecting them, of a superheater comprising an upper and a lower head, and steam-tubes connecting them, the direction of said steam-tubes being substantially parallel to the water-tubes and located to one side of them, substantially as set forth.

8. In a water-tube boiler, the combination with the steam and water drums, and water-tubes connecting them, of a superheater comprising an upper and a lower head, and steam-tubes connecting them, some of said steam-tubes arranged to form a medial deflecting-wall, whereby furnace-gases will be directed down one side and up the other side of said superheater, substantially as set forth.

9. The combination with a water-tube boiler having steam and water drums and water-tubes connecting them, of a superheater comprising an upper head forming part of the steam-drum, and a lower head, said heads connected by steam-tubes, and a deflecting-wall in the superheater formed by the juxtaposition of some of said steam-tubes, substantially as set forth.

10. The combination with a water-tube boiler having steam and water drums, water-tubes connecting them and a fireplace, of a superheater comprising an upper head forming part of the steam-drum and a lower head, said heads connected by steam-tubes adjacent the fireplace, said steam-tubes having substantially the same direction as the water-tubes, substantially as set forth.

11. The combination with a water-tube boiler having steam and water drums and water-tubes connecting them, of a superheater comprising a divided upper head, a steam connection between one side thereof and the steam-space of the steam-drum, and a lower head, said heads connected by steam-tubes, substantially as set forth.

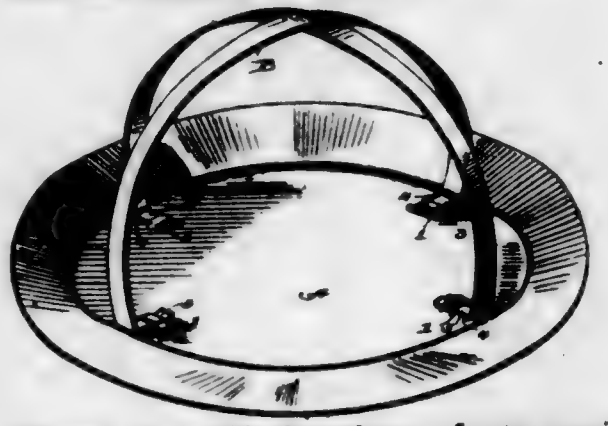
12. The combination with a water-tube boiler having steam and water drums and water-tubes connecting them, of a superheater comprising a divided upper head, a steam connection between one side thereof and the steam-space of the steam-drum, a lower head, suitably-curved tubes connecting the heads and a deflecting-wall formed by the juxtaposition of some of the steam-tubes intermediate their ends, substantially as set forth.

13. The combination with a water-tube boiler having a fireplace, steam and water drums, water-tubes connecting them, of a superheater, comprising a chamber formed in the steam-drum, a lower head, and steam-tubes connecting the steam-space of the boiler with the lower head and similar tubes connecting the lower head with said chamber, a protecting-wall of water-tubes between the fireplace and superheater bent at their ends to form passages for the furnace-gases and a damper controlling the passages of the gases therethrough, and a wall dividing the water-leg to separate the superheater from the water-tube portion, substantially as set forth.

14. The combination with a water-tube boiler having steam and water drums, and water-tubes connecting them, a wall dividing the water-tubes into two sets and a superheater comprising a lower head and an upper head forming part of the steam-drum, and a plurality of deflecting-walls formed by the juxtaposition of some of the steam-tubes intermediate their ends, substantially as set forth.

15. The combination with a water-tube boiler, comprising two steam and three water drums, water-tubes connecting them, of a superheater between the steam-drums comprising a divided upper head one side thereof connected to the steam-spaces of the steam-drums and the other side to a service-pipe, a lower head and steam-tubes connecting them, and dampers to control the admission of furnace-gases to the superheater, substantially as set forth.

707,022. **FLUE-STOP.** JACOB SEITZER, Keokuk, Iowa. Filed Jan. 11, 1902. Serial No. 89,358. (No model.)

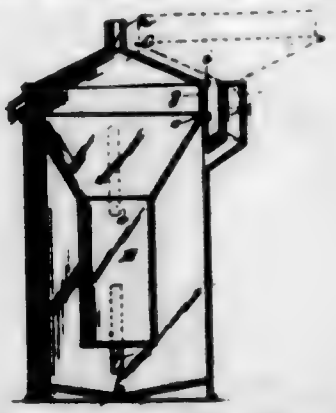


Claim.—1. As an article of manufacture, a flue-stop comprising a cap having sockets formed therein, said sockets open at each end, and a pair of bails crossing each other at or near the center, their ends extending through the sockets and bent to prevent their accidental withdrawal therefrom while admitting a limited movement therein.

2. As an article of manufacture a flue-stop, comprising a sheet-metal cap having flattened sockets formed on its inner surface, and a pair of bails composed of band-iron, crossing each other at the center and having sliding connection with the sockets at their ends, their extreme tips being constructed to prevent accidental removal from the sockets.

3. As an article of manufacture, a flue-stop, comprising a cap having sockets on its inner surface, and a pair of bails adapted to cross each other at the center, said bails having restricted ends adapted to fit said sockets, shoulders formed between the restricted ends and the body portion of the bails whereby to serve as stops to prevent further inward movement within the sockets.

707,028. **CREAM-SEPARATOR.** JACOB SEITZER, Keokuk, Iowa. Filed Feb. 4, 1902. Serial No. 92,576. (No model.)



Claim.—1. The combination with a milk-can and a water-can, one adapted to fit into the other, the milk-can having a filling-tube and the water-can an outlet-spout, of a funnel-shaped cover having a spout adapted to enter the filling-tube whereby to facilitate the operation of pouring milk into the milk-can, and said spout adapted to reach to or nearly to the bottom of the water-can when used in the operation of filling the latter.

2. The combination with a milk-can, and a funnel-shaped water-can closed at the lower end and open at the upper end, said upper end of a size to fit the milk-can and constitute a cover therefor, and this upper end provided with a water-overflow spout, of a funnel-shaped cover capable of inversion to serve as a filling device as well as a cover, the spout of the funnel-shaped cover having an extension of sufficient length to discharge its contents at or near the bottom of the water-can.

3. The combination with a milk-can provided with a filling-tube, and a funnel-shaped water-can closed at its lower end and constructed at its upper end to fit the upper end of the milk-can whereby to close it, said water-can provided with an overflow-spout, of a cover of funnel shape and of a size to cover the water-can when placed thereon in either its normal or inverted position, and the spout of the cover of a size to fit the

filling-tube of the milk-can whereby when joined thereto it may be utilized in the operation of filling the milk-can with milk, and said spout adapted to reach to or nearly to the bottom of the water-can when placed therein whereby to discharge water at that point.

707,024. PROJECTILE. JOHN B. SEMPLE, Sewickley, Pa. Filed Aug. 12, 1901. Serial No. 71,863. (No model.)

Claim.—1. The combination of a projectile, a progressively-combustible and non-explosive pyrotechnic compound carried by the projectile in front of the sabot or bearing portion thereof and having its point of combustion during the flight of the projectile in front of the sabot or bearing portion thereof, and a part or member capable of movement independent of the projectile for igniting said compound, substantially as set forth.

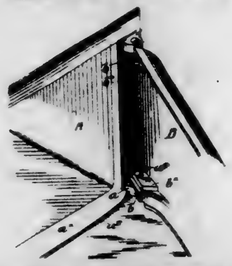
2. The combination of a projectile, a strip or band of combustible non-explosive or pyrotechnic compound extending from a point at or near the front end of the projectile toward the rear end thereof and having the point or points of flame exposure or illumination in advance of the rear end of the projectile and means carried by the projectile for igniting said compound, substantially as set forth.

3. A projectile provided with a cavity extending from a point at or near the front end of the projectile toward the rear end thereof and having the point or points of flame exposure or illumination in advance of the rear end of the projectile, a combustible non-explosive or pyrotechnic compound arranged in said cavity, a movable part or member for causing ignition of said compound, substantially as set forth.

4. A projectile provided with an external groove at or near its front end, a combustible non-explosive or pyrotechnic compound arranged in said groove, a movable part or member to ignite the compound, substantially as set forth.

5. A projectile provided with a cavity extending from a point at or near the front end of the projectile toward the rear end of the same and having the point or points of flame exposure or illumination in advance of the rear end of the projectile, a combustible non-explosive or pyrotechnic compound arranged in said cavity, and a movable part or member arranged within the projectile to ignite the compound, substantially as set forth.

707,025. STOVE-DOOR HINGE. FRANKLIN L. SHEPPARD, Philadelphia, Pa. Filed Dec. 31, 1901. Serial No. 87,869. (No model.)



Claim.—1. The combination of a frame or body having hinge-lugs, said frame having a continuously-depressed portion formed concave from the outside and extending between said lugs, a door for the frame, and means for supporting said door from said lugs, the entire side of the door extending beyond the line of the said supporting means and being constructed to enter the depressed portion in the frame when the door is opened, substantially as described.

2. The combination of a frame or body having projecting hinge-lugs, said frame having a continuously-depressed portion adjacent to said lugs said portion being formed concave from the outside and extending between the lugs, a door for the frame and pins whereby said door is pivotally hung from said lugs, the entire side of the said door extending beyond the line of said pins and being constructed to enter the depressed portion in the frame when the door is opened, substantially as described.

3. The combination of a frame or body having in it an opening, hinge-lugs adjacent to the same, a door closing said opening and pins whereby said door is hung between said lugs, one of said pins passing from the door to the lip of a lug and the other pin passing from the upper lug into the door, the line of said pins being within the body of the door, and the edge of said door extending in an unbroken straight line between said lugs, substantially as described.

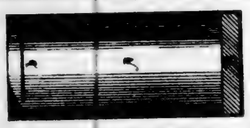
4. The combination of a frame or body of a stove having projecting hinge-lugs and provided with a single continuous cylindrical curved depressed portion extending between said lugs, a door and pins for holding the same to the lugs, the edge of the door being placed to rotate within said depression in the frame, substantially as described.

707,026. HOLDER FOR BLANK CARTRIDGES. MILTON J. SMINER, Freemansburg, Pa. Filed June 3, 1902. Serial No. 110,078. (No model.)

Claim.—1. A cartridge-holder, consisting of a body having a fixed jaw and a spring-controlled pivotally-mounted opposing jaw, the jaws having opposing longitudinal channels in their inner faces for the reception of a cartridge-shell, and transverse channels forming an opening for the exit of smoke, powder, &c., as described.

2. A cartridge-holder, consisting of a body constructed in two sections, one section having a jaw formed integral therewith, which jaw is provided with an inner vertical channel, the opposing section of the body having a longitudinal slot formed therein, a movable jaw adapted to enter said slot, and having a knuckle received in a channel formed in the two sections of the body, which movable jaw consists of a body carrying the said knuckle, a clamping-section below the knuckle, opposed to the fixed jaw and provided with longitudinal and transverse channels in its inner face, a spring having bearing against the upper end of the movable jaw and against a section of the body, and means, substantially as described, for connecting the sections of the body, as set forth.

707,027. CARBID-HOLDER. FLAVEL SIMONDS, Sterling, Ill. Original application filed Dec. 20, 1899, Serial No. 77,451. Divided and this application filed Jan. 31, 1902. Serial No. 91,996. (No model.)



Claim.—1. A weighted carbid-holder for an acetylene-gas generator, formed of an imperforate body, an open top and a closed bottom with the body of greatly-increased length as compared with its width making a deep and narrow closed chamber with an open top for receiving the carbid and maintained by the weight in a vertical position when dropped for use, for presenting a small area of live carbid for surface exposure to the action of the water; clearing the holder of the residuum from the slaked carbid and maintaining the holder beneath the water, substantially as described.

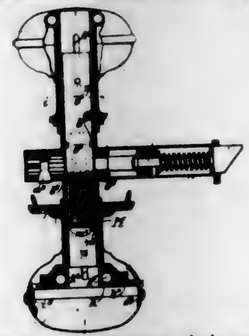
2. A carbid-holder for a gas-generator, formed of an imperforate body, an open top, and a closed and weighted bottom with the body of greatly-increased length as compared with its width making a deep and narrow closed chamber with an open top for receiving the carbid and weighted at the bottom for maintaining the holder in a vertical position when dropped, presenting a small area of surface exposure for the live carbid to the action of the water, maintaining the holder beneath the water and clearing the holder from the residuum of the slaked carbid, substantially as described.

707,028. LOCK. HENRY W. SHEPPE, Ithaca, N. Y. Filed Nov 26, 1901. Serial No. 83,783. (No model.)

Claim.—1. The combination of a casing having a latch, tumblers for operating said latch, a hollow knob-spindle rigidly held in the casing and knobs having sleeves on said spindle operatively engaging the tumblers, said latch having mechanism whereby it may be operated by means of a key inserted through said hollow spindle, substantially as described.

2. The combination of a casing having a latch, tumblers for operating the same, a knob-spindle immovably held to said casing, sleeves revolubly carried on the spindle in operative engagement with the tumblers, knobs fixed to said sleeves, and antifriction-bearings between said spindle and the knobs, substantially as described.

3. The combination of a casing having a latch, tumblers for operating the same, a knob-spindle immovably held to said casing, extension-pieces for the spindle, sleeves revolubly carried on the spindle in operative engagement with the tumblers, knobs fixed to said sleeves and held in place by the extensions of the spindle, and antifriction-bearings between said spindle extensions and the knobs, substantially as described.



4. The combination of a casing having a latch, a tumbler for operating the latch, a hollow knob-spindle rigidly held in the casing, a knob having a sleeve engaging the tumbler and revolubly on the spindle, with locking mechanism in the casing for locking the said latch in its extended position, the same being constructed to be operated through said hollow spindle, substantially as described.

5. The combination of a casing having a latch, a tumbler for operating the latch, a hollow knob-spindle rigidly held in the casing, a knob having a sleeve engaging the tumbler and revolubly on the spindle, with locking mechanism in the casing for locking said latch in its extended position, the same being constructed to be operated through said hollow spindle, with a guide-piece in the hollow spindle for holding the key during its action upon said mechanism, substantially as described.

6. The combination of a casing having a latch, a tumbler for operating the latch, a hollow knob-spindle rigidly held in the casing, a knob having a sleeve engaging the tumbler and revolubly on the spindle, with locking mechanism in the casing for locking the said latch in its extended position, the same being constructed to be operated through said hollow spindle, with a guide-piece in the hollow spindle having a hole for the end of the key, said hole being eccentric to the bore of said spindle, substantially as described.

7. The combination of a casing having a latch, a tumbler for operating the latch, a hollow knob-spindle rigidly held in the casing, a knob having a sleeve engaging the tumbler and revolubly on the spindle, with locking mechanism in the casing for locking the said latch in its extended position, the same being constructed to be operated through said hollow spindle, a movable guide-piece in the hollow spindle, the same serving to hold the key during its operation upon said mechanism, irrespective of the end of the spindle through which said key is inserted, substantially as described.

8. The combination of a casing having a latch, a tumbler for operating the latch, a hollow knob-spindle rigidly held in the casing, knobs having sleeves engaging the tumblers and revolubly on the spindle, with locking mechanism in the casing for locking the latch in its extended position, the same being constructed to be operated through said hollow spindle, a guide-piece made to slide in said spindle, having means to prevent its rotation and being provided with a hole in each end eccentric to the bore of the spindle, said piece being movable by the key so that said key will be free to set upon the locking mechanism when inserted in the spindle from either end thereof, substantially as described.

9. The combination with a casing having a latch and mechanism for locking the same in an extended position, of a hollow spindle carrying knobs for operating the latch, said spindle having an opening where it passes through the casing, a pin fixed to the spindle and engaging a fixed part of said casing, whereby said spindle is held from longitudinal movement, substantially as described.

10. The combination with a casing having a latch and mechanism for locking the same in an extended position, of a hollow spindle carrying knobs for operating the latch, a portion of said spindle being cut away where it passes through the casing, a retaining-piece on the spindle engaging the casing, for preventing rotary motion of the spindle, and a projection also on the spindle and also engaging the casing for preventing longitudinal motion of said spindle, substantially as described.

11. The combination with a casing having a latch and mechanism for locking the same in an extended position, of a hollow spindle carrying knobs for operating the latch, the opening through said spindle being eccentric to the outside surface thereof, means for preventing motion of the spindle and means for guiding the key inserted into the same, to bring it into contact with the locking mechanism, substantially as described.

12. The combination with a casing having a latch and locking mechanism for retaining the latch in an extended position, of a hollow knob-spindle rigidly fixed to the casing, knobs operatively connected to the latch carried by the spindle, the bore of the spindle being eccentric to its outside surface, a key-guide piece within the spindle having means for engaging the key and for holding the same eccentric to the bore of said spindle, substantially as described.

13. A casing having a latch, a yoke-piece connected to the same, a tumbler engaging with said yoke, a knob having means connecting it to said tumbler, a locking-bar constructed to be engaged by a key, the same passing through the yoke and engaging a piece projecting from the latch, substantially as described.

14. A casing having a latch, a yoke-piece connected to the same, a tumbler engaging with said yoke, a knob having means connecting it to said tumbler, a locking-bolt constructed to be engaged by a key, said bolt passing through the yoke and engaging a piece projecting from the latch, means for preventing motion of the tumbler, a plate parallel to the said bolt and also passing through and connected to the yoke, the construction being such that motion of the plate will move the yoke independently of the tumblers, substantially as described.

15. The combination with a casing having a latch, a yoke connected thereto, and tumblers operated by the knobs, of a locking-bolt constructed to be moved by a key to prevent motion of the latch, a plate on each side of said locking-bolt said plates being pinned together and with the locking-bolt, passing through an opening in the yoke, a pin in the yoke passing through said plates and the locking-bolt, with means for preventing motion of the tumblers, substantially as described.

16. The combination of a casing, a latch, a tumbler, a yoke-piece connecting the latch and the tumbler, means for turning the tumbler so as to operate the latch, a locking-bolt for the latch having in it a notch, a plate sliding on the locking-bolt also having a notch, means for connecting the plate to the yoke whereby when the bolt and the plate are in position to lock the latch a single revolution of the key will operate the locking-bolt and the second revolution of the key will operate the latch independently of the tumblers, substantially as described.

17. The combination of a casing, a latch, a tumbler, a yoke-piece connecting the latch and the tumbler, means for turning the tumbler so as to operate the latch, means for locking the tumbler, a locking-bolt for the latch having in it a notch, a plate sliding on the locking-bolt also having a notch, a pin connecting the plate to the yoke, said plate having a slot through which said pin extends, said pin being at one end of the slot when the locking-bolt is in a position out of engagement with the latch, substantially as described.

18. In a latch mechanism of the character described, the combination of a yoke-piece, a locking-bolt, a plate lying on each side of the locking-bolt, a pin extending through the slot and rigidly holding said members together, a slot in each of the members, a pin in the yoke extending through said slots placed to engage one end of the same, whereby when the key engages said notched pair of members and is revolved, the yoke is moved back independently of the tumblers, substantially as described.

19. A casing having a latch, a yoke-piece connected to the same, a tumbler engaging with said yoke, a knob having means connecting it to said tumbler, a locking-bolt constructed to be engaged by a key, the same passing through the yoke and engaging a piece projecting from the latch, and an auxiliary lock-bolt operated by said locking-bolt, substantially as described.

20. A casing having a latch, a yoke-piece connected to the same, a tumbler engaging with said yoke, a knob having means connecting it to said tumbler, a locking-bolt constructed to be engaged by a key, the same passing through the yoke and engaging a piece projecting from the latch, and a bolt fixed to said locking-bolt and projecting beyond the casing when the locking-bolt is in its forward position, substantially as described

21. In a locking mechanism of the character described, a hollow knob-spindle having an opening for the passage of the key-blade, a movable key-guide in said spindle having two faces for the reception of a key, said faces being of a contour requiring said key to be of a definite form in order to operate the lock, with means for limiting the motion of said key-guide, substantially as described.

22. In a locking mechanism of the character described, a hollow knob-spindle having an opening for the passage of the key-blade, a movable key-guide in said spindle having two faces for the reception of a key, the said faces being provided with projections placed to correspond with depressions on the end of the key thereby requiring a key of definite form to operate the lock, and means for limiting the motion of the said key-guide, substantially as described.

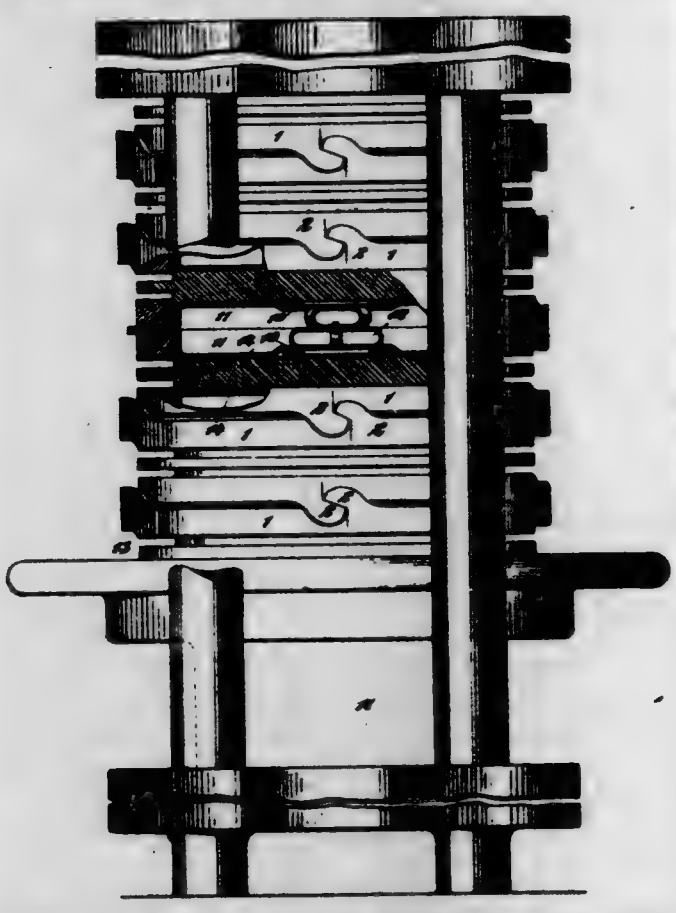
23. In a locking mechanism of the character described, a hollow knob-spindle having an opening for the passage of the key-blade, a movable key-guide in said spindle having its face or faces engaged by the key, said faces being provided with a series of segmental projections, said guide

being constructed to hold the key-spindle eccentric to the knob-spindle, with means for limiting the motion of the key-guide so as to bring the blade of the key into operative relation to the opening in the knob-spindle, substantially as described.

24. The combination of a casing having a latch, tumblers for operating said latch, a hollow knob-spindle held in the casing, knobs having sleeves on said spindle in operative engagement with said tumblers, said latch having mechanism whereby it may be operated by means of a key inserted through either end of the spindle, substantially as described.

25. The combination of a casing having a latch, tumblers for operating said latch, a hollow knob-spindle held in the casing, knobs having sleeves on said spindle in operative engagement with said tumblers, said latch having mechanism whereby it may be operated by means of a key inserted through either end of the spindle, said spindle having within it means for closing the direct passage therethrough, substantially as described.

707,029. FILTER AND HYDRAULIC PRESS MEMBER. MYRON A. SMITH, New York, N. Y., assignor to International Machine Co., New York, N. Y. Filed May 25, 1901. Serial No. 61,851. (No model.)



Claim.—1. A plurality of metallic rings or frames adapted and arranged to interchangeably form a part of a filter-press and of a hydraulic press, in combination with filter-cloths held between each pair of rings or frames, and means for holding said cloths apart at their centers, substantially as shown and described.

2. A plurality of metallic rings or frames adapted and arranged to interchangeably form a part of a filter-press and of a hydraulic press, in combination with separating-plates interposed between each pair of pairs of rings or frames.

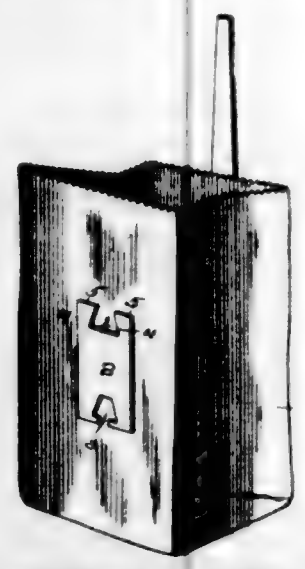
3. The combination with a pair of interlocking rings or frames and interposed dividing-plates, of filter-cloths located between the rings or frames, and means for holding said cloths against the inner faces of the dividing-plates.

707,080. PAPER-BAG FASTENER. SAMUEL S. SMITH, Lewis township, Northumberland county, Pa. Filed Jan. 14, 1902. Serial No. 89,726. (No model.)

Claim.—1. A paper-bag fastener, consisting of a paper or cardboard blank having a pair of open slots therein, the body of said blank secured to the surface of the bag with the portion free in which the outer ends of the slots are located, in connection with a tongue secured to the opposite surface of the bag-mouth and passed through the two slots wherein it is held by the frictional engagement of its edges with the ends of the slots.

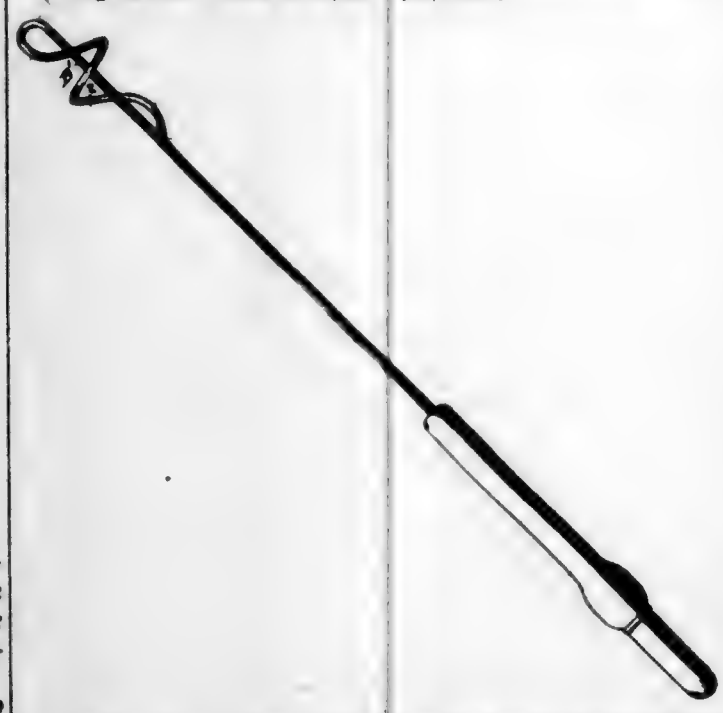
2. A paper-bag fastener, consisting of a tongue, and a blank having open slots in its ends, said slots having sharp angles at their outer edges adapted to receive the edges of the tongue and hold them by frictional engagement.

3. The combination with a tongue having a slight taper, said tongue adapted to be secured to one side of a bag at or near its mouth, of a blank secured to the opposite side of the bag, said blank having an open slot at each end, the outer angles of which slot are sharp or acute, they being adapted to receive and hold the edges of the tongue by frictional engagement.



4. A bag or envelop having a tapering tongue on its flap, and a fastening device on the body portion, said fastening device provided with a pair of slots approximately triangular in shape in alinement with the tongue, in position to receive the tongue by inserting the tongue endwise successively first through one slot and then the other.

707,081. CURETTE. CHARLES W. SPAULDING, Carroll, Iowa. Filed Aug. 11, 1900. Serial No. 26,594. (No model.)



Claim.—1. A curette, comprising a shank and a spiral made from the shank extension, the shank and the outer end of the coils of the spiral being bent out of alinement sufficiently to secure easy entrance and enable the spiral to begin at once to draw on turning it into its place of use, the coils of the spiral being far enough apart to enable the curette to make its entrance with very little dilation of the parts, the spiral being at the end of the shank and enlarged to its greatest diameter, then decreased until it again enters the shank, being when complete, an instrument of oblong, oval shape, that will excavate a space of oblong oval shape, as set forth, both ends of the spiral being integral with the shank for the purpose of avoiding free ends.

2. A curette, comprising a hollow tubular, perforated shank, and a spiral made from the shank extension, the shank and outer end of spiral being bent out of alinement sufficiently to secure easy entrance and enable the spiral to at once begin to draw the instrument on turning the handle into its place of use, the end of the shank forming a center post for the spiral, the perforation enabling the device to be used as a douche, the coils of said spiral being far enough apart to enable the curette to make easy entrance with little distention, and the spiral being decreased in size at the end of the shank and enlarged at its greatest diameter, then decreased until it again enters the shank, and when complete, is an oblong oval in shape, as set forth.

3. A curette as above described with a spiral constructed with a groove in the inner and under side so arranged that the outer corner will form a scraping edge.

4. A curette, comprising a handle, a member of spring metal secured thereto at one of its ends and terminating at its other end in an endless loop for the purpose of avoiding free ends, a part of said loop being spirally wound so as to present a general egg shape, and another portion of said loop being straight for the purpose of acting as a snare.

5. A curette, comprising a handle, a member of spring metal secured by one of its ends thereto and terminating at its other end in an endless loop for the purpose of avoiding free ends, a portion of said loop being spirally wound into a general olive shape and provided with a scraping edge.

6. A curette, comprising a handle, and a member of spring metal mounted thereon and also terminating in an endless loop for the purpose of avoiding free ends, a part of said loop serving as an axis of rotation for another part of said loop, said other part being provided with a scraping edge.

7. A curette, comprising a handle, a member of spring metal secured thereto and terminating in an endless loop for the purpose of avoiding free ends, a part of said loop being straight and serving as an axis, and another part of said loop being provided with an operative edge and being wound around said part serving as an axis.

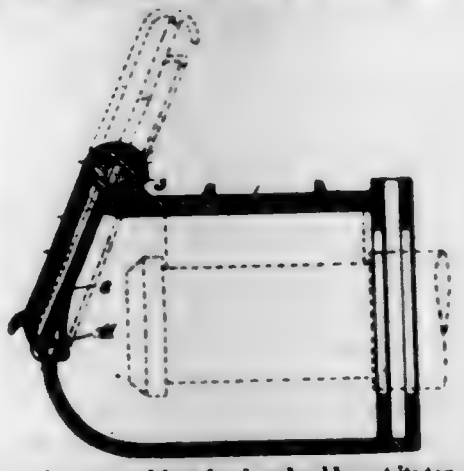
8. A curette, comprising a handle, and an endless loop of spring metal connected therewith, said loop consisting of a straight member and a spiral member bent into a general egg shape so as to surround said straight member, all parts of the apparatus being so constructed as to avoid free ends.

9. A curette, comprising a handle, a longitudinal member of spring metal connected therewith and terminating in an endless loop for the purpose of avoiding free ends, a part of said loop being straight and another part of said loop being wound spirally around said straight part, said straight part extending entirely through said spirally-wound part.

707,082. GARMENT-SUPPORTER. FERDINAND SPERING, Arlington, Minn. Filed Sept. 7, 1901. Serial No. 74,633. (No model.)

Claim.—A garment-supporter comprising two separable members formed of resilient material, one of which is provided with a central elongated vertical slot, the other member being constructed in hook form having on its front portion an outwardly-bent portion terminating in a reduced end provided with outwardly-extended curved arms whereby to coact with the slot of the first-mentioned member to connect the two members together, the upper end of the hook having a curved loop portion and an inwardly-bent or contracted portion below the same so as to form a spring-clamp between the front and rear wall of the hook, substantially as and for the purpose specified.

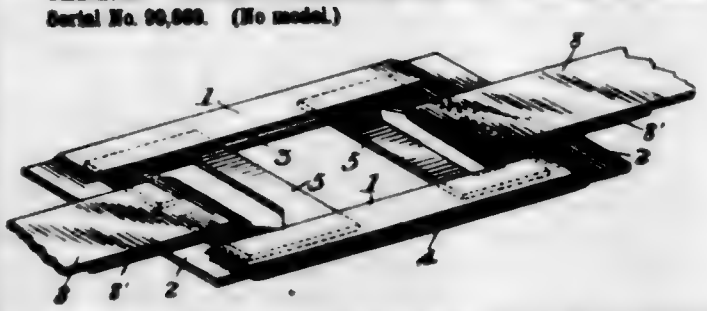
707,088. JOURNAL-BOX. ANDREW G. STEELSMITH, St. Louis, Mo., assignor of forty-nine one-hundredths to Sanford Northrop, St. Louis, Mo. Filed Apr. 29, 1901. Serial No. 59,041. (No model.)



Claim.—1. In a journal-box having shoulders at its top, a vertically-movable cap having a curved lip at the top, a central upward and forward inclined enlargement 6 on the box, over which the said lip is adapted to fit to make a dust-proof joint, in combination with springs provided with bends at their lower ends adapted to engage the box when the cap is closed, the bends of said springs adapted to yieldingly bear against said shoulders when the cap is raised.

2. In a journal-box, a central upward and forward enlargement 6, having a groove in the top thereof, a vertically-movable cap, a flange on the cap adapted to enter said groove when the cap is closed, lips on the side of the cap adapted to engage flanges on the box, and springs secured to the cap and adapted to engage the forward edge of the top of the box when the cap is in its open position, said springs also adapted to engage the box when the cap is in its closed position, substantially as set forth.

707,084. CLAMP-BUCKLE OR FASTENER FOR BALE-TIES OR THE LIKE. WILBUR R. STURGESS, Conway, Ark. Filed Mar. 24, 1902. Serial No. 99,869. (No model.)

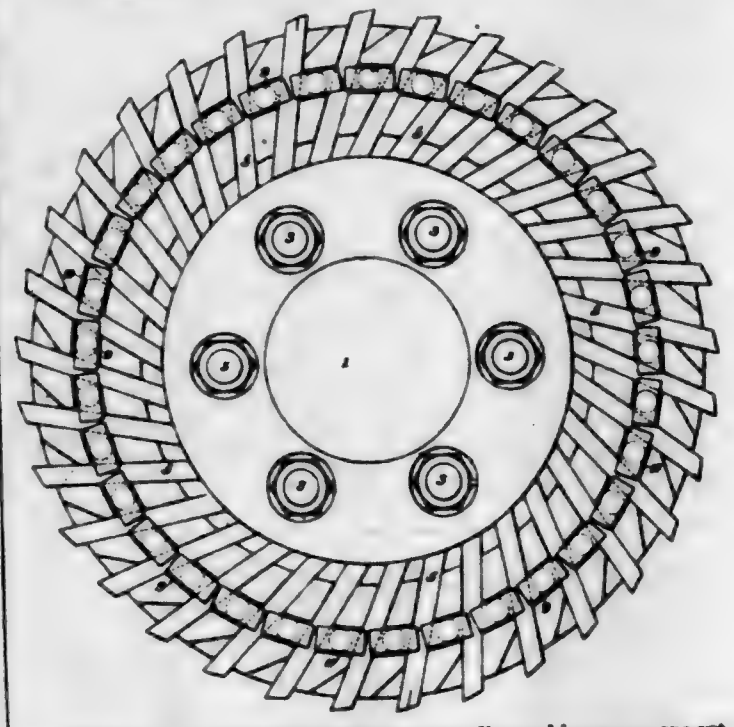


Claim.—1. A clamp or buckle for bale-ties and the like, comprising a rectangular base having an open center and grooved inner edges, and an open-centered slide operating in said grooves and serving to receive the looped end of the tie and bind the free end thereof against the end of said base.

2. A clamp or buckle for bale-ties and the like, comprising an open rectangular base, having grooves in its opposite inner edges and a pair of open slides operating in said grooves and serving to bind the free ends of a tie, which are looped through their respective centers, against the ends of the base.

3. A buckle or clamp for bale-ties and the like, comprising a base formed of side bars 1, each provided with a groove, 3, on its inner edge, and end bars, 2, connecting said side bars, and two flat rectangular, open-centered slides, 5, operating between said side bars and engaging said grooves, said slides serving to bind the free ends of a tie, which are looped through their centers, against the ends of the base.

707,085. METAL-WORKING TOOL. ADAM TINDEL, Philadelphia, Pa., assignor to Tindel-Morris Company, Eddystone, Pa., a Corporation of Pennsylvania. Filed Apr. 28, 1902. Serial No. 105,022. (No model.)



Claim.—1. A cutter-head having cutters disposed in groups, the cutters in each group being in different planes transverse to the axis of rotation of the cutter-head and securing-bolts for said cutters, each bolt having a head engaging with a pair of adjoining cutters, one side of the head being of greater depth than the other, substantially as specified.

2. A cutter-head having cutter-receiving grooves in the face of the same, an annular groove transverse to said cutter-receiving grooves, and openings extending from the base of said annular groove to the back of the cutter-head, a series of cutters adapted to the cutter-grooves, and cutter-securing bolts having heads overlapping the cutters and adapted to

said annular groove in the face of the cutter-head, the stems of the belts passing through the openings in the cutter-head, substantially as specified.

707,036. **PISTOL.** GUSTAVUS TROXLER, Jr., Newark, N. J., assignor to Charles F. Panhus, Newark, N. J. Filed Oct. 22, 1901. Serial No. 79,515. (No model.)

Claim.—1. In a pistol for firing paper or percussion caps, the combination, with the frame of the pistol having an opening in the top, and an anvil at or near said opening, said anvil having a striking-surface extending in a downward direction and tapering at an angle away from said opening, of a firing-hammer having a tapering striking end corresponding to the angle of the inclination of the striking-surface of the anvil, a cap-feeding mechanism, and means connected with said hammer for causing an intermittent feeding motion of said feeding mechanism, substantially as and for the purposes set forth.

2. In a pistol for firing paper or percussion caps, the combination, with the frame of the pistol having an opening in the top, and an anvil at or near said opening, said anvil having a striking-surface extending in a downward direction and tapering at an angle away from said opening, of a firing-hammer having a tapering striking end corresponding to the angle of the inclination of the striking-surface of the anvil, a pair of feed-rolls between which a strip of paper caps is passed and fed beneath the striking-surface of said anvil, and means connected with said hammer and engaging with one of said feed-rolls for causing an intermittent rotary feeding motion of the rolls, substantially as and for the purposes set forth.

3. In a pistol for firing paper or percussion caps, the combination, with the frame of the pistol having an opening in the top, and an anvil at or near said opening, said anvil having a striking-surface extending in a downward direction and tapering at an angle away from said opening, of a firing-hammer having a tapering striking end corresponding to the angle of the inclination of the striking-surface of the anvil, a pair of feed-rolls between which a strip of paper caps is passed and fed beneath the striking-surface of the anvil, ratchet-teeth on one of said feed-rolls, and a pawl pivotally attached to said hammer having a hook-shaped end in engagement with said ratchet-teeth for causing an intermittent rotary motion of said feed-rolls, substantially as and for the purposes set forth.

4. In a pistol for firing paper or percussion caps, the combination, with the frame of the pistol having an opening in the top, and an anvil at or near said opening, said anvil having a striking-surface extending in a downward direction and tapering at an angle away from said opening, of a firing-hammer having a tapering striking end corresponding to the angle of the inclination of the inputing surface of the anvil, a pair of feed-rolls between which a strip of paper caps is passed and fed beneath the striking-surface of the anvil, ratchet-teeth on one of said feed-rolls, and a pawl pivotally attached to said hammer having a hook-shaped end in engagement with said ratchet-teeth for causing an intermittent rotary motion of said feed-rolls, and means for operating said hammer, consisting, of a finger pivotally connected with said hammer, and a pivoted trigger adapted to be brought in active sliding engagement with said finger, substantially as and for the purposes set forth.

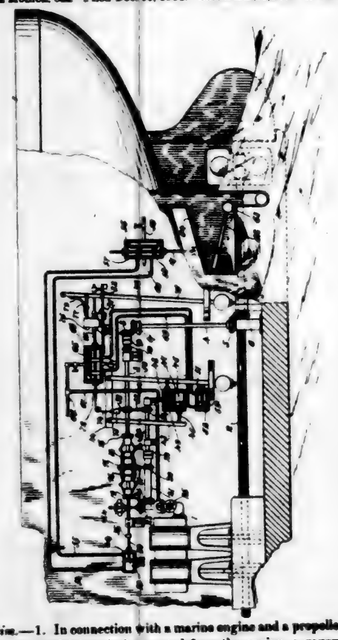
707,037. **PAPER-BINDER.** FERDINAND H. VOLKERT, Chicago, Ill. Filed Mar. 17, 1902. Serial No. 98,511. (No model.)

Claim.—1. In a binder for sheets of paper, the combination with clamping-bars, of a hollow post composed of telescopic sections attached at their outer ends to said bars and in sliding engagement at their inner ends, the inner section of said post being split at its end, a rod located within said inner section and in screw-threaded engagement therewith, a conical wedge integrally secured to the end of said rod and located within the split end of the inner section, and means for rotating said rod whereby said wedge expands the split end of the inner section into frictional contact with the interior surface of the outer section of said post.

2. In a binder for sheets of paper, the combination with clamping-bars, of a hollow post composed of telescopic sections attached at their outer ends to said bars and in sliding engagement at their inner ends to said post being split at its end, a rod located within said inner section and longitudinally movable therein, a conical wedge integral with the end of said rod and located within the split end of the inner section, and means for moving said rod longitudinally within the inner section whereby said wedge expands the split end of the inner section into frictional contact with the interior surface of the outer section of said post.

3. In a binder for sheets of paper, the combination with clamping-bars, of a hollow post composed of telescopic sections attached at their outer ends to said bars and in sliding engagement at their inner ends, the inner section of said post being split at its end, a rod extending through said inner section and in screw-threaded engagement with the portion thereof adjacent to the clamping-bar to which it is connected, a conical wedge on the end of said rod adapted to expand said split end of the inner section into frictional contact with the interior surface of the outer section of said post, and means for rotating said rod.

707,038. **MARINE-ENGINE GOVERNOR.** MARTIN F. VOLKMANN, Santa Monica, Cal. Filed Dec. 19, 1901. Serial No. 86,525. (No model.)



Claim.—1. In connection with a marine engine and a propeller-shaft driven thereby, a driving-shaft operated from the engine, a governor for the steam-valve of the engine and normally operated from said driving-shaft, and means for speeding the governor upon the rise of the propeller in the water, substantially as specified.

2. A marine-engine governor, comprising a governor having connection with the steam-controlling valve of the engine, a driving-shaft operated from the engine, a driven shaft operated from the driving-shaft, the said driven shaft consisting of two sections, one mounted to rotate on the other, a gear connection between the governor and said section mounted to rotate on the other section, a sprocket-wheel loosely mounted on the driving-shaft, a driving connection between said sprocket-wheel and the last-named member of the driven shaft, clutch devices carried by the driving-shaft and adapted for engagement with the sprocket-wheel, and means for engaging the clutch devices with said sprocket-wheel, substantially as specified.

3. In a marine-engine governor, a ball-governor having connection with the inlet-valve, a propeller-shaft driven by the engine, a driving-shaft, a gear connection between the propeller-shaft and driving-shaft, a driven shaft consisting of a main section and a tubular section, means for locking the two sections together, a gear connection between the tubular section and the governor, a sprocket-wheel loosely mounted on the driving-shaft and having driving connection with the sleeve-section, a driving connection between the driving-shaft and the main section of the driven shaft, a clutch device mounted to rotate with the driving-shaft and adapted for engagement with the loose sprocket-wheel thereon, a pendulum for moving said clutch, and a steam-controlled device for moving the pendulum, substantially as specified.

4. In a marine-engine governor, a governor for the engine, a propeller-shaft driven by the engine, a driving-shaft, a gear connection between the driving-shaft and propeller-shaft, a sprocket-wheel loosely mounted on the driving-shaft, a driven shaft consisting of a main section and a tubular section, a gear connection between the tubular section and the governor, a sprocket-chain connection between the driving-shaft and the main section of the driven shaft, a sprocket-wheel loosely mounted on the driving-shaft and having chain connection with the tubular section of the driven shaft, a clutch device mounted on the driving-shaft and adapted for engagement with said loose sprocket-wheel, a steam-cylinder, a piston in said cylinder having connection with the clutch device, a steam-cylinder arranged at the stern of the vessel and having pipe connection with the first-named cylinder, a rod movable in the last-named cylinder, valves on said rod for controlling the passage of steam through the pipes, a water-trunk supported at the stern of the vessel, and a float in said water-trunk having connection with said rod, substantially as specified.

5. In a marine-engine governor, a ball-governor having connection with the controlling-valve for the engine, a propeller-shaft operated by the engine, a driving-shaft, a gear connection between the propeller-shaft and the driving-shaft, a driven shaft consisting of a main section and a tubular section, the said tubular section being geared to the governor, a chain connection between the driving-shaft and the main section of the driven shaft, a sprocket-wheel loosely mounted on the driving-shaft and having driving connection with the tubular section of the driven shaft, a clutch member mounted on the driving-shaft and adapted for engagement with said loose sprocket-wheel, a pendulum having connection with said clutch, a main steam-cylinder, a supply-pipe leading therein, a slide-valve in said cylinder, a steam-chest having pipe connection with the supply-pipe, a slide-valve operating in said chest, a pendulum with which said slide-valve connects, a cylinder receiving steam from the steam-chest, a piston operating in said cylinder and adapted for engagement with the first-named pendulum, a steam-cylinder having connection with the main cylinder, and a piston in said cylinder having connection with the last-named pendulum, substantially as specified.

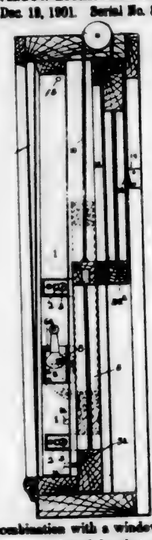
6. In a marine-engine governor, a ball-governor, a driving-shaft operated from the engine, a driven shaft consisting of a main section and a tubular section, the said tubular section having gear connection with the governor, a driving connection between the driving-shaft and the main section of the driven shaft, a sprocket-wheel loosely mounted on the driving-shaft and having driving connection with the tubular section of the driven shaft, a clutch on the driving-shaft adapted for engagement with said last-named sprocket-wheel, a pendulum having connection with the clutch, a main steam-cylinder, a valve mounted to slide in said steam-cylinder, a rod extended through the heads of the cylinder and to which the valve is connected, a weight at one end of said rod, teeth on the other end of said rod, a pendulum rearward of the first-named pendulum, a pawl mounted to swing on said pendulum and adapted for engagement with the teeth on said rod, means for lifting the pawl out of engagement with a tooth as the pendulum moves to normal position, and means controlled by said slide-valve for operating the first-named pendulum in one direction, substantially as specified.

7. A controlling device for the governor of a marine engine, comprising a steam-cylinder for receiving steam from the boiler, a slide-valve arranged in the cylinder, a rod connected to the slide-valve and extended through the heads of the cylinder, a weight attached to one end of said rod, teeth on the other end of said rod, a pendulum, a spring-pressed arm mounted to swing on the pendulum, a pawl carried by the arm for engaging with the teeth, a tappet extended downward from the pawl, and a block adapted for engagement with said tappet for raising the pawl out of engagement with a tooth, substantially as specified.

8. In connection with a governor for a marine engine, a driving-shaft driven from the engine, a driven shaft geared to the governor, and means operated from the driving-shaft for imparting different rates of motion to the driven shaft, substantially as specified.

9. In connection with a governor for a marine engine, a driving-shaft, a sprocket-wheel loosely mounted on the driving-shaft, a driven shaft geared to the governor and having connection with said sprocket-wheel, clutch devices on the driving-shaft at opposite sides of the sprocket-wheel, and means operated by the pitching of the vessel, for moving either one of said clutch devices into engagement with the sprocket-wheel, substantially as specified.

707,039. **WINDOW-LOCKING DEVICE.** JOHN WARLIER, Bay City, Mich. Filed Dec. 18, 1901. Serial No. 86,576. (No model.)



Claim.—1. In combination with a window-frame having a pair of transversely-movable stops; a slotted bracket secured to each stop, said bracket having a pair of outwardly-extending flanges; a cam pivotally mounted on the window-frame and operating between the flanges of each bracket to actuate the stops toward and away from the sash; a projecting pin secured to the sash, and recesses in the clamping edge of the stop to receive said pin when the stop is in contact with the sash.

2. In combination with a window-frame having a pair of transversely-movable stops secured thereto; a bracket secured to each stop, said bracket having a pair of outwardly-extending parallel flanges; a cam pivotally mounted on the window-frame and operating between the flanges of the bracket to engage said flanges thereby actuating the stops toward and away from the sash; a handle for said cam, together with a locking-latch pivoted to the handle and adapted to engage the flanges of the bracket.

3. A clamp for window-sash comprising in combination with a transversely-movable stop; a bracket having a transverse slot and a pair of flanges carried by said stop; a pin passing through the movable stop and the slot of the bracket; a cam mounted on said pin between the bracket-flanges; a locking-latch pivotally mounted on the cam; a projecting pin secured to the sash; together with recesses in the clamping edge of the stop, substantially as and for the purpose set forth.

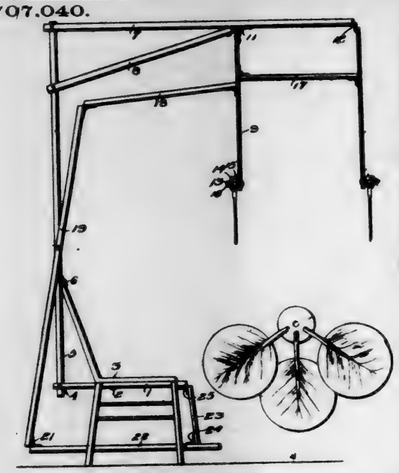
707,040. **FAN-OPERATING DEVICE.** ROAB F. WARLICK, Chattanooga, Tenn. Filed Feb. 19, 1902. Serial No. 94,894. (No model.)

Claim.—1. A device of the class described comprising a frame designed to be mounted on a chair, an oscillatory fan-supporting bar or arm depending from the frame and located above the chair, a treadle supported from the frame and arranged to be engaged by the foot of a person occupying the chair, and an upright lever fulcrumed on the frame and connected at its lower end to the treadle and at its upper end with the fan-supporting bar or arm, substantially as described.

2. A device of the class described comprising a frame, an oscillatory fan-supporting bar or arm depending from the frame and located above the chair, a treadle arranged beneath the chair and extending in advance of the same, a hinged bar depending from the frame and supporting the front portion of the treadle, and an upright lever supporting the rear portion of the treadle and connected with the fan-supporting bar or arm, substantially as described.

3. A device of the class described comprising a frame, composed of a horizontal bar designed to be secured beneath the seat of a chair, an upright standard connected with the bar and adapted to be secured to the back of the chair, and a horizontal bar extending from the top of the standard, depending fan-supporting arms or bars hinged to the horizontal bar, a link connecting the fan-supporting bars, an upright lever fulcrumed on the standard and connected with the fan-supporting bars, a treadle extending beneath the chair and supported at its rear end by the upright lever, and a hinged bar connected with the frame and supporting the front portion of the treadle, substantially as described.

707,040.

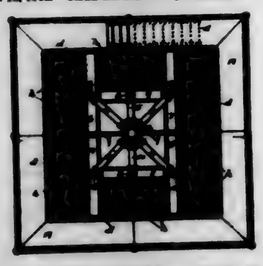


707,041. HARP. KARL WEIGEL, Hanover, Germany. Filed May 9, 1900. Serial No. 16,056. (No model.)

Claim.—1. A harp having a single-row chromatic arrangement of the strings, and a support for the harp having an inclined upper surface, the said inclined surface being adapted for engagement with the base of the harp.

2. A harp having a single-row chromatic arrangement of the strings, the strings ranging obliquely to the floor when the harp is standing, and a hand-support comprising a rail extending from the pillar of the harp to the resonance-box and ranging transversely of the strings, as set forth.

707,042. WATER-COOLING TOWER. CLIFTON H. WHEELER and LOUIS L. PRATT, Shorthills, N. J., assignors to Wheeler Condenser and Engineering Company, New York, N. Y., a Corporation of New Jersey. Filed Jan. 16, 1902. Serial No. 89,888. (No model.)



Claim.—1. In a cooling-tower of the open type, the combination with a reservoir, suction and discharge pipes, of independent series of vertically-placed mats arranged at right angles to each other and with intervening spaces between said series at right angles to each other, and means for independently distributing the circulating liquid to the mats of each series, substantially as specified.

2. In a cooling-tower of the open type, the combination with a reservoir, suction and discharge pipes, of independent series of vertically-placed mats in corresponding vertical planes, two short intermediate series of independent vertically-placed mats in corresponding vertical planes and at right angles to the aforesaid series with intervening and central spaces between said independent series of mats at right angles to each other, and means for independently distributing the circulating liquid to the said series of mats, substantially as specified.

3. In a cooling-tower of the open type, the combination with a reservoir, suction and discharge pipes, of long parallel series of independent vertically-placed mats in corresponding vertical planes, two short intermediate series of independent vertically-placed mats in corresponding vertical planes and at right angles to the aforesaid series with intervening and central spaces between said independent series of mats at right angles to each other, means for independently distributing the circulating liquid to the said series of mats, and means for holding the mats taut and vertical, substantially as set forth.

4. In a cooling-tower of the open type, the combination with a reservoir, suction and discharge pipes, of long parallel series of independent vertically-placed mats in corresponding vertical planes, two short intermediate series of independent vertically-placed mats in corresponding vertical planes, and at right angles to the aforesaid series with intervening and central spaces between said independent series of mats at right angles to each other, means for independently distributing the circulating liquid to the said series of mats, and means for holding the mats taut and vertical, substantially as set forth.

5. In a cooling-tower of the open type, the combination with a reservoir, suction and discharge pipes, of an open frame, mats placed in independent series, the said series being at right angles to each other, means for distributing the circulating liquid to any and all of the said independent series of mats, and means for holding the said mats taut and vertical, substantially as set forth.

6. In a water-cooling tower of the open type, the combination with a reservoir, suction and discharge pipes, of a frame, independent troughs at right angles to each other and means for supporting the same in said frame, mats arranged in independent series, the said series being at right angles to each other, and independent means for conveying the circulating water from the said discharge-pipe to the respective troughs and therefrom to the mats of the independent series, substantially as specified.

7. In a water-cooling tower the combination with a reservoir, suction and discharge pipes, of a frame, independent troughs at right angles to each other and means for supporting the same in said frame, mats arranged in independent series, the said series being at right angles to each other, independent means for conveying the circulating water from the said discharge-pipe to the respective troughs and therefrom to the mats of the independent series, radial baffles at right angles to each other and adjacent to the said discharge-pipe and dividing the spaces within the said series of mats, substantially as specified.

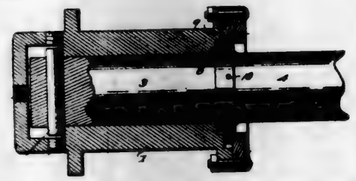
8. In a water-cooling tower of the open type, the combination with a reservoir, suction and discharge pipes, of a frame, independent troughs at right angles to each other and means for supporting the same in said frame, mats arranged in independent series, the said series being at right angles to each other, independent means for conveying the circulating water from the said discharge-pipe to the respective troughs and therefrom to the mats of the independent series, distribution-pipes extending between the said troughs and frame and from which the said mats are suspended, and pipes having valves therein connecting the discharge-pipe with the several independent troughs, substantially as specified.

9. In a water-cooling tower of the open type, the combination with a reservoir, suction and discharge pipes, of an open frame, a pair of independent troughs axially in line with one another, a similar pair of troughs parallel to and spaced apart from the said pair of troughs, a pair of independent troughs spaced apart, between and at right angles to the aforesaid pairs of troughs, all the troughs being secured in said frame, distribution-pipes extending from said troughs, independent series of mats suspended from said distribution-pipes, and means for conveying the circulating water from the discharge-pipe independently to each of said troughs, substantially as specified.

10. In a water-cooling tower, the combination with a reservoir, a suction-pipe and a central discharge-pipe, of an open frame, a pair of independent troughs axially in line with one another, a similar pair of troughs parallel to and spaced apart from the said pair of troughs, a pair of independent troughs spaced apart, between and at right angles to the aforesaid pairs of troughs, distribution-pipes extending outwardly from said troughs, independent series of mats suspended from said distribution-pipes, there being spaces left between the respective series of mats which are at right angles to one another, baffle-plates adjacent to the discharge-pipe extending radially from the same and at right angles to one another, and means for distributing the circulating water from the discharge-pipe independently to said troughs, substantially as specified.

707,048. OIL-RETAINING BOX. GEORGE W. WILMOT, ELIJAH HALST, and GEORGE T. BROWN, Freeland, Pa. Filed Nov. 7, 1901. Serial No. 81,419. (No model.)

Claim.—1. In a device of the class described, the combination of a hub provided at its inner end with an annular recess, a plate detachably secured to the inner end of the hub beyond the recess and forming an outer wall for the recess to provide a vertical way and extending entirely around the recess and closing the same at the top, bottom and sides of the hub, a spindle, and a vertical shield or ring arranged within the said way and presenting metallic faces to both of the walls of the same and to the spindle to form dust-proof and oil-tight joints at the spindle and at the inner end of the hub, said shield or ring terminating short of the periphery of the annular recess and being capable of radial movement in the way, whereby the shield or ring is prevented from being subjected to the weight of the spindle when the parts become worn, substantially as described.



2. In a device of the class described, the combination of a hub provided at its inner end with an annular recess and having an annular flange extending outward from the hub in substantially the same plane as the annular recess, a plate detachably secured to the annular flange and forming an outer wall for the annular recess and extending entirely around the same and closing the said recess at the top, bottom and sides of the hub, a spindle, and a vertically-disposed shield or ring presenting metallic faces to the spindle and to the walls of the recess to prevent the escape of oil and to exclude dust, said shield or ring being of less diameter than the recess and spaced from the periphery thereof to permit it to move radially and to prevent it from coming in contact with the hub when the bearing becomes worn, substantially as described.

3. In a device of the class described, the combination of a hub provided at its inner end with an annular recess, a detachable plate secured to the inner end of the hub and extending entirely around the recess and forming an outer wall for the same to provide a vertical way, and an expansible shield or ring arranged in the way and composed of two metal side plates presenting metallic faces to the walls of the way and to the spindle, and an intermediate layer of compressed material adapted to hold the metal side plates in contact with the sides of the way, said shield or ring being of less diameter than the recess and spaced from the periphery thereof to permit it to move radially with the spindle without being subjected to the weight of the same, substantially as described.

707,044. SWING-BRIDGE. CHARLES WORTHINGTON, Pittsburg, Pa. Filed Oct. 28, 1901. Serial No. 80,241. (No model.)

Claim.—1. In a swing-bridge, the combination with a central tower and two girders or trusses hinged to said tower at their inner ends, of lifting mechanism and flexible connections between said mechanism and each of the girders or trusses.

2. The combination with end and middle piers, and trusses or girders supported thereby, of lifting mechanism on the middle pier and flexible connections between the same and the trusses or girders, said connections having lost motion in operation whereby each truss or girder is independently supported when in use.

3. In a swing-bridge, the combination with two trusses or girders independently supported in alinement and a structure to which their inner ends are hinged, of lifting mechanism and jointed connections between said mechanism and the respective trusses or girders, said connections having lost motion when said mechanism is operated.

4. In a swing-bridge, the combination with a central structure and two trusses or girders hinged thereto in alinement, of vertical struts, connections between the upper ends of said struts and the hinged trusses or girders, means for raising and lowering the struts and guides for insuring ease and accuracy of movement.

5. In a swing-bridge, the combination with a central structure and two trusses or girders hinged thereto in alinement, of a strut and two lifting-screws at each side of the structure, means for rotating the screws in unison and flexible connections between the struts and the hinged trusses or girders.

6. In a swing-bridge, the combination with a central structure and two trusses or girders hinged thereto in alinement, of two vertically-movable girders provided with struts, connections between the struts and the hinged trusses or girders, guides for the free ends of the struts and means for raising and lowering the girders on which the struts are mounted.

7. In a swing-bridge, the combination with a central structure and two trusses or girders hinged thereto in alinement, of two vertically-movable girders each having a vertical strut projecting upwardly therefrom and two stationary nuts, connections between the free ends of the struts and the hinged trusses or girders, guides for said free ends, screws operating in said nuts and means for rotating all of said screws in unison to effect the desired movement of the hinged trusses or girders.

8. In a swing-bridge, the combination with a central structure and two trusses or girders hinged thereto in alinement, of vertically-movable girders at the respective sides of the central structure each having a pair of stationary nuts and an intermediate strut, guides for the free ends of the struts, connections between said free ends and the hinged trusses or girders, screws coöperating with said nuts and gearing for rotating said screws in unison from a single source of power.

9. In a swing-bridge, the combination with a central structure and two trusses or girders hinged thereto in alinement, of a vertically-movable member at each side of said structure, means for preventing lateral and rotative movement of said members, connections between the upper ends of said members and the hinged trusses or girders and means for raising and lowering said members in unison.

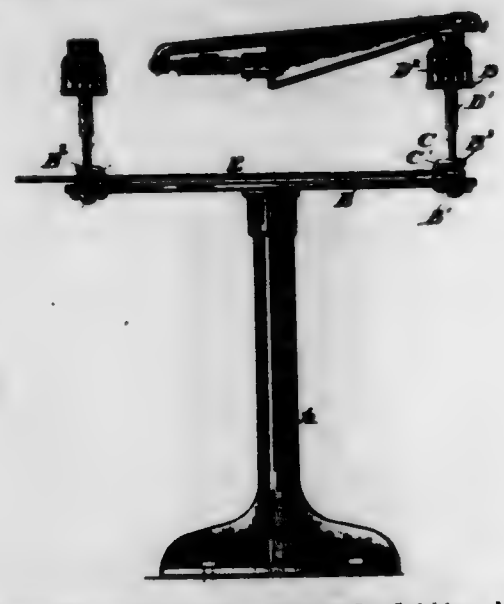
10. In a swing-bridge, the combination with a central structure and trusses or girders hinged thereto in alinement, of two vertically-movable members, means for preventing lateral and rotative movement of said members, connections between said members and the hinged trusses or girders, a plurality of raising and lowering screws for each of said members, and mechanism for rotating all of said screws in unison.

707,045. GLASS-FINISHING MACHINE. LAFAYETTE T. KIMBERLY, Cumberland, Md., assignor of one-half to Henry Knierim, Cumberland, Md. Filed Mar. 26, 1902. Serial No. 100,049. (No model.)

Claim.—1. In a machine for fire-finishing the edges of tumblers or the like, the combination of means for supporting and turning tumblers, and the retort comprising the box or casing having its upper plate extending laterally outward beyond its lower plate forming an opening below the upper plate through which the tumblers may be passed, and provided with a vaporizing-pipe extending below the upper plate of the box or casing at the outer edge thereof, and forming an outer wall for the opening through which the tumblers are directed, and the burner-pipe and connections between the same and the vaporizing-pipe, substantially as set forth.

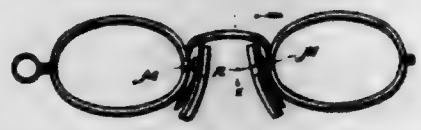
2. In an apparatus for fire-finishing the edges of tumblers and the like, a retort comprising a box or casing tapering toward one end and having at each end its upper plate extending laterally outward beyond its lower plate forming in the under side of the box or casing an opening to receive the tumblers, and having a vaporizing-pipe extending beneath

sash outward extension of the upper plate, substantially as and for the purposes set forth.



3. The combination in an apparatus for fire-finishing the edges of tumblers, of the table, devices thereon for supporting the tumblers and the retort composed of the box or casing having in its under side an opening forming the glory-hole, the vaporizing-pipe secured to the box and extending along the outer side of said opening, the feed-pipe connected with the vaporizing-pipe at one end of the latter, the burner-pipe, and the connecting-pipe between the burner-pipe and the vaporizing-pipe, substantially as set forth.

707,046. EYEGLASSES OR SPECTACLES. CHARLES O. BAILEY, Ogdensburg, N. Y. Filed Apr. 14, 1902. Serial No. 102,699. (No model.)



Claim.—1. The combination with the lenses, of a bridge having a forwardly-extending arched portion lying in a substantial horizontal plane, and merging at its rear into downwardly-extending arms located to the rear of the lenses, said arms being looped and slightly offset at an intermediate point and bent upwardly to form arms for securement to the lenses, said last-named arms adapted to move about said looped and offset portion as a point of fulcrum.

2. The combination with the lenses and the clamps carried thereby, of a bridge comprising an arched portion extending in a substantially horizontal plane and at its rear merging into downwardly-extending arms, said arms being looped at an intermediate point and converging in an upward direction to form arms adapted to be engaged by said clamps, the arched portion of the bridge extending to the front of the lenses, and the downwardly-extending arms located to the rear thereof, substantially as described.

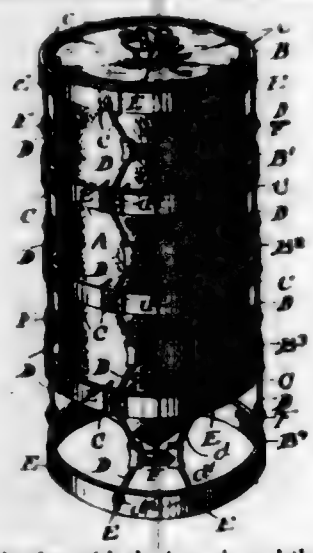
3. The combination with eyeglasses and the like, of a bridge having an arc-shaped portion extending to the front of the eyeglasses and having its ends bent downwardly in a vertical direction to extend to the rear of the eyeglasses, looped, extending upwardly in a vertical direction and connected thereto, whereby the lenses when adjusted may have a purely horizontal movement, substantially as described.

4. In a device of the type set forth, the combination with the lenses, of a bridge having an arched portion lying in a substantially horizontal plane, and merging into downwardly-extending arms looped and bent upwardly and converging and secured to the lenses and located interiorly of the downwardly-extending arms.

5. In combination with the lenses, a bridge formed of an integral piece of metal comprising an arched portion carrying downwardly-extending arms lying in a transverse plane to that assumed by the arched portion and to the rear of the lenses, the arms being looped and extending upwardly and inwardly and clamped to the lenses whereby the upwardly-extending arms may move about the looped portion as a point of fulcrum, substantially as described.

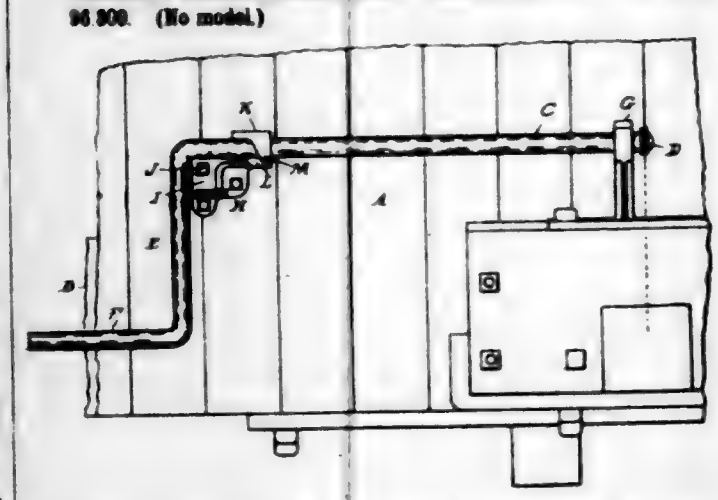
707,047. BANANA-SHIPPING CASE. HARRY BITNER, Berwyn, Ill. Filed Jan. 18, 1902. Serial No. 90,264. (No model.)

Claim.—1. The combination with the bag, A, and the hoops, B, B', B², B³, B⁴, secured thereto and out of contact therewith, of the braces, D, made up of the U-shaped portions pivoted together and respectively to the respective hoops, and means for rigidly locking the portions of the braces against angular movement at the hinges; substantially as described.



2. The combination with the bag, A, and the hoops, B, B', B², B³, B⁴, secured thereto out of contact therewith, of the braces, D, composed of the U-shaped portions, *d*, *d'*, having their ends hinged to the hoops and their middle portions to each other, and the slide, F, adapted to engage said portions against angular movement in one position, and to be moved so as to release said portions; substantially as described.

707,048. UNCOUPLING MECHANISM FOR CARS. JAMES A. CRUSE, Detroit, Mich., assignor of two-thirds to Delmar C. Ross and Edmund D. Bronner, Detroit, Mich. Filed Mar. 5, 1902. Serial No. 96,909. (No model.)



Claim.—1. In uncoupling mechanism for car-couplers, the combination with a rock-shaft having a crank-arm thereon, of a bearing for said shaft having formed therein, for the passage of said arm, a slot equal in width to the full diameter of said shaft, said bearing having portions upon opposite sides of said slot which together prevent lateral displacement of said shaft in any direction.

2. In uncoupling mechanism for car-couplers, the combination with a rock-shaft extending from the side to the center of said car at the end thereof, and having crank-arms at opposite sides thereof, of bearings for the inner and outer ends of said shaft adjacent to said respective cranks, and secured to the end sill of the car, said outer bearing being longitudinally slotted for the passage of said outer crank therethrough, and said slot being inclined to the axis of the bearing for the purpose described.

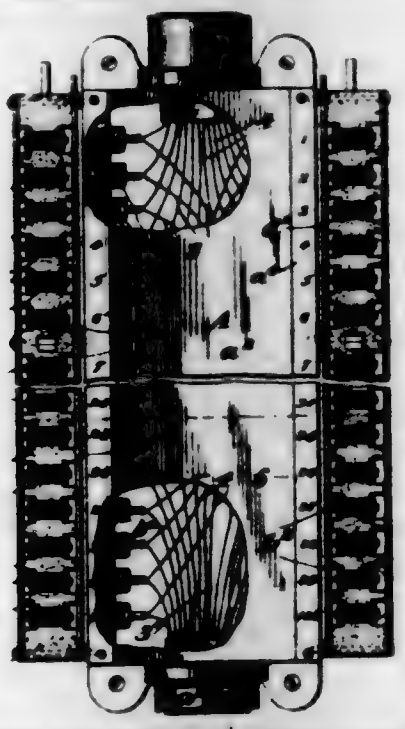
3. In an uncoupling mechanism for car-couplers, the combination with a rock-shaft having crank-arms at opposite ends thereof, of the bearing therefor comprising the securing-plate I and the journal K having the spiral slot L therethrough for the purpose described.

4. In uncoupling mechanism for car-couplers, the combination with a rock-shaft having a portion thereof bent to form a rock-arm, of a bearing for said shaft having a longitudinal slot therein, of a width equal to the diameter of said arm, said slot being bent to form projecting portions on opposite sides thereof for retaining said shaft from lateral displacement.

707,049. TERMINAL BOX FOR PROTECTED ELECTRICAL CIRCUITS. FRANK B. COOK, Chicago, Ill. Original application filed July 29, 1896, Serial No. 600,970. Divided and this application filed May 21, 1902. Serial No. 108,338. (No model.)

Claim.—1. A combined cable terminal and protector, comprising a suitable box, a plurality of thermal protectors arranged at each side of

the box, a pair of metal strips whereby the thermal protectors are each operative to establish connection to the ground, carbon lightning-arresters arranged in conjunction with said thermal protectors, and binding-posts arranged inside of said box and extending through the walls thereof, the outer ends of said binding-posts being connected with said thermal protectors and lightning-arresters.



2. A combined cable terminal and protector, comprising a suitable box, binding-posts arranged inside of said box and extending through the walls thereof, a removable cover for said box, a plurality of heat-coils, a plurality of spring-switches upon which said heat-coils are supported, a plurality of metal strips whereby each spring-switch, when released by a heat-coil, is capable of establishing connection with the ground, and a plurality of carbon lightning-arresters associated with said heat-coils.

3. A combined cable terminal and protector, comprising a suitable box, binding-posts arranged within said box and extending through the walls thereof, said binding-posts being arranged in upper and lower rows, line-springs mounted upon the binding-posts in the lower rows, switchboard-conductor springs mounted upon the binding-posts in the upper rows, each line-spring being arranged to oppose a switchboard-conductor spring, heat-coils arranged to hold said springs under tension, metal strips arranged to serve as stops for limiting the movement of said line-springs, said metal strips being adapted to be connected to earth, spring-jaws mounted upon the binding-posts in the lower rows, other spring-jaws opposing those thus mounted, and carbon blocks with interposed insulation mounted between said jaws.

4. A combined cable terminal and protector, comprising a suitable box, a plurality of thermal protectors mounted at each side of said box, each thermal protector when operated by the passage of an abnormally large current being adapted to produce a gap in the circuit and establish connection with the ground, a carbon lightning-arrester associated with said thermal protectors, and also adapted to be connected with the ground.

5. A combined cable terminal and protector, comprising a metal box adapted to be connected with a grounded conductor, a plurality of thermal protectors arranged in parallel rows at opposite sides of said box, insulated binding-posts extending through the walls of the box and connected with said thermal protectors, line-wires leading through one end of the box and connected with a number of said binding-posts, switchboard-wires leading through the other end of the box and connected with the remaining binding-posts, each thermal protector being operative to break a circuit and simultaneously therewith establish connection with the ground through said box, and carbon lightning-arresters associated with said protectors and connected to allow lightning-discharges to jump to ground through said box.

6. A combined cable terminal and protector, comprising a metal box, a plurality of thermal protectors mounted upon said box, a grounded conductor connected with said box, insulated binding-posts extending through the walls of said box and connected with said thermal protectors, line-wires connected with part of said binding-posts, switchboard-wires connected with the remaining binding-posts, each thermal protector being operative to produce a gap in a circuit when operated by the passage of an abnormally large current, and spring switch devices adapted to establish connection between the line-wires and the said metal box.

7. A combined cable terminal and protector, comprising a metal box adapted to be connected with the earth, spring-jaws arranged in pairs and suitably mounted upon said box, a removable heat-coil device mounted upon each pair of jaws, suitable connections for including each heat-coil and its pair of jaws serially in a circuit, insulated binding-posts extending through the walls of said box and connected with said jaws, line-wires leading through one end of the box and connected with a number of said binding-posts, switchboard-wires leading through the other end of the box and connected with the remaining binding-posts, and contacts whereby certain of said spring-jaws, when released by the heat-coils, establish connection with the ground through said box.

8. A protective apparatus for telephone and telegraph systems, consisting of a terminal box, a plurality of quantitative protectors mounted on the exterior of the box, conductors entering into and passing out from the interior of said box, terminal holders and terminal conductors connecting the interior conductors with the exterior quantitative protectors, and a plurality of intensity-protectors also mounted on said box, together with conducting-strips, and spring contact-strips, also mounted on said box but each insulated from the others, the conducting-strips being adapted to be respectively connected to a ground-circuit and a signal-circuit, the spring contact-strips being normally disconnected from the conducting-strips.

9. A protective apparatus for telephone and telegraph systems consisting of a terminal box, a plurality of quantitative protectors mounted on the exterior of the box, spring-contacts for said quantitative protectors, a guiding and holding plate for said spring-contacts which is secured to the side of the terminal box, conductors entering into and passing through the interior of said box, terminal holders and terminal conductors connecting the interior conductors with the exterior quantitative protectors and a plurality of intensity-protectors also mounted on said box, which latter is connected with the ground, together with a conducting-strip attached to the guiding and holding plate, which conducting-strip is connected to ground, and two other conducting-strips also attached to the guiding and holding plate, which latter conducting-strips are connected to a signal-circuit.

10. The combination of a support, switch-springs mounted in pairs at each side of said support, a heat-coil mounted upon each pair of switch-springs, means for connecting one spring of each pair with a line conductor, suitable connections whereby each line-spring when released establishes connection between a line conductor and the ground, means for connecting the other spring of each pair with a switchboard-conductor, a pair of metal strips arranged at each side of said support, each pair of metal strips being adapted to be included in a signal-circuit, and means whereby each switchboard-spring when released operates to connect the two members of one of said pairs of metal strips.

11. The combination of a support, a pair of metal strips mounted at each side of said support, each pair of metal strips being adapted to be included in a signal-circuit, thermal protectors arranged in parallel rows at opposite sides of said support, each thermal protector being provided with means for establishing electrical connection between the members of the adjacent pair of metal strips, and means for grounding said support, each thermal protector being also provided with means for establishing connection between a line conductor and said grounded support.

12. The combination of a metal support, a pair of insulated metal strips adapted to be included in a signal-circuit, a plurality of heat-coil-protecting devices arranged in a row along said strips, each of said protecting devices being provided with means for establishing electrical connection between said strips and also with means for establishing connection between a line conductor and said support.

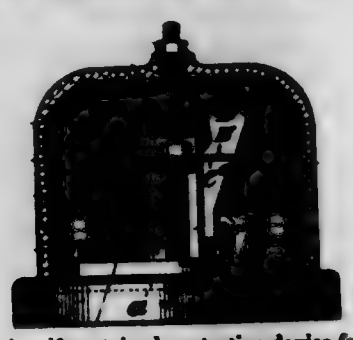
13. The combination of a suitable support, a pair of insulated meta strips adapted to be included in a signal-circuit, line and switchboard springs arranged in pairs along said strips, a heat-coil removably mounted on each pair of springs, each switchboard-spring being provided with means for establishing electrical connection between said strips, and each line-spring being provided with means for establishing connection between a line conductor and a grounded conductor.

14. The combination of a support, a strip of insulation mounted at each side of said support, a pair of metal strips extending lengthwise of each strip of insulation, line and switchboard springs arranged in a row along each strip of insulation, a heat-coil removably mounted on each pair of springs, each switchboard-spring being associated with means for establishing electrical connection between the two adjacent metal strips.

15. The combination of a grounded member, a plurality of carbon lightning-arresters supported by said member, heat-coil-protecting devices arranged in two parallel rows on opposite sides of said support, each heat-coil device being arranged opposite a carbon lightning-arrester, line conductors and switchboard-conductors, each thermal protector when operated establishing connection between a line conductor and said grounded member, means for including each line conductor serially in circuit with a carbon lightning-arrester and said grounded member, a pair of metal strips associated with each row of heat-coil-protecting devices, each pair of metal strips being adapted to be included in a signal-circuit, and each

protecting device being provided with means for establishing electrical connection between the members of the adjacent pair of metal strips.

707,050. ELECTRICAL PROTECTOR SET. FRANK B. COOK, Chicago, Ill. Original application filed July 29, 1898, Serial No. 690,970. Divided and this application filed May 21, 1902. Serial No. 108,329. (No model.)



Claim.—1. A self-contained protecting device for complete metallic circuits, comprising a base composed of insulation, a post rising from said base, a dome-shaped glass cover clamped upon said base by a nut screwed upon the said post, and a plurality of protecting devices mounted upon said base and partially supported by said post.

2. A self-contained protector device for subscribers' stations, consisting of a plurality of heat-coil protectors, conductor-holders therefor and spring-contacts adapted to disrupt the circuit or circuits, together with high-tension protectors and holding-plate of insulating material secured by a central standard and serving to hold one side of contact-springs without movement in either direction, and a holding-plate for the high-tension protectors connected with the said central standard, the contact-points of which plate are held in the same position relative to the movable spring-contacts by the connection aforesaid.

3. The combination with a support, of a plurality of lines, carbon-holders mounted on said support, carbons in said holders, an earth branch connected with said holders, carbon-holders having carbons therein also mounted on said base, line branches connected with said last-named holders, and line-springs and heat-coils in series in the lines, the conducting earth branch being normally out of contact with said springs but adapted to contact therewith in the operation of the heat-coils, substantially as described.

4. The combination with a support, of a plurality of sets of opposing carbon-holders with normally separated carbons therein, sets of opposing line-springs also mounted on said support, heat-coils between the ends of said opposing springs, and a strip adjacent the free ends of one of said opposing sets of line-springs normally out of contact therewith but adapted to be engaged by any of said adjacent springs when the heat-coil in circuit therewith is operated by an abnormal current.

5. The combination with a base, of opposing carbon-holding spring-strips having normally separated blocks of carbon between their free ends opposing line spring-strips in line with the other strips, one member of each pair of line-strips being electrically connected with one of the holding-strips, heat-coils between the free ends of the line-strips, a stationary bar or strip mounted adjacent the free ends of one set of the line-strips with which they contact when the heat-coils are operated to release said free ends.

6. A device for protecting circuits against excessive current, consisting of a base, a post rising from said base, a cover resting upon said base, a nut applied to the outer end of said post and holding said cover upon said base, springs mounted upon said base, a stop arranged to limit the movement of said springs, said stop having an opening through which the said post extends, a nut clamping a portion of said stop upon a shoulder on said post, suitable connections for grounding said stop, one or more electric circuits including one or more of said springs, suitable connections for normally holding said springs away from said stop, one or more heat-concentrating members arranged to cause said last-mentioned connections to weaken or break upon the passage of excessive current through said circuit or circuits, said spring or springs, when released, operating to break said circuit or circuits and to establish connection with the ground through said stop.

7. The combination of a base having an annular groove, a post rising from said base, a glass cover seated in said groove, a nut applied to the outer end of said post for clamping said cover in place, automatic cut-out devices mounted upon said base and inclosed by said cover, and a member suitably connected with said post and arranged to coöperate with said cut-out devices in establishing connection with the ground.

8. The combination of a suitable base, a centrally-located post rising from said base, a cover and nut applied to the outer end of said post for clamping said cover upon the base, circuit connections mounted upon said base and including one or more springs held under tension, a stop connected with said post and adapted to limit the movement of said spring or springs, a binding-post for connecting said stop with a grounded conductor, heat-coil devices connected and arranged to release the connections holding said spring or springs under tension, the said spring or springs, when released as a result of the passage of excessive current through said heat-coils, operating to automatically establish connection with the ground through said stop.

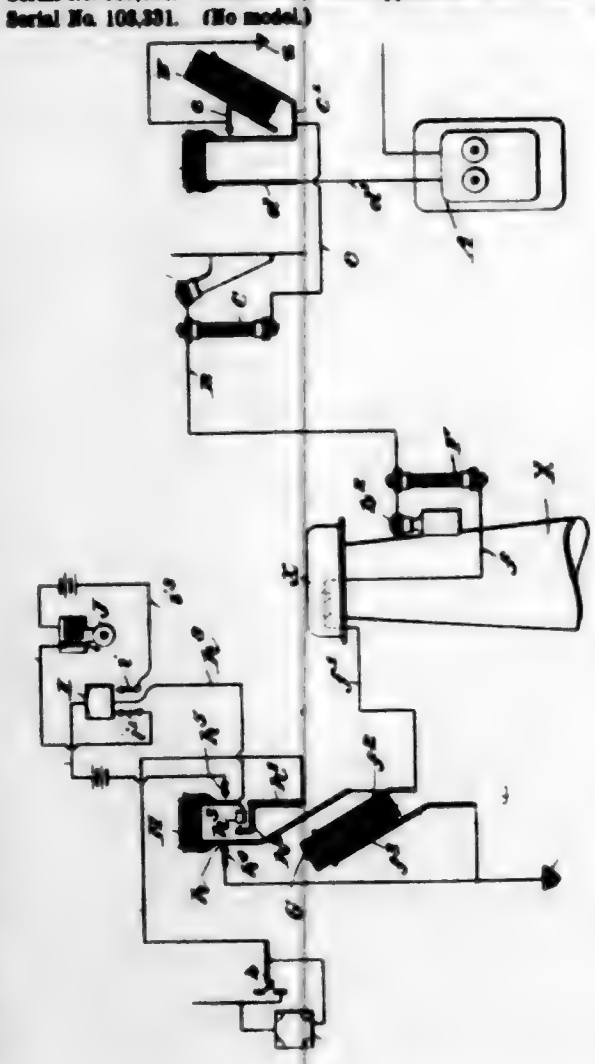
9. The combination of a suitable base, a post rising from said base, a suitable cover, a nut applied to the outer end of said post for clamping said cover upon said base, suitable binding-posts mounted upon said base and inclosed by said cover, and automatic cut-out devices connected with said binding-posts and partially supported by said post.

10. A circuit-protector comprising a suitable base, a cover, a post rising from the base, a nut applied to the outer end of said post for clamping the cover upon the base, a stop mounted upon the base, a nut for clamping a portion of said stop upon a shoulder on the post, a plurality of springs, carbon blocks interposed between said springs and said stop, other springs held normally away from said stop, a binding-post for connecting said stop with the grounded conductor, suitable binding-posts for including said last-mentioned springs in one or more circuits, and means for automatically releasing said last-mentioned springs upon the passage of excessive current through said circuit or circuits, the springs, when released, establishing connection with the ground through said stop.

11. In a protector set for electrical circuits, the combination of a suitable base, a metal plate mounted thereon and adapted to be connected with a grounded conductor, a pair of carbon blocks suitably held against said plate, a binding-post adapted to be connected with a line conductor, the carbon blocks being normally separated but adapted to come together and establish connection between the line and the grounded conductor through the medium of said plate, a quantitative protector mounted to form part of the line-circuit, a member which when released by said quantitative protector establishes connection between the line conductor and the said plate, a post rising from said base, and a dome-shaped glass cover held in place upon said base by a nut screwed onto the threaded upper end portion of said base.

12. In a protector set for electrical circuits, the combination of a quantitative protector, an intensity-protector, means whereby the quantitative protector when operated produces a break in the circuit, and means whereby either protector when operated establishes connection between the line and a grounded member.

707,051. SYSTEM OF STRONG-CURRENT PROTECTION. FRANK B. COOK, Chicago, Ill. Original application filed July 29, 1898, Serial No. 690,970. Divided and this application filed May 21, 1902. Serial No. 108,331. (No model.)



Claim.—1. In a system of protection for electrical circuits, the combination of a line-wire, a fuse hung on said wire, a pair of posts, a cylindric heat-coil removably mounted upon said posts, means for connecting the said fuse, heat-coil and posts in series between said line-wire and the instruments to be protected, an earth branch and carbon lightning-arrester connected at a point between the fuse and the heat-coil, and a grounded conductor connected with said lightning-arrester.

2. In a system of protection for electrical circuits, the combination of a line conductor, a fuse connected at one end with said line conductor, a pair of metal posts, a cylindric heat-coil device removably mounted upon the ends of said posts, one of said posts being flexible and held under tension by said heat-coil, means for connecting the said fuse, heat-coil and posts in series between the line conductor and the instruments to be protected, a grounded stop for limiting the movement of the said post which is held under tension, and a carbon lightning-arrester connecting said stop with the post under tension.

3. The combination of a line conductor, an insulator for supporting said line conductor, a fuse having its upper end clamped upon said line conductor, a line-spring connected with the lower end of said fuse, a post connected with the instruments to be protected, a heat-coil device connecting said post and spring and holding the latter under tension, a grounded stop for limiting the movement of said spring, and a carbon arrester connecting said stop with said spring.

4. In a protecting system, the combination of a line conductor, a fuse supported upon said line, a pair of metal strips, a heat-coil mounted upon the ends of said strips, one of said metal strips being bent to provide one jaw for holding a pair of carbon blocks, another jaw for holding said carbon blocks, said second jaw serving as a stop for limiting the movement of the portion of the strip supporting the heat-coil, a grounded conductor connected with said stop, suitable connection between the lower end of said fuse and the metal strip which partially supports both the heat-coil and the carbon blocks, and a conductor leading from the other metal strip to the instruments to be protected.

5. In a protecting system, the combination of a line conductor, insulators supporting said conductor, fuse-protectors clamped upon the line conductor adjacent the said insulators, a thermal protector connected up in series between one fuse and the instruments or electrical devices to be protected at one station, a heat-coil connected up in series between the other fuse and the instruments or electrical devices to be protected at the other station, and a signal at said last-named station adapted to be displayed upon the operation of said last-mentioned heat-coil.

6. In a protecting system, the combination of a plurality of line-circuits, a plurality of thermal protectors connected in said line-circuits and arranged in banks or sections, a visual indicator allotted to each bank or section, each indicator being adapted to display a signal when a thermal protector is operated, and a general signal connected and arranged to be operated by any one of the said visual signals.

7. A current-protective system for telephone, telegraph and other like stations, consisting of a plurality of circuit disrupting devices arranged in sections or banks, an indicating device for each section, the circuit of which is adapted to be established by any one of the disrupting devices when operated by excessive currents to point out the section in which the circuit is disrupted, and an alarm or indicator common to the whole station, the circuit of which is adapted to be established by any one of the indicators of the sections.

8. A current-protective system for telephone, telegraph and other like stations, consisting of a plurality of circuit-disrupting devices arranged in sections or banks, an indicating device for each section included in a local circuit, means for establishing the local circuit of a section when any line-circuit of that section is disrupted to operate the indicating device aforesaid, another local circuit including an indicator common to the whole station, and means for automatically establishing said latter local circuit.

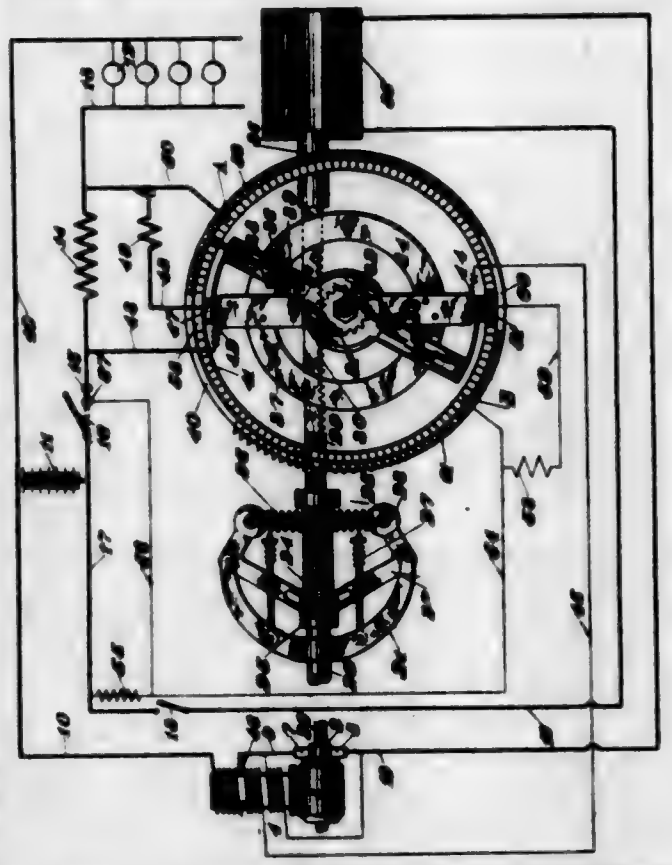
9. A current-protective system for telephone, telegraph and other like stations, consisting of a plurality of circuit-disrupting devices arranged in sections or banks, an indicating device for each section included in a local circuit for each indicating device, means for establishing the local circuit of a section when any line-circuit of that section is disrupted to operate the indicating device aforesaid, and another local circuit including the indicator common to the whole station, which latter circuit is established in the act of establishing any one of the former local circuits of the sections or banks.

10. A current-protective system for telephone, telegraph and other like stations consisting of a plurality of circuit-disrupting devices arranged in sections or banks, an indicating device for each section included in local circuits, means for establishing the local circuit of a section when any line-circuit of that section is disrupted to operate the indicating device aforesaid, and another local circuit including an indicator common to the whole station adapted to be established by any one of the indicating devices of the sections.

11. In a telephone or telegraph circuit protective system, a plurality of current-protectors arranged in sections, sets or banks, an indicating device for each of the said sets, sections or banks, and a local circuit including the said indicating device together with means for closing the local circuit upon the disruption of any circuit of a set, section or bank of protectors, whereby the indicating device is operated to point to that section, set or bank of protectors in which the circuit is severed, and another indicator in an independent circuit common to the exchange as a whole by which attention is directed to the fact that a circuit of some set, section or bank of protectors is disrupted.

12. A plurality of thermal protectors arranged in banks or sections, a plurality of visual indicators arranged in a bank, one for each bank or section of thermal protectors, and circuit connections whereby each indicator may be operated by any protector in its allotted bank or section.

707,052. REGULATION OF ELECTRIC-LIGHTING SYSTEMS. JOHN I. CRETELLIN, New York, N. Y. Filed July 17, 1901. Serial No. 68,550. (No model.)



Claim.—1. In a system of electrical distribution the combination of a generator, a mechanical governor or regulator therefor and electric means for compounding for the lag of the governor.

2. In a system of electrical distribution the combination of a generator, a mechanically-operating governor therefor and electrical means under the control of the governor for compounding for the lag thereof.

3. In a system of electrical distribution the combination of a generator and an external circuit, a mechanical governor for the generator and the external circuit, and means for compounding for the lag of the governor.

4. In a system of electrical distribution the combination of a generator, a mechanical governor, regulating the field resistance and the resistance of the external circuit and means for compounding for the lagging tendency of the governor.

5. In a system of electrical distribution the combination of a generator, a mechanical governor therefor, means for regulating the external circuit actuated from the governor and means for causing the variations of the governor and the regulating means to occur in harmony with each other.

6. In a system of electrical distribution the combination of a generator, a mechanical governor and regulating means for the field-circuit of the generator and for the external circuit and means for causing variations in the governor and in the regulating means to occur in harmony with each other substantially as described.

7. In a system of electrical distribution the combination of a centrifugal governor, electromagnetic means in circuit with the generator for aiding the said governor in its action and circuit-controlling means operated by the governor.

8. In a system of electrical distribution the combination of a mechanical governor, a plurality of means for controlling the field-circuit and the external circuit, means for operating one controlling means from the gov-

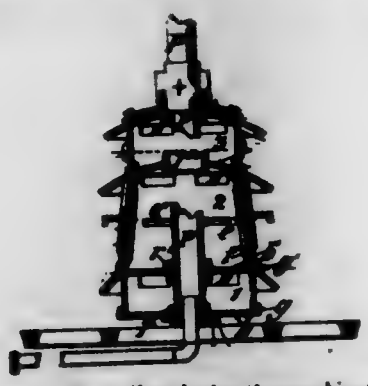
ernor and the other controlling means from the first-mentioned controlling means.

9. In a system of electrical distribution the combination of a generator, a centrifugal governor and means for controlling the external circuit and the field-circuit of a generator from the said governor, comprising in its structure means for so operating the circuit-controlling means as to compensate for the lagging tendency of the generator.

10. In a system of electrical distribution the combination of a generator, variable resistances for controlling the output of the generator, a mechanical governor for the generator and means for controlling the variable resistances from the governor and compensating for the lagging tendency of the governor.

11. In a system of electrical distribution the combination of a generator, variable resistances for controlling the output of the generator, and a governor therefor constructed and arranged to augment the strength of the field when delivering current to the lamps.

707,053. AIR-FEEDING DEVICE. WILLIAM D. DOUGLAS, Chicago, Ill. Filed Mar. 5, 1902. Serial No. 96,846. (No model.)



Claim.—1. In an air-feeding device, the combination with a casing having a plurality of openings in its walls, of an outwardly and downwardly projecting collar or piece located thereon above said openings, and a skeleton frame located on the lower portion of the casing, substantially as described.

2. In an air-feeding device, the combination with a casing having a plurality of openings in its walls, of an outwardly and downwardly projecting collar or piece located thereon above said openings, and a skeleton frame located on the lower portion of the casing, said frame comprising an inner and outer ring and a series of bars uniting said rings, substantially as described.

3. In an air-feeding device, the combination with a casing having a plurality of openings in its walls, and a number of openings in its top, of an apertured register movable on the top of the casing, and an outwardly and downwardly projecting collar or piece located on the casing above the openings in its walls, substantially as described.

4. In an air-feeding device, the combination with a casing having a plurality of openings in its walls and a number of openings in its top, of an apertured register movable on the top of the casing, an outwardly and downwardly projecting collar or piece located on the casing above the openings in the walls thereof, and a skeleton frame located on the bottom of the casing, said frame comprising an inner and outer ring and a series of bars uniting the same, substantially as described.

5. In an air-feeding device, the combination with a casing provided in its top with a number of openings and having in its walls a plurality of horizontal rows of openings, of an outwardly and downwardly projecting collar or piece located on the casing above each of its rows of openings, and an apertured register movable on the top of the casing, substantially as described.

6. In an air-feeding device, the combination with a casing having a plurality of horizontal rows of openings in its walls and a number of openings in its top, of an apertured register movable on the top of the casing, an outwardly and downwardly projecting collar or piece located on the casing above each of the rows of openings therein, a skeleton frame located on the bottom of the casing, a plurality of skeleton frames located within the casing between its bottom and top, each of said skeleton frames comprising an inner and outer ring and a series of bars uniting the same, substantially as described.

7. In an air-feeding device, the combination with a casing having a plurality of horizontal rows of openings in its walls and a number of openings in its top, of an apertured register movable on the top of the casing, and a downwardly and outwardly projecting collar or piece located on the casing above each of the rows of openings in the walls thereof, a pipe extending centrally and vertically through the casing and means to secure the casing thereon, substantially as described.

8. In an air-feeding device, the combination with a casing comprising a plurality of hollow sections, each provided with a plurality of openings arranged in a horizontal row, of an outwardly and downwardly projecting collar located on the casing above each of the rows of openings therein, a skeleton frame located on the bottom of the casing, and one or more skeleton frames located within the casing between its bottom and top, each of said skeleton frames comprising an inner and outer ring and a series of bars uniting the same, a pipe located in the inner rings of the skeleton frames and extending through the casing, and means to secure the casing on the pipe, substantially as described.

9. In an air-feeding device, the combination with a casing having a plurality of openings in its walls, of an outwardly and downwardly projecting collar or piece located thereon above said openings so as to shield the same, and a skeleton frame located on the lower portion of the casing, said frame comprising an inner and outer ring and a series of arched bars uniting said rings, substantially as described.

10. In an air-feeding device, the combination of a casing having a plurality of horizontal rows of openings in its walls, of an outwardly and downwardly projecting collar or piece located on the casing above each of the rows of openings therein so as to shield the same, a skeleton frame located on the bottom of the casing, a plurality of skeleton frames located within the casing between its bottom and top, the bottom skeleton frame comprising an inner and outer ring and a series of arched bars uniting the same, and the other skeleton frames each comprising an inner and outer ring, and a series of bars uniting the same, substantially as described.

11. In an air-feeding device, the combination with a grate, of a casing located thereabove and having a plurality of horizontal rows of openings in its walls and a number of openings in its top, of an apertured register movable on the top of the casing, an outwardly and downwardly projecting collar or piece located on the casing above each of the rows of openings therein, so as to shield said openings, a skeleton frame located on the bottom of the casing, a plurality of skeleton frames located within the casing between its bottom and top, each of said skeleton frames comprising an inner and outer ring and a series of bars uniting the same, a pipe located in the inner rings of the skeleton frames and extending through the casing, a feed-pipe communicating at one of its ends with the lower end of the first-named pipe, and a damper located in the feed-pipe, substantially as described.

707,054. FASTENER. WILLIAM B. H. DOWSE, Newton, Mass. Filed June 6, 1900. Serial No. 19,230. (No model.)

Claim.—1. A socket member of a snap-fastener comprising a cup having a perforated and rounded crown; and a stud-receiving cone having an annular flange, said casing being located within said cup with the imperforate material therebetween and held crimped between the cup and the edge of said flange, said cone having a stud-receiving chamber, the top of which is adapted to hold said material in close contact with the inner surface of said crown.

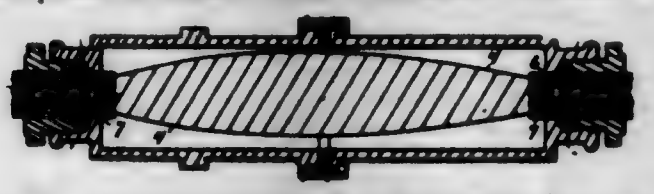
2. A socket member of a snap-fastener comprising a cup having a crown; and a stud-receiving cone lying within said cup with the material to which the member is attached lying between the cup and cone, said cone comprising a central stud-chamber, having a closed top, and a surrounding flange extending from the lower edge of the stud-chamber outward, the lower edge of the cup being turned inward under the flange of the cone and the confined flexible material, said top holding the material in close contact with the inner surface of the crown.

3. A socket member for a snap-fastener comprising a cup having a crown; and a stud-receiving cone lying within said cup with the material to which the member is attached lying between the cup and cone, said cone comprising a central stud-chamber having a closed top and a surrounding flange extending outward and upward from the lower edge of the stud-chamber, the lower edge of the cup being turned inward under the flange of the cone and the confined material, said top holding the material in close contact with the inner surface of the crown.

4. A socket member for a snap-fastener comprising a cup having a crown, said cup having its lower edge rolled and a stud-receiving cone lying within said cup with the material to which the member is attached lying between the cup and cone, said cone comprising a central stud-chamber having a closed top, and a surrounding flange extending outward and upward from the lower edge of the stud-chamber, the rolled edge of the cup being turned inward under the flange of the cone and the confined material, said top holding the material in close contact with the inner surface of the crown.

707,055. CABLE-SLEEVE. CHARLES M. EARL, Detroit, Mich., assignor of two-thirds to William J. Stapleton and Edward McBride, Detroit, Mich. Filed Dec. 6, 1901. Serial No. 84,886. (No model.)

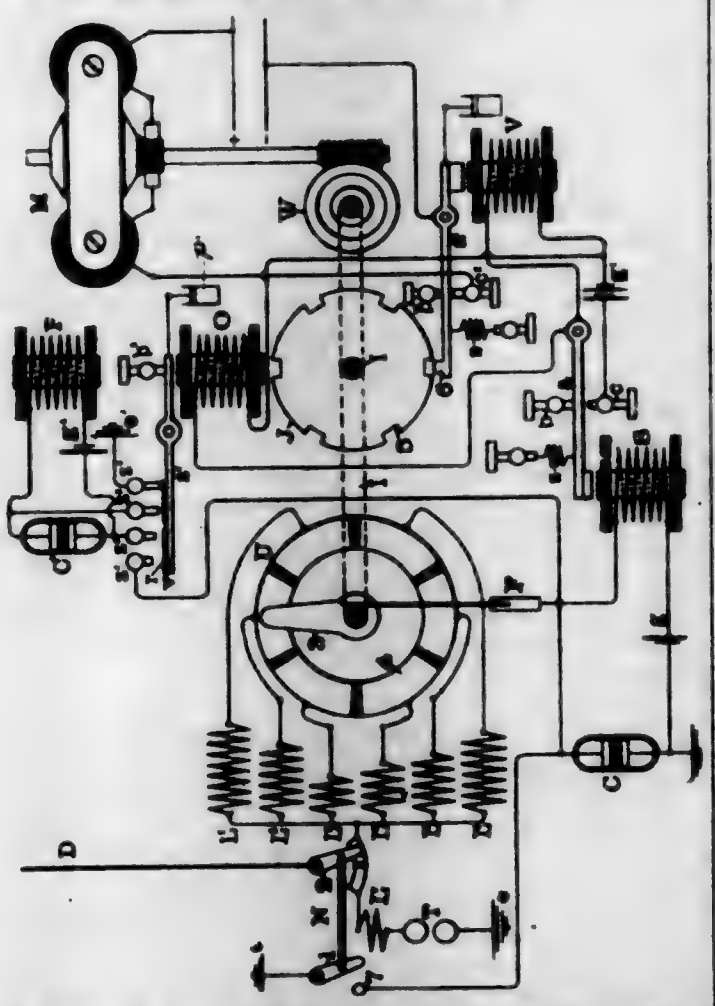
Claim.—1. In a cable-sleeve the combination of the separable members, means for uniting said members of the sleeve to form a water-tight joint, the ends of the sleeve having reduced apertures through which the cable runs, and means for closing said apertures around the casing of the cable to prevent the entrance of water to the interior of the sleeve.



2. In a cable-sleeve the combination of the separable sleeve members forming, when united, an inclosed chamber adapted to embrace the splice of a cable, means for joining the members of the sleeve in a manner to exclude water from said joint, the ends of the sleeve having reduced apertures communicating with said chamber, through which the cable is adapted to run, compressible washers surrounding the casing of the cable within said apertures, and the glands surrounding the cable adapted to screw into said apertures to compress said washers therein.

3. In a cable the combination of the separable members adapted to be united by a union-joint whereby they are detachably connected, the ends of the sleeve having reduced apertures through which the cable is adapted to run, stuffing-boxes around said apertures, compressible washers embracing the cable within said stuffing-boxes, the normal diameter of said washers being such as to enable them to slide freely over the cable, and the glands surrounding the cable screwing into said stuffing-boxes against said compressible washers.

707,056. AUTOMATIC SELECTIVE SYSTEM. CORNELIUS D. EHRET, Philadelphia, Pa., assignor, by direct and mesne assignments, to American Wireless Telephone and Telegraph Company, a Corporation of Arizona Territory, and the Consolidated Wireless Telegraph and Telephone Company, a Corporation of Arizona Territory. Filed Jan. 10, 1902. Serial No. 89,211. (No model.)



Claim.—1. In a signaling system, a plurality of frequency-determining elements, a sunflower, a frequency-determining element connected to each segment of the sunflower, means for rotating the trailer over the segments of said sunflower, and a wave-responsive device, in electrical communication with said trailer.

2. In a signaling system, a conductor influenced by energy transmitted through the natural media, a receiving device in communication with said conductor, and automatic means responsive to the received energy for locking the receiving device in position to receive a message from a desired station only.

3. In a signaling system the combination of a conductor for receiving the energy from the natural media, a pilot wave-responsive device and a main responsive device controlled by said pilot device.

4. In a signaling system, a conductor influenced by energy transmitted through the natural media, a plurality of elements for rendering the circuit of said receiving-conductor selective of energies of different frequencies, a receiving device controlled by the received energy, and means for locking the receiving mechanism in position to respond to energy of a desired and predetermined frequency.

5. In a signaling system, a conductor influenced by energy of a definite frequency transmitted through the natural media, a receiver controlled by such energy, and automatic means for locking said receiver in position to receive energy from a desired station only.

6. In a signaling system, a conductor influenced by energy of definite frequency transmitted through the natural media, a receiver controlled by such energy, and automatic means for locking said receiver in position to receive energy from a desired station only after the persistence of such energy for a definite interval of time.

7. In a wireless signaling system, the combination of a receiving-conductor, a pilot wave-responsive device, and a main responsive device brought into action by the pilot device.

8. In a wireless signaling system, the combination of a receiving-conductor, a pilot wave-responsive device, and a main wave-responsive device brought into action by the pilot device after the persistence of transmitted energy for a definite interval of time.

9. In a wireless signaling system, the combination of a receiving-conductor, a pilot wave-responsive device, and a main wave-responsive device brought into action by the pilot device after the persistence of a definite interval of time of transmitted energy of a definite frequency.

10. In a signaling system, a plurality of conductors, each selective of energy of definite frequency, a receiver, and means for maintaining the receiver in communication with a conductor during the persistence of energy of a frequency of which said conductor is selective.

11. In a signaling system, a plurality of conductors, each selective of energy of a definite frequency, a receiver, and automatic means for maintaining the receiver in communication with a conductor during the persistence of energy of a definite frequency of which said conductor is selective.

12. In a signaling system, a plurality of conductors each selective of energy of a definite frequency, a receiver, and means for locking the receiver in communication with a conductor during the persistence of energy of a frequency of which said conductor is selective.

13. In a signaling system, a plurality of conductors each selective of energy of definite frequency, a receiver, and automatic means for locking the receiver in communication with a conductor during the persistence of energy of a definite frequency of which said conductor is selective.

14. In a wireless signaling system, a plurality of conductors, a receiver, and automatic means for locking the receiver in communication with a certain conductor.

15. In a wireless signaling system, a plurality of conductors selective of energies of different frequencies, a receiver, and automatic means for locking the receiver in communication with a certain conductor.

16. In a wireless signaling system, a plurality of transmitting-stations, and automatic means for putting a receiver in communication with a certain station.

17. In a wireless signaling system, a plurality of transmitting-stations, each emitting a characteristic energy, and automatic means for putting a receiver in communication with a certain station.

18. In a wireless signaling system, a plurality of transmitting-stations, and automatic means for locking a receiver in communication with a certain station.

19. In a wireless signaling system, a plurality of transmitting-stations, each emitting a characteristic energy, and automatic means for locking a receiver in communication with a certain station.

20. In a wireless signaling system, a plurality of transmitting-stations, a receiver, a wave-responsive device and means controlled thereby for putting the receiver in communication with a certain station.

21. In a wireless signaling system, a plurality of transmitting-stations each emitting characteristic energy, a receiver, a wave-responsive device and means controlled thereby for putting a receiver in communication with a certain station.

22. In a wireless signaling system, a plurality of transmitting-stations, a receiver, a pilot wave-responsive device and means controlled thereby for putting the receiver in communication with a certain station.

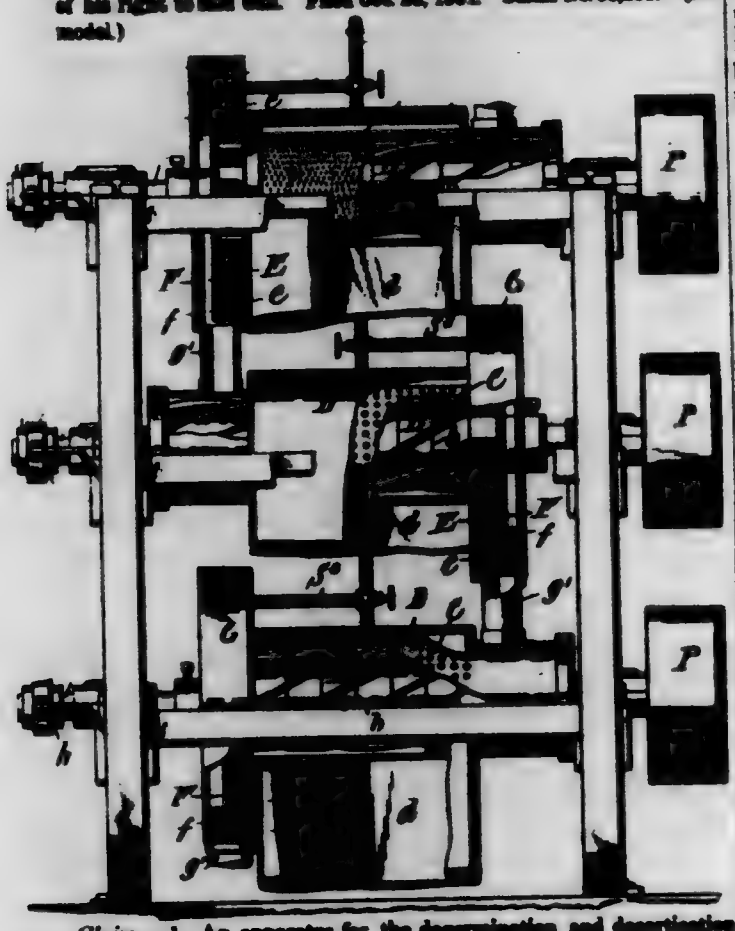
23. In a wireless signaling system, a plurality of transmitting-stations, each emitting characteristic energy, a receiver, a pilot wave-responsive device and means controlled thereby for putting the receiver in communication with a certain station.

24. In a wireless signaling system, a plurality of transmitting-stations, a pilot wave-responsive device, a main wave-responsive device, and

means controlled by the pilot device for putting the main wave-responsive device into communication with a certain station.

25. In a wireless signaling system, a plurality of transmitting-stations each emitting characteristic energy, a pilot wave-responsive device, a main wave-responsive device, and means controlled by the pilot device for putting the main wave-responsive device into communication with a certain station.

707,057. APPARATUS FOR THE DEGERMINATION AND DECORTICATION OF INDIAN CORN. THOMAS T. GAFF, Barnstable, Mass., and JOSEPH F. GUTZ, Indianapolis, Ind.; said Gutz assignor of one-third of his right to said Gaff. Filed Oct. 26, 1901. Serial No. 80,208. (No model.)



Claim.—1. An apparatus for the degermination and decortication of maize consisting of a plurality of breaking devices, through and out from which the grain will pass in uninterrupted flow, constructed and arranged to break or split the kernels into fragments of a size to insure the breaking away of the germ from the starch-bearing portions in contradistinction to grinding or comminuting the grain, and a plurality of screening devices arranged in alternating sequence with, and connected to, the breaking devices as described and adapted to separate out from the grain under treatment, such fragments of grain as are broken to the proper size, along with corresponding bits of germ and other bodies of the same or less size produced in the last preceding breaker before the grain enters the next succeeding breaker, substantially as and for the purposes hereinbefore set forth.

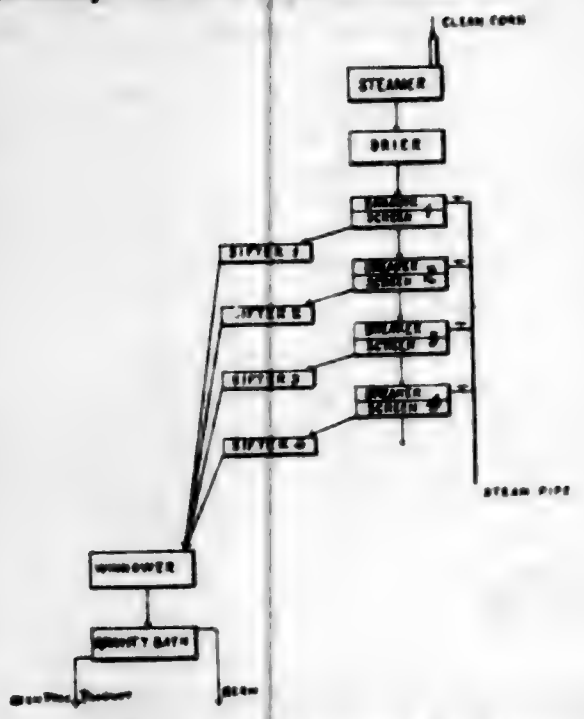
2. An apparatus for the degermination and decortication of maize, consisting of a connected series of breaking and screening devices arranged in alternating sequence, together with means for supplying moisture to the material under treatment at a number of points during its passage through the apparatus as and for the purposes hereinbefore set forth.

3. An apparatus for the degermination and decortication of maize consisting of a series of breaking and screening devices arranged in superposed pairs consisting each of a screening device and a breaking device having its inlet connected with one end of its own screening device and its outlet or discharge spout connected with the opposite end of the screening device of the pair next below, substantially as and for the purposes hereinbefore set forth.

4. An apparatus for the degermination and decortication of maize consisting of a connected series of breaking and screening devices arranged in alternating sequence, together with valve-controlled pipes which are connected with a suitable source of steam or water supply, and open into the interior of the breaking devices so as to supply moisture to the material there under treatment, substantially as and for the purposes hereinbefore set forth.

707,058. PROCESS OF DEGERMING MAIZE OR INDIAN CORN. THOMAS T. GAFF, Barnstable, Mass., and JOSEPH F. GUTZ, Indianapolis, Ind.; said Gutz assignor of one-third of his right to said Gaff. Filed Dec. 28, 1901. Serial No. 87,281. (No specimens.)

Claim.—1. In the treatment of maize or Indian corn for the production of hominy, flakes, grits and other products of corn-milling, the process of degerming the corn consisting in preliminarily moistening the corn to such an extent only as to toughen it without destroying the structural adhesion of the starch-cells and the glutinous principle of the grain; then subjecting the thus-moistened grain while moving in free and continuous flow to a succession of breaking or splitting operations whereby the kernels are broken into fragments of a size to insure the detaching of the germ from the starch-bearing portions, alternating with screening operations whereby after each breaking such fragments of grain as are broken to the proper size, along with corresponding bits of germ and other bodies, are separated out and carried off from the still-unreduced portion of the charge before the latter is subjected to the next succeeding breaking operation; and finally separating out and carrying off the thus-broken starch-bearing fragments or pieces from the germs and other lighter bodies, substantially as and for the purposes hereinbefore set forth.



2. In the treatment of maize or Indian corn for the production of hominy, flakes, grits and other products of corn-milling, the process herein described of degerming the corn consisting in preliminarily moistening the corn to such an extent only as to toughen it without destroying the structural adhesion of the starch-cells and the glutinous principle of the grain; thus subjecting the thus-moistened grain while moving in free and continuous flow to a succession of breaking or splitting operations whereby the kernels are broken into fragments of a proper size to insure the detaching of the germs from the starch-bearing portions, alternating with screening operations whereby after each breaking those fragments broken to a proper size are separated out and carried off from the still-unreduced portion of the charge before the latter is subjected to the next succeeding operation, and furnishing to the charge at various points in its movement during this series of operations, additional moisture, to maintain it in properly moist condition; and finally separating out and carrying off the thus-broken starch-bearing fragments from the germs and other lighter bodies intermingled therewith, substantially as and for the purposes hereinbefore set forth.

707,059. TREATMENT OF MAIZE FOR THE PRODUCTION OF GRITS, FLAKES, &c. THOMAS T. GAFF, Barnstable, Mass., and JOSEPH F. GUTZ, Indianapolis, Ind.; said Gutz assignor of one-third of his right to said Gaff. Filed Apr. 23, 1902. Serial No. 104,237. (No specimens.)

Claim.—1. The hereinbefore-described improvement in the treatment of Indian corn for the production of corn-milling products, consisting in coarsely breaking the corn, separating out the starchy portions as far as possible by sifting and winnowing, further comminuting the residual mass of mixed germ and starchy matter, subjecting the thus-comminuted residue to the action of a solvent whereby the oil is removed therefrom, purging the thus-deoiled residue from all traces of the solvent, separating out as far as possible by sifting and winnowing the starchy portions from the remainder of the thus-purified residue, adding to and mixing with the thus-separated-out starchy matter an agglutinating material, and finally moistening and rolling the thus-prepared mixture, substantially as set forth.

2. In the treatment of Indian corn for the production of corn-milling products, the process of making flaked corn from the comminuted residual mixture of starchy and oil-bearing material known as "feed" which consists in subjecting said residue to the action of a solvent to extract and remove the oil as far as possible therefrom, then purging the thus-deoiled

residue from all traces of the solvent, then separating out as far as possible the starchy particles from the remainder of the thus distilled and purified residue, then adding to and mixing with the thus-recovered starchy matter an agglutinating material, and finally moistening the thus-prepared mixture and rolling it into flakes, substantially as hereinbefore set forth.

707,060. FOLDING OR COLLAPSIBLE BATH-TUB. WILLIAM H. SAMBLE, Miamisburg, Ohio, assignor of one-half to David H. Allen, Miamisburg, Ohio. Filed Apr. 8, 1901. Serial No. 54,913. (No model.)

Claim.—1. A collapsible tub composed of a sheet of flexible material, rims of less length than the sides of the sheet secured to the sides respectively, the ends of the sheet projecting beyond the said rims forming fastening-flaps, detachable end pieces adapted to be secured to said fastening-flaps, and means for supporting said side rims and end pieces, whereby when the latter are brought against the ends of the former respectively, the sheet collapses into a tub without folds or creases, substantially as specified.

2. A collapsible bath-tub composed of a sheet of flexible material, rims of less length than the sides of the sheet secured thereto leaving the sheet projected beyond the ends of the rims forming a fastening-flap at each end, detachable end pieces adapted to be secured to said fastening end flaps, legs pivoted to said side rims and brackets on said legs for supporting said end pieces in juxtaposition to the ends of the side rims, when the tub is erected, whereby the sheet collapses into a tub, without creases or folds, the supporting structure being adapted to be knocked down into straight parallel lengths shorter than the length of the sheet so as to be wrapped therein without projecting ends, substantially as specified.

3. In a bath-tub of the class described, the combination of the sheet A, the sectional top rim composed of the rails B and C, the legs D attached to two opposite rim-sections and the clamping devices attached to the legs D and adapted when the legs D are in opened position to bind the sections of the rim together, substantially as specified.

4. A collapsible tub composed of a sheet of flexible material, rims of less length than the side of the sheet secured to the sides respectively, the ends of the sheet projecting beyond the said rim forming fastening-flaps, means for securing the fastening-flaps adjacent to the respective ends of the side rims and means for supporting the said side rims in erect position whereby when the said fastening-flaps are secured against the ends of the said side rims, the sheet collapses into a tub without folds or creases, substantially as described.

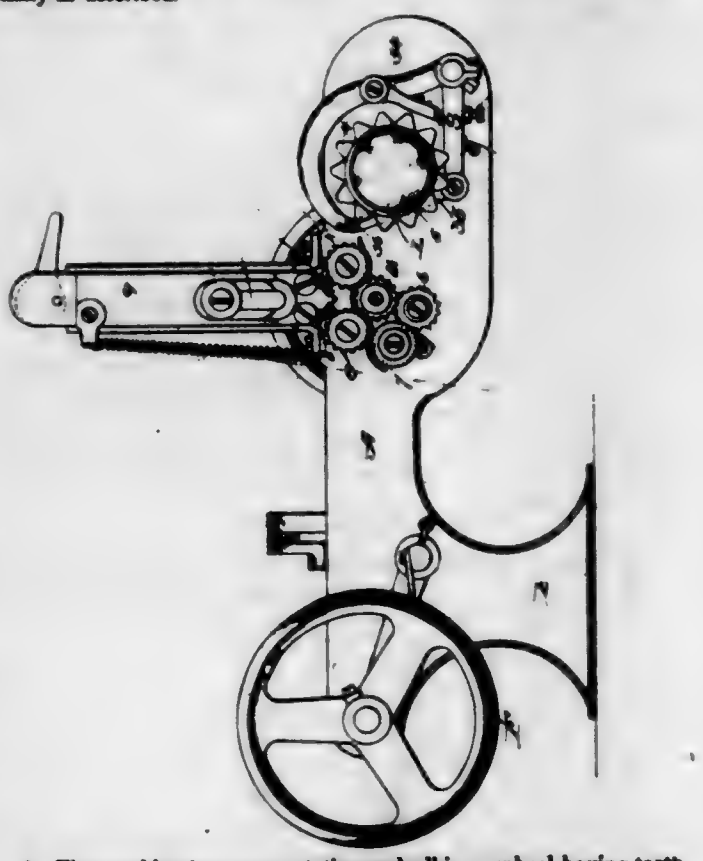
707,061. MACHINE FOR INSERTING TAPE INTO EDGING. EDWARD P. HAVEN, Lagrange, Ill., assignor, by mesne assignments, to himself, Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois, and Myron H. Powell, Muskegon, Mich. Filed Jan. 5, 1897. Renewed June 12, 1902. Serial No. 111,312. (No model.)

Claim.—1. A machine for automatically inserting tape into meshed edging comprising a rotatable support for the edging having teeth registering with the spaces between the bars of said edging, a bodkin to which the tape is attached, feeding devices, and means for positioning the cross or connecting bars of the edging alternately at opposite sides of the forward end of the bodkin; substantially as described.

2. A machine for automatically inserting tape into meshed edging comprising a supporting-wheel for the edging having projecting teeth extending upwardly between the cross-bars of said edging, a stationary bodkin carrying a tape, means for feeding the edging toward the bodkin, and means for positioning the cross-bars of the edging alternately above and below the forward end of the bodkin; substantially as described.

3. A machine for automatically inserting tape into meshed edging comprising a supporting-wheel having teeth extending through the meshes and fitting between the cross-bars of the edging, a stationary bodkin carrying a tape and means for positioning the cross-bars of the edging alternately above and below the forward end of the bodkin, and feeding-rolls centrally grooved for the reception of the bodkin and toothed to grasp the sides of the meshed edging and feed it onto the bodkin; substantially as described.

4. A machine for automatically inserting tape or the like into edging or other material comprising a supporting-wheel, a stationary bodkin arranged with its point adjacent the supporting-wheel, feeding-rolls for grasping the material after it is on the bodkin, and means located between the bodkin-point and the supporting-wheel for positioning the cross bars of the edging alternately above and below the bodkin-point; substantially as described.



5. The combination with a stationary bodkin, a wheel having teeth adapted to enter the meshes of edging, vibrating fingers for positioning cross or connecting bars forming the meshes of the edging alternately at opposite sides of the forward end of the bodkin, said vibrating fingers being located between the wheel and the forward end of the bodkin, means for feeding edging upon the bodkin comprising rollers located back of the point of the bodkin and adapted to grasp the material; substantially as described.

6. In an apparatus for inserting tape into meshed edging, a bodkin carrying a tape, a rotatory support for the edging, having teeth registering with the meshes in the edging and a vibrating member between the support for the edging and the bodkin-point whereby the cross-bars of the edging are alternately positioned above and below the bodkin-point; substantially as described.

7. In combination, a bodkin, a support therefor, and a rotatory support for meshed edging having teeth registering with the meshes in said edging, means for alternately positioning the cross-bars of the edging above and below the bodkin-point, and means for feeding the meshed edging onto the bodkin; substantially as described.

8. An apparatus for inserting tape into meshed edging comprising a stationary bodkin carrying a tape, a supporting device for delivering the edging to the bodkin which supporting device has means for engaging the meshes of the edging, and a vibrating member arranged between the support for the edging and the bodkin-point, which vibrating member alternately positions the cross-bars of the edging above and below the bodkin-point; substantially as described.

9. In a machine for inserting tape or the like into edging or other material, means for feeding the material, a bodkin carrying the tape, fingers located adjacent the point of the bodkin between which the edging or other material passes, a rock-shaft with means for oscillating it, an arm rigidly attached to said rock-shaft to which arm one of said fingers is secured, and a second arm to which the other finger is secured sleeved on the rock-shaft and held normally in engagement with the first arm, whereby it is operated with said first arm, the fingers being thereby raised and lowered; substantially as and for the purpose specified.

10. In a machine for inserting tape or the like into edging or other material, means for feeding the material, a bodkin carrying the tape, fingers located adjacent the point of the bodkin between which the edging or other material passes, a rock-shaft with means for oscillating it, an arm rigidly attached to said rock-shaft to which arm one of said fingers is secured, and a second arm to which the other finger is secured sleeved on the rock shaft, a spring normally holding said second arm in position to be positively raised by the upward movement of the lower arm and for lowering it as the lower arm is dropped, whereby the fingers carried by the arms are raised and lowered; substantially as and for the purpose specified.

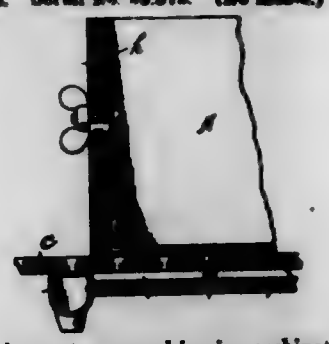
11. In a machine for inserting tape or the like into edging or other material, means for feeding the material, a bodkin carrying the tape, fingers located adjacent the point of the bodkin between which the edging

or other material passes, a rock-shaft with means for oscillating it, an arm rigidly attached to said rock-shaft to which arm one of said fingers is secured, and a second arm to which the other finger is secured sleeved on the rock-shaft, and having a projection or arm 24, a spring normally holding the projection 24 against the first arm whereby the arms and the fingers carried thereby are raised and lowered in unison; substantially as described.

12. In a machine of the character described, a bodkin, a supporting-wheel for meshed edging having vertically-projecting beveled teeth passing through the meshes of the edging and fitting between the cross-bars thereof, means for positioning the material alternately upon opposite sides of the forward end of the bodkin and feeding-rollers arranged above and below the bodkin and grooved to receive the same and adapted to feed the material onto the bodkin; substantially as described.

13. In a machine of the character described, a bodkin, a supporting-wheel for the meshed edging having projecting tapered teeth to fit between the bars of said edging, said teeth at their base being of width sufficient to snugly fit, or even slightly spread the cross-bars and means for positioning the material above and below the bodkin-point; substantially as described.

707,062. COUNTING-MACHINE. SOLOMON B. KEKEMIAH, Detroit, Mich., assignor to the Mors Capsule Company, Detroit, Mich. Filed Mar. 24, 1902. Serial No. 99,579. (No model.)



Claim.—1. A counter comprising in combination a hopper, a fixed base to said hopper, a slide arranged to slide under said hopper and above said fixed base, and provided with perforations, said fixed base provided with a serpentine groove, and a pin extending from said slide into said groove.

2. In a counter for small articles, the combination of a hopper with adjustable front and rib walls, a slide arranged to engage under the hopper and provided with a perforated and an imperforated section, and a raceway arranged to receive articles withdrawn from the hopper and dropping out from said perforations, substantially as described.

3. In a counter for small articles, the combination of a hopper, a slide arranged to slide under said hopper provided with a perforated section and an imperforate section and means for producing a lateral vibratory motion of the slide, substantially as described.

707,068. SPARK AND CINDER ARRESTER FOR LOCOMOTIVE SMOKE-STACKS. LOUIS C. LAUBERT, Denver, Colo. Filed Oct. 3, 1901. Serial No. 77,488. (No model.)

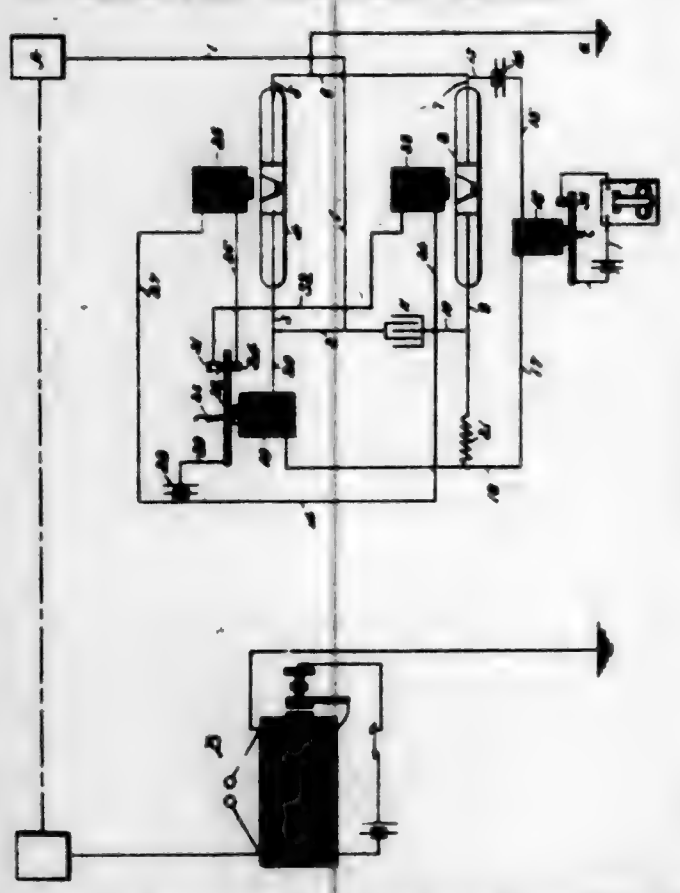
Claim.—1. The combination of a locomotive smoke-stack provided with cinder-escape openings at the bottom, a conduit leading downwardly therefrom on each side of the locomotive, a tube extending upwardly into the stack, the bottom of the tube having a flange extending outwardly forming the bottom for a chamber between the tube and the stack proper, and an arrester device located in the stack a suitable distance above the top of the tube, substantially as described.

2. The combination of a locomotive smoke-stack provided with cinder-escape openings at the bottom, a conduit leading downwardly therefrom on each side of the locomotive, a tube extending upwardly within the stack, the bottom of the tube having a flange extending outwardly forming the bottom of a chamber between the tube and the stack, an arrester device located in the stack a suitable distance above the top of the tube, an additional tube inserted in the stack above the arrester, said having an offset at its bottom partly closing a portion of the stack below and forming the bottom of a chamber between the last-named tube and the upper part of the stack, openings being formed around the lower portion of the upper part of the stack, a housing surrounding the stack and communicating at its lower extremity with the aforesaid downwardly-leading conduits, the top of the housing being closed around the stack above the openings in the bottom of the upper chamber, and a spark-arrester located in the stack above the upper tube.

3. The combination of a locomotive smoke-stack provided with cinder-escape openings at the bottom, a tube extending upwardly within the stack, the bottom of the tube having a flange extending outwardly forming the bottom of a chamber between the tube and the lower part of the stack, and an arrester device located in the stack a suitable distance above the top of the tube.

4. The combination of a locomotive smoke-stack provided with cinder-escape openings around its bottom, a tube extending upwardly within the stack, the bottom of the tube having a flange extending outwardly forming the bottom of a chamber between the tube and the lower part of the stack, the said tube receiving at the bottom the products of combustion from the furnace or fire-box, an arrester device located in the stack a suitable distance above the top of the tube, an additional tube inserted in the stack above the arrester and having an offset at its bottom partly closing a portion of the stack below, and forming the bottom of a chamber between the last-named tube and the upper part of the stack, openings around the lower portion of the upper part of the stack, a housing surrounding the stack and communicating with its outlet at the bottom, the top of the housing being closed around the stack above the outlet-openings of the upper chamber, substantially as described.

707,064. WIRELESS TELEGRAPHY. HARRY SHOEMAKER, Philadelphia, Pa., assignor of one-half to Gustave P. Gehring, Philadelphia, Pa. Filed June 1, 1901. Serial No. 62,717. (No model.)



Claim.—1. In a system of wireless telegraphy, a transmitting and a receiving apparatus; said receiving apparatus, consisting of a series of coherers in the same main circuit and in parallel, and a decohering device for each coherer, said decohering devices being dependent upon the action of the coherers, one being operated when the coherers conduct and the other when one of the coherers has been decohered.

2. A receiving apparatus for wireless telegraphy, comprising a series of imperfect electrical contacts, said contacts being in the same main circuit, a relay in said main circuit, a receiving-instrument circuit controlled by the relay, another relay in said main circuit and decohering devices adapted to be operated in succession as the last-mentioned relay is magnetized and demagnetized.

3. A receiving apparatus comprising air and ground plates, a series of coherers in parallel and in circuit therewith, a relay in circuit with the coherers, a sounder-circuit operated by said relay, another relay in the coherer-circuit, and decohering means for each coherer adapted to be operated in succession as the last-mentioned relay is magnetized and demagnetized.

4. A receiving apparatus comprising a series of coherers in parallel

and in the same main circuit, a decoherer for each coherer, separate circuits for each decoherer and a relay in said main circuit for operating said decoherers one at a time in succession as the said relay is magnetized and demagnetized.

5. A receiving apparatus, comprising a series of coherers, air and ground plates connected therewith, a main circuit embracing said coherers which are in parallel, a relay in said circuit, a sounder-circuit operated by said relay, another relay in said main circuit and a decoherer for each coherer adapted to be operated in succession as the last-mentioned relay is magnetized and demagnetized.

6. In a receiver, a plurality of wave-responsive devices, a relay controlled by said devices, two circuits controlled by said relay, each including a decohering device.

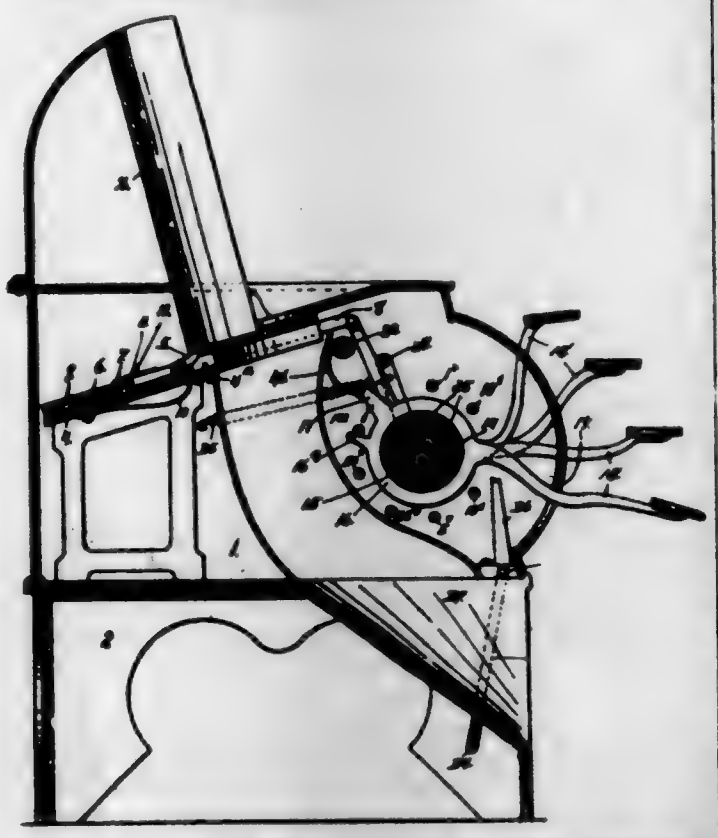
7. In a receiver, a plurality of wave-responsive devices, a relay controlled by said devices, a decoherer circuit operated upon the energization of said relay, and a decoherer-circuit closed upon the deënergization of said relay.

8. In a receiver, a plurality of wave-responsive devices, a relay controlled by one of said devices, a decohering device for the wave-responsive device controlling said relay, actuated upon the energization of said relay, and a decoherer-circuit closed upon the deënergization of said relay.

9. A plurality of wave-responsive devices, a recorder-relay controlled thereby, a second relay controlled by a portion of said wave-responsive devices, a decoherer actuated upon the energization of the second relay, and decohering means for the remaining wave-responsive devices actuated upon the restoration of said first-mentioned portion.

10. In a receiver, a plurality of wave-responsive devices connected in parallel, an automatic decoherer for a portion of said devices, and means operative upon the restoration of said portion of said devices to decohere the remaining wave-responsive devices.

707,065. COIN-DELIVERY DEVICE. JAMES M. BUCKLEY and WILLIAM G. HARVEY, Chicago, Ill., assignors to the American Automatic Change Maker Company, Little Rock, Ark. Filed Feb. 15, 1902. Serial No. 94,224. (No model.)



Claim.—1. In a coin-delivery device, the combination with a suitable casing, coin-holders and coin-displacing mechanism, of a suitable stationary support mounted in the casing, rings mounted to turn on said support and provided with keys passing through openings in the casing, and a suitable operative connection between the rings and the coin-displacing mechanism, substantially as described.

2. In a coin-delivery device, the combination with a suitable casing, coin-holders and coin-displacing mechanism, of a drum mounted in the casing, toothed rings mounted to turn on the drum and provided with keys passing through openings formed in the casing, and a suitable operative connection between the rings and the coin-displacing mechanism whereby the pressing of the keys actuates said mechanism, substantially as described.

3. In a device of the class described, the combination with a casing, coin-holders and coin-displacing mechanism, of a drum or shaft mounted in the casing, yieldingly-retained rings mounted to turn on said drum, and provided with keys passing through openings in the casing, and a suitable operative connection between the key-rings and the coin-displacing mechanism, whereby as the keys are pressed the said mechanism is actuated, substantially as described.

4. In a coin-delivery device, the combination with a suitable casing, coin-holders and coin-displacing mechanism, of a stationary shaft or drum mounted in the casing, rings mounted to turn on said drum, and provided with keys passing through openings formed in the casing, other rings also mounted to turn on the drum and connected with the coin-displacing devices, and an operative connection between the two sets of rings, whereby as the keys are operated, the coin-displacing mechanism is actuated, substantially as described.

5. In a device of the class described, the combination with a casing, coin-holders and coin-displacing mechanism, of a stationary shaft or drum mounted in the casing, rings mounted to turn on said drum and provided with keys protruding from the casing, other rings also mounted to turn on the drum, and connected with the coin-displacing devices, separating-washers fast on the drum between the rings, to prevent the movement of any ring by the frictional contact of an adjacent ring, and a suitable operative connection between a key-ring and one or more coin-displacing rings, whereby the operation of the key actuates the coin-displacing mechanism, substantially as described.

6. The combination with a casing, coin-holders, and coin-displacing devices, of a shaft or drum fast on the casing, rings mounted thereon, provided with one or more teeth or projections, and having keys protruding from the casing, other rings having teeth or projections, the last-named rings being also mounted to turn on the drum and connected with the coin-displacing devices, and rods mounted to oscillate on the drum and engaged by the projections of the two sets of rings from opposite sides, whereby as any key is operated and one or more rods actuated, the coin-displacing rings engaged by the said rods are also actuated.

7. The combination with a casing, coin-holders and coin-displacing mechanism, of a ring mounted to turn on the casing, provided with one or more projections, and a key projecting from the casing, other rings also mounted to turn in the casing and having projections, the last-named rings being connected with the coin-displacing devices, and rods mounted to oscillate in the casing and engaged by the projections of the key-rings and the coin-displacing rings, the projections of the key-rings, engaging the rods on the side opposite the projections of the other rings, substantially as described.

8. The combination with a casing, coin-holders and coin-displacing devices, of a ring movably mounted in the casing, provided with projections, and having a key protruding through an opening formed in the casing, rods mounted to oscillate in the casing and engaging the projections of the key-ring, other rings mounted in the casing and corresponding in number with the number of projections of the key-rings, each of the other rings being connected with coin-displacing mechanism and having a projection engaging a rod on the side opposite the projection of the key-ring, whereby as the latter is operated, all of the said coin-displacing rings will be actuated, substantially as described.

9. The combination with a casing, coin-holders and coin-displacing mechanism, of rings mounted to turn in the casing and provided with keys protruding from the casing, each ring having one or more projections, rods mounted to oscillate in the casing and engaged by the projections of the key-rings, other rings also mounted in the casing and provided with projections engaging the rods on the sides opposite the projections of the key-rings, the other rings having upwardly-projecting arms and links connecting the coin-displacing devices with said arms.

10. The combination with a casing and coin-holders, of coin-displacing dogs mounted to move forward in the plane of the lowermost coins of the coin-holders, and backward below the plane of said coins, rings mounted to turn in the casing and provided with keys projecting therefrom, other rings mounted to turn in the casing and provided with upwardly-projecting arms, a suitable connection between the said arms and the coin-displacing dogs, and a suitable connection between the key-rings and the other rings, whereby as the key-rings are operated the coin-displacing dogs are actuated.

11. In a device of the class described, the combination with a suitable casing and coin-holders, of dogs mounted to move forwardly in the plane of the lowermost coins, springs engaging said dogs from below, blocks with which the dogs are pivotally connected, pins projecting laterally from the blocks, rings mounted to turn in the casing and provided with upwardly-projecting arms, links connecting said arms with the pins, other rings mounted to turn in the casing and provided with protruding keys, and a suitable connection between the two sets of rings, whereby as the keys are operated the coin-displacing dogs are actuated, substantially as described.

12. The combination with a casing, coin-holders and coin-ejecting devices, of a drum made fast in the casing and provided with longitudinal

grooves, rock-shafts located in said grooves, rods occupying positions parallel with the shafts, arms connecting the shafts and the rods, rings surrounding the drum outside of the shafts, provided with projections engaging the rods, and having keys projecting from the casing, other rings mounted to turn on the drum, connected with the coin-displacing devices and having projections engaging the rods on the side opposite the projections of the key-rings.

13. The combination with a casing, coin-holders, coin-displacing devices and operating-keys protruding from the casing, of two sets of rings mounted to turn in the casing, one set of rings being connected with the coin-displacing devices, and the other set of rings with the keys, and a suitable connection between the two sets of rings, whereby as the keys are operated, the coin-displacing devices are actuated, substantially as described.

14. The combination with a casing, coin-holders and coin-ejecting devices, of rings mounted to turn in the casing and provided with projections, other rings mounted to turn in the casing and connected in operative relation with the key-rings and the coin-ejecting devices, whereby as the key-rings are actuated the other rings are operated to actuate the coin-ejecting devices, and suitable means for returning the coin-ejecting rings to their normal position after each coin-ejecting act.

15. The combination with a casing, coin-holders and coin-ejecting devices, of a stationary drum mounted in the casing, spring-actuated rings mounted to turn on said drum and provided with protruding keys, other rings mounted to turn on the drum and provided with upwardly-projecting arms connected with the coin-ejecting devices, a spring-held oscillating rod connected with the drum, and lying in the path of the upwardly-projecting arms of the coin-ejecting rings, whereby as soon as said rings are released, they are returned to their normal position by the spring-held rod, and a suitable operative connection between the key-rings and the coin-ejecting rings, substantially as described.

16. The combination with a casing, coin-holders and coin-displacing devices, of a drum fast on the casing, and provided with grooves, rock-shafts located in said grooves, rods parallel with the rock-shafts, arms connecting said rods with the shafts, spring-held rings having projections engaging said rods, and provided with keys protruding through openings formed in the casing, other rings also mounted to turn on the drum and provided with projections engaging the said rods on the side opposite the projections of the key-rings, the other rings having upwardly-projecting arms connected with the coin-displacing devices, and another rod lying in the path of said upwardly-projecting arms, crank-arms connecting a rock-shaft of the drum with the last-named rod, and a spring connected with said rod and with the casing, whereby the upwardly-projecting ring-arms and their connections are returned to their normal position after each coin-displacing act, substantially as described.

17. The combination with a casing, coin-holders and coin-displacing mechanism, of a device fast on the casing and provided with oscillating rods corresponding in number with the denominations of coins to be delivered by the machine, rings mounted on said drum and provided with keys protruding from the machine and provided at their free extremities with buttons upon which is indicated the amount of change to be delivered, other rings also mounted on the drum, connected with the coin-displacing mechanism and having projections engaging the rods on the side opposite from the projections of the key-rings, and means mounted on the drum, actuated by any key-ring, and adjustable at the will of the operator, for causing the operation of an additional rod when a key is operated, substantially as described.

18. The combination with a casing, coin-holders, and coin-displacing devices, and a coin-chute adapted to receive and discharge the displaced coins, of a drum fast on the casing and provided with grooves, rock-shafts located in said grooves, rods parallel with the rock-shafts, arms connecting said rods with the shafts, spring-held rings having projections engaging said rods, and provided with keys protruding through openings formed in the casing, other rings also mounted to turn on the drum and provided with projections engaging said rods on the side opposite the projections of the key-rings, the other rings having upwardly-projecting arms connected with the coin-displacing devices, another rod lying in the path of said upwardly-projecting arms, crank-arms connecting a rock-shaft of the drum with the last-named rod, a spring connected with said rod and with the casing, whereby the upwardly-projecting ring-arms and their connections are returned to their normal position after each coin-displacing act, a disk mounted to turn on one end of the drum, and provided with a projection lying in the path of the last named rod and engaging the same on the side opposite the upwardly-projecting arms of the rings, a plate slidably mounted on said disk and arranged to turn therewith, an additional rod, said plate being capable of adjustment to bring it into engagement with the additional rod, a spring normally holding the sliding plate in the inoperative position, and a lever having one arm projecting below the coin-chute, and the other arm arranged to engage the sliding plate for shifting the latter to the operative position, substantially as described.

19. The combination with a casing, and coin-holders, of a plate or platform located at the bottom of the coin-holders and forming a support for the stacks of coins, grooves formed in said platform, blocks slidably mounted in said grooves, dogs pivotally mounted in the blocks, a retaining-spring attached to the platform above the blocks, a spring attached to the lower surface of the platform and passing through an opening formed in the platform to engage the dog from below, the arrangement being such that when the dog is at its rearward limit of movement, the spring engages the dog in front of its pivot and holds its forward extremity in the plane of the lowermost coin of the stack, while when the dog has reached its forward limit of movement, the spring engages it in the rear of its pivot and throws its forward extremity downwardly below the lowermost coin, and suitable means for actuating the coin-displacing dog, substantially as described.

20. The combination with a casing, and coin-holders, of a platform located below the coin-holders and forming a support for the coin-stacks, grooves formed in the platform in line with the coin-holders, blocks slidable in said grooves, coin-displacing dogs pivoted in the blocks which are provided with recesses to receive them, retaining-plates attached to the platform above the blocks for holding the latter in place, the said plates being slotted to receive the dogs, the slots being enlarged at their rear extremities, the dogs being provided with cross-pieces at their rear extremities, adapted to pass through the enlarged part of the slot, and springs attached to the lower surface of the platform and engaging the dogs from below, the mechanism being constructed and arranged to operate, substantially as described.

707,066. UPRIGHT AUTOMATIC SWITCH-STAND. DAVID H FREEMAN, Denver, Colo., assignor of one-fourth to Arthur T. Hurt, Denver, Colo. Filed Mar. 13, 1899. Serial No. 708,868. (No model.)

Claim.—1. In an upright switch-stand construction the combination of the revolvable toggle-crank arranged to be rotated by hand, and suitably connected by a switch-rod to the switch-points, an upright main shaft secured to the toggle-crank, a jointed hand-lever secured to the shaft, and a semicircular flanged supporting-top provided with two diametrically opposite lever-locking slots with which the hand-lever is designed to register when in either completely-thrown position, thereby interlocking the toggle-crank against revolvable movement, the interlocking slots being in a plane at right angles to the line of switch-rod connection.

2. In an upright switch-stand construction, the combination with a revolvable, spring-actuated, flexible toggle-crank suitably connected with switch-points, adapted for automatic use and arranged to be rotated by hand, of a main shaft secured to said toggle-crank, a jointed hand-lever secured to the shaft and arranged to interlock the toggle-crank construction against revolvable movement when in position for automatic action, the hand-lever being interlocked to the supporting-standard in a plane at right angles to the line of automatic action of the toggle-crank.

3. In an upright switch-stand construction, the combination with a revolvable, spring-actuated, flexible toggle-crank suitably connected with switch-points, adapted for automatic use and also arranged to be rotated by hand, of an upright column or standard upon which the toggle-crank is mounted, said column having a flanged top provided with slots, an upright main shaft secured to the toggle-crank, and having free rotary and vertical sliding movement within said column, a retaining-spring mounted upon the main shaft between the toggle-crank and the supporting-top of the column, and a jointed hand-lever secured to the main shaft and arranged to interlock the main shaft and the flexible toggle-crank, when completely thrown and in position for automatic action, against revolvable movement, but to permit the free, vertical, sliding movement of the main shaft and the hand-lever during the automatic action.

4. The combination with the flexible toggle-crank, of an upright, hollow column, within and upon which said toggle-crank is mounted, said column having an opening in its top and an interior shoulder surrounding said opening, a sleeve located in said opening and adapted to protrude above the top of the column, said sleeve having a flange engaging the interior shoulder of the column, a shaft attached to one end member of the toggle-crank and protruding through said sleeve in which it is permitted both axial and rotary movement, a block K attached to the outer extremity of the shaft above the column, a hand-lever mounted on the block, and a spring interposed between a shoulder surrounding the lower extremity of the shaft, and the flanged sleeve near the top of the column, whereby the head-block K normally rests upon and forces said sleeve downwardly sufficiently to overcome the friction incident to the engagement of the flange of the sleeve with the top of the column during the turning of the toggle-crank and shaft by the use of the hand-lever.

5. In an upright switch-stand construction, the main supporting-standard, comprising an integral casting having the traverse base-flanges, the adjoining bored supporting-hanger, an upright cylindrical column with semicircular flanged covering, provided upon the periphery thereof with two diametrically opposite interlocking slots and upon the top thereof with suitably-disposed stops or lugs, and a raised, centrally-located bored seat and interior shoulder for supporting the main shaft, and signal-standard brackets for supporting a signal-standard shaft, one of which is provided with a semicircular locking-flange, substantially as described.

6. The combination with the upright hollow column having openings formed in its top and bottom, a flexible toggle-crank, a revolvable foot-block connected with one end member of the crank, said block engaging the opening in the base of the column, a revolvable sliding headpiece connected with the other end member of the toggle-crank, a suitable connection between the center member of the toggle-crank and the switch-point, a shaft secured to said headpiece and protruding through the opening in the top of the column, a spring surrounding the shaft and interposed between said headpiece and the top of the column, a hand-lever connected with the upper protruding extremity of said shaft and adapted to turn in a plane above the top of the column, which is provided with locking-slots for the engagement of the hand-lever.

7. In a switch-stand, the combination of an upright column, a revolvable toggle-crank arranged to be rotated by hand, a rod for connecting said crank with the switch-point, an upright main shaft secured to the toggle-crank, a jointed hand-lever secured to the upper protruding extremity of the shaft, and suitable means for locking the hand-lever to the column in a plane at right angles to the line of switch-rod connection when the toggle-crank is in either fully-thrown position.

8. In an upright automatic switch-stand construction, the combination of the main supporting-column, an upright main shaft, a hand-lever head-block, a revolvable, flexible, spring-retained toggle-crank, a constant high-tension retaining-spring interposed between the head-block and a stop on the column, and an elongated flanged sleeve, all constructed and arranged substantially as described.

707,067. TERRESTER-SCREEN. JOHN H. JOHNSON, Minden, Nebr. Filed July 16, 1900. Serial No. 23,767. (No model.)

Claim.—1. In a screen the combination of two relatively adjustable apertured plates arranged face to face, stringers arranged across the face of the upper one of said plates and extending longitudinally of the screen, stringers arranged under the lower one of said plates longitudinally of the screen and means for connecting said stringers together, substantially as set forth.

2. In a screen the combination of two apertured plates arranged face to face and being relatively adjustable, a plurality of stringers arranged at short intervals apart across the face of one of said plates and extending longitudinally of the screen, a plurality of stringers arranged at intervals across the face of the other of said plates and extending lengthwise of said first stringers, and means extending through said plates and connecting the stringers on one side thereof with the stringers on the other, substantially as set forth.

3. In a screen the combination of two relatively adjustable apertured plates arranged face to face, stringers secured under independently of and supporting the lower one of said plates, stringers arranged over the face of the upper one of said plates for holding it down and means connecting said second stringers with said first stringers and thereby holding said second stringers against movement with the upper one of said plates, substantially as set forth.

4. In a screen the combination of two relatively adjustable apertured plates, stringers arranged under the lower one of said plates, stringers extending over the upper one of said plates, cross-beams extending under and supporting said first stringers, and means supporting said cross-beams at intervals from said stringers, substantially as set forth.

5. In a screen the combination of two relatively adjustable screen-plates arranged face to face, stringers located across one of said plates, stringers arranged across the other of said plates and being fixed with relation to both of said plates, and connections passing through said plates and securing said stringers together, the adjustable one of said plates being movable longitudinally and transversely and having apertures for the passage of said connections of greater diameter than said connections in all directions whereby said adjustable plate may move transversely and longitudinally independently of said connections, substantially as set forth.

6. In a screen the combination of a screen proper, a plurality of stringers arranged at short intervals apart across one face of said screen and extending longitudinally of the screen, a plurality of stringers arranged at short intervals apart across the other face of said screen and extending lengthwise of said first stringers and means extending through said screen proper and connecting the stringers on one side thereof with the stringers on the other, substantially as set forth.

7. In a screen the combination of two apertured plates arranged face to face and being relatively adjustable, a plurality of stringers arranged at short intervals apart across the face of one of said plates and extending longitudinally of the screen, a plurality of stringers arranged at intervals across the face of the other of said plates and extending lengthwise of said first stringers, and means extending through said plates and connecting the stringers on one side thereof with the stringers on the other, substantially as set forth.

8. In a screen the combination of two apertured plates arranged face to face and being relatively adjustable transversely and longitudinally, a plurality of continuous stringers arranged across the face of one of said plates and extending longitudinally of the screen, and being fixed against movement with said plates, a plurality of stringers arranged across the face of the other of said plates, and means passing through said plates and securing said stringers together, substantially as set forth.

9. In a screen the combination of two apertured plates arranged face to face and being relatively adjustable transversely and longitudinally, a plurality of continuous stringers arranged across the face of one of said plates and extending longitudinally of the screen and being fixed against movement with said plates, a plurality of continuous stringers arranged across the face of the other of said plates and extending lengthwise of said first stringers and means passing through said plates and securing said stringers together, substantially as set forth.

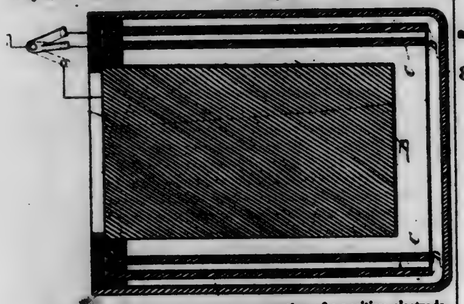
10. In a screen the combination of upper and lower apertured plates arranged face to face, stringers extending longitudinally of the screen and bearing upon the face of the upper one of said plates, stringers extending longitudinally of the screen and bearing against the face of the lower one of said plates, means passing through said plates and connecting said stringers together, cross-bars extending under said lower stringers and means passing through said plates and connecting said cross-bars with said upper stringers, substantially as set forth.

11. In a screen the combination of a screen proper having apertures therein, stringers extending longitudinally of said screen and bearing against the upper face thereof, stringers extending lengthwise of said first stringers and bearing against the lower face of said screen proper, said stringers being located to one side of or between the apertures of said screen proper, means passing through the apertures of said screen proper and connecting said stringers together, cross-bars arranged under and supporting said lower stringers and connections passing through the apertures of the screen proper and secured at their upper and lower ends to said upper stringers and cross-bars respectively, substantially as set forth.

REISSUES.

12,019. ELECTROCHEMICAL GENERATOR. HARRY S. ASWARD, Camden, N. J., assignor to Charles H. Graham and George B. Burton, Philadelphia, Pa. Filed July 16, 1902. Serial No. 115,594. Original No. 702,709, dated June 17, 1902.

Claim.—1. An electrochemical generator consisting of a single fluid-cell, provided with a positive electrode and a negative fixed electrode, an electrolyte, and a current-conducting baffle-partition in said electrolyte, between said electrodes and normally insulated therefrom.



2. An electrochemical generator, consisting of a positive electrode, a negative fixed electrode, an electrolyte, an electric-current-conducting baffle-partition normally insulated from said electrodes and means for making said baffle-partition part of either of said electrodes to set therewith.

3. An electrochemical generator consisting of a single fluid-cell having positive and negative electrodes and a current-conveyer of high conducting or current-carrying capacity interposed as a modifier, screen or baffle between the positive and negative electrodes and adapted to control the rate of change of position of the electrolyte attacking the electrodes most to be acted upon without interfering with the current-flow between the electrodes in the case.

4. An electrochemical generator consisting of a single fluid-cell provided with a positive electrode and a negative fixed electrode, an electrolyte and a current-conducting baffle-partition in said electrolyte between said electrodes and normally insulated therefrom, providing means for causing a higher temperature of the electrolyte between the largest areas of the baffle-partition and the positive electrode and lower temperature between the smallest areas opposed.

5. An electrochemical generator consisting of a single fluid-cell, a positive electrode, a negative electrode, an electrolyte, and a current-conducting baffle, normally insulated from the electrodes, which baffle is in the electrolyte and surrounds one of the electrodes.

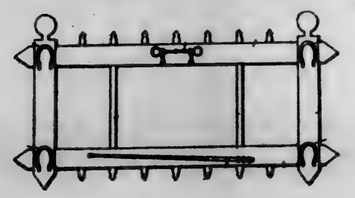
6. An electrochemical generator consisting of a single fluid-cell, a positive electrode, a negative electrode, an electrolyte, and a current-conducting baffle, in the electrolyte, which baffle surrounds one of the electrodes, is open at the bottom, and is normally insulated from the electrodes, substantially as described.

DESIGNS.

35,991. PENDENT PIN. GERRIT G. VAN RENSS, Philadelphia, Pa., assignor to J. E. Caldwell & Company, Philadelphia, Pa. Filed Dec. 14, 1901. Serial No. 85,982. Term of patent 14 years.

Claim.—The ornamental design for a pin as herein described and as illustrated in the accompanying drawings.

35,992. PICTURE-FRAME. ISAAC H. GOULD, Philadelphia, Pa. Filed Feb. 21, 1902. Serial No. 96,194. Term of patent 3½ years.



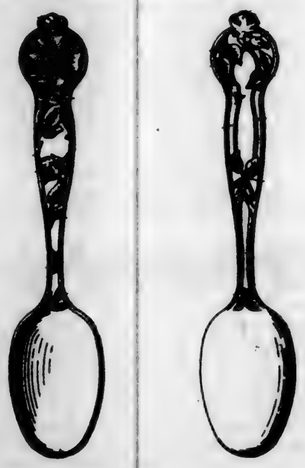
35,992.

Claim.—The ornamental design for a picture-frame, as herein shown and described.

35,993. BACK FOR MIRRORS, BRUSHES, OR SIMILAR ARTICLES. WALTER THORN, Arlington, N. J., assignor to Evans H. Eastwood, Charles W. Park, and Edward Hakins, copartners trading as Eastwood and Park, Newark, N. J. Filed June 24, 1902. Serial No. 113,041. Term of patent 7 years.

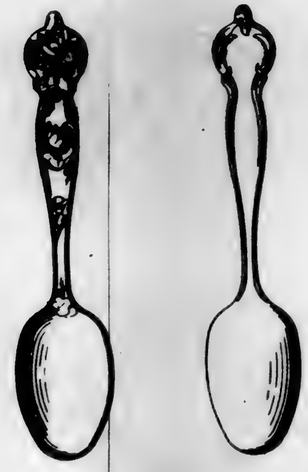
Claim.—The ornamental design for a back for mirrors, brushes or similar articles, substantially as herein shown and described.

35,994. HANDLE FOR SPOONS OR SIMILAR ARTICLES. ISSACHAR GREEN and CHARLES S. COREY, Providence, R. I., assignors to the Watson and Howell Company, a Corporation of Rhode Island. Filed June 20, 1902. Serial No. 113,562. Term of patent 7 years.



Claim.—The ornamental design for the handle of a spoon or similar article, as herein shown and described.

35,995. HANDLE FOR SPOONS OR SIMILAR ARTICLES. ISSACHAR GREEN and CHARLES S. COREY, Providence, R. I., assignors to the Watson and Howell Company, a Corporation of Rhode Island. Filed June 20, 1902. Serial No. 112,564. Term of patent 7 years.



Claim.—The ornamental design for the handle of a spoon or similar article, as herein shown and described

35,996. HANDLE FOR SPOONS OR SIMILAR ARTICLES. ISSACHAR GREEN and CHARLES S. COREY, Providence, R. I., assignors to the Watson and Howell Company, a Corporation of Rhode Island. Filed June 20, 1902. Serial No. 113,565. Term of patent 7 years.

Claim.—The ornamental design for the handle of a spoon or similar article, as herein shown and described.

35,997. HANDLE FOR SPOONS OR SIMILAR ARTICLES. WILLIAM F. MARSHALL, North Attleboro, Mass., assignor to Henry H. Curtis, North Attleboro, Mass. Filed June 23, 1902. Serial No. 113,999. Term of patent 7 years.

Claim.—The ornamental design for the handle of a spoon, or similar article, as herein shown and described.

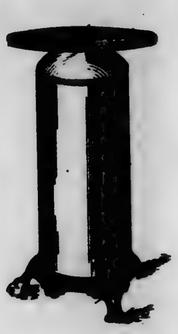
35,998. METAL ORNAMENT FOR SILVER OR PLATED WARE. SETH WILLIAM BARRETT, Meriden, Conn. Filed June 30, 1902. Serial No. 113,873. Term of patent 3½ years.

Claim.—The ornamental design for a metal ornament for silver and plated ware as herein shown and described.

35,999. SKIRT-HOLDER PLATE. LAGE WERTHEIMER, New York, N. Y. Filed Mar. 28, 1902. Serial No. 100,483. Term of patent 3½ years.

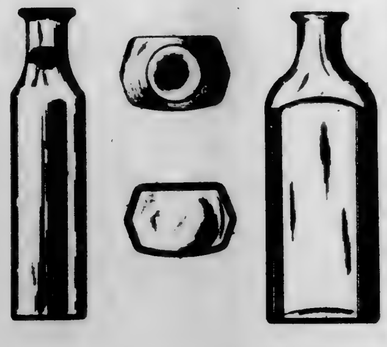
Claim.—The ornamental design for a skirt-holder plate, substantially as herein shown and described.

36,000. NEBULIZER-SUPPORT. WILLIAM BOEKEL and JULIUS BOEKEL, Philadelphia, Pa. Filed Apr. 12, 1902. Serial No. 102,653. Term of patent 14 years.



Claim.—The ornamental design for a nebulizer-support as herein shown and described.

36,001. PRESCRIPTION-BOTTLE. HENRY FOEHRY, East St. Louis, Ill., assignor to Obear-Nester Glass Company, a Corporation of Missouri. Filed May 10, 1902. Serial No. 106,841. Term of patent 14 years.

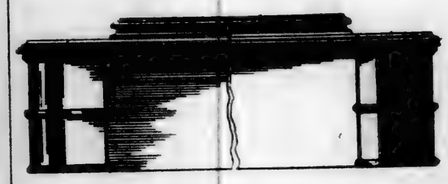


Claim.—The ornamental design for a prescription-bottle, as herein shown and described.

36,002. LAMP OR CANDLE SHADE. BERTHA STRASBURGER, New York, N. Y. Filed June 26, 1902. Serial No. 113,281. Term of patent 3½ years.

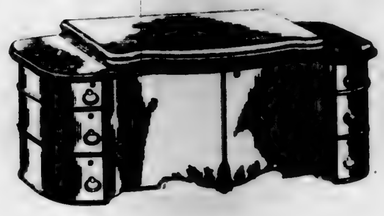
Claim.—The ornamental design for a lamp or candle shade, as herein shown and described.

36,003. SEWING-MACHINE TABLE. HERBERT J. ABRAHAM, Rockford, Ill. Filed June 23, 1902. Serial No. 112,940. Term of patent 3½ years.



Claim.—The ornamental design for a sewing-machine table herein shown and described.

36,004. SEWING-MACHINE TABLE. FRANK G. ROSLAND, Chicago, Ill., assignor to Illinois Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed July 10, 1902. Serial No. 115,101. Term of patent 7 years.



Claim.—The ornamental design for a sewing-machine table herein shown and described.

36,005. SCHOOL-DESK CASTING. MICHAEL A. DONOHUE, Jr., Chicago, Ill. Filed May 23, 1902. Serial No. 108,008. Term of patent 7 years.

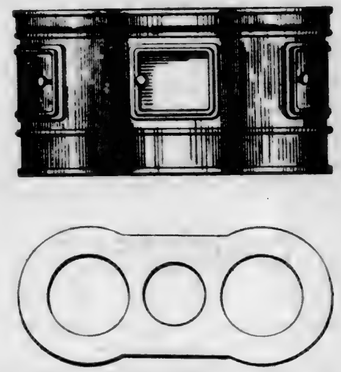
Claim.—The ornamental design for a school-desk casting, substantially as herein shown and described.

36,006. RANGE. RICHARD H. WHITEFIELD, Easton, Ohio. Filed June 6, 1902. Serial No. 110,556. Term of patent 3½ years.

36,006

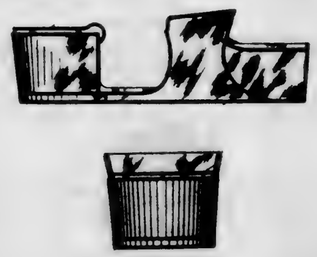
Claim.—The ornamental design for a range, as herein shown and described.

36,007. STOVE. HENRY D. PERRY, Niagara Falls, N. Y. Filed June 10, 1902. Serial No. 111,075. Term of patent 14 years.



Claim.—The ornamental design for a stove, as herein shown and described.

36,008. AUTOMOBILE-BODY. CLOVIS M. TAYLOR, Columbus, Ohio. Filed June 23, 1902. Serial No. 112,927. Term of patent 14 years.



Claim.—The ornamental design for an automobile-body as herein shown and described.

TRADE-MARKS

REGISTERED AUGUST 12, 1902.

88,742. GLOVES. James McCreery & Co., New York, N. Y. Filed May 28, 1902.

LA ZARRE

The words "La Zarre." Used since November 6, 1901.

88,743. SUSPENDER-BELTS. Alfred J. Koch, New York, N. Y. Filed June 4, 1902.

MILITARY FORM

The words "Military Form." Used since January 14, 1902.

88,744. CERTAIN NAMED RAWHIDE GOODS. A. & G. W. Hathaway, Providence, R. I. Filed June 27, 1902.

CRUDEPELT

The word "Crudepelt." Used since January, 1893.

88,745. RUBBER BELTING, RUBBER HOSE, AND RUBBER PACKING. The Consolidated Rubber Co., Cleveland, Ohio. Filed May 31, 1902.

EUCLID

The word "Euclid." Used since October 23, 1900.

88,746. CAKE TOILET SOAP. Frank M. Collins, Los Angeles, Cal. Filed June 23, 1902.

The representation of a branch of a lemon-tree, with lemons, leaves, and blossoms thereon. Used since August 3, 1901.

88,747. THROAT-PASTILS. William Alfred Josse, West Kirby, England. Filed June 2, 1902.

THROATLETS

The word "Throatlets." Used since September 27, 1901.

88,748. REMEDY FOR TUBERCULOSIS. Dwight A. Harrison, Kalamazoo, Mich. Filed July 14, 1902.

TUBERBACILINE.

The word "Tuberbacilixe." Used since March 17, 1902.

88,749. CERTAIN NAMED MEDICAL COMPOUNDS. Edward T. Richards, Chicago, Ill. Filed May 20, 1902.

PINEOLES

The word "Pixoles." Used since 1892.

88,750. LIQUID MEDICINE FOR BLOOD DISEASES. James Le Roux, Toledo, Ohio. Filed June 7, 1902.

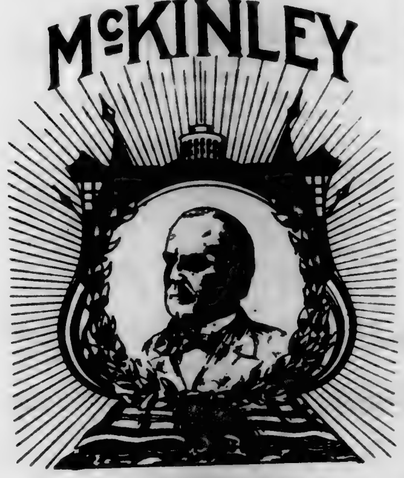
The representation of two angels on either side of a curved tube emanating from a heart and connecting with a retort, one end of the tube extending to the mouth of one angel, who is shown as pouring medicine from a bottle, the opposite end of the tube being grasped by the other angel, who is shown as dispensing a liquid flowing therefrom into a receptacle, the retort at the bottom of the circle being represented as catching the impurities which issue from the blood. Used since July 30, 1900.

88,751. BLOOD AND LIVER TONIC. William Jessoph, St. Louis, Mo. Filed Oct. 30, 1901.

Ton-Ka-Wah,

The hyphenated word "Ton-ka-wah" and a portrait of the registrant. Used since May 1, 1900.

88,752. TONIC MEDICINE. McKinley Tonic Medicine Company, Columbus, Ohio. Filed Oct. 14, 1901.



The name "McKinley," associated with a portrait of the late William McKinley, said portrait being arranged in the center of an ornamental border consisting of a wreath, draped flags, radiating rays, and the representation of the dome of the State Capitol building at Columbus, Ohio. Used since October 1, 1901.

88,753. REMEDIES FOR RHEUMATISM AND OTHER SIMILAR INFLAMMATORY DISEASES. Kadelina A. Hardwat, New York, N. Y. Filed June 18, 1902.

The words "Great Eastern," associated with the pictorial representation of a star, an anchor, a bottle, and a jar. Used since June 14 1902.

88,754. REMEDY FOR PILES AND OTHER RECTAL DISEASES. Volney C. Stoddard, Denver, Colo. Filed Apr. 19, 1902.

Three superimposed figures—namely, a pentagon, a triangle, and a quadrilateral having one reentering angle—the pentagon being at the bottom and the quadrilateral at the top, the uppermost figure having the word "INO" in its upper central field and the individual letters "INO" arranged at its respective corners, each being surrounded by concentric circles. Used since April 1, 1902.

88,755. OINTMENT FOR TREATING RECTAL AND SKIN DISEASES. George B. Ainsworth, St. Paul, Minn. Filed May 23, 1902.

The words "The President," and below the same the representation of a hand holding a tube from which is being discharged a stream of ointment, the cap of the tube lying adjacent. Used since May 16, 1902.

88,756. MEDICAL COMPOUNDS USED FOR SKIN DISEASES. J. D. McCabe Company, Hornellsville, N. Y. Filed Feb. 18, 1902.

HOKARA

The word "Hokara." Used since January, 1900.

88,757. DANDRUFF CURE. Reginald Platt, Silver City, N. Mex. Filed Apr. 14, 1902.

Micro-Nit

The hyphenated word "Micro-Nit." Used since December 1, 1901.

88,758. REMEDY FOR TREATMENT OF THE HAIR AND SCALP. The Altheimer Medical Dispensary, Cincinnati, Ohio. Filed May 13, 1902.

PosoFoam

The words "Poso Foam." Used since January 1, 1885.

88,759. REMEDY FOR THE HAIR AND SCALP. The Altheimer Medical Dispensary, Cincinnati, Ohio. Filed May 12, 1902.

FOSO

The word "Foso." Used since January 1, 1885.

88,760. REMEDIAL PASTE FOR BURNS, SCALDS, WOUNDS, AND RUNNING SORES. Sanders & Rice Sisters, Chicago, Ill. Filed Nov. 7, 1900.

The representation of a Greek cross having flames situated in the angles between its transverse members. Used since October 12, 1899.

88,761. ANTISEPTIC DETERGENT DISINFECTANT. Puroline Chemical Company, Boston, Mass. Filed July 14, 1902.

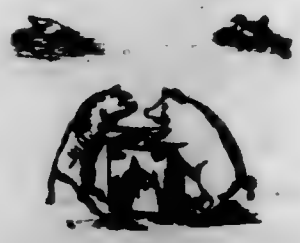
PUROLINE

The word "Puroline." Used since June 20, 1902.

88,762. REMEDIES FOR SPAVIN, RINGBONES, SPLINTS, AND CURBS. Charles A. Silver, Rosemont, N. H. Filed July 8, 1902.

A portrait of the registrant. Used since January 1, 1896.

88,763. VETERINARY REMEDIES FOR CHOLERA. The Bowell & Bircher Manufacturing Company, Rolling Prairie, Ind. Filed May 15, 1902.



The representation of two pigs, one thin and ill-conditioned and the other fat and sleek, standing erect on opposite sides of a box-support bearing the registrant's present trade-mark, each pig resting one forefoot on the box and advancing the other to touch that of the other pig, and two hens, one small and thin, sitting with drooping wings on a nest, and the other large and plump on a nest overflowing with eggs. Used since March 18, 1902.

88,764. DYEING AND TANNING ASSISTANT. Wilhelm Behrens, New York, N. Y. Filed July 15, 1902.

VEGETALIN

The word "Vegetalin." Used since January 1, 1902.

88,765. FIREPROOF PAINT OR COATING. Chicago Fire Proof Covering Co., Chicago, Ill. Filed June 2, 1902.

ANTI-FLAME

The hyphenated word "Anti-Flame." Used since September 1, 1895

88,766. FIRE-EXTINGUISHER IN POWDER FORM. William H. Scott, Reading, Pa. Filed June 19, 1902.

The word "Pyrex" arranged on the representation of a hollow triangle. Used since January, 1902.

88,767. POLISH FOR METALS. Charles M. Kimball, Winthrop, Mass. Filed Apr. 18, 1902.

A fanciful monogram of the letters "C M K" inclosed in an ellipse. Used since 1896.

88,768. CRACKERS, BREAD, CAKES, AND PUDDINGS AND PIES. Epicure Baking Co., Detroit, Mich. Filed Jan. 24, 1902.

EPICURE

The word "Epicure." Used since February 19, 1901.

88,769. FRUIT-KING CHOCOLATE, CANDIES AND ICE-CREAM, AND RED COLOR. THE GLEN-ARMSTRONG CO., Chicago, Ill. Filed May 10, 1902.

The initial letters "G A C" of the registrant company's name, said letters being arranged in the order named in two intersecting series, with the intermediate letter "A" common to both series and disposed on a background of solid color and in the form of a Maltese cross, the intermediate common letter "A" being at the center of the intersection of the arms of the cross and the terminal letters "G" and "C" of the intersecting series being disposed, respectively, upon the arms of the cross. Used since March, 1902.

88,770. CANDIES, CHOCOLATE, AND PREPARATIONS OF CHOCOLATE AND COCOAS. ZIER, SUCHARD AND COMPANY, Neuchâtel, Switzerland. Filed June 24, 1902.

MILKA

The word "MILKA." Used since January 1, 1901.

88,771. DRIED AND EVAPORATED FRUITS AND VEGETABLES. LOUIS BERN, Dansville, N. Y. Filed May 17, 1902.

APELPI

The word "APELPI." Used since May 1, 1902.

88,772. SODA-WATER AND COMPOUNDS AND EXTRACTS FOR FLAVORING SAME. HANCE BROS. & WHITE, Philadelphia, Pa. Filed June 21, 1902.

PING PONG PUNCH

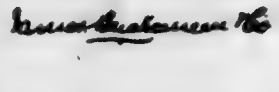
The words "PING PONG PUNCH." Used since February 1, 1902.

88,773. LAGER-BEER. JOS. SCHLITZ BREWING COMPANY, Milwaukee, Wis. Filed Apr. 11, 1902.

ATLAS

The word "ATLAS." Used since March 1, 1896.

88,774. WHISKY. JAMES BUCHANAN, London, England, and Glasgow, Leith, and Glenlivet, Scotland. Filed Jan. 27, 1902.



The facsimile signature of the firm-name "JAMES BUCHANAN & Co.," as written by the registrant. Used since June, 1893.

88,775. GIN. JAN HENDRIK HEIJER, Rotterdam, Netherlands. Filed Apr. 23, 1902.

The representation of a corn-flower (*Centaurea*) and the representation of two circular disks or plates, one having thereon a picture of a group of persons and representing one of said persons conferring an award upon some of the others and the other disk having upon it the representation of a wreath. Used since July 1, 1899.

88,776. CIGARS, CHEROOTS, AND CIGARETTES. MARKS BLASHOWER, San Francisco, Cal. Filed July 8, 1902.

The words "LORDS OF ENGLAND" and the pictorial representation of the House of Lords of England in session and a helmet and breastplate. Used since May 1, 1902.

88,777. SCHOOL-DESKS, SCHOOL-SEATS, AND OPERA-CHAIRS. SHERIDAN MANUFACTURING COMPANY, Chicago, Ill. Filed May 19, 1902.

A monogram of the letters "S M Co" inclosed in a circle. Used since May 1, 1902.

88,778. MACHINERY FOR PURIFYING AND SOFTENING WATER. WM. B. SCAIFE & SONS CO., Camden, N. J., and Pittsburg, Pa. Filed June 26, 1902.

38,778.

WE-FU-GO.

The hyphenated word "We-Fu-Go." Used since January 1, 1900.

38,779. INCANDESCENT ELECTRIC LAMPS. Bohemia Electric Co., Cleveland, Ohio. Filed Mar. 11, 1902.

The pictorial representation of the head of a buck inclosed within a circular band, over and beyond which the antlers extend. Used since December, 1901.

38,780. INCANDESCENT ELECTRIC LAMPS. The Columbia Incandescent Lamp Co., St. Louis, Mo. Filed Apr. 30, 1902.

The symbol "W. C. P." surrounded by the letter "C," which is made to form about three-fourths of a circle. Used since April 17, 1901.

38,781. INCANDESCENT ELECTRIC LAMPS. Peerless Incandescent Lamp Co., Cleveland, Ohio. Filed Mar. 11, 1902.

The monogram "F I L" inclosed within the letter "C," which is made to form about three-fourths of a circle. Used since December, 1901.

38,782. INCANDESCENT ELECTRIC LAMPS. Sherman Inc. Lamp Co., New York, N. Y. Filed Mar. 11, 1902.

A head of the shape of the letter "S," back of the middle portion of which and partly covered thereby is the pictorial representation of the sun with beams radiating therefrom. Used since December, 1901.

38,783. ICE-CREAM FREEZERS. Dana & Co., Cincinnati, Ohio. Filed June 2, 1902.

QUEEN

The word "Queen." Used since 1899.

38,784. COOKING STOVES AND RANGES. Arlington Stove Company, Jersey City, N. J. Filed June 25, 1902.

KOOL KITCHEN

The words "Kool Kitchen." Used since May 2, 1902.

38,785. COOKING STOVES AND RANGES. Arlington Stove Company, Jersey City, N. J. Filed June 25, 1902.

COOL COOK

The words "Cool Cook." Used since May 2, 1902.

38,786. RANGE-BOILERS AND HOT-WATER GENERATORS. Thurston Iron Works, Philadelphia, Pa. Filed June 10, 1902.

A monogram of the letters "T I W." Used since May 24, 1902.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

FUNK *v.* MATTESON *v.* HAINES.

Decided November 15, 1901.

1. INTERFERENCE—ORIGINALITY—BURDEN OF PROOF.

Where it is shown that H. independently built and operated a machine and filed an application for a patent on the same, H. must be presumed to be an original inventor, and it is incumbent upon F., who alleges prior disclosure to H., to establish his allegation by clear proof.

2. SAME—TESTIMONY AT VARIANCE WITH PRELIMINARY STATEMENT IS INADMISSIBLE.

A party is confined in his proofs to the dates set up in his preliminary statement as to conception and disclosure, and evidence tending to establish an earlier date is inadmissible. (*Cross v. Phillips*, 87 O. G., 1899.)

3. SAME—ORIGINALITY—PROOF OF DISCLOSURE.

When H. is the only party to establish an actual reduction to practice and when the testimony in behalf of F. not only does not support the allegation of F. that the invention was disclosed through his agent to H., but is quite persuasive that the invention disclosed to H. related to another structure, *Held* that priority of invention should be awarded to H.

APPEAL from Examiners-in-Chief.

HARVESTERS.

Application of Charles M. Funk filed June 12, 1900, No. 19,992. Application of Walter C. Matteson filed December 18, 1899, No. 740,737. Application of George W. Haines filed December 29, 1898, No. 700,644.

Messrs. Munn & Co. for Funk.

Messrs. Dewey, Strong & Co. for Matteson.

Mr. T. Walter Fowler for Haines.

MOORE, *Acting Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority of invention to Haines on the following issue:

1. In a sidehill-harvester, the combination with a main frame, of supporting-wheels, bearings for the wheels movable relative to the frame, screws connecting the main frame and the bearings for changing the vertical positions of the wheels relative to each other, and means for actuating said screws.

2. A thresher supported on wheels placed on opposite sides of it and having screws connected to the same combined with means to turn said screws together to move the said wheels simultaneously in opposite vertical directions whereby the thresher is maintained in a vertical position while working on a hillside.

3. In a traveling harvester and in combination with a threshing-machine frame thereof, bearing-wheels upon opposite sides of said frame having independent shafts and journal-boxes therefor, guides in which said journal-boxes are movable up or down with relation to the ground, vertical screw-shafts connecting with the wheel-boxes, mechanism by which the journal-boxes of one wheel are moved in the opposite direction to and in unison with those of the other wheel and mechanism for reversing said movement.

The Examiner of Interferences rendered a decision awarding priority of invention to Funk.

Haines, Matteson, and Funk, respectively, filed their allowable applications on December 29, 1898, December 18, 1899, and June 12, 1900, and they stand, therefore, in the order named as to their dates of constructive reduction to practice.

The lower tribunals concur in the finding that the award of priority depends upon the determination of the question whether or not the junior party, Funk, disclosed the invention of the issue through his agent Hughes to Haines before the date of Haines's proven conception. With this finding I also concur.

They differ, however, in their determination of this question. That the award of "priority of invention" depends on the question of originality is clear from the evidence presented by the several parties. The testimony has been carefully analyzed by the Examiner of Interferences and by the Examiners-in-Chief, and it is therefore unnecessary to again analyze that portion of the same which relates to the individual efforts of the parties Haines and Matteson, inasmuch as the findings of the lower tribunals are concurred in as to the following points:

Haines is the only party to prove an actual construction of an operative machine. He is entitled to an actual reduction to practice not earlier than the month of October, 1898, and a date of conception and disclosure of the invention not earlier than June 1, 1898. Matteson cannot be given a date of conception and disclosure earlier than September, 1898. He never actually reduced the invention to practice. He is only entitled to his date of filing, December 18, 1899, for a constructive reduction to practice.

Matteson having conceived and disclosed the invention after the proven date of Haines's conception and disclosure, and also being later by a year, less eleven days, in filing his allowable application and consequent constructive reduction to practice, cannot prevail over Haines. Besides this, even though it could be held, and I am convinced that it cannot, that Matteson conceived and disclosed his invention to his father, D. C. Matteson, in the year 1897, which is earlier than Haines's date of conception and disclosure, Matteson clearly would not be entitled to an award of priority over Haines, for the reason that he is guilty of the charge of lack of diligence in constructively reducing his invention to practice, Haines in the meantime having

entered the field and reduced his invention to practice. Matteson did nothing from his date of conception and disclosure to the date of his constructive reduction to practice on December 18, 1899, except to make some drawings, a model, and some patterns and castings for a full-sized machine. These castings were afterward broken up, and the machine was never completed. Matteson cannot be held to have shown diligence from the time of his conception and disclosure to the date of his constructive reduction to practice, which date is eleven days short of one year after the date of the constructive reduction to practice by Haines.

Funk never made an actual reduction to practice by his own efforts. He alleges that he conceived the invention, that he disclosed the same to others, more especially to one Hughes, who as his agent disclosed and explained the invention to Haines before Haines had conceived the same, and that Haines was not an independent inventor, and therefore that all of Haines's subsequent actions inure to the benefit of Funk. In other words, it is claimed by Funk that the complete and operative machine which it is clearly proven was built and successfully operated under the direction of Haines was not the invention of Haines, but was the invention of Funk.

Haines must be presumed to be an original inventor of the machine which he built and operated and for which he filed an application for a patent. Funk alleging otherwise, it is incumbent upon him to show it by clear proof.

The invention which is covered by the counts of the issue relates to a specific improvement in the wheel structure of a carriage for an agricultural implement. The wheels are so mounted on the carriage-body that they may be adjusted vertically with relation to each other. A structure permitting such an adjustment of wheels permits of its use either on hillsides or level ground. In either instance the mechanism upon the carriage-frame between the wheels is always kept level whatever be the nature of the ground over which the carriage is drawn. A type of the broad invention is disclosed in the patent to Holt, No. 496,311, granted April 25, 1893, and was well known to the parties to this interference before they filed their present applications. It is brought out in the evidence that it was the purpose of the parties to this interference to improve upon the structure disclosed in this patent to Holt.

Count 1 differs from the Holt structure in that screws are connected to the main frame and the bearings for the wheels for changing the vertical position of the wheels relative to each other. Means are provided for actuating said screws.

Count 2 differs from count 1 in that the means for actuating the screws is so constructed that the wheels are moved "simultaneously in opposite vertical directions."

The following patents have come to my knowledge which belong to an analogous art to the invention of the issue:

No. 295,788, March 25, 1884, McNary, Plows, wheel.

No. 499,853, June 20, 1893, Pirch, Plows, sidehill.

The devices shown in these patents are agricultural implements the carriages of which are so constructed that the machine may be used either on sidehills or level ground and in both instances the mechanism kept level at all times.

These machines are not only *analogous* machines, but they belong to the *same* broad art—that of agricultural implements—and they are constructed so that they are used for the *same* purpose. Though the agricultural machinery supported by the carriage-body is specifically different, the structure of the carriage is the same, and the uses to which it is put are the same.

For these reasons count 1 is anticipated by the patents to McNary and Pirch, and count 2 is anticipated by the patent to Pirch.

The patent to Warren, No. 225,668, March 16, 1880, Plows, wheels, may also be referred to as having another specific means for operating the wheels of the carriage in the same way for the same purpose.

After the termination of this interference the Examiner is directed to reject the claims corresponding to counts 1 and 2 in the applications involved in this interference on the state of the art above referred to.

Count 3 differs from count 2 by including in the combination the following elements: "guides for the journal-boxes" and "mechanism for reversing" the movement of the wheels. The combination of elements covered in count 3 is not found in the art above referred to; neither is it found in the structure disclosed in any of Funk's exhibits (1, 2, 3, 4, 5, 6, or 7) which have been placed in evidence by Funk to show a disclosure of the invention by him through his agent Hughes to Haines. Haines must therefore be held to be the prior inventor as between either of the other parties to this interference of the invention defined in count 3.

It remains now to consider the evidence relating to Funk's alleged disclosure to Haines and to determine whether or not Funk has maintained said allegation of disclosure to Haines of the invention defined in counts 1 and 2.

Funk testifies that he conceived the invention defined in the issue in—

the summer of 1893 while I (he) was to work on John Hoffman's place. (Answer 3.)

This statement is not corroborated by any witness. The harvester that he was then running was built on the lines of the Holt patent above referred to. He testifies that the *first* sketch made by him was on a leaf from a blank book. This leaf shows page number 128. It is afterward introduced in evidence as Funk's Exhibit 7. Funk's testimony is as follows on this point:

Q. 10. Did you ever make a sketch of that invention?
A. Yes; I made something that some one else might make a sketch from. There is the first sketch I ever made of it.
(Witness refers to a pencil-sketch on a leaf from blank book, No. 128, showing the page which he says is the first sketch he ever made of it.)
Q. 11. Did you ever disclose this invention of yours to any other person?
A. Yes, I did.
Q. 12. To whom?
A. To Severance. I showed the sketch to Severance, and to J. L. Hughes, too.

Q 13. State, if you can remember, about what time you made that sketch or showed it to Severance and Hughes.
A. The one to Severance and Hughes? I made it along about—when this sketch was made in full, the way it is now, it was along somewheres about the 1st of May, 1898, but then we had talked with Severance before that, and directed him in another sketch of this same thing, but never showed it to him in full. There was some things that he didn't know how it would work, and I showed him those.

It will be noted that Funk states in answer to question 10 that the sketch on page 128 is the first sketch he ever made; in answer 12, that he "showed the sketch to Severance," and in answer 13 that the sketch was made "about the 1st of May, 1898." The evidence as to this sketch on page 128 (Exhibit 7) and the sketch on page 170 (Exhibit 5) is very important, as they are the only two sketches which can be held to be disclosures of counts 1 and 2. Neither of them shows a disclosure of count 3. No mechanism for reversing the movement of the wheels is shown in the figures shown in Funk's Exhibits 5 and 7.

Funk further testifies as follows:

Q. 16. Did Severance ever make a sketch of this himself for you?
A. Yes.
Q. 17. Do you remember when he made the first sketch?
A. He made it along the first, second, or possibly the third of May, 1898, when he made that.
Q. 18. What was done with that sketch?
A. It was mailed to J. L. Hughes, to Stockton, California.
Q. 19. Who made that sketch?
A. Severance.
Q. 20. What did you mail it to him for?
A. I had a proposition from Mr. Hughes from the Haines-Houser people, to get them up a sidehill-machine.
Q. 21. What was that proposition?
A. If I got them up a sidehill-machine I was to have the exclusive right for Washington and Oregon.
Q. 22. Did you ever work on any other device before you got up this?
A. Yes; I had worked the same that Hughes had.
Q. 23. Ever made any sketch or drawing of this?
A. Yes.
Q. 24. What did you do with that?
A. I have got one of them yet.
Q. 25. Did you ever send one of them down to the Haines-Houser people?
A. Yes; I sent one down.
Q. 26. Was that before you got up this invention?
A. Yes; before I sent them this one.
Q. 27. You may look at these sketches and see whether these are the sketches that you sent them.
A. Yes; this is the one on cloth that I sent down to the Haines-Houser people.
Q. 28. This drawing is the one that you sent down to the Haines-Houser people?
A. Yes; to Stockton, California; but I think I sent it to J. L. Hughes, because he was their agent, and I was familiar with him but not with the company.
Q. 29. You sent it to him at California, to Stockton, California, to be shown to the Haines-Houser people?
A. Yes.
(Counsel for Funk offers in evidence drawings referred to, which are marked "Funk's Exhibit 1" and "Funk's Exhibit 2," respectively.)
Q. 35. You said that Severance made a sketch of this invention of yours, and you inclosed it in a letter and sent it to Hughes at Stockton, California?
A. Yes, sir.
Q. 36. Who wrote that letter?
A. Severance first wrote the letter in lead-pencil and then his daughter wrote it in ink.
Q. 37. And that, you think, was along about the first of May.
A. It was the 1st, 2d, or possibly the 3d of May, 1898.
Q. 38. Of 1898?
A. Yes, 1898.
Q. 39. Do you know whether Severance made any more sketches of that machine or any part of it?
A. Yes, he made some more.
Q. 40. What did he make it in?
A. In the same book that this here came out of.
Q. 41. The old blacksmith's book? This book?
A. Yes.
Q. 42. See if you can find any more sketches in that old book.
A. That sketch there; he made that.
Q. 43. Where?
A. On page 168, he made that. He made this one, too.
Q. 44. Another sketch at page 170?
A. Yes.
Q. 45. Another little sketch at page 171?
A. Yes; that shows where the joints was, and the upper and lower boxes.
(Counsel for Funk offers in evidence pages 168, 169, 171 and 128 of the old book, belonging to A. W. Severance, showing sketches. Received and marked "Funk's Exhibits 4, 5, 6 and 7.")
* * * * * * *

Q. 48. Did Hughes ever report to you, what he had done when he received that sketch?
A. He showed it to Haines, and Haines made a drawing of it later on, but said it was too late then for the harvest of 1898. He said he didn't believe it would work well—that the jack-screws would cramp. That is what Mr. Hughes told me when he came back.

From this it is clear, according to Funk's statement, that he made sketch No. 7 and that Severance made sketches Nos. 4, 5, and 6 and that Severance made *another* sketch, which was sent to Hughes at Stockton, Cal. These facts are corroborated by Severance, who testifies as follows:

Q. 21. Do you remember ever making another sketch, shortly after that, of Mr. Funk's device?
A. Yes, sir.
Q. 22. What did you do with that sketch?
A. Put it into a letter and sent it to Hughes.
Q. 23. Who wrote the letter?
A. My daughter.
Q. 24. Where was it mailed to; do you remember?
A. To Stockton, California.
* * * * * * *
Q. 33. Do you remember about what date it was that you mailed that letter to Mr. Hughes?
A. It was very close to the first of May, 1898.
Q. 34. May, 1898?
A. Yes, sir.

It may therefore be said to be proven that Funk disclosed the invention disclosed in counts 1 and 2 to Severance the early part of May, 1898, and that a sketch of something invented by Funk which was drawn by Severance was mailed to Hughes at Stockton, Cal., about May 1, 1898. With this sketch was inclosed a letter (Funk Exhibit 14) copied by the daughter of Severance, and the two were mailed to Hughes.

From the testimony of Funk and Severance it cannot be determined what this sketch sent on or about May 1, 1898, actually disclosed. All that can be determined from this testimony is that a sketch of some nature was sent.

From the above-quoted testimony it is certain that neither of the Exhibits 4, 5, 6, and 7 were sent to Hughes by Funk. This fact is stated to be true by Funk in his testimony. He testifies:

X-Q. 66. Were these Exhibits 4, 5, 6 and 7 ever sent to Mr. Hughes, while he was in Stockton?
A. No.
X-Q. 67. Did he ever see them?
A. Not that I know of.

It is also certain that Exhibit No. 2 was sent to Hughes at Stockton, Cal., in order to show it to Haines. The letter which was sent to Hughes, accompanied by some sketch, although it is not clearly stated what sketch, except that it is claimed that the sketch disclosed the issue and was made by Severance, reads as follows:

WALLA WALLA, *May 2, 1898.*

Mr. J. L. HUGS, *Stockton, Cal.*

Find enclosed drawing to overcome the sagment patent, you will see by the chain passing over shieve on top of circle-frame and down to the slide box that caries the main axel and through a shieve and back to top of circle-frame there to be held by tention spring on eyebolt and the same below as above.
The box or slide is to be webed to keep it in place and two rollers on back of slide to relieve the friction.
We think it would be best to key the shaft solid in the slides and let the drive wheel turn in place of the shaft.
The folks are all well.
Yours respectfully,
C. M. FUNK.

It is impossible to conceive that this letter describes the invention of the issue—such, for instance, as might be shown in a sketch similar to Funk's Exhibit 7. This letter would seem to more nearly describe a structure built upon the lines of the Holt patent or upon the lines of the device shown in Funk's Exhibit 2. This letter is dated May 2, 1898.

The Examiner of Interferences states with reference to this letter:

Counsel for Haines has attempted in his argument to show that no device such as called for by the issue is indicated in this letter and consequently it can have no weight. The letter was produced in evidence in the presence of counsel for Haines without objection, nor was any cloud cast upon it during cross-examination. Counsel for Funk has properly given an oral explanation of the bearing of this letter upon the device as shown in Funk's application.

The fact that the letter was introduced in evidence in the presence of counsel for Haines and without his objection is not indicative of the fact that the disclosure in the letter is admitted by Haines to be a disclosure of the issue. That counsel for Haines did not make objection to this piece of evidence on the ground of irrelevance to Funk's case is no reason that the letter is admitted to be relevant. It is not incumbent on Haines to assist Funk in proving his case. Though this letter is not conclusive, it throws strong doubt upon the matter sought to be proved—namely, that the sketch inclosed with this letter and duly forwarded to Hughes disclosed anything similar to sketch No. 7. On the other hand, it seems much more likely that the sketch accompanying this letter showed a structure similar to the Holt patent or the structure disclosed in Funk's Exhibit 2. The Examiner of Interferences states that Funk—

has properly given an oral explanation of the bearing of this letter.

No proper explanation of this letter is found in the record or the briefs filed in this case.

Hughes testifies that he received this letter—that it accompanied the "Funk drawing:"

Q. 27. Is this letter dated at Walla Walla, May 2d, 1898, addressed to you, the letter which you received from Walla Walla, and which contained that Funk drawing?

A. Yes, that is the letter.

(Counsel for Funk introduced in evidence a letter dated Walla Walla, May 2, 1898, addressed to J. L. Hughes, Stockton, California, and signed C. M. Funk. Received in evidence, and marked "Funk's Exhibit No. 14.")

There is no definite testimony on the part of Funk which shows what the invention was that was disclosed by Hughes to Haines. The testimony on the part of Funk not only fails to prove his allegation, but tends to throw a doubt on the fact that the invention of the issue was disclosed to Haines. It is quite clear that some structure was shown by Hughes to Haines, and from the letter, Exhibit No. 14, which accompanied the sketch the probabilities are that this disclosed structure was not the structure defined in counts 1 and 2 of the issue.

Hughes testifies:

Q. 14. Do you remember seeing a sketch of Funk's invention, something similar to this drawing here marked Funk's Exhibit 7, at any time, embracing these same ideas?

A. Yes, I saw that, and I presume that I saw the man that drew it.

Counsel for Funk contends that Hughes's statement that he saw *that* means that he saw sketch No. 7. In the brief filed by counsel for Funk it is stated on page 4:

It appears from the foregoing that Exhibits 4, 5, 6 and 7 were made in April and May of 1898, were *seen by Mr. Severance at that time;* in fact, that Severance aided in making most of the sketches, and that *Exhibit 7 was s en by Mr. Hughes,* and that Hughes took a sketch involving the invention to Mr. Haines, and that a further sketch, more clearly illustrating the invention, was sent to Hughes by Funk and shown by Hughes to the party in May, before the date of conception accorded to Haines.

This contention is not founded upon the evidence. Funk in his cross-examination states that Hughes never saw Exhibit 7. (X-Q. 66.) Not only is this explicitly stated by Funk, but it clearly appears to be a fact from the direct testimony of Funk and Severance.

In view of the testimony of Funk and Severance it cannot be held that sketch No. 7 was ever seen by Hughes. The only testimony to support such a holding is the very loose language used by Hughes in his answer to question 14.

The preponderance of evidence as to this point is in favor of Funk. The date of May 12, 1898, alleged by Funk in his preliminary statement as the date on which he made a drawing, is the earliest date that can be given to the sketch No. 7, the *first* sketch made by Funk. (*Cross* v. *Phillips*, 87 O. G. 1399.)

The letter accompanying the sketch which was made by Severance and sent to Hughes is dated May 2, 1898. The sketch which was sent must therefore have been made by Severance earlier than May 2, 1898. The sketches 4, 5, and 6 were made by Severance on the same evening. (Funk X-Q. 29.) The sketch No. 7 was made about the same time. (Q. and A. 5 and Q. and A. 6, Severance's testimony.)

It is not proven that any sketch showing the screw-rod construction—*i. e.*, the invention of the issue—was made by Funk or by Severance under his direction before the day on which sketches 3, 4, 5, 6, and 7 were made.

It is shown, however, that a sketch of a construction on the lines of the Holt machine or on the lines of Funk's Exhibit No. 2 was made earlier than May 2, 1898, and this is another reason to indicate that the letter of May 2, 1898, refers to a structure more nearly resembling the Holt construction or the construction Exhibit No. 2 than it does the invention of the issue.

The testimony on the part of Funk not only does not prove that Funk through Hughes disclosed the invention of the issue to Haines, but is quite persuasive that the invention really disclosed by Hughes to Haines related to a structure similar to the Holt machine or to that shown in Funk's Exhibit No. 2.

These conclusions are strengthened not only by the positive denial by Haines that the invention of the issue was ever disclosed to him by Hughes, but by his affirmative statement that the structure shown him by Hughes related to improvements on the Holt machine.

Haines's witnesses, Kincaid and Martyn, also testify that Hughes never said anything to them of the screw devices for adjusting the wheels when he was with them, and this was at the time of the alleged disclosure to Haines. Speaking of the testimony of Haines, Kincaid, and Martyn, the Examiners-in-Chief well say:

Each of these three testify that Hughes never spoke to him of any screw device. Yet Hughes states that he talked for days with Haines. It seems strange, that friendly as he was to all of them and to their company, that he did not also speak with the others of the screw device. He was there more than a week while his own device was being made and tried and Kincaid was with him much of the time. It is incredible that if he had this device that all of these men should not have heard of it, all being friendly and all disposed to help anything along which would help the company.

It is undoubtedly true that Funk had a conception of the issue and that when he saw the machine which was built by Haines it seemed to embody some of his ideas. That the two men conflicted in their inventions is not only probable but natural. This is a daily occurrence, as shown by the records of the Interference Division in this Office.

The allegations of Funk that the efforts of Haines were not independent, but grew out of a disclosure by him (Funk) to Haines, are not proven. Not only are the allegations not proven, but it seems quite clear that what Hughes really did show to Haines did not relate to the invention of the issue, but to some structure similar to the Holt machine.

Priority of invention is awarded to George W. Haines.

The decision of the Examiners-in-Chief is affirmed.

Orders for Printed Copies of Specifications, Trade-Marks, and Designs.

The attention of all who order printed copies is respectfully called to the following directions, the observance of which will aid greatly in the accuracy and promptness with which miscellaneous orders can be filled.

The printed copies are now divided into sixteen sections, as follows:

1. Patents from 1790 to 1836.
2. Patents Nos. 110 to 2,969.
3. Patents Nos. 2,990 to 4,809.
4. Patents Nos. 4,810 to 12,479.
5. Patents Nos. 12,480 to 99,999.
6. Patents Nos. 100,000 to 182,314.
7. Patents Nos. 182,315 to 284,999.
8. Patents Nos. 285,000 to 350,999.
9. Patents Nos. 400,000 to 486,999.
10. Patents Nos. 500,000 to 579,999.
11. Patents Nos. 580,000 to 639,999.
12. Patent No. 640,000 to ——.
13. Additional improvements.
14. Reissues.
15. Designs.
16. Trade-Marks.

Never place on a slip orders for copies belonging to different groups. Prepare a separate slip for each such separate group.

A slip should bear the desired copies arranged chronologically or numerically, beginning always with the oldest copy.

Classification Bulletin.

CLASSIFICATION BULLETIN No. 7, containing the revision made during the months of May and June, 1902, has been published. Price, ten cents.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business August 12, 1902.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
	In arrears—Under one month.

Photographic Copies of Drawings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 1, 1902.

The Patent Office is now prepared to furnish black line on white ground copies of any unbound drawing, foreign or domestic, which may be in its possession, instead of the blue-prints heretofore furnished. Only the 7x11 (patent) size and the full or 10x15 size prints will hereafter be furnished, at 15 and 25 cents per sheet, respectively.

Copies of drawings of pending, abandoned, forfeited, or informal cases and of caveats may be had in either of the above-named sizes except when they are to be certified, in which case they must be the 10x15 size.

Copies of United States or foreign patent drawings will be made only in the 10x15 size.

When ordering copies of foreign patent drawings, either the serial number of the applications in which they were cited as references or the class and subclass where they may be found must be given. The title of the invention or the number of the division will not be sufficient. Bound volumes cannot be used for making prints. Failure to give the fullest data whereby the mounted drawing may be found will result in delay and unnecessary correspondence.

The work will be much facilitated if a separate order be made for each drawing. The Office will furnish, gratuitously, blanks for this purpose on request.

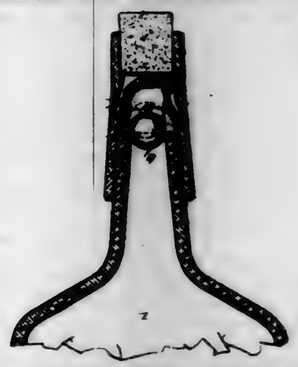
As a result of abolishing the small (5x8) size the requirement that duplicate prints must be ordered in certain cases will no longer be enforced. The requirement that less than all the sheets of a case will not be printed unless there is already a full set in the file will not be insisted upon; but applicants or attorneys are strongly urged to file a set of prints or order them to be made by the Office at the time of filing an application. Such procedure will save delay later if correction of the drawing is desired or required.

F. I. ALLEN,
Commissioner.

PATENTS

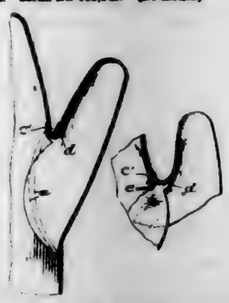
GRANTED AUGUST 19, 1902.

707,068. NON-REFILLABLE BOTTLE. EDWARD I. ALLEN, Beaumont, Tex. Filed Jan. 31, 1902. Serial No. 92,659. (No model.)



Claim.—An attachment for bottles provided at its bottom with a neck-receiving socket and composed of inner and outer shells, the outer shell being extended above the inner shell to receive a cork, and the inner shell being closed at the top and provided with a laterally-extending spout, substantially as described.

707,069. GLOVE. JOHN C. ALLEN, Gloversville, N. Y. Filed May 3, 1902. Serial No. 105,903. (No model.)



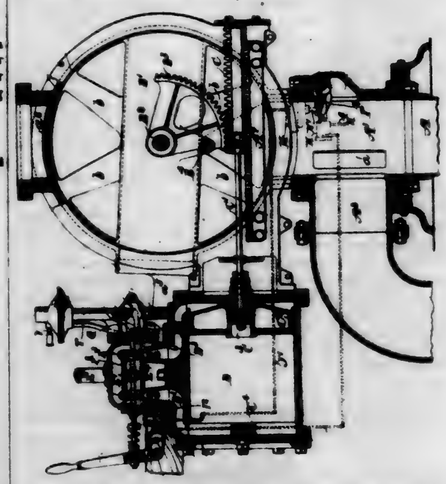
Claim.—In a glove, a body-blank having a stitching-tongue projecting therefrom and integral therewith and a thumb-blank having a stitching-tongue integral therewith and underlapping the body-blank and securing means, substantially as described.

707,070. GARMENT-SUPPORTER. DYRUS L. BADGER, Columbus, Ohio. Filed Jan. 27, 1902. Serial No. 91,269. (No model.)

Claim.—1. In a garment-support, the combination with the slip-body 1 having a slot in its forward member and a bar intersecting said member, of a lever having an enlarged head provided with substantially keyhole-shaped openings adapted to receive said bar as described and hooks projecting from said lever-head, substantially as specified.

2. In a garment-support, the combination with a slip-body 1 having a slot in its forward member and a bar intersecting said slot, of a lever 4 having its head portion provided with inwardly-projecting side flanges or wings 5, the latter having oppositely-located substantially keyhole-shaped openings therein to receive said bar and hooks projecting inwardly from the base of said lever-head, substantially as specified.

707,071. PNEUMATIC TIME-LOCK FOR PNEUMATIC-TUBE SYSTEMS. ROBERT C. RATHBONE, Philadelphia, Pa. Filed Oct. 11, 1900. Serial No. 32,631. (No model.)

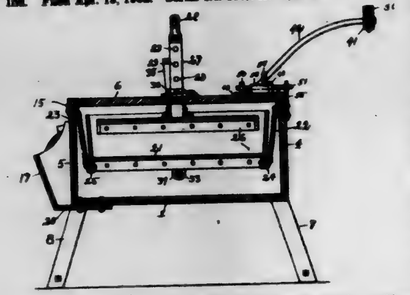


Claim.—1. In a pneumatic-tube system, a pneumatic cylinder and piston actuating a movable device forming part of the system, a lock for holding said movable device in one position, a pneumatic time-escapement device arranged to withdraw the said lock after the admission of compressed air to the escapement device, a source of air-supply having connections to the cylinder and escapement aforesaid and means for opening said connections to the source of supply or to exhaust.

2. In a pneumatic-tube system a pneumatic cylinder and piston actuating a movable device forming part of the system, in combination with a part leading to one end of the cylinder, a pneumatic time-escapement, a part leading thereto, a valve controlling the connection of said parts with a source of air under pressure and with an exhaust so that air is admitted to and exhausted from one end of the cylinder and to and from the escapement during the same positions of the valve, and a locking device actuated by said time-escapement.

3. In a pneumatic-tube system a pneumatic cylinder and piston actuating a movable device forming part of the system, in combination with a port leading to one end of the cylinder, a pneumatic time-escapement, a port leading thereto, a valve controlling the connection of said ports with a source of air under pressure and with an exhaust so that air is admitted to and exhausted from one end of the cylinder and to and from the escapement during the same positions of the valve, and a locking device actuated by said time-escapement and arranged to engage and prevent a second movement of the valve to admit air to the port for a determined time.

707,072. WASHING-MACHINE. THOMAS H. C. BEALL, Cicero, Ind. Filed Apr. 19, 1902. Serial No. 103,749. (No model.)



Claim.—1. In a washing-machine the combination of an oblong tank, a hinged cover thereon, a presser-receptacle located in said tank and provided with hangers 33 and clips 34 and 25, springs 22 and 23 secured to the ends of the tank and to the said clips, a presser rigidly suspended from said cover and extending into the presser-receptacle, a shaft mounted in said hangers, yokes 35 and 36 pivotally connected with said shaft and extending over the sides of the tank, said yoke being provided with axles at their outer ends, springs connected to said axles and to said tank, and a pair of arms pivotally connected to said axles and to said tank and connected at their outer ends by a handle.

2. In a washing-machine the combination of an oblong tank, a presser-receptacle in said tank provided with hangers 33, springs 22 and 23 attached to the upper edge of the tank and the lower part of the receptacle, the shaft 34 mounted in said hangers and extending across the under side of the presser-receptacle, a presser extending into the presser-receptacle, means for vertically adjusting said presser and means for vertically reciprocating said shaft.

3. In a washing-machine the combination of an oblong tank, a hinged cover thereon, a presser-receptacle located in said tank and provided with hangers 33 and clips 34 and 25, springs 22 and 23 secured to the ends of the tank and to the said clips, a shaft mounted in said hangers, yokes 35 and 36 pivotally connected with said shaft and extending over the sides of the tank, said yokes being provided with axles at their outer ends, springs connected to said axles and to said tank, a pair of arms pivotally connected to said axles and to said tank and connected at their outer ends by a handle, a presser in the presser-receptacle, the post 27 secured to presser 26 and extending upward through and beyond the cover 6 and means whereby said post may be secured to the cover at the point desired, all substantially as shown and described.

707,078. FOLDING BOX. ALEXANDER W. BERRY, Bayonne, N. J. Filed May 20, 1901. Serial No. 61,091. (No model.)

Claim.—1. A box comprising a foldable blank formed of a base, sides, and partially-closed top, all connected, and normally, in the unfolded condition, open at either end, and a supplemental base secured to the base of the foldable body and projecting beyond the same; and the upper members of the foldable body being provided at their normally open ends with flaps adapted to be interengaged.

2. A box comprising a blank formed of a bottom, two sides and a top portion comprising a partial closure, the said top portion being slitted centrally to form two hinged flaps which open outwardly and being slitted outwardly of the said flaps along rounded or curved lines to leave the said flaps connected or integrally hinged at specific points, and flaps upon the several portions adapted to overlap, the said flaps being provided with means for securing or connecting the same.

3. A box comprising a foldable blank formed of a base, sides and partially-closed top, all connected, and normally, in the unfolded condition, open at either end, and a supplemental base secured to the base of the foldable body and projecting beyond the same; and the upper members of the foldable body being provided at their normally open ends with flaps adapted to be interengaged, the flaps of the top portion of the box being extended beyond the other flaps and adapted to be inserted between the base of the foldable portion and the supplemental base of the box.

4. A box comprising a blank formed of a bottom, two sides and a top portion comprising a partial closure, the said top portion being slitted integrally to form two hinged flaps and being slitted outwardly of the said flaps along rounded or curved lines to leave the said flaps connected or integrally hinged at specific points, and flaps upon the several points adapted to overlap, the said flaps being provided with means for securing or connecting the same, and the flaps of the top or closure portion being extended beyond the other flaps; and a supplemental base secured to the bottom of the blank and connected thereto at specific points and adapted to receive the projecting portions of the flaps of the top portion between the bottom of the blank and the said supplemental base.

5. A box comprising a blank formed of a bottom, two sides, and a top portion comprising a closure; flaps upon the several portions adapted to overlap, the said flaps being provided with means for connecting the same; and a supplemental base secured to the bottom portion; the outermost of the said flaps being tapered and formed with a projecting tongue adapted to fold under the bottom of the box.

6. A box comprising a blank formed of a bottom, two sides, and a top portion comprising a closure; flaps upon the several portions adapted to overlap, the said flaps being provided with means for connecting the same; and a cover comprising a top portion formed with tapered flaps, sides, and side extensions adapted to be folded the latter over the former, and provided with flaps adapted to be interengaged, and the top flaps being provided with tongues adapted to engage between the side flaps; the said cover being adapted to inclose the top of the box.

7. A box formed of a bottom portion and sides provided with flaps, the bottom flap being lapped in front of the side flaps, and a top portion provided with a tapered flap having a projected tongue formed with an indented projection, and the bottom being formed with a corresponding indentation; and a supplemental base secured to the bottom portion and unconnected therewith at the point of entrance of the tongue.

8. A box formed of a suitable body portion and a cover comprising a top portion formed with flaps, sides and side extensions, adapted to be folded, the latter over the former, and each provided with flaps, the flaps of the sides being relatively short and those of the side extensions relatively long and continuous with the short flaps throughout a portion of the length thereof whereby when the cover is folded and the long flaps inserted between the opposite flaps the cover will be held in assembled position without other fastenings.

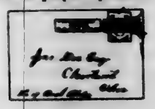
9. A box formed of a suitable body portion and a cover comprising a top portion formed with flaps, sides and side extensions, adapted to be folded, the latter over the former, and each provided with flaps, the flaps of the sides being relatively short and those of the side extensions relatively long and continuous with the short flaps throughout a portion of the length thereof whereby when the cover is folded and the long flaps inserted between the opposite flaps the cover will be held in assembled position without other fastenings; and top flaps provided with tongues adapted to engage between the side flaps.

10. A box formed of a suitable body portion and a cover comprising a top portion formed with tapered flaps, sides, and side extensions adapted to be folded the latter over the former, and each provided with flaps adapted to be interengaged, the flaps of the sides and side extensions being partially connected at the end or corners of the box, and the top flaps being provided with tongues adapted to engage between the side flaps; the said cover being adapted to inclose the top of the box.

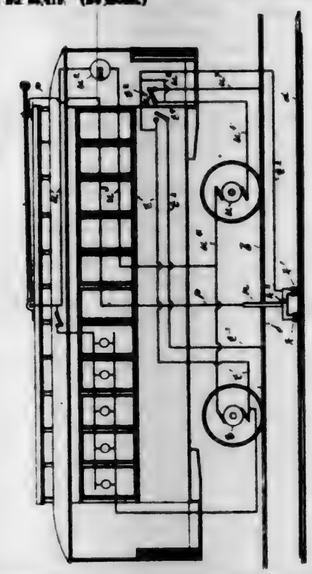
11. A box comprising a blank formed of a bottom, two sides and a top portion comprising a parallel closure, the said top portion being slitted centrally to form two hinged flaps which open outwardly and being slitted outwardly of the said flaps by discontinuous slits whereby to leave the said flaps connected or integrally hinged at specific points and flaps upon the several parts adapted to overlap, the said flaps being provided with means for connecting the same.

707,074. ENVELOP. LYDIA A. BENNETT, Cleveland, Ohio. Filed July 22, 1901. Serial No. 69,260. (No model.)

Claim.—In an envelop of the type set forth the combination with the body thereof, of a closing-flap formed with inclined edges, one of said inclined edges terminating adjacent the upper edge of the body of the envelop in a horizontal edge which extends outward to the vertical edge of the envelop, a slip having gum on its outer face and formed integral with the said closing-flap and having inclined edges which merge in the inner edge of the said flap and the said horizontal edge thereof, the address side of the envelop having a single slot formed therein adjacent its upper edge adapted to receive said slip, the said slip engaging over the address side and having its end received in the slot, and sealed to the interior of the envelop, said exposed portion of the slip adapted to be covered by the stamp, for the purpose specified.



707,075. COMBINED OVERHEAD AND UNDERGROUND ELECTRIC RAILWAY. DANIEL S. BURNS, Chicago, Ill. Filed Feb. 10, 1902. Serial No. 93,419. (No model.)



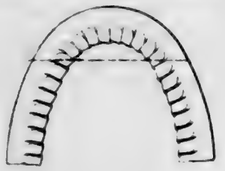
Claim.—1. In a combined overhead and underground electric-railway system, the combination of an overhead collector, a conduit having outgoing and return conductors therein, removable underground contact members for separately engaging said underground conductors, a conductor running from the positive member of said underground contact to an engaging member on top of the car, means for connecting said overhead collector with said engaging member, a motor, means for permanently connecting said overhead collector therewith, means for electrically connecting the terminal of said motor with the negative member of said contact element, means for connecting said terminal with the track-rails, and a switch for cutting out the latter.

2. In a system of the class described, the combination of underground conductors for outgoing and return currents respectively, overhead and underground contacts, a motor in permanent circuit with said overhead contact, a controller, means for electrically connecting said direct underground contact with the circuit of said overhead contact, means for connecting the negative terminal of said motor with the underground return-contact, and means for connecting the same terminal with the track-rails.

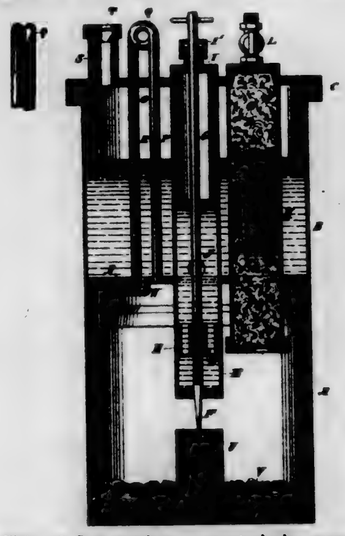
707,076. WELTS FOR BOOTS OR SHOES. JOHN O. BOZZELL, Weymouth, Mass. Filed Mar. 13, 1902. Serial No. 98,091. (No model.)

Claim.—1. A welt-strip having inclined lateral cuts, thereby forming tongues and admitting of bending, each of said tongues having a wedge-shaped portion removed, whereby the bending of the welt will not cause an increase of thickness, substantially as and for the purpose set forth.

2. A welt-strip having one vertical edge and one inclined edge, and having inclined lateral cuts extending from the inclined edges toward the center, substantially as and for the purpose set forth.



707,077. ACETYLENE-GAS GENERATOR. DAVID W. BISHOP, Lenox, Mass. Filed Mar. 7, 1902. Serial No. 97,155. (No model.)



Claim.—1. In an acetylene-gas generator having an upper water-reservoir and a lower gas-generating compartment, means for regulating escape of water from said reservoir directly to said compartment, means for reducing the excess of flow of said water due to sudden increased movement of said generator, a gas-escape duct and means independent of said duct and controlled by the hydrostatic pressure in said apparatus for relieving the gas-pressure due to said excess of flow, substantially as described.

2. In an acetylene-gas generator having an upper water-reservoir and lower gas-generating compartment, a compartment having an opening communicating with said reservoir and hermetically sealed above said opening to form a chamber for air under pressure and having an aperture below said reservoir-opening communicating directly with said gas-compartment, and a valve in said opening adjustable in definite position to regulate the water flow from said reservoir to said compartment, substantially as described.

3. The combination in an acetylene-gas generator with a vessel for containing carbid, of a second vessel forming a water-reservoir, adapted to fit upon the said carbid vessel, and, in said water-reservoir, first, a conduit for liquid communicating with the interior thereof, and an escape-valve in the bottom of said conduit; second, a gas-conduit; third, a bent tube having one end opening through the bottom of said vessel, extending through the cover thereof and then extending downwardly and having an open end near said bottom, and, fourth, a gas-escape opening in said cover, substantially as described.

4. The combination in an acetylene-gas generator, having a lower carbid-compartment and an upper water-reservoir, disposed wholly above the same, of means for regulating the escape of water from said reservoir to said compartment, a gas-escape duct leading from said compartment, a tube communicating with the gas-space in said compartment rising upward through the reservoir, bent over above the same and extending downward into the reservoir and open above and in proximity to the bottom

thereof; the said reservoir being provided with an opening through its shell or wall located above the water-level for the escape of gas, substantially as described.

5. In an acetylene-gas generator having an upper water-reservoir and a lower gas-generating compartment, a tube E having an opening communicating with said reservoir and hermetically sealed above said opening to form a chamber for air under pressure and extending below said reservoir into said gas-compartment, and a valve seated in the closed lower end of said tube and positively adjustable to regulate the escape of water from said tube to said compartment, substantially as described.

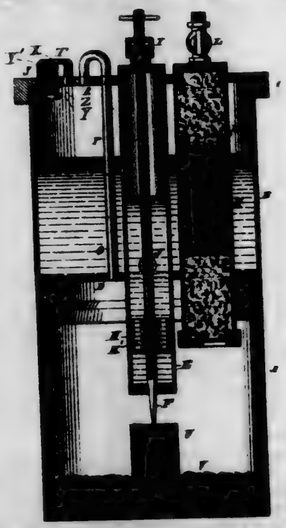
6. In an acetylene-gas generator having an upper water-reservoir and a lower gas-generating compartment, a cylindrical gas-escape duct K leading from said gas-compartment and extending through said reservoir and filled over a portion of its length greater than the distance between the top and bottom of said reservoir with drying materials for the gas passing through it, substantially as described.

7. In an acetylene-gas generator having an upper water-reservoir and a lower gas-generating compartment, a cylindrical gas-escape duct K extending through said reservoir and projecting at its lower portion into said gas-compartment and containing materials for absorbing the moisture of the gas passing through it, substantially as described.

8. In an acetylene-gas generator having an upper water-reservoir and a lower carbid-compartment, a water-tube communicating with said reservoir at its lower portion and closed at its upper end to form a compressed-air chamber, a valve in said tube for admitting water therefrom to pass to said compartment, and a transverse partition in said tube above said valve having apertures and operating to check the sudden flow of water in said tube toward and from said valve, substantially as described.

9. The combination in an acetylene-gas generator having an upper water-reservoir B and a lower carbid-compartment A, of the tube E closed at its upper end to form a compressed-air chamber and communicating with said reservoir, a valve in the bottom of said tube, threaded valve-stem G, partition H in said tube receiving said stem, and having openings H', substantially as described.

707,078. ACETYLENE-GAS GENERATOR. DAVID W. BENNOT, Lenox, Mass. Filed Mar. 7, 1902. Serial No. 97,156. (No model.)



Claim.—1. In an acetylene-gas generator having an upper water-reservoir and a lower gas-generating compartment, a compartment having an opening communicating with said reservoir and hermetically sealed above said opening to form a chamber for air under pressure and having an aperture below said reservoir-opening communicating directly with said gas-compartment, a valve in said aperture adjustable in definite position to regulate water-flow from said reservoir to said compartment, and means for increasing the air-pressure in said air-chamber above that due to the hydrostatic pressure in said reservoir, substantially as described.

2. In an acetylene-gas generator having an upper water-reservoir and a lower gas-generating compartment, a compartment having an opening communicating with said reservoir and hermetically sealed above said opening to form a chamber for air under pressure and having an aperture below said reservoir-opening communicating directly with said gas-compartment, a valve in said aperture adjustable in definite position to regulate the water-flow from said reservoir to said compartment, a gas-escape duct leading from said gas-compartment, and means independent of said escape-duct for varying the water-pressure in said air-chamber controlled by the gas-pressure in said compartment, substantially as described.

3. In an acetylene-gas generator having an upper water-reservoir and a lower gas-generating compartment, a compartment having an opening communicating with said reservoir hermetically sealed above said opening to form a chamber for air under pressure and having an aperture below said reservoir-opening communicating directly with said gas-compartment, a valve in said aperture adjustable in definite position to regulate the water-flow from said reservoir to said compartment, a gas-escape duct leading from said gas-compartment, means independent of said escape-duct for normally increasing the air-pressure in said air-chamber above that due to the hydrostatic pressure of the water column in said reservoir, and means controlled by the gas-pressure in said gas-compartment for decreasing the said air-pressure when said gas-pressure shall exceed a predetermined limit, substantially as described.

4. In an acetylene-gas generator, having a closed upper water-reservoir and a lower gas-generating compartment, a valve-chamber communicating with said reservoir, a valve in said chamber for admitting water therefrom to said compartment, an air-chamber above the water column in said valve-chamber, a gas-escape duct leading from said gas-compartment and a tube independent of said gas-escape duct leading from said gas-compartment to said reservoir above the water-level thereof, substantially as described.

5. In an acetylene-gas generator having a closed upper water-reservoir and a lower gas-generating compartment, a gas-escape duct leading from said gas-compartment, means independent of said duct, for conducting gas under pressure from said compartment and into said reservoir above the water-level thereof, a valve-chamber within said reservoir closed at its upper end and receiving water at its lower portion, a valve for admitting water from said chamber to said compartment, and means for positively adjusting said valve to vary the water-flow, substantially as described.

6. In an acetylene-gas generator having an upper water-reservoir and a lower carbid-compartment, a valve for admitting water from said reservoir to said compartment, means for positively adjusting said valve to vary the water-flow, a tube adapted to lead gas from said compartment into said reservoir through the top wall or cover thereof, and a relief-valve in said wall or cover; the said valve being constructed and arranged to permit the escape of gas from said reservoir upon the gas-pressure therein reaching a predetermined limit in excess of that due to the normal working pressure in the apparatus, substantially as described.

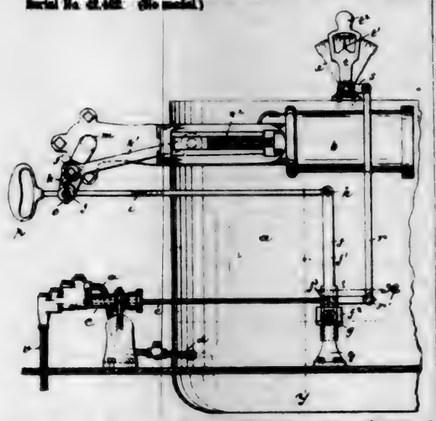
7. In an acetylene-gas generator, in combination with a gas-generating compartment and a pipe for conducting gas therefrom, of a closed water-reservoir above said compartment, means for gradually admitting water from said reservoir to said compartment, a tube extending upwardly through said reservoir from the gas-space in said compartment and bent over above said reservoir and opening into said reservoir through the cover thereof, and a relief-valve in said reservoir above the water-line therein; the said valve being constructed and arranged to open and permit the escape of gas from reservoir upon the pressure thereof reaching a predetermined limit in excess of that due to the normal working pressure in the apparatus, substantially as described.

8. In an acetylene-gas generator, an upper water-reservoir and a lower gas-generating compartment, a tube in said reservoir having an opening in its wall communicating with and near the bottom of said reservoir, and extending upwardly above the water-level in said reservoir and closed at its upper end, a valve in the lower portion of said tube for admitting water therefrom into said gas-generating compartment, and means for equalizing pressures in said compartment and in the space above the water in said reservoir, substantially as described.

9. In an acetylene-gas generator, a closed upper water-reservoir B, lower gas-generating compartment A, tube E closed at its upper end extending through the top and bottom walls of said reservoir, and having an opening J communicating with said reservoir, a valve F in the bottom of said tube for admitting water therefrom into said gas-generating compartment, means for positively adjusting said valve, a gas-escape duct leading from said gas-compartment and a separate tube O for conducting gas from said compartment into said reservoir above the water-level thereof, substantially as described.

10. In an acetylene-gas generator, a closed upper water-reservoir B, lower gas-generating compartment A, tube E closed at its upper end extending through the top and bottom walls of said reservoir and having opening J communicating with said reservoir, a valve F in the bottom of said tube for admitting water therefrom into said gas-generating compartment, means for positively operating said valve, a gas-escape duct leading from said compartment, a separate tube O for conducting gas from said compartment into said reservoir, and above the water-level thereof, and relief-valve T in said reservoir, substantially as described.

707,079. FEED-PUMP AND COMBUSTION FOR HORSELESS CARRIAGES. JOHN C. BLEVNEY, Newark, N. J. Filed Jan. 2, 1901. Serial No. 42,462. (No model.)



Claim.—1. The combination with the boiler, engine and pump, of a fulcrum, a lever *f*, formed in sections, one of which is permanently fulcrumed on said fulcrum, and the other of which is free to slide in the first said section, the free section being connected both to the piston of the pump, the piston of the engine and to a handle *p*, substantially as set forth.

2. The combination with the boiler, engine and pump, a handle and pump-stroke indicator, of a fulcrum, a lever *f*, formed in sections, one of which is free to slide lengthwise of the other, the free section being connected to the piston of the pump, the piston of the engine, the handle and to the pump-stroke indicator, substantially as set forth.

3. The combination with the engine, boiler and pump, of a fixed fulcrum, a sectional lever, one of the sections of which provides the bearings for the fulcrum of said lever, and the other section of which is connected to the pistons of said pump and the piston of the engine, and means for changing the relation of the said sections to increase or diminish the length of stroke of the pump, substantially as set forth.

4. The combination with the boiler and engine, of a pump, for supplying the said boiler with water, a piston moving reciprocally in said pump, a lever formed in sections, one of which is longitudinally adjustable in its relation to the other, the adjustable section being pivotally connected to the piston-rod of the piston, the said piston-rod being also connected to a connecting-rod *r*, said connecting-rod *r*, a hand-operable indicator connected with the rod *r* for adjusting the sections of the lever, a connecting-rod *i*, for operating said lever, and a connecting-rod *k'*, connecting the said connecting-rod *i*, with the piston of the engine, substantially as set forth.

5. The combination with the engine and pump and their respective piston-rods, of a fixed fulcrum, a sectional lever, one of the sections of which is free to slide longitudinally on the other, the pump piston-rod being connected to the sliding section, and said piston-rod extending into connection with a connecting-rod of an indicator, said connecting-rod and a hand-operable indicator serving both to indicate the stroke of the pump and to move the sliding section of the lever on the fulcrumed section and connections of said sliding section with the piston-rod of the engine, substantially as set forth.

6. The combination with the engine and its piston-rod k^2, and connecting-rod k', of the separable rod *i*, connected to the rod k', and having a handle *p*, a lever *f*, connected to said rod *i*, a fixed fulcrum for said lever, the pump and piston-rod *o*, the latter being connected to the lever and extending therefrom into connection with the rod *r*, said rod *r*, and a hand-lever for operating the same and changing the stroke of the pump piston-rod, substantially as set forth.

7. The combination with the boiler and engine, of a crank-shaft and connecting-rod of the engine, said rod having the screw *k*, the handled rod *i*, pivotally connected to said arm, the sectional lever, the section f^2, of which is fulcrumed on a fixture, and is provided with a groove to receive the section *f*, a pump piston-rod pivoted upon the section *f*, a pump and its piston, a connecting-rod *r*, and means for raising and lowering the same to change the stroke of the pump-piston, substantially as set forth.

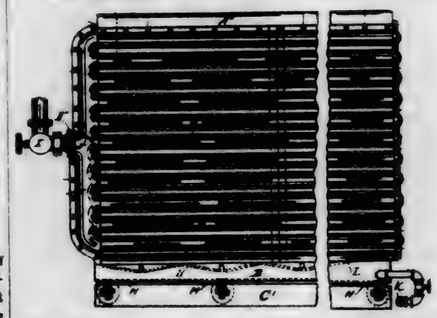
707,080. MATCH. CHARLES M. BOWMAN, Lebanon, Pa., assignor to the Diamond Match Company, New York, N. Y., a Corporation of Illinois. Filed Feb. 3, 1900. Serial No. 3,818. (No model.)

Claim.—1. A match treated with oil of mint, substantially as and for the purpose described.

2. A match treated with paraffin containing oil of horsemint, substantially as and for the purpose described.

3. A match having a portion carrying oil of horsemint, as a repellent of rats or mice, substantially as described.

707,081. ATMOSPHERIC STEAM-CONDENSING APPARATUS. FREDERIC E. BRANDT, Dayton, Ohio. Filed Dec. 23, 1901. Serial No. 86,570. (No model.)



Claim.—1. In an atmospheric steam-condensing apparatus, the combination of two or more series of condenser-sections, each section consisting of two corrugated walls, a two-part front and rear upright head to which the vertical edges of said walls are united, the front head providing an inlet for the steam, a crown to which the upper horizontal edges of said walls are united, said crown having its sides tapering in order to direct water to the exterior surfaces of said walls, interior means for bracing and sustaining said walls, a base to which the lower horizontal edges of said walls are connected, and means within said base for cooling the water of condensation from contact with the steam, substantially as specified.
